The next institution to be stressed was the Church. Any one year since 1911 has witnessed more agitation and statesman-like activity in behalf of the rural church than any five years previously. No book or magazine article bearing upon rural improvement has been without a chapter on the Church, and some of our most competent authorities have said the Church must play the leading role in the Country Life Movement. Dr. Thomas N. Carver, formerly of Harvard Universtiy, later Director of the Rural Organization Service in the Department of Agriculture at Washington said a couple of years ago: "The solution of the rural problem lies largely with the rural ministers who are helping rural people to form their likes and their dislikes." About the same time a leading agricultural editor wrote: To the Church we must look for leadership in this matter of higher and better living in the country." But we did not hear anything like this during the first year or two of the Country Life Movement. In his excellent book, "The Country Life Movement," Dr. Bailey does not give a single page to the Church. The same is true of other first class books on the subject. President K. L. Butterfield of the Massachusetts Agricultural College, in his widely read book, "The Country Church and the Rural Problem," was the first to stress the Church as a significant factor in the solution of the rural problem. This book was published in 1911.

The third and latest institution to receive marked emphasis by those trying "to make rural civilization as effective and satisfying as other civilization," is the Home. It is more difficult to fix the time when the accent mark was shifted to this all-important institution, since it was not without occasional stress during the ascendency of the School and the Church. If I were asked to say what, in my opinion, did most to cause emphasis to be placed upon the Home by rural welfare workers, I should say the publication by the Department of Agriculture of those four bulletins which are based upon the answers received by Secretary Houston to his 55,000 letters of inquiry to farm women. These bulletins show the social, the domestic, the educational and the economic needs of farm women to be all but overwhelming, and no one can read a single one of them without seeing that until we effect material changes in home conditions on the farm we need not expect to hold the young people or keep well and happy the old. The cry just now is for instruction in home economics and assistance in making the home more attractive, sanitary, and restful, and it is a timely cry. For an ambitious young person from an average farm home to make one visit to the home of a city cousin and note the superior improvements and advantages is enough to prejudice him or her against life in the country. We have been too prone to compare our best rural homes with our cities' worst. The country no less than the city has its slums, and the average country

home has fewer advantages than the average city home.

But it is not the purpose of this paper to say that all efforts should now be directed toward securing the needful physical improvement in the average rural home, great as this need is. Running water in the kitchen and bath room, a furnace in the basement, and electric lights within and without will not solve "the rural problem." These things will contribute toward the solution of the problem in much the same way that a modern school and an efficient church contribute toward making any rural community more "effective and satisfying." And I would not have one individual cease laying stress on the Home as an all-important agency or medium in rural betterment. I wish I might say or do something to add the the present emphasis on the home as regards any social service program. I rejoice also that so much attention has been given the School and the Church in connection with rural welfare work. All that has been done can be utilized most advantageously. It is as though six or seven years had been spent in developing athletes and preparing them for important games. Individual muscle and efficiency are not only necessary, but indispensable. But these alone will not win the game. Team work is more important than individual strength and efficiency, notwithstanding the indispensability of the latter.

The next step in the Country Life Movement is the securing of team work by the School, the Church and the Home. Each has been working independently long enough. There can be no decisive victory without team play. It would be no less preposterous for a football coach to go on and on with his training and conditioning of individuals without ever assembling them for action as a team than for rural life coaches to go on and on first developing strong schools, then building up strong and efficient churches, and lastly effecting needful improvements in the homes in their communities, and making each of these steps ends and not means. There would be better schools, better churches, and better homes, to be sure. Likewise would the football coach develop better individual men. But what about the game? It would be lost; and who wants to be on a team that never plays a real game?

Just as no squad of men can win a game working independently one of another, neither can any number of institutions or agencies solve our social and industrial problems working independently one of another. There is hardly a township in Indiana where there is not a woeful lack of team work on the part of these three most indispensable institutions. The School teaches sanitation, but the Home calls it "theory," and backs the statement up by recounting the many good and apparently efficient persons who lived happily in ignorance of such instruction. The School encourages athletics, but the Church too often acquiesces in the saying that "all such things belong to the Devil." In a certain school, with a building having an excellent gymnasium and facilities for recreation, the children from several homes were forbidden by their parents to make use of the gymnasium because their pastor had given it as his opinion that basket ball and the like were "the inventions of the Devil." And this building is not thirty miles from Purdue University, and was not erected until the year 1913 A. D. The Church teaches godliness, and the School and the Home not infrequently exult in godliness. The Home teaches progress, and more frequently than not the School and the Church stand as conspicuous monuments of ultra conservatism and the utter absence of progress. The Home tries to hold the boys and the girls on the farm, the School in its arithmetic, geography and grammar lessons entices them to the city. The Church emphasizes other-worldliness while the School and the Home emphasize happiness and efficiency here and now. There is not only the absence of team work, but there is open disagreement and willful contradiction among these three institutions which ought to be "purveyors of a common good."

The old saying "United we stand; divided we fall" finds indubitable application at this point in the development of rural America. Not only Indiana, but every state in the union is in need just now of an Arnold Winkelried who will go up and down its highways crying "make way for cooperation, or die," not as a threat, but as prophecy. For nothing can be more manifest to those who are familiar with present conditions and present needs than that the very preservation of our highest rural ideals are in no small measure dependent upon team work, by School, Church and Home. And he who leads in this next great step in the Country Life Movement will render conspicuous service to the world as a whole.

WHAT FERTILIZER SHALL I USE

Because of the European War prices of some fertilizers have become almost prohibitive and it is necessary for farmers to study very carefully what fertilizers to use in order to get the most value for their money. An excellent article appears in Bulletin 139 of the Missouri Experiment Station by Professor P. F. Trowbridge which we reproduce here for the excellent advice it gives on this subject.

Potash and sulphuric acid are in such great demand in the manufacture of explosives at this time that their use in fertilizers must be limited or the cost to the consumer very materially increased.

Small amounts of potash are present in tankage and in manures. When wood ashes are available, from three to seven per cent potash may be obtained. The usual supply of potash salts from Germany is now entirely cut off. Some potash is now obtained from kelp on the Pacific coast but it is all used west of the Rocky Mountains. In Missouri, we must temporarily get along without that fertilizer ingredient and naturally wish to consider whether we have a substitute, or how we can best meet the emergency.

There is no substitute for potash. All plants must have this element but some need it much more than others. Fortunately, most Missouri soils are supplied with a great abundance of potash but it is in the form of insoluble silicates. Experience has demonstrated that soils abundantly supplied with organic matter and lime will produce abundant yields without the addition of the soluble potash. Pulverized limestone can be added at once, two or three tons to the acre. Utilize all the old straw stacks and work them down to make all the manure possible. Do not burn corn stalks, disk them thoroughly and plow them under. Grow clover, cowpeas, rye, or even oats to plow under to furnish the organic matter. It is generally advisable to plow under the weeds rather than to burn them.

The phosphoric acid question is more serious. Missouri soils are deficient in that element. We cannot grow it on the farm as we grow the nitrogen. Every bushel of grain, every steer, or other animal sold from the farm removes a certain amount of phosphoric acid. This must be returned in the form of fertilizers or we are depleting the land.

The supply of bone meal is limited Use all you can get. Rock phosphate is abundant and the war should not affect the price. The past results hardly warrant us to recommend its general use in Missouri where immediate returns are desired, owing to its being so insoluble and therefore so slowly available. However, the same conditions which favor the availability of the insoluble potash solicates will favor the availability of the phosphorus from the pulverized rock phosphate. We can, therefore, say to the land owner who is planning for the future as well as for the present, apply some of the phosphorus as the pulverized rock phosphate where you have an abundance of lime and organic matter. Use also some bone or acid phosphate for present needs. Generally speaking we may consider the phosphoric acid of acid phosphate as being chiefly available the first year When added in bone, its effect extends over four or five years and when added as rock phosphate the effect will extend over 10 or 12 years.

The only limitation of the supply of acid phosphate will be the cost of the sulphuric acid used to make it. We are making more sulphuric acid now in the United States than ever before, but the demand has made an enormous increase in the price. This condition will result in an increase in the price of acid phosphate. Farmers are not advised to reduce the amount of phosphoric acid used, especially in the production of grain crops. It is generally estimated that one pound of the available phosphoric acid is worth fully three pounds of the insoluble phosphoric acid of the mixed fertilizers. High-grade fertilizers are cheaper per pound of plant food than the low-grade ones.

The nitrogen in fertilizers should not cost any more than formerly and it should be used liberally wherever there is insufficient plant growth. It is always to be emphasized that the farmer can produce the nitrogen on the farm cheaper than he can buy it in the commercial fertilizer. This takes a season, however, and must be planned for in advance. For the particular crop and field in question, buy the nitrogen in the fertilizer if you do not already have it in the soil.

For permanent soil improvement, get plenty of limestone and organic matter in the soil. Buy phospheric acid; the soluble forms for immediate needs and the insoluble forms as the deposit in the bank for future needs. Buy (with your neighbors) a car load of rock phosphate. Use it on the manure spreader at the rate of from five hundred to a thousand pounds an acre. Then, when planting the crop (wheat, corn, or oats), use from one to two hundred pounds of 16 per cent acid phosphate, with nitrogen if needed.—P. F. Trowbridge.

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from $12 to $30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. **There is no war tax on land, nor is there any conscription.** For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

AN AMERICAN CHAMBER OF AGRICULTURE

By HON. DAVID LUBIN, American Delegate to the International Institute of Agriculture, at Rome.

Before the Hearing at a joint session of the Senate and the House Committee on Agriculture.

In the political and economic life of the nation, as is well known, there are two forces. One, the progressive and radical force of the cities, the financial, commercial and industrial force. The other, is the conservative force of the country, the force of the agricultural industry. These two forces act and react upon each other.

The force of the cities is dynamic, progressive and radical. The force of the country, the farmer, is static and conservative. The first of these forces is aggressive, militant. The second is static, defensive.

There has always been, there is, there will be an interminable struggle between these two forces. And what of the battle? It is always a combat of financial experts and master merchants on the one hand, and "Rubes", clod-hopping farmers on the other.

In this combat, like those in the arena of ancient Rome, the first of these combatants, is as it were, armed with the double edged sword of financial and commercial masterships, whereas, the second is compelled to fight armed with a reed, the reed of financial incompetency, of commercial impotency.

Tenant Replaces Land Owner

No wonder then, that as the combat proceeds the land-owning farmer is gradually eliminated, is replaced by the renter, ending in the consequent decay and ultimate death of the nation.

How does the matter stand here, what is the state of the fight in these, the United States?

As is well known, in the beginning of our national life the nation consisted almost entirely of country, of farmers. Of the cities there were but very few and these inconspicuous. Such a nation was not to the likeing of that illustrious statesman, Alexander Hamilton. He saw clearly that the overwhelming preponderance of the static, conservative force swaying the destinies of the nation would soon freeze to death the liberal progressive tendencies of the cities, and thus undermine and destroy the Republic. Hamilton clearly perceived that if the course of the nation was to be upward and onward that there would have to be an equitable balance between the force of the cities, the progressives, and the force of the country, the conservatives. Hamilton clearly perceived that the equilibrium between the progressive and the conservative forces was esssential in order to permit the evolution toward that stable political and economic condition so essential to national strength and to national life.

The City's Grip on Country

But how was that to be achieved? It was to be done by building up the cities; by a high protective tariff. Hamilton thus became the father of the protective system. With the tariff came the many cities, both great and small, and in time there came, as Hamilton foresaw, the balance of power between the conservative force of the country and the progressive force of the cities. And when that was brought about the nation was strong. The ' 'Golden-mean", as Confucius would have it, had been reached.

But unfortunately, there was nothing provided to have the equilibrium between these two forces persist, and thus maintain that golden mean. The time soon came when the skillful financier, the master merchant, the force of the cities, as is its habit everywhere and at all times, gripped the force of the country in deadly embrace, in mortal combat. The combat is still going on, with the force of the cities irresistably in the lead, and unless the grip of the city force is loosened from the throat of the country force the inevitable ultimate must be national decay and national death.

In what then does the "death grip" of the city force consist? In this: the city man is a financier and a merchant, the countryman is not. The city man knows how to buy but the countryman does not know how to sell. As a result the city man manages to buy the country man's product and pay him a price for it denominated by himself, regardless of the equities in the case.

A continuation of such a system must, of course, tend to drive the land-owning farmers off their lands, when they are replaced by renters.

But where is the harm in this? Was it not previously asserted that the farmers are conservatives; that the equilibrium between the conservatives of the country and the progressives of the cities tend toward the "Golden-mean"? How then can there be a disturbance of the equilibrium so long as there is a replacement of the land-owning farmer by the renter? Is not the renter also a farmer?

Renters Are Radicals

He may do farming, but he is not a conservative. Renters the world over are, as a rule, radicals. Thus it follows that whenever the land owning farmer has been replaced by the renters there has been a change from the conservative to the radical. Continue such changes and in time we will have changed the social, economic and political system. We will then have had a quiet dry-rot sort of a revloution, or as is the case sometimes, a loud, boisterous one. But be it quiet or be it boisterous it has been a revolution, and of a deteriorating character.

Let but that condition persist and in time it will corrode and consume the entire body-politic. It was such a condition that consumed Rome; that persists in maintaining a rude mode of government in Russia; that, in the face of her 89% farm renters, denies to England the privilege of exerting the mighty power she might otherwise exert.

The Lesson of Russia

There was a momentary time when the otherwise murkey public policy of Russia was replaced by some rays of political sunshine, when at the command of one of her Czars the serfs were rendered freemen. But more than this; the former serfs were to be converted into land-owning farmers.

What was the result? Very shortly thereafter the city financiers and the city merchants owned the farms of the freed serfs and substantially owned the ex-serf too. Why? Because the ex-serf was no financier, no merchant, but the city-man was, so the financiers and the merchants came to their own. As a result, the serf that formerly belonged to the lord now belongs to the merchant, or to anyone that may want him.

As it is in Russia so has it been all over the world, and no wonder, for the financier and the merchant everywhere, in his combat with the farmer, is armed by a keen double-edged sword, while the farmer is armed with a reed.

What is the state of the fight in the United States? Let us enter this assembly room, for there is a meeting of the Grange going on, when we may hear something of which we wish to know. There are say fifty people present, and the Master of the Grange has asked one of the members to speak on the economic situation of the farmers.

You will soon be informed that the conditions are grossly inequitable; that the American Farmer is being eaten up by "Wall Street"; is being consumed by the trusts. What is the remedy? They do not know, but have some vague hope that some day they will get even, somehow.

Where Agriculture Has Its Own

And now let us enter an assembly room in Germany, at a meeting of German financiers and merchants, and we will be likely to hear the complaint that they are being eaten up by the aggrarian interests; that the farmers are gaining ground, and that they win easily in the economic combat. Strange cry, that, and significant.

It is probably the first time in the political and economic history that there was justification for such a cry. Truly, in Germany, "the shoe is on the other foot". Agriculture there has its own. It is to all intents and purposes permanently intrenched in its stronghold of the offensive and the defensive in the economic combat. As a result the industry of agriculture in Germany is not merely an entity, it is a Giant among giants. It is the equal as a combatant of the financial and the commercial forces.

It is not far from the mark to say that it is this economic status which has rendered Germany one of the most powerful nations of the world. And the cause of all this is not far to seek; it is the strength which has evolved through her great agricultural organizations, the Landwirtschaftsrat, which has made Germany so strong.

Beginning with the local units throughout the empire, with its organizations of land-owning farmers; each with its bureau of secretaries and workers, thence upward to each county, thence upward to each of its state organizations, all affiliated and federated into its national organization, substantially renders the German farmer invincible and invulnerable in his economic combat with the financier and the merchant.

The bill before Congress (S. 5687, H. .R 14903) is an adaptation of this German system, and follows it quite closely. Intelligent consideration will clearly show that its adoption in the United States will not alone be conducive to the economic welfare of the American farmer but that it will be of great political benefit to this nation.

It can readily be seen that its adoption will change the status of the American farmer. Instead of the nonentity that he is now he will become, through this organization, the peer of the financier and the merchant in his knowledge of finance and commerce.

But, say some, why shall we adopt a plan from an autocratic government? Why not devise a plan of our own? Let such an objector go over the bill intelligently and carefully and he will fail to find a trace of an objection on the score of autocracy in it. No more so than he would find in the organization of the Grange or of the Farmer's Union.

Farmers Must Do It

But can not all this be done by the government, by the Bureau of Markets of the Department of Agriculture? No, it can not be done by that Bureau. In the first place, government employees are under orders of government officials, and no sensible person would expect that prompt action from government bureaus that is required in the course of current business. Let us remember that an error in change at a store may be rectified in an hour, whereas an error in a money-order may take several months to correct. But the chief objection is this, that a government would have no more right to tell a farmer to whom to sell a lot of potatoes or apples or to whom not to sell them than it would to tell the shirt maker or the shoe maker to whom to sell shirts or shoes or to whom not to sell them. A government that would attempt such mode of procedure would be classed as childish.

It would be such a downright paternal function that it would not even be tolerated in such paternal governments as Siam, Burmah, or Afghanistan. Such paternalism was only attempted once in the history of the world, and that was by a Pharoh, in the seven year of famine in Egypt.

There is no objection to having the Bureau of Markets perform the functions mapped out for it, when the proposed organization can make use of its labors in the course of its routine. The Bureau of Markets will then be a valuable aid to the American farmers.

Benefits Producer and Consumer

In conclusion let me say that the American Chamber of Agriculture will be of great benefit to the American farmer by enabling him to market his products intelligently and at equitable price, both in the nearby and in the remote markets.

It will be of great benefit to the consumers, because intelligent and equitable distribution will do away with the high cost of living.

Finally, the adoption of the proposal before us will be of great benefit to the American people by restoring and by maintaining that equilibrium of economic and political power between the forces of the cities on the one hand, and the forces of the country on the other and thus best serve the political interests of this nation.

How can you get more for a dollar than to get The Missouri Farmer three years for one dollar?

For Greatest Satisfaction Use

DOUBLE SERVICE Automobile Tires

Guaranteed 7,000 Miles Service

Absolutely Punctureproof

Double Service Tires are made double the thickness of the best standard make tires.

This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof.*

These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.

They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.

Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an Introductory Offer:

PRICES

	Tires	Tubes		Tires	Tubes
30x3 in.	$ 8.60	$2.30	36x4 in.	$17.45	$4.65
30x3½ in.	10.85	3.10	35x4½ in.	21.20	5.60
32x3½ in.	12.75	3.20	36x4½ in.	22.50	5.75
33x4 in.	15.75	4.20	37x4½ in.	23.60	6.20
34x4 in.	16.70	4.35	37x5 in.	26.30	6.60

All other sizes not included in above list also furnished. Non-skids at 10% additional.

Terms: Payment with order at above special prices, a 10% discount allowed on orders for two or more tires. All personal checks must be certified.

Try these tires now and be convinced of their very high qualities. Sold direct to the consumer only. *Descriptive folder upon request. Write for it.*

Double Service Tire & Rubber Co., Akron, O. Dept. M T

STATE FAIR JUDGES

The members of at least two important breeds of swine have, we understand, been notified by the management of the Missouri State Fair, that the board refused to act upon the recommendations submitted by the State associations of the two breeds in the matter of selecting the judges for the 1916 show.

Just why the board should take this stand is difficult indeed to understand, especially so, when the majority of the exhibitors are members of the associations making the recommendations.

A state fair should concern itself first with the public and then with the exhibitors, but should not loose sight of the fact that without the good will of the exhibitor they could offer very little to the public. Perhaps the question of judges causes the various fair managers more trouble than any other problem and it would seem that they would welcome an easy solution of such a vexing question by appointing men who are known to be acceptable to the majority of the breeders who contemplate showing, certainly, would this seem logical when the men are known to be capable and honest judges.

No one was trying to "put anything over" on the management, the men suggested were prominent breeders and judges of recognized ability, the associations making the request are recognized as standing for the best interests of the breed, then why should the state fair board refuse to take counsel with them?

The Missouri State Fair has yet a long way to go before it becomes one of the big fairs of the country, and if it ever does reach the front rank it will require a bit more constructive work than has recently been shown.

For the past two years the swine show has made great strides and the increased interest among the breeders was due almost entirely to the work of these State Associations.

The swine exhibitors at Sedalia have been putting up with great inconveniences for years and it would seem that the least the board could do would be to grant them their request in the matter of judges. There has been some talk among the exhibitors that they would pass up Sedalia this year and if the majority do, the public can only blame the management for adopting such country fair tactics.

It takes team work to build up any enterprise and it will take team work between the State Fair Board and the exhibitors to put on a great show at Sedalia. The public will suffer most and the public has a right to expect that the state board will make every effort to satisfy the exhibitors.

R. P. Royce.

A WORKING FARM CLUB

To The Missouri Farmer:

Answering your request for information about farm clubs will say that I am serving as secretary of our local bureau and if you have anything of interest for us it will be thankfully received.

The Pee Dee Farm Bureau is situated in the western part of Marion County and is a branch of the County Bureau. It was organized in April, 1915, by the Marion County Farm Agent.

Our membership is short in numbers but long on enthusiasm. Meetings are held each month, which are both educational and profitable, and at these meetings various farm subjects are discussed in a way that brings out many ideas that broaden our views and give us a better understanding of things. The County Agent was with us quite often until he resigned his work here, always giving us good practical talks and sound advice. So far we have been unable to get a man from the State Board of Agriculture to talk to us. Miss Root was here in August and conducted a canning demonstration for the ladies.

We held a farmers picnic the 26th of August and it was a success. Every body had a good time and enjoyed the day. A basket dinner was served by the ladies at the noon hour which was "well received." Some exhibits of farm products were shown, premiums were given on the best colts of different classes and a colt judging demonstration was conducted by the County Agent.

We bought our binder twine together last year and made a good saving. This year we hope to ship our hogs together and save the local shippers' profit.

Realizing that the mud hole is a great chasm between farm and market, road work was taken up last year and a nice donation of money and labor was soon raised among the members. A committee was appointed to interview the County Court and that body gave us aid and some substantial improvements were made.

A sale list is a late feature with us. Each member lists his "wants" and "for sales" with the secretary who reads the list. The first represented more than $1,500.00 worth of live stock, feed, seed, farm machinery, etc., and a number of sales were made.

We are striving for greater things for the future and believe that a better condition of things can be brought about. But to do this it is important that each member realize the fact that he is a part of the organization and do his part to help bring about the things hoped for. We helped to put The Missouri Farmer in several homes here and would like to see it go into many more. A. P. Calvert,

MANURE AND CROP ROTATION

At the Experiment Station at Columbia a plot of land which had been planted to corn for twenty-five years has had the supply of organic matter so reduced that the soil has assumed the light-colored, exhausted appearance of worn-out land. Incidentally, the yield has decreased until during the last five years it has averaged but ten bushels per acre. Of course, considerable quantities of plant food have been removed during this time and more or less insect injury has developed, but the most important difference between this plot and a rotated plot near it on which the corn yield has been maintained at around fifty bushels per acre has been the difference in the supply of organic matter.

Since the loss of organic matter is greater on corn than on any other crop commonly grown in Missouri, it becomes evident that if the fertility of the soils is to be maintained a crop rotation must be adopted. It is only on overflow lands that we can expect to maintain the productiveness of corn lands without rotation, and even there insect enemies soon develop, which make it desirable to change the crop occasionally. Missouri corn growers have heard rotation of crops urged at every meeting since the association was organized, and there is little doubt but it will be urged at every meeting for years to come. The term "crop rotation" has become so common that I often wonder if it makes the least impression on the men who are not following a crop rotation. I wonder, too, if most farmers who have been practicing a more or less systematic crop rotation are not discouraged as a result of the recent dry years in which clover has failed almost regularly. It certainly has been discouraging. Nevertheless, the time is upon us when a systematic crop rotation must be followed if fertility is to be maintained on the well-handled farm, and the chances are that we are near the end of these poor clover years. Rotation with clover, soy beans or cowpeas and grass is the only method of handling lands to keep them in condition for growing satisfactory corn crops, and the sooner we learn to handle a systematic crop rotation the better it will be for the land and the better for us. Rotation alone, however, is only the first essential. In the rotation experiments at Columbia, where was grown for seventeen years without change, the yield was reduced to 11.8 bushels per acre, while a rotation of corn, wheat and clover gave a corn yield the same year of 50.7 bushels per acre. In the same season land which had been rotated in corn, wheat and clover and manured heavily yielded 77.6 bushels per acre. Thus it will be seen that rotation alone helps much, but manuring must accompany it if the highest yields are to be secured.

The station has been experimenting for a good many years on the use of manure and fertilizers for corn. Of course, barnyard manure, where it can be secured, is the very best fertilizer for any cornfield, but on the average Missouri farm this material is always more or less limited in quantity. Unfortunately, one of the reasons for this limited amount of manure is due to carelessness in handling. The average of all the results secured in the outlying fields of the experiment station throughout the state have shown that a ton of manure is worth on corn $2.29. This emphasizes as much as anything could the value of manure on corn land from the standpoint of money returns. The man who is handling a four-year rotation under a system of live-stock farming should be able to return to the land between six and eight tons of barnyard manure to each acre during the round of the rotation. Of course, this may not all be handled from the stable as much manure goes back when pasturing down the crops, but if all crops are stable-fed and the bedding properly used, a man should be able to manure his corn in a four-year rotation at the rate of six or eight tons per acre. Experience has shown this to be possible, and as farming becomes more intensive this much barnyard manure, or its equivalent from crops pastured, should go back to each acre of corn land during a four-year rotation where live stock is all that is sold from the land.

It is perfectly possible to maintain the supply of organic matter in the and through the use of green manure crops. This is done in European countries to a large extent. It is done to a certain extent in the United States, but the average corn-belt farmer, who handles more or less stock, will use green manures to only a slight extent in most cases. Where clover is practically a sure crop, however, and where the land is productive, it is perfectly possible in Missouri to practice a system of grain farming and maintain the supply of organic matter by using clover, rye and cowpeas as green manures. Green manuring is to have a much more important place in our systems of farming from now on, and the careful farmer will begin to familiarize himself with the methods of handling green manure crops.—M. F. Miller, College of Agriculture.

Baled Hay at Lowest Cost

THE price of hay, and the profit in it for the grower, depends upon the condition in which the hay is marketed. Hay of the same quality, in tight, smooth bales, brings a higher price than when shipped in loose, ragged bales.

International Hay Presses, with their powerful toggle-joint plungers, produce tight, solid bales. The roller tucker makes the bales smooth. The bale chamber tension produces bales of uniform size. The presses work fast, the different sizes and styles baling from 6 to 35 tons per day.

The line consists of one and two-horse presses, motor presses, belted jack presses and fast power presses. The one-horse press is made in 14 x 18 size only—all others in 14 x 18, 16 x 18, and 17 x 22 sizes, the accepted standard. The capacities vary from a small horse power press for the man who wishes to bale a little hay, to the largest, fastest custom power presses ever required.

An attractive mailing folder, in colors, shows **International Hay Presses** as they are, and gives complete specifications. Write for it.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII June 1, 1916 No. 11

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

TOWN AND COUNTRY

There are a great many schemes offered for the organization of farmers just now and there is at least one plan that we can not subscribe to and that is for the bringing all classes of town people and country people into the same organization. In the early organization of the Grange this plan of permitting so many whose primary interest was not agriculture to get into the order was the cause of the failure of hundreds of local granges. The Farmers and Laborers Union which flourished for a while was broken up largely because men whose interest was not in farming were permitted to enter the Union.

It is argued that the town is interested in the country and the country in the town and therefore both should work together for the good of all. This argument if sound would demand that we have but one organization in the whole country a thing too absurd on its face to need argument. Will any one deny that organization has been a very great benefit to all classes of labor that have been successful in forming unions? But has not both history and common sense proved that it is necessary to form separate unions for the different classes of laborers. Why not say that it would be better to have both employer and employee in one organization? What would you think of an organization with the railroad bondholders, the stock holders, the car builders, the steel mills, the tie makers, the train men, the station agents, the track men and many others all in one great railroad union? But why not go further and say that everybody who is interested in the success of our reailroads should be eligible. Everybody is interested in the success of the railroads but not exactly in the same way, yet no one who has the welfare of one of the above separate classes at heart would think of suggesting that they all get together in one union. There are some things for which these people can all stand together but there are others where they clash and, therefore the necessity for a narrower and closer organization.

Those who suggest that the townsman and the farmer get together in one great body forget that they are asking farmers to unite not only with merchants and professional men but with the railroad employee, the miner, the promoter and everybody else because all who do not live on the farms are living in the towns.

When legislation is pending affecting the railroads' interest you will find all classes of railroad men standing arm to arm for the railroad but when that mutual interest clashes with the rights of some class it is easy to see the need of separate organization.

There are many things of mutual interest to both countryman and townsman but there are others where these interests cross and we think any farmers' organization which takes in others than farmers will fail to accomplish much good for the real betterment of the business of farming. Let the farmers organize solely in their own interest and let the business men, the laboring men and others do likewise then when great social, moral or economic questions come up that affect all alike it will be easy to bring about a unity of action of business men, farmer and laboring men, federated in the movement where all can unite.

We do not find this suggestion for the farmers and townsmen to get together in one organization to come from farmers but it comes from well meaning (sometimes but often designing men who hope to postpone the day of real farm organization as long as possible) but impractical men who do not know many of the real problems farmers have to meet.

We do not want to be understood as opposing county wide, or state wide community clubs but we do oppose the idea that a club of this kind can take the place of a farmers' organization. Our belief is that farmers should organize among and for themselves then federate and coperate with all others for the community welfare.

THE IDLE ACRE

Investigations made by the United States Department of Agriculture of a large number of farms have shown that if the farmer is allowed a fair rate of interest on his investment that about one-third of them had nothing left to pay for their labor except that part of the living furnished by the farm. There are a number of things which must be remedied before a great many farms will pay a reasonable profit and furnish the operator or owner a surplus which he may use to educate his children or keep for support in old age, but the one we want to call attention to here is the idle acre.

On most hill-farms small areas of seepy, wet land of a few acres are found which produce very little, although these acres must be plowed and cultivated at as much expense of labor and wear of machinery as the most fertile acre on the farm. If the farm is worth $75 an acre altogether it is because a part of it is fertile enough to make up for the loss of the undrained land. Possibly by spending $25 an acre on these wet places they can be made to produce as much as any on the farm and the increased product will be almost clear gain for the cost of cultivation will not be increased.

On other farms there are the "worn out" patches that not only produce nothing but are a constant unsightly reminder of the poverty of the farm. About the best plan for the recovery of these worn out acres is to start them up with a few loads of manure and then by growing some crop like sweet clover or other rank growing plant and turning down one or two crops these idle acres may be made to produce an income.

Unfortunately the farmer can not weed out his idle acres as the dairyman does his lazy cows and he must therefore, build them up to get them into the profitable class. We have now reached the place in American agriculture where we must look at farming as a business and when we find something that does not pay its way, we must get rid of it, whether it is the scrub cow, scrub variety of grain, out of date and worn out machinery, or the unproductive, idle acre of land.

WHY NOT SOME ALFALFA?

We have talked a lot about how to make the farm pay better and we know of no one thing that offers a bigger chance to increase the fertility of the land and to swell the bank account than to add alfalfa to the crops usually grown.

Last year we reported a crop of alfalfa on a piece of average Boone County upland soil that produced a crop ready for cutting May 10 and which averaged 26 inches high and was estimated to produce one ton an acre from the first cutting. With the favorable season last year the land produced four cuttings and approximately four tons of cured hay per acre. This year the season being a little later we found the alfalfa with about the same growth on May 15. Allowing for bad seasons this field should produce at least three and a half tons of hay every season for four to six years and longer if manured and limed.

We would like for our readers to make an estimate of their best paying crops on upland soil and compare them with the value of three and a half tons of good alfalfa hay and see if there is not good reason for us urging our farmer friends to try alfalfa. In making this comparison you consider that the ground is plowed but once and seeded but once for the five or six years that the alfalfa will stand before it is plowed under. If it is allowed to stand but three years, a rather short time for this crop, there will be quite a saving per acre when compared with the annual cost of plowing and preparing the ground and for seed with any of the annual crops now produced.

Another credit given to alfalfa is the good work done by the deep growing roots which aerates the soil to a greater depth than most other crops and leaves the decayed roots there to loosen up the soil and increase its water holding capacity. Then this wonderful plant draws a part of its living from the air above where there is an inexhaustible supply of nitrogen and much of this expensive fertilizer is left in the soil to feed other crops.

Yet another virtue accredited to alfalfa is its power to hold the soil from washing away to the Gulf of Mexico. We have often called attention to the enormous loss of fertility from our hill-side farms which are cultivated in wet seasons. There is no way to escape this loss entirely but with alfalfa growing on the land for six years in ten the loss will be reduced more than one-half.

It is now timely to plan for sowing alfalfa for this year. A piece of land already in good state of fertility may be plowed immediately after the wheat, oats or cowpeas are taken off and worked into a good seed bed and sown in August.

MORE MONEY REQUIRED

Will those fellows who are opposed to the Missouri Land Bank or in fact opposed to cheaper and easier money for needy farmers, tell us how we are to provide for the greater amount of money required now to own and operate a farm than what was required ten years ago? The scarcity of labor on the farm means a greater use of machinery and machinery costs money. The man who would stock up with pure bred live stock finds that it takes a great deal more money to handle them than it does to keep scrub stock, although the time has come when scrub stock does not pay a profit on high priced land and fed on high priced corn and hay. A few years ago pasturage could be had for cattle at from fifty to sixty cents a month per head but today the same kind of pasturage will cost three times that amount.

Some are opposing the Land Bank because they say cheaper money will mean higher priced land. If cheaper money under the restrictions of the Missouri Land Bank will make land higher in price as these fellows say it will then why are they not working for a law that will increase the rates of interest so that the price of land will come down? The truth is, and these people offering this objection know it, that money can not be obtained for speculative purposes under the provisions of the proposed Missouri law. In the first place no one can borrow more than $10,000 under this law and preference will be given to those wanting to borrow not over $5,000. Then the borrower must satisfy the governing board that the money is to be used only for the following purposes: 1. To increase the production of the land. Many farms in Missouri need drainage but it costs sometimes as much as the land is now worth to put in an adequate system of drainage and it will be a good thing for the state as well as for the land owner to have this land producing better. 2. The money can be used for making useful improvements on the land to be mortgaged. On many farms in Missouri it would pay to build silos, hay sheds, better barns, etc., but without the owner can negotiate the loan at a reasonable rate and for long time he will not take chances on making these improvements and he does not make them. The building of a good barn or silo on every farm that needs one would call for a lot of labor and this for the time being would be a good thing for the state as well as the continued profits on the better improved farms. 3. The money borrowed may be used for paying off existing indebtedness on the land or for making part payment of purchase price where the borrower has a part of the purchase money. 4. The borrowers may use one-fourth of the money borrowed for the purchase of live stock and machinery. We all know that live stock farming is about the only system adapted to about ninety per cent of the farms in this state but we find a great many farmers raising and selling grain, depleting the fertility of their land just because they have no money to buy live stock. Grain selling off the farms of Missouri has already so depleted thousands of acres of our farming lands that will take years to build up the land in fertility to the point of profitable cultivation.

Let those who are opposed to a remedy for the above needs among Missouri farmers tell us what they have to offer that is better than the Missouri Land Bank.

BARNYARD GOSSIP

Sometimes I think the poor man is largely responsible for his own condition. You have no doubt seen a lot of the same kind of people I have seen —people who blame Providence with all their "bad luck," sickness, high taxes and all the other evils man is heir to but I think like the old philosophy that we are largely the "architects of our own fortunes." I know there are unforeseen and unpreventable things happening to some one or other every day in the year but I think it is safe to say that ninety per cent of our bad luck is only poor management and if we would only exercise our good sense a little harder, get rid of our prejudices against man and measures, use all the means we can get hold of to inform ourselves before we become "sot in our way" about anything, that we would find this a pretty well balanced world after all.

We all belong to one or the other of two classes of people—we are either optimists or pessimists. We either magnify the good in the world or brood over the evil. The optimist is a progressive. He sees more good than bad in the world and he strives to make things better. He will even take a chance on making a mistake rather than do nothing. He knows that good deeds are like good seeds that when planted they will grow and produce after their own kind. And so the optimist puts his shoulder to the wheel and pushes or if working in the lead he goes up against the collar and pulls. It is always forward with him, never backward. If there is a bad place in the road he says let's fix it and he is ready with work or money to do it. He would rather vote for a 100-cent tax and have a good school than to vote for a 50-cent tax and have a poor school because he knows the poor school is like the losing horse in a race—whatever amount you have "up" on it you lose.

The pessimist is a "stayer," I will not say "stand pat" because you might associate the name with politics and you know I never talk partisan politics in these columns. The pessimist says, if the road is bad, "well, the road is no worse than it has always been and I guess we can travel it somehow. There's no money made in traveling roads any way. If the roads were good all the time people would go to town too often and they would lose more time and spend more money," just as if we did not try to make money for the things we can buy with it. The pessimist is opposed to having a high-grade teacher because he fears it will increase his taxes a few cents. You know I doubt if the pessimist ever looks at his tax receipts to find out how little he does really pay for his school. He contents himself with thinking about how poor the schools were when he went to school and that what was good enough for dad is good enough for son. Miserable man!—the Devil ought to get you. Why, do you not enjoy a thousand things your grandsire never dreamed about. If the fathers and grandfathers of this good old world in all its periods of development had stood on the platform of the pessimist—what was good enough for dad is good enough for son—what would we have today? We would be cutting our wheat with the reap hook or the cradle and planting our corn with a crooked stick. Our products would have to find their way to market on a pack-horse or the ox-cart but more likely decay for want of a market. The railroad, the steamship, the air ship, the telephone, the telegraph, the reaping machine, the thrashing machine, the sewing machine, the cooking stove, the spring bed, the carriage, the automobile, the cultivated fruits and vegetables we eat and a thousand other things we enjoy would never have been heard of. Get away with such ideas, get away with pessimism, kill off the drones, figuratively speaking, and let us have no one in the community who is not trying to do his part towards making the world a better place for our happiness.

I like the man who says I'll try, I can, and I will do all in my power to make the world better and happier.

JORDAN'S SENSE AND NONSENSE

Life is worth while since skirts still g t shorter and the scenery continues to get better.

* * *

If those unkissed students really desire to be kissed but do not know how to go at it to get one, it might be suggested that they go to the movie and take a lesson, then try it. I have noticed that when a fellow proposes to a girl at the movie, that the girl melts every time, and the old boy lands on her busser. If I were not so old I might try it once myself, but I will have to admit that I've been kissed, sad as it may seem.

* * *

Don't it beat the dickens what the packers have done to us?

* * *

The paper says that Hetty Green chews an onion all day, to keep germs away. Who can blame the poor little germs? Cheaper, too, than germs.

* * *

The world will make good headway in proportion as each man gets it into his bean that "the other fellow may be right after all and has most as much sense as he has himself."

* * *

Did you ever notice that we think a fellow smart when his ideas coincide with our own? Why not try to get over it?

* * *

If more of us could really see ourselves as others see us, don't you think a lot more of us would take poison? Burns was wrong on that proposition, too many killing themselves already.

* * *

I went to a ball game a few days ago but it was a punk affair. The score was 5 to 4 against the home team, which was very good, but they had only one fight.

* * *

I see a good many signs out saying "Men Wanted for the Army," but the boys don't seem to "come across" very fast. I guess the reason is that they think there is likely to be a fight.

* * *

Don't you really think that a "mutt" who will embark on a belligerant ship, taking chances of getting "busted" by the Germans or somebody, is a traitor to his country? He should know that his foolhardiness is likely to involve his country in war, and such should be looked upon as high terason.

* * *

If a person going into the "War Zone" with full knowledge of what is likely to happen to his hide, and he does get it shot full of holes, so far as I can see, he alone should be responsible for the results.

* * *

The boys are ready to shoulder a gun for real and just causes, but in some cases that have happened, I cannot see that they are to be blamed for being cold to the proposition.

* * *

This country sold bullets to kill men, yet when one happens to be turned on us we raise a row about it.

* * *

When nations get to where they have as much sense as individuals, war will cease.

* * *

Men in this country and in every other civilized country must abide by the decision of the courts of justice, because each court is backed with means to enforce its mandates, and some day there will be an international court of justice, backed by an international army that will enforce its mandates. Then war will cease.

* * *

If we had no war scares our gun makers, and bullet and powder makers, and battle ship builders would be out of a job. Of course, we should give them a job, even at the cost of war. Such as the Dupont's and the Krupp's, and the Maxims, need the money, you know.

* * *

Don't you think the new style coats for men are dandies, with "tucks" and a "belly band" on the back?

* * *

Now just as a little bit of sense and sentiment added to the nonsense I want to add the following letter I recently wrote as a tribute to the splendid work of a splendid Missouri teacher, Professor W. H. Lynch of the state normal school at Springfield. Professor Lynch has already reached a ripe old age but is carrying sunshine and hope to the schools and the people of southern Missouri just like he has been doing for many years. But here is the letter:

"I want to assure you that I am always glad to hear from you, as every word that ever came to me about you was a kindly word. What greater thing could one ask? If one has been busy during a long life time, spreading only sunshine in the lives of others, what happier thing can anyone do?

"The finest thing I know, or any man can know, was something about the life and death of Henry Wallace, of Wallaces' Farmer. The common good of the human race was always uppermost in his thought and action. He worked every day and when eighty useful years had passed he 'died in harness'. He did not want to outlive his usefulness for a single day. His life and death were both among the grandest I have ever known.

"It seems, from what I have seen and known of your life, no less can be said. The sunshine you have scattered, the lives you have helped, and the warm grip of the hand, with a soul too full for language, it seems to me, is all one could wish for in himself or a friend.

"If the death sentence comes to you first, I fully expect to hear that you, too, died in harness! But eighty years are all too short for a life like yours, for you do us all good. You have always handed us a good word when a good word was due. In other words, 'do it now' has been a rule of action with you, and we cannot forget,

"If with pleasure you are viewing,
Any work a man is doing,
If you like him, or you love him, tell
him now;
Don't withhold your approbation
Till the parson makes oration,
And he lies with snowy lilies o'er
his brow.

For no matter how you shout it,
He'll not really care about it.
He'll never know how many teardrops
you've shed
If you think some credit due him,
Now's the time to slip it to him,
For he cannot read his tomb stone
when he's dead.

More than fame and more than money
Is the comment kind and sunny,
The hearty, warm approval of a friend,
For it gives to life a savor,
Makes you stronger, braver,
Gives you heart and spirit to the end

If he's earned your praise bestow it,
If you like him, let him know it.
Let the words of true encouragement
be said.
Do not wait till life is over,
And he's underneath the clover,
For he cannot read his tombstone
when he's dead."

Don't Abuse Your Tractor

Let it do the work for which it was intended. It will do it if you will use the proper lubricating oil. An oil of the correct lubricating body to minimize friction. An oil that maintains that correct lubricating body even under extremely high temperature conditions.

Get Stanolind Gas Engine Tractor Oil

It minimizes friction and eliminates the usual trouble of scored cylinders. This oil is made expressly for the lubrication of tractor engines, where kerosene is used as fuel. It is equally efficient for lubricating bearings of all types of harvester machinery and for heavy gearings of tractors.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER X

When the hot, close-cropped fields took on their first suggestion of autumn and a fuller note was heard in the requiem of the songbirds, when the twilights were of purple and the morning skies delicately mackereled in gray, David entered the little, red, country schoolhouse. M'ri's tutelage and his sedulous application to Jud's schoolbooks saved him from the ignominy of being classified with the younger children.

When he sat down to the ink-stained, pen-scratched desk that was to be his own, when he made compact piles of his new books and placed in the little groove in front of the inkwell his pen, pencils, and ruler, he turned to Little Teacher such a glowing face of ecstasy that she was quite inspired, and her sympathies and energies were at once enlisted in the cause of David's education.

It was the beginning of a new world for him. He studied with a concentration that made him oblivious to all that occurred about him, and he had to be reminded of calls to recitations by an individual summons. He fairly overwhelmed Little Teacher by his voracity for learning and a perserverance that vanquished all obstacles. He soon outstripped his class, and finally his young instructress was forced to bring forth her own textbooks to satisfy his avidity. He devoured them all speedily, and she then applied to the Judge for fuel from his library to feed her young furnace.

"He takes to learning as naturally as bees to blossoms," she reported.

"He must ease off," warned Barnabas. "Young hickory needs plenty of room for full growth."

"No," disagreed the Judge, "young hickory is as strong as wrought iron. He's going to have a clear, keen mind to argue law cases."

"I think not," said M'ri. "You forget another quality of young hickory. No other wood burns with such brilliancy. David is going to be an author."

"I am afraid," wrote Joe, "that Dave won't be a first-class ranchman. He must be plum locoed with dreams."

This prognostication reached David's ears.

"Without dreams," he argued to Barnabas, "one would be like the pigs."

"Wal, now, Dave, mebby pigs dream They sartain sleep a hull lot."

David laughed appreciatively.

"Dave," pursued Barnabas, "they're all figgerin' on your futur, and they are a-figgerin' wrong. Joe thinks you'll take to ranchin'. You may—fer a spell. M'ri thinks you may write books. You may do even that—fer a spell. The Jedge counts on yer takin' to the law like a duck does to water. You may, but law larnin', cow punchin', and story writin' 'll jest be steppin' stuns to what I know you air goin' ter be, and what I know is in you ter be."

"What in the world is that, Uncle Barnabas?" asked David in surprise. "A farmer?"

"Farmer, nuthin'!" scoffed Barnabas. "Yer hain't much on farmin', Dave, though I will say yer furrers is allers straight, like everythin' else you do. Yer straight yerself. No! young hickory can bend without breakin', and thar's jest one thing I want fer you to be."

"What?" persisted the boy.

Barnabas whispered something.

The blood of the young country boy went like wine through his veins; his heart leaped with a big and mighty purpose.

"Now, remember, Dave," cautioned Barnabas, "what all work and no play done to Jack. You git yer lessons perfect, and recite them, and read a leetle of an evenin'; the rest of the time I want yer to get out and cerkilate."

November with its call to quiet woods came on, and David was eager to "cerkilate." He became animated with the spirit of sport. Red-letter Saturdays were spent with Uncle Larimy, and the far-away echo of the hunter's bullet and the scudding through the woods of startled game became new, sweet music to his ears. Rifle in hand, with dog shuffling at his heels or plunging ahead in search of game, the world was his. Life was very full and happy, save for the one inevitable sprig of bitter—Jud! The big bully of a boy had learned that David was his equal physically and his superior mentally, but the fear of David and of David's good standing kept him from venturing out in the open; so from cover he sought by all the arts known to craftiness to harass the younger boy, whose patience this test tried most sorely.

One day when Little Teacher had given him a verbose definition of the word "pestiferous," David looked at her comprehendingly. "Like Jud," he murmured.

Many a time his young arms ached to give Jud another thrashing, but his mother's parting injunction restrained him.

"If only," he sighed, "Jud belonged to some one else!"

He vainly sought to find the hair line that divided his sense of gratitude and his protection of self-respect.

Winter followed, and the farm work droned. It was a comfortable, cozy time, with breakfast served in the kitchen on a table spread with a gay, red cloth. Pennyroyal baked griddle-sized cakes, delivering them one at a time direct from the stove to the consumer. The early hour of lamplight made long evenings, which were beguiled by lesson books and storybooks, by an occasional skating carnival on the river, a coasting party at Long Hill, or a "surprise" on some hospitable neighbor.

One morning he came into school with face and eyes aglow with something more than the mere delight of living. It meant mischief, pure and simple, but Little Teacher was not always discerning. She gave him a welcoming smile of sheer sympathy with his mood. She didn't smile, later, when the schoolroom was distracted by the sound of raucous laughter, feminine screams, and a fluttering of skirts as the girls scrambled to standing posture in their chairs. Astonished, she looked for the cause. The cause came her way, and the pupils had a fresh example of the miracles wrought by a mouse, for Little Teacher, usually the personification of dignity and repose, screamed lustily and scudded chairward with as much rapidity as that displayed by the scurrying mouse as it chased for the corner and disappeared through a knothole.

As soon as the noiseful glee had subsided, Little Teacher sought to recover her prided self-possession. In a voice resonant with sternness, she commanded silence, gazing wrathfully by chance at little Tim Wiggins.

"'T was David done it," he said in deprecating self-defense, imagining himself accused.

"David Dunne," demanded Little Teacher, "did you bring that mouse to school?"

"He brung it and let it out on purpose," informed Tim eagerly.

Little Teacher never encouraged talebearing, but she was so discomfited by the exposure of the ruling weakness peculiar to her sex that she decided to discipline her favorite pupil upon his acknowledgment of guilt.

"You may bring your books and sit on the platform," she ordered indignantly.

David did not in the least mind his assignment to so prominent a position, but he did mind Little Teacher's attitude toward him throughout the day. He sought to propitiate her by coming to her assistance in many little tasks, but she persistently ignored his overtures. He then ventured to seek enlightenment regarding his studies, but she coldly informed him he could remain after school to ask his questions.

David began to feel troubled, and looked out of the window for an inspiration. He found one in the form of big, brawny, Jim Block—"Teacher's Jim," as the school children all called him.

"There goes Teacher's Jim," sang David, soto voice.

The shot told. For the second time that day Little Teacher showed outward and visible signs of an inward disturbance. With a blush she turned quickly to the window and watched with expressive eyes the stalwart figure striding over the rough-frozen road.

In an instant, however, she had recalled herself to earth, and David's dancing eyes renewed her hostility toward him. Toward the end of the day she began to feel somewhat appeased by his docility and evident repentance. Her manner had perceptibly changed by the time the closing exercise began. This was the writing of words on the blackboard for the pupils to use in sentences. She pointed to the first word, "income."

"Who can make a sentence and use that word correctly?" she asked.

"Do call on Tim," whispered David. "He so loves to be the first to tell anything."

She smiled her appreciation of Tim's prominent characteristic, and looked at the youngster, who was wringing his hand in an agony of eagerness. She gave him the floor, and he jumped to his feet in triumph, yelling:

"In come a mouse!"

This was too much for David's composure, and he gave way to an infectious fit of laughter, in which the pupils joined.

Little Teacher found the allusion personal and uncomfortable. She at once assumed her former distant mien, demanding David's presence after school closed.

"You have no gratitude, David," she stated emphatically.

The boy winced, and his eyes darkened with concern, as he remembered his mother's parting injunction.

Little Teacher softened slightily.

"You are sorry, aren't you, David?" she asked gently.

He looked at her meditatively.

"No, Teacher," he aswered quietly.

She flushed angrily.

"David Dunne, you may go home and you need n't come back to school again until you tell me you are sorry."

David took his books and walked serenely from the room. He went home by the way of Jim Block's farm. "Hullo, Dave!" called Big Jim, who was in the barnyard.

"Hello, Jim! I came to tell you some good news. You said if you were only sure there was something Teacher was afraid of, you wouldn't feel so scared of her."

"Well," prompted Jim eagerly.

"I thought I'd find out for you, so I took a mouse to school and let it loose."

"Gee!"

David then related the occurrences of the morning, not omitting the look in Little Teacher's eyes when she beheld Jim from the window.

"I'll hook up this very night and go to see her," confiided Jim.

"Be sure you do, Jim. If you find your courage slipping, just remember that you owe it to me, because she won't let me come back to school unless she knows why I wasn't sorry."

"I give you my word, Dave," said Jim earnestly.

The next morning Little Teacher stopped at the Brumble farm.

"I came this way to walk to school with you and Janey," she said sweetly and significantly to David.

When they reached the road, and Janey had gone back to get her sled, Little Teacher looked up and caught the amused twinkle in David's eye. A wave of conscious red overspread her cheeks.

"Must I say I am sorry now?" he asked.

"David Dunne, there are things you understand which you never learned from books."

CHAPTER XI

Late spring brought preparations for M'ri's wedding. Rhody Crabbe's needle and fingers flew in rapturous speed, and there was likewise engaged a seamstress from Lafferton. Rhody had begged for the making of the wedding gown, and when it was finished David went to fetch it home.

"It's almost done, David, and you tell M'ri the last stitch was a loveknot. It's most a year sence you wuz here afore, a-waitin' fer her blue waist tew be finished. Remember, don't you, David?"

He remembered, and as she stitched he sat silently reviewing that year, the comforts received, the pleasures pursued, and, best of all, the many things he had learned, but the recollection that a year ago his mother had been living brought a rush of sad memories and blotted out happier thoughts.

"I wish yer ma could hev seen Mart and M'ri merried. She was orful disapp'inted when they broke off."

There was no reply. Rhody's sharp little eyes, in upward glance, spied the trickling tear; she looked quietly awyy and stitched in furious haste.

"But, my!" she continued, as if there had been no pause, "how glad she would be to know it was you as fetched it around."

David looked up, diverted and inquiring.

"Yes; I learnt it from M'ri. She told me about the flowers you give him. I thought it was jest sweet in you, David. You done good work thar."

"Miss Rhody," said David earnestly, "maybe some day I can get you a sweetheart."

"'T ain't no use, David," she sighed. "No one wants a plain critter like me."

"Lots of them don't marry for looks," argued David safely. "Besides, you look fine in your black silk, and your hair crimped. Joe thinks your picture is great. He's got it on a shelf over his fireplace at the ranch."

"Most likely some cowboy 'll see it and lose his heart," laughed Miss Rhody, "but thar, the weddin' dress is all done. You go home and quit thinkin' about gettin' me a man. I ain't ha'nted by the thought of endin' single.

Great preparations for the wedding progressed at the Brumble farm. For a week Pennyroyal whipped up eggs and sugar, and David ransacked the woods for evergreens and berries with which to decorate the big barn, where the dance after the wedding was to take place.

The old farmhouse was filled to overflowing on the night of the wedding. After the ceremony, Miss Rhody, resplendent in the black silk and waving hair loosed from the crimping pins that had confined it for two days and nights, came up to David.

"My, David, I've got the funniest all over feelin' from seein' Mart and M'ri merried! I was orful afeerd I'd cry."

"Sit down, Miss Rhody," said David, gallantly bringing her a chair.

"Didn't M'ri look perfeckly beyewtiful?" she continued, after accomplishing the pironette that prevented creases. "And Mart, he looked that proud, and solemn too. It made me think of that gal when she spoke 'Curfew shall not ring tewnight' at the schoolhouse. Every one looks fine. I hain't seen Barnabas so fussed up sence Libby Sukes' funyral. It makes him look real spry. And whoever got Larimer Sasser to perk up and put on a starched shirt!"

"I think," confided David, "that Penny got after him. She had him in a corner when he came, and she tied his necktie so tight I was afraid she would choke him."

"Look at old Miss Pankey, David. She, as rich as they make 'em, and a-wearin' that old silk! It looks as ef it hed bin hung up fer you and Jud to shoot at. Ain't she a-glarin' and a-sniffin' at me, though? Say, David, you write Joe that if M'ri did look the purtiest of any one that my dress cost more'n any one's here, and showed it, too. I hope thar'll be a lot of occasions to wear it to this summer. M'ri is a-goin' to give a reception when she gits back from her tower, and that'll be one thing to wear it at. Ain't Jud got a mean look? He's as crooked as a dog's hind leg. But, say, David, that's a fine suit you're a-wearin'. You look handsome. Thar ain't a stingy hair on Barnabas' head. He's doin' jest as good by you as he is by Jud. Don't little Janey look like an angel in white, and them lovely beads Joe

ive her? I can't think of nothin' else ut that little Eva you read me about. shouldn't wonder a bit, David, if I ome to yer and Janey's weddin' yet!" he said, as Janey came dancing up o them.

A slow flush mounted to his forehead, but Janey laughed merrily.

"I've promised Joe I'd wait for him," he said roguishly.

"She's only foolin' and so wuz he," uickly spoke Miss Rhody, seeing the urt look in David's eyes. "Barnaas," she asked, stopping him as he assed, "you air a-goin' to miss M'ri urrible. You could never manige if t wa'n't fer Penny. Won't she hev he time of her life cleanin' up after his weddin'? She'll enjoy it more'n he did gettin' ready fer it."

"I hope Penny won't go to gittin' nerried—not till Janey's growed up."

"David's a great help to you, too, Barnabas."

"Dave! I don't know how I ever ot along afore he came. He's so villin' and so honest. He's as good as old. Only fault he's got is a quick emper. He's doin' purty fair with it, hough. If only Jud—"

He stopped, with a sigh, and Rhody astened to change the subject.

"You're a-lookin' spry to-night, Barabas. I hain't seen you look so pruce in a long time."

"You look mighty tasty yerself, Rhody."

This interchange of compliments vas interrupted by the announcement f supper.

"I never set down to sech a repast," hought Miss Rhody. "I'm glad I didn't eed much today. I don't know wheth-r to take chickin' twice, or to try all hem meltin', flaky lookin' pies. And est see them layer cakes!"

After supper adjournment was made o the barn, where the fiddles were lready swinging madly. Every one aught the spirit, and even Miss Rhody inally succumbed to Barnabas' insistnce. Pennyroyal captured Uncle Larimy, and when Janey whirled away n the arms of a schoolmate, David, vho had never learned to dance stood solated. He felt lonely and depressed, nd recalled the expression in which Joe Forbes had explained life after e had acquired a stepmother. "I was lways on the edge of the fireside," e had said.

"Dave," expostulated Uncle Barnaas, as soon as he could get his breath fter the last dance, "you'd better edlicate yer heels as well as your head. t's unnateral fer a colt and a boy not o kick up their heels. You don't never want to be a looker-on at nuthn' except' from ch'ice. You'd orter e a stand-in on everything that's agoin' instead of a stand-by. The standys never git nowhar."

PART TWO

CHAPTER I

David Dunne at eighteen was graduated from the high school in Lafferon after five colorless years in which study and farm work alternated. Throughout this period he had continued to incur the rancor of Jud, whose youthful scrapes had gradually developed into brawls and carousals. The Judge periodically extricated him from serious entanglements, and Barnabas continued optimistic in his expectations of a time when Jud should "settle." On one occasion Jud sneeringly accused David of "working the old man for a share in the farm," and taunted him with the fact that he was big enough and strong enough to hustle for himself without living on charity. David started on a tramp through the woods to face the old issue and decide his fate. He had then one more year before he could finish school and carry out a long-cherished dream of college.

He was at a loss to know just where to turn at the present time for a home where he could work for his board and attend school. The Judge and M'ri had gone abroad; Joe was on his ranch; the farmers needed no additional help.

He had been walking swiftly in unison with his thoughts, and when he came out of the woods into the open he was only a mile downstream from town. Upon the river bank stood Uncle Larimy, skillfully swirling his line.

"Wanter try yer luck, Dave?"

"I have no luck just now, Uncle Larimy," replied the boy sadly.

Uncle Larimy shot him a quick, sidelong glance.

"Then move on, Dave, and chase arter it. Thar's allers luck somewhar. Jest like fishin'. You can't set in one spot and wait for luck tew come to you like old Zeke Foss does. You must keep a-castin'."

"I don't know where to cast, Uncle Larimy."

Uncle Larimy pondered. He knew that Jud was home, and he divined David's trend of thought.

"You can't stick to a plank allers, Dave, ef you wanter amount tew anything. Strike out bold, and swim without any life preservers. You might jest as well be a sleepy old cat in a corner as to go smoothsailin' through life."

"I feel that I have got to strike out and at once, Uncle Larimy, but I don't just know where to strike."

"Wal, Dave, it's what we've all got to find out fer ourselves. It's a leap in the dark like, and ef you don't land nowhere, take another leap, and keep a-goin' somewhar."

David wended his way homeward, pondering over Uncle Larimy's philosophy. When he went with Barnabas to do the milking that night he broached the subject of leaving the farm.

"I know how Jud feels about my being here, Uncle Barnabas."

"What did he say to you?" asked the old man anxiously.

"Nothing. I overheard a part of your conversation. He is right. And if I stay here, he will run away to sea. He told the fellows in Lafferton he would."

"You are going to stay, Dave."

"You won't like to think you drove your son away. If he gets into trouble, both you and I will feel we are to blame."

"Dave, I see why the Jedge hez got it all cut out fer you to be a lawyer. You've got the argyin' habit strong. But you can't argue me into what I see is wrong. This is the place fer you to be, and Jud 'll have to come outen his spell."

"Then let me go away until he does. You must give him every chance."

"Where'll you go?" asked Barnabas curiously.

"I don't know, yet," said the boy, "but I'll think out a plan to-night."

It was Jud, after all, who cut the Gordian knot, and made one of his welcome disappearances, which lasted until David was ready to start in college. His savings, that he had accumulated by field work in the summers and a very successful poultry business for six years, netted him four hundred dollars.

"One hundred dollars for each year," he thought exultantly. "That will be ample with the work I shall find to do."

Then he made known to his friends his long cherished scheme of working his way through college. The Judge laughed.

"Your four hundred dollars, David, will barely get you through the first. After that, I shall gladly pay your expenses, for as soon as you are admitted to the bar you are to come into my office, of course."

David demurred.

"I shall work my way through college," he said firmly.

He next told Barnabas of his intention and the Judge's offer which he had declined.

"I'm glad you refused, Dave. You'll only be in his office till you're ripe fer what I kin make you. I've larnt that the law is a good foundation as a sure steppin' stone tew it, so you kin hev a taste of it. But the Jedge ain't a-goin' to pay yer expenses."

"I don't mean that he shall," replied David. "I want to pay my own way."

"I'm a-goin' to send you tew college and send you right. No starvin' and garret plan fer you. I've let Joe and the Jedge do fer you as much as they are a-goin' to, but you're mine from now on. It's what I'd do fer my own son if he cared fer books, and you're as near to me ez ef you were my son."

"It's too much, Uncle Barnabas."

"And, David," he continued, unheeding the interruption, "I hope you'll really be my son some day."

A look of such exquisite happiness came into the young eyes that Barnabas put out his hand silently. In the firm hand-clasp they both understood.

"I am not going to let you help me through college, though, Uncle Barnabas. It has always been my dream to earn my own education. When you pay for anything yourself, it seems so much more your own than when it's a gift."

"Let him, Barnabas," again counseled Uncle Larimy. "Folks must feed diff'rent. Thar's the sweet-fed which must allers hev sugar, but salt 's the savor for Dave. He's the kind that flourishes best in the shade."

Janey wrote to Joe of David's plan, and there promptly came a check for one thousand dollars, which David as promptly returned.

(To be continued.)

LETTERS FROM THE BOYS AND GIRLS

Here are two more nice letters from our boy and girl friends who find interest in reading "David Dunne." This shows that they are carefully reading and studying the characters of the story which is the right thing to do. There is little benefit from reading any thing unless we do some real thinking as we read.

We hope to get other letters from our young friends who are reading the story and would also appreciate letters telling us what you are interested in most and some of the things you are trying to do on the farm. Let us have a nice lot of these letters and we may be able to soon start a "Boys' and Girls' Page in The Missouri Farmer.—The Editor.

Thelma Lives on a Big Farm

Nettleton, Mo.

To the Editor:—

I am a girl fourteen years old and I live on a four-hundred-acre farm south-east of Nettleton. I like your paper very much and I am very much interested in the story, "David Dunne." The character which interests me most is David, although I like all the other characters except Jud. I will be glad when the next paper comes.

Thelma S.

(A nicely written letter Thelma and not a correetion has been made in it. This surely speaks well for the school you attend. Not many letters are received by the editor which do not require some "fixing up" before they are printed.—Editor.)

Walter Likes the Story

Platte City, Mo.

The Missouri Farmer:

I think your story of David Dunne is the best I ever read and I think David is the best character in the story.

I do not take the paper but our landlord does and gives it to me ever once in a while. How much does it cost to take for a year?

Walter McDaniel.

(You mlst have a real good landlord Walter and maybe he thinks your father will be a better farmer if he reads The Missouri Farmer. You can get the paper, one year for fifty cents or three years for one dollar, and that is not much when you think of how much good reading you can get for so long a time. Will appreciate your name on our list.—Editor.)

CHICK CHATTER

Well fed is half raised.

Poor feeding kills many chicks.

Give no feed for two days after hatching.

Leg weakness results from lack of bone-making feed.

The first chick feed should be a dry mixture of cracked grains. Cracked corn, wheat, kafir, and pin-head oats are all good.

Feed sour milk or beef scrap to help build muscle, feathers, and bone. One per cent of bone meal should also be included in the ration.

Feed three times a day and no more. but add rolled oats to the chick feed twice a day and stale bread crumbs or corn bread will do if there are no rolled oats on hand.

Feed finely cut lettuce, onion tops, or other green stuff if the chicks cannot be allowed to run on grass, for they must have something of this kind to keep the bowels working properly

Poor growth and lack of thrift usually indicate something wrong with the feeding. A few grains of sand during the first few days after hatching help to prepare the stomach for food later, though the chick is still living on the yolk drawn into its body just before hatching.

Commercial ground feed may be fed or a coffee grinder may be used in cracking the grains. Never feed wet mixtures until the chicks are at least five weeks old. Use corn meal that has not heated in sack or bin and place a wire screen over it, in the trough to prevent it from being scratched out and wasted.—H. L. Kempster, Missouri College of Agriculture.

Blue Ointment for Lice

Blue ointment, a preparation which may be procured at any drug store, is suggested by the College of Agriculture as a very effective agent in completely ridding chickens of lice. To cheapen the preparation, as good results may be had by adding one-half part of vaseline. Apply a small amount, such as a thimbleful, of the grease just below the vent of each bird. Do not attempt to grease sitting hens with this preparation. The blue ointment contains mercury and suet. The lice eat the suet and are poisoned with the mercury. This method of treatment is more effective than dusting, inasmuch as it remains intact longer and not only kills the lice that are alive, but also catches those that hatch out later.

The agricultural department of the state university is doing a good work for boys and girls of the state in the organization of pig clubs among the boys and tomato clubs among the girls. The boy who learns how to handle one pig successfully has won the first step towards making a successful swine raiser, and the girl who wins a prize in a tomato club has learned a valuable lesson in household economy.

Billy Sunday's Kansas City Revival

Will Begin In April and Last Eight Weeks

His sermons in full, and every detail of his tabernacle meetings, the greatest evangelist of the world in action, all fully illustrated, true to life, as real as if you were there to see and hear it all, will be printed in

The Weekly Kansas City Star

The greatest farm paper—Best market reports—Farm questions answered by experts—the news of the world condensed.

Five years $1.00, single year 25 cents. Subscribe today and get it all.

Address THE WEEKLY STAR, Kansas City, Mo.

SOY BEANS

Planted before July 1st, Mikado, Ito San and Mongol will mature seed. Farm Bureau Premium Beans while they last at $2.75 per bushel.

JESSE J. CULP, Warrensburg, Mo.

Build Your WORN OUT SOIL **SWEET CLOVER**

The great crop for soil fertility and animal feed. Exceptionally rich in nitrogen and humus. Higher protein content than alfalfa. Sow in spring, summer or winter. Write for prices.
Bokhara Seed Co., Box F, Falmouth, Ky.

WE WILL PAY YOU $120.00 to distribute "Successful Farming" in your locality. Money making book for farmers. Write at once for our new Institute plan. 60 days' work or less. No money required.

431 Winston Bldg., - Philadelphia

RAISING SKIMMED MILK CALVES

It is a well established fact that a calf raised on skim milk is equally as good as one nursed by its mother. In localities familiar with dairying this is well understood, but in other places it is virtually unknown, and a strong prejudice exists against feeding skim milk on account of the unhealthy and undersized calves that have been raised in this way. Such calves are the victims of ignorance or carelessness. The skimmed milk calf raised properly differs little, if any, in size, quality, thrift and value from the same animal when raised by the cow. The poor results which have so often followed the feeding of skim milk have been due to faulty methods of feeding, and not because the cream which has been taken out is of so much importance to the calf.

Skim milk does not differ from whole milk except in butter fat content. The following figures give the average composition of each in parts of 100:

	Whole Milk	Skim Milk.
Water	87.1	90.5
Fat	3.9	0.1
Protein, casein, albumen	3.4	3.57
Sugar	4.75	4.95
Ash	0.75	0.78

The skim milk differs from the unskimmed milk only in the amount of fat it contains. The fat is not the most important part of the milk for the calf. The protein builds up the muscles, nerves, hair, hoofs and horns, while the ash is used for building the bones. Protein is the curd of the milk which is seen when milk sours. The fat in the milk does not go to form growth in the animal, but furnishes heat and fat on the body. A substitute for the fat can be supplied much cheaper with grains such as corn. The calf fed on skim milk is not generally quite so fat during the first six months of its life as the one nursed by the cow, but often has a better developement of bone and muscle.

The first milk of the cow after calving is called colostrum. It is important to feed this milk for a few days at first, since the calf seems to need the colostrum milk to start the organs of digestion properly. After a few days mixed milk may be given.

In the case the milk is very rich in fat it will be best, even with the young calf, to dilute it with skim milk, as rich milk is liable to cause indigestion.

There is some difference in practice regarding the time to begin handfeeding. Some do not allow the calf to nurse at all. Others prefer to let it nurse once, and some allow it to remain with the cow three or four days, or until the fever is out of the udder. When it is impossible to feed the calf often, it is best to let it remain about two days, as at first it will take food often and in small amounts. The earlier the calf is taken away from the cow the easier it will be taught t odrink milk from a bucket. If the cow's udder is in good condition it is more satisfactory to take the calf away early, but when the udder is caked it is best to leave the calf with the mother for a few days.

Don't Feed Too Much

Under natural conditions the calf takes its milk frequently and in small quantities. The calf's stomach at this time is small and an excessive amount always results in indigestion and scours. For the first two weeks five or six quarts, or about ten or twelve pounds per day, is all the largest calf should be allowed to take. A small calf, as a Jersey, does not need over eight or ten pounds per day on the start. This may be fed in two feeds per day, or better, in three, for two or three weeks. As the calf grows older somewhat more milk may be used, but at no time does it need over sixteen or eighteen pounds, or eight or nine quarts per day, but it is safe and economical to feed as high as twenty pounds to a large calf if skim milk is plentiful.

At the end of two weeks the strong and vigorous calf can be changed to skim milk. This is done gradually and not by abrupt change. About a week should be taken to make the complete change, replacing a pound or two of whole milk with an equal quantity of skim milk each day until the change is complete. The milk may then be increased to fourteen to fifteen pounds per day.

Another very important precaution that must be taken is to have the milk warm and sweet when fed. Nature furnishes the milk to the calf in this condition, and we must carefully imitate her. Nothing will more quickly upset the digestion of the calf than feeding warm milk at one feed and cold at another. For the first few weeks the calf is especially sensitive to the temperature of its feed. After the calf is three or four months old it may take cooler milk, but in this case the milk should be cool all th time. The best results are obtained with warm milk, however, at all ages. The temperature of the milk when it comes from the cow is about 100 degrees F. If separated immediately it can be fed without warming and will be above ninety degrees. However, in the cooler season, say from October to April, it is necessary to warm it artificially.

Keep the Pails Clean

Old or stale milk often causes indigestion or scours. A calf is better off to miss a feed than to have a feed of sour milk. Pails and utensils must be kept clean. A good rule is to keep the calf pails as clean as the milk pails. The hand separator on the farm makes it possible to get the milk to the calf fresh, warm and sweet. Calves can be raised on skim milk where cream is raised by gravity, but more difficulties are experienced.

The calf which is to be raised on skim milk should be taught to eat grain early. When they have access to it, many of them will begin eating at two weeks of age or three at the latest. The grain should be placed in a box where they can easily get to it, and they can be encouraged at first by placing a little in their mouths after they have consumed their milk. Grain can best be fed dry after the milk is fed. In no case should it be fed in the milk, as in that case it will be gulped down without chewing, which is bad for the digestion.

After a calf begins to eat considerable, grain should not be kept before it. No more should be given than will be eaten up twice each day, which will not be over one-half pound daily for the first two months.

After this they may have more, but it will not be necessary to feed more than one pound per day up to six months unless it is desired to push them rapidly. If grain is allowed to remain in the trough, it often becomes damp and decayed and may cause sickness, just as a dirty pail will do.

Calves will begin to nibble hay almost as soon as they will eat grain. For young calves, timothy-mixed hay is well adapted, as clovers and alfalfa are laxative and so palatable the animal often overeats, and this helps produce scours.

It is a mistake to believe that a calf does not require water while still receiving milk. An abundance of clean water should be given and salt after the animal is old enough to eat grain and hay.

When the milk is sold for market milk or to cheese factory, or a milk condensery, the problem is how to raise calves without the feed costing more than the value of the animal raised. At the same time it is a most serious mistake under these circumstances to depend upon buying co rather than raising calves. The only practical way to improve the production of the herd is by raising heifer calves from the best cows.

C. H. Eckles.

SWEET CREAM FOR BUTTER-MAKING

In general, the souring of cream is an indication of its age and condition under which it has been kept. Very sour cream then naturally indicates that the cream is very old, or has been kept at too high a temperature. In the creamery it makes little difference whether the cream is very sour from old age or has been kept at too high a temperature, for in neither case can the cream be made into first class butter. Therefore, the market value of cream does not depend on the per cent of fat alone, but on the sourness or perecentage of acid, as well.

Sour cream generally results from the lack of immediate or thorough cooling after separation. Investigation shows that sweet cream of a good quality can be produced on the average farm with but little extra labor and expense. In fact, many dairymen are selling only sweet cream and are not delivering oftener than two or three times a week during the summer months. These farmers are not delivering sweet cream simply to comply with the wishes of the creameryman; they find it more profitable and rather a simple matter to keep it sweet. In some parts of the state, farmers are advantageously making use of natural ice stored during the winter months for cooling the cream, while others are resorting to the use of running water, a tank, a cool spring or well, or a cool, well ventilated cellar which greatly assist in maintaining a fairly low temperature. Special cabinets for cooling the cream with ice or running water can be constructed at little cost. Such a cabinet will aid in cooling the cream more rapidly as well as in saving ice. If a limited amount of ice or water under pressure is available the corrugated surface coolers can be advantageously used. One-half ton of ice per cow is probably sufficient for cooling the cream during the summer.

The farmers should bear in mind that the man who controls the quality and price of creamery butter is the one who produces the cream. The producer is responsible to a large degree for the low prices paid for cream and received for butter manufactured therefrom. Wholesale butter merchants are continually looking for high-grade butter and are willing to pay a special premium for it, but the poorer grades of butter roughly estimated at about 80 per cent, soon glut and dull the market because of the limited demand. In order to force this kind of butter on the market the price is dropped far below that of the higher grades of butter, and it is this price that regulates the price paid for the cream from which that butter wa made.

Sweet cream is worth from two to four cents more than sour cream to the creamery purchasing it for butter making, and the dairymen should urge rather than discourage the grading of cream and the paying for same according to quality. The cream grading system of paying according to quality must eventually be adopted by all creameries as it is generally admitted to be the only method whereby the quality of cream and butter ca be improved.

O. W. Holmes,
Dairy Department, Idaho.

SOME PHASES IN MANAGEMENT IN BREEDING PURE BRED SHEEP

The breeding flock may be compared with a modern manufacturing plant. The efficiency of the plant depends largely upon its machinery, its material and its organization. So with the pure bred flock, its efficiency depends upon the breeding animals, the machinery, the available feeds and pasture, the materials, and the shepherd, the directing force of the manufacturing plant, the flock.

It has been assumed that a breed has been selected which is adapted to general farm conditions. Also, that fifty pure bred ewes of this breed, possessing health, strength, scale and uniformity of breed type, are headed by a masculine, robust, thickly fleshed, densely covered, blocky, and low set, ram. Further, feeds, pasture and equipment are available.

The breeder must have a definite plan of management. Beginning with the breeding flock the first days of August, an attempt is here made to touch briefly, the main phases of management in breeding a pure bred flock of sheep.

The breeding ewes have just been separated from their lambs. The shepherd takes care that when the lambs are weaned from the ewes no caked udders result, either by millking the ewes by hand or allowing the lambs to suckle them at one or two day intervals until thoroughly "dried up." It is best not to feed the breeding ewes grain or any feed that would stimulate milk flow for a week following lambing. At this time the skilled and experienced shepherd exercises his judgment and foresight. He proceeds to "cull" his breeding flock, ewes that have raised inferior lambs those infected with parasites, others that are poor milkers or bad dispositioned or are for some reason undesirable for breeding purposes, are eliminated from the flock. Remember, he does not always "cull out" the ewe that is in low condition of flesh, because the good mother, the deep milker or the "twin getter" is invariably in low flesh at this time. Good mothers give a large supply of milk and lose weight and vitality while suckling their lambs. The "culls" are separated and fattened for market.

The ewes are now prepared to be placed in fit condition for breeding purposes. To be fit they must be vigorous, healthy, and carrying a "flushed" condition. By a "flushed" condition is meant a physical condition and thrift, favorable for breeding. This is accomplished by judicious feeding combined with exercise and proper care. The ewes may be placed on a luxuriant pasture, either of permanent grass or a soiling crop. If such pasture is not available a grain mixture fed in amounts of ¼ to ½ pounds per ewe daily, having a nutritive ratio of 1 to 6, produces satisfactory results. Usually it takes 6 to 8 weeks after weaning to get breeding ewes into the best condition for breeding purposes. Ewes that are in favorable physical condition at the breeding season produce a higher percentage of twins than those that are in low thrift. This is explained by the supposed correlation that exists between optimum physical condition and the activity of the ovaries secreting the female germ cells, the ova.

The ram likewise must be in a robust condition of health and vitality, obtained through exercise, proper feeding and care. It is considered safer to practice a system known as "Hand coupling" in mating pure bred sheep when the number of ewes to be bred by one ram exceed twenty-five in number. By this method the energy of the ram is saved in a large degree. That is, allow the ram to be with the breeding flock only in the cool of the morning or evening for a sufficient length of time so that he may serve any ewes that be in heat. Do not allow, however, the ram to serve more than three ewes in one day. Lamp black should be placed on the brisket of the ram so that he marks each ewe that is bred. The shepherd should keep a record of the service for each ewe. The gestation period in sheep varies from 148 to 152 days. Sheep normally breed in the fall of the year when cool nights occur. If ewes are bred during the last two weeks in September and the month of October lambs will be weaned in February and March.

In breeding the ram is allowed to serve the ewe at least once after the first service provided she does not become pregnant. The periods of heat occur at intervals of 16 to 21 days in sheep. Six weeks is therefore considered a desirable length of time for the breeding season.

This method of procedure has been followed by many successful sheep breeders. The exception to this method would be in the case where winter lambs are raised. For this purpose breeds of sheep that mate during late spring and early summer must be used, (they include such breeds as the Dorset, Tunis, and the smooth bodied Merino.) these lambs are weaned from the first of September through to the middle of December.

In conclusion, successful breeding of pure bred sheep depends largely upon the man who mates his breeding animals. The breeding animals under the breeder's direction must be placed in a condition fit for mating.—B. O. Severson, Pennsylvania State College.

Handling Alfalfa for Horses

To make the best horse hay, alfalfa should be allowed to stand until well in bloom, according to the College of Agriculture.

In curing horse hay it is well to keep in mind that the dust which is present in so much alfalfa is largely a result of the presence of foreign moisture such as rain or dew at making time, rather than the presence of a little moisture within the plant.

If alfalfa hay is stored in the barn for horses, it is well, while mowing it away, to sprinkle it generously with a mixture of salt and air-slaked lime, equal parts.

A "RED DANGER SIGNAL"

This danger signal is not a flag but weed—and a bad one! It is easily ecognized at this time, and is com- only best known as "Red Topped orrel", or "Red Sorrel".

It starts in small spots and spreads y seed and root-stalks, and the spot rows rapidly larger year by year un- l it will almost completely destroy eadows and pastures.

The tops or seed and blossom parts ange from pale red to bright red. his makes the pest easily recogniz- ble from May 15 to early June. tems are slender, and from six inch- s to a foot tall commonly, and the aves have a sort of lobe at each de toward the base. The roots are ot large and run out under the sur- ace, and new plants are sent up from e roots at short intervals. It is one f the hardest of all weeds to g d of.

If work is begun, before it spreads o much, it may be smothered out by overing heavily with manure or traw. Heavy oiling or salting will ill it, but after it once spreads over field there is no practical way to et rid of it, that is known at this me.

Since it likes sour soil best, liming nd manuring heavily will help to rowd it out with plants that like lime.

The juice of the plant is sour and s said to be poisonous to some kinds f stock when they may accidentally at it.

BE WISE TO YOUR OWN INTER- ESTS AND STAMP IT OUT, as it has ot yet much of a start in Missouri, ut is certainly coming fast.

The writer has seen, in other states, housands of acres of meadows, hill astures, and other lands, especially here the soil is sandy, overrun with his pest.

The seed is small and shaped like buckwheat grain. They are com- nonly found in a rough hull of a red- lish brown color. Seed are most ommonly found in the seed of alsike lover, and in pasture mixtures. The writer has not examined a "pasture mixture" put out by a seed house, that lid not contain seed of red top sorrel.

A farmer should never buy a "pas- ure mixture" unless he gets a gov- ernment test, which he can get by sending as much as a tablespoonful of seed to the Seed Testing Laboratory, t Columbia, Mo., and at no cost ex- cept the postage for sending it. Ev- ery farmer in Missouri has this pro- ection, and he should most certainly make use of it. If the farmer sows mpure seed he will grow the same s he sows. The dealer cannot always sell better seeds than the farmers pro- duce. Two classes, then, ought to know something about seeds, as an obligation rests on each!

Sam Jordan.

A TWENTY YEAR BREEDING EXPERIMENT

An interesting departure from the usual scope of experiments with live- stock has been made by the Kansas Agricultural Experiment Station at Manhattan in cooperation with the Animal Husbandry Division, Bureau of Animal Industry, Washington, D. C. A breeding experiment has been start- ed with beef breeding cows that is to run for twenty years, the purpose be- ng to ascertain whether or not there s a specific type of cow which can be relied upon to produce beef calves of prize-winning merit.

Twenty Shorthorn cows have been put into this experiment and were selected by Professor W. F. Ward, Senior Animal Husbandman in Beef Cattle Investigations, of the Depart- ment of Agriculture, from the herds of the best Shorthorn breeders in the country. They were not selected up- on the basis of their merit and breed- ng but because each had produced an outstanding calf.

Shorthorns were selected for this experiment as the beef breed most widely distributed throughout the United States and because of the nat- ural tendency of the Shorthorn cow to produce both beef and milk in profit- able quantities.

An inspection of this group of fe- males furnishes the evidence that Pro- fessor Cochel and Ward had a clear and definite conception of the purpose n hand. They adhere to the type generally accepted by experienced breeders as the most reliable produc- ing type. They are of breedy appear- ance, distinctly feminine in character, of smooth conformation, level lines, carrying an even distribution of flesh and also displaying pronounced milk- ing qualities. The shoulders are well laid, hips well covered and there is ample breed type. It is remarkable that this number of females could be obtained from nearly as many herds in various states representing differ- ent strains of breeding so nearly of one type. This demonstrates at the outset that Shorthorn breeders are working definitely toward a standard.

It is the purpose to mate with these females, Scotch bulls bred along show yard lines. The first sire to be used is Matchless Dale, the present stock bull in the College herd, a massive son of the noted sire of show winners, Avondale. Matchless Dale has made a record as a sire of show steers, be- ing accredited with having sired more champion Shorthorn steers than any bull, living or dead.

The experiment is now under way. The first crop of calves will be dropp- ed in September and it is needless to say that more than ordinray interest will center in this first group of youngsters.

The purpose is to follow a process of elimination, discarding those cows that do not measure up to the required standard as producers and substitut- ing others bred within this group. Whether the specific purpose for which this experiment is being con- ducted will be fulfilled or not, there is certain to be a vast amount of light shed upon the problems that confront cattle breeders who will attentiv follow the progress of the undertak- ing. The result should have a far- reaching influence in the important field of cattle improvement.

Frank D. Tomson.

THE HESSIAN FLY IN 1916

"Lock the Stable After the Horse is Stolen". This article is not about horses—it deals with a different "ani- mal", a very serious pest, a pest caus- ing enormous losses, yet one that could be very readily and easily con- trolled if it were better understood. It is the Hessian fly that is now going to be "talked about".

The "Key to combat" any pest or enemy is to know its habits of "thought and action".

Key Number One.—It consumes food in grub or worm stage only.

Key Number Two.—Its food, so f as greatly concerns folks in Missouri, is the juice of the wheat plant.

Key Number Three. — Since when the wheat is ripe the plant has no juice, there is no food for the pest, hence it is in the resting or "dromant" stage, on the stubble where it remains from two to six weeks from the time of harvesting the wheat, depending somewhat on weather conditions.

Since the juice of the wheat plant is the fly's food, the transformation from the resting stage is not likely, naturally, to occur till the volunteer grain or early sown grain has come up. Knowing that all flies are in the resting or dormant stage on the stub- ble from two to six weeks after the wheat is harvested ought to be suffi- cient information for us to come to some conclusion as to a means of combat. Burning stubble will have great effect, depending on how com- pletely this can be done, but on an average many are likely to escape. Perhaps the best way would be to first disk the ground well, then immediate- ly plow deep, turning stubble under completely as possible, then harrow- ing the ground well and rolling it also, unless the seed bed has already been made fine. If this work is well done and in time great destruction may re- sult. It should be noted that all in a community must work together, as only a few following this plan will not amount too much.

Sowing other crops such as timothy and clover in the wehat would have to be omitted until the fight was over.

Farm Clubs should take action, and attempt to get every farmer in the community to take hold and help.

Where wheat seems to be straw-fall- ing or lodging badly it is most com- monly caused by fly. Examine plant by pulling down the outside blades and the little white grubs or brown flax-seed can be found, usually at first or second joint above ground. A field was examined the day this is written, and the writer found a field that at this time it would seem impossible for it to make a crop. Nearly every plant examined had fly, and twenty-four grubs were found on a single plant.

Find out early whether or not your community is infested—and if so, why not get busy. Cooperation is the only way that any means of Hessian fly destruction can be attained. Each wheat grower must do his part. Will you do your share?

Why not make this one of the lead- ing subjects for discussion in farmers' club meetings, from now till harvest time? Write the Missouri State Board of Agriculture at Columbia for free bulletin on "Some Insect Pests and Their Enemies."

Sam Jordan.

HOW MUCH PROFIT

is there in a pig? That depends on the man, on the feed, and on the pig. But how do you know when the combination is right to produce best results? **Keep a Farm Account Book and let it be**

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK

Complete Account of Hogs ..... , 19 14

Date	Person, Firm, or Account	Item, Description, Price	Cash Received	Cash Paid	Labor Hours Man	Labor Hours Horse	Labor Hours Tractor	Amount Charged	Amount Credited
Nov. 1	Corn Account	100 bus. corn @ 60 ¢						60 00	
Dec. 10	"	80 bus. corn @ 64 ¢						51 20	

Charge the pigs with the corn they eat and then—

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK is a splendid 176 page book, well bound and ruled on extra quality ledger paper. It is designed to contain the accounts of the average farm for five years. This is especially desirable for the purpose of comparison. The book also contains forms for crop, stock, employment, and insurance records.

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK

Complete Account of Corn Crop , 19 14

Date	Person, Firm, or Account	Item, Description, Price	Cash Received	Cash Paid	Labor Hours Man	Labor Hours Horse	Labor Hours Tractor	Amount Charged	Amount Credited
Nov. 1	Hog Account	100 bus. corn @ 60¢							60 00
Dec. 10	" "	80 bus. corn @ 64¢							51 20

Give the corn crop credit and that transaction is closed. Remember that in farm bookkeeping perhaps the greatest number of transactions will be between accounts on your farm.

We will give **The Missouri Farmer** for 3 years, either renewal or new subscription and a copy of **The Practical Farm Account and Record Book** for $2.25.

The Missouri Farmer, Columbia, Mo.

By Old Jim Riley

For th' last two or three years we'v bin sellin' th' Mexicans guns and car- tridges by th' car load—and now they'r turnin' around and shootin' us with em. That may be statesmanship but it ain't horse sense. But for that we could lick em with a bunch of rocks. Here's a good recipe for cut worms. Catch th' cut worm, put him on a log —and then when he ain't lookin', bust him over th' head with an axe. This may not be scientific, but its sure.

WORLD'S RECORD "FARMER"

Bob Simpson is only a modest, un- assuming, Missouri farmer boy, but while he was learning something about better farming in the Missouri College of Agriculture he had to have plenty of exercise and fresh air to which he had always been accustomed, so he took it under the direction of Coach H. F. Schulte, and almost before any- one knew what was happening, he was able to run the 120-yard high hurdles faster than anyone else on earth had ever run them before. The best of it is that his honors haven't spoiled him at all, and Coach Schulte says he is just the same modest, sensible boy that he has always been and that his influence among the other students is much greater than if he had become conceited when he made such a good record and found himself asked to pose for the moving pictures that are now showing him all over the country.

But Simpson isn't the only "farm- er", as the College of Agriculture stu- dents call themselves, who has done good work for the University in the track, football, cross country, basket- ball, and baseball teams. The cap- tains of all five of these teams last year were "farmers" and more than two-thirds of the basketball, more than half of the track, more than one-third of the football, and more than a quar- ter of the baseball men were from the College of Agriculture.

Those who reach a certain standard in athletics are given the privilege of wearing sweaters, bearing the "M" of the University, and Coach Schulte says that while it is too early to be sure of all the men who will get "M's" this year in track work, there will probably be twenty of whom eleven are "farmers".

As the College of Agriculture is only one of nine colleges and schools in the University at Columbia, it is easy to see that the "farmers" are doing their share of the work and getting their share of the honors.

We are informed that the State Twine Plant at Jefferson City has left several thousand pounds of binding twine which farmers can buy while the supply lasts for 9 cents a pound in 1000-pound lots or 9½ cents in smaller lots. Don't wait if you will need twine but see your neighbors and send your order right away.

Live Stock Notes

R. P. ROYCE, Fieldman

Unsell's Durocs

Dr. J. B. Unsell the popular Duroc breeder of Louisiana, Mo., was in the office last week and reports his Cloverleaf herd to be in great shape. Some of the boys started to guy the Doctor but when he pulled a lot of pictures on them there eyes began to open. Judging from the pictures Dr. Unsell will have out a remarkable lot of Durocs at the fall shows.

When this herd was established the owner spared no expense to get together as high-class lot of brood sows as possible and many of the most famous show and producing sows are now in his herd. At the head of the herd is the mamoth young boar, World's Fair Col.. It will be recalled that this boar was developed by Harry Browning who placed to show him at San Francisco, and was sold to Dr. Unsell late last fall at a long price. World's Fair Col. has every indication of making one of the very largest boars the herd has produced and the way his pigs are showing up it looks as though he would be a sire of first rank. The young stuff being prepared for sale and show, are remarkable for their extreme size and bone. We will have more to say concerning this herd in subsequent issues.

Moss & Son's Holstein's

D. D. Moss & Son, Columbia, Mo., find it necessary to reduce their herd of Holsteins and are offering eight extra good young cows for sale. The cows are all high grade and were sired by a son of the famous cow Missouri Chief Josephine and sell bred to Campus Josephine Lad, a son of the great producing cow Pontiac Gerben De Kol. This breeding combines the blood of two of the greatest cows ever developed in the herd owned by the College of Agriculture.

The Moss herd is a working herd and a profitable one and the only reason for offering the above stock is to keep the herd within limits. Mr. Moss has sold a great many Holsteins to our readers and we have never heard of a displeased purchaser. Each cow is sold on a guarantee to be free from tuberculosis and contagious abortion. This is a splendid opportunity for our readers to purchase high grade, tested, cows, at very reasonable prices. When writing kindly mention this paper.

Red Polled Bulls and Heifers

M. L. Snyder, Polo, Mo., now offers a number of good useful Red Polled bulls and heifers for sale at very moderate prices. Mr. Snyder has developed his herd along lines that will suit the average farmer. He has tried to bring about a combination of beef and milk and the young things he now offers are bound to develope into useful breeding animals. If interested, write Mr. Snyder for further information.

Brockman's Durocs

A. C. Brockman, Centralia, Mo., the veteran breeder of Durocs, writes that his spring crop of pigs is by for the best he has ever raised. That is saying a whole lot, because Mr. Brockman has a herd that stands right up in the front rank.

For years he has been carefully culling his herd with the sole idea of establishing a herd combining extreme quality and size. Few breeders can show more size and quality and prolificacy than Mr. Brockman, and his friends have openly charged him with being entirely too modest in telling the public about his Durocs. There is something to this charge, for we know breeders who make strong claims, but when it comes down to "brass tacks" can't show the stuff that Mr. Brockman has. It will be well for prospective buyers to keep this herd in mind and investigate it before buying Durocs this fall. You are assured of good quality and fair treatment.

Shorthorn Bull For Sale

W. H. Hamilton, Guthrie, Mo., is offering a good value in the Shorthorn bull he advertises elsewhere in this paper. Mr. Hamilton writes that the bull is a well grown roan, from a splendid family and that he is putting the price down in order to move him as soon as possible. If any of our readers are interested we would suggest that they get into communication with Mr. Hamilton at once.

Frost's O. I. C.'s In Big Demand

S. D. & B. H. Frost write that they are having a heavy inquiry for their spring crop of O. I. C.'s and that everything points to an early closing out of the lot. The Frost herd has been before the public so long and is so well known that each year their old customers and many new ones tax the capacity of the herd.

Messrs. Frost can fit out our readers with single pigs or pairs or more of unrelated stock. It might be well to add that every litter offered is bred deep in the blood of champion sires and dams. The prices are very reasonable and the quality very high. Mention the paper when you write.

$12,000 Worth of Holtsteins Sold

S. W. Cooke & Son, Maysville, Mo., who advertise Holtsteins in this paper write that during the year ending April 30, the total sales from their herd amounted to more than $12,000.00. This is a mighty fine showing from a mighty fine herd,—over $1000 worth of breeding stock sold each month and the herd not impaired in efficiency. There is just as great an opportunity for a lot of other Missouri farmers to do as well—providing they start right. Messrs. Cooke will be glad to advise with prospective purchasers in regard to the stock they now have for sale. Mention this paper when you write.

Holstein Bull Calves

B. C. Hemphill, proprietor of the Roadside Dairy, Dexter, Iowa, is advertising a few choice Holstein bull calves for sale. Our readers who are in the market should lose no time writing Mr. Hemphill. Kindly mention this paper.

Turpin's Angus Offering

Robt. D. Turpin, Carrollton, Mo., is advertising seven extra good Angus bulls. These youngsters run in age from 12 to 19 months and are well bred. The prices are very reasonable.

Lawrence's Angus

V. E. Lawrence, Salisbury, Mo., is now offering a few good young Angus bulls and heifers for sale at prices that will make money for the purchaser.

Jersey Cattle

Wm. H. Bruns and Sons, Concordia, Mo., are making especially attractive offers on a number of young Jersey bulls old enough for service. The bulls are sired by The Owl's Champion a very highly bred Jersey sire.

A splendid young sow in the Adenhill herd of Durocs, owned by R. L. Hill

Eight Choice High Grade Holstein Cows

To reduce my herd I offer eight high grade, high producing Holstein cows. All are sired by a son of Missouri Chief Josephine and are bred to Campus Josephine Lad, a son of Pontiac Gerben De Kol. Guaranteed free from tuberculosis and contagious abortion. Price reasonable.

D. D. MOSS & SON, - - - COLUMBIA, MO.

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.

BENNETT BROS. R. 5, LEE'S SUMMIT, MO.

Spring Boars by the Grand Champion

A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.

WILL G. LOCKRIDGE - - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns

Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.

H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS

We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.

W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands

I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.

H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.

EDGAR DOOLEY, - Ettervile, Mo.

DUROC JERSEYS

THE BEST DUROC BLOOD--COL. WONDER

At recent Missouri State Fair my herd won 35 ribbons—3 championships, 15 firsts. Col. Wonder sires my champions—he will sire them for you. Choice bred gilts. Nothing but the best sent on mail orders.

CHAS. L. TAYLOR - - - - - - Olean, Mo.

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.

A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

BIG EARLY DUROC SPRING PIGS

Pigs with size, lots of bone and quality sired by our big prize-winning boars, Col. Wonder II., Merry Chief, and Rexall Col., and out of big prolific sows. None from litters of less than 11. Spring pigs are cheapest to buy, costs practically nothing to ship them, and they can be grown cheaply.

R. L. (BOB) HILL ADENHILL FARM, - - COLUMBIA, MO.

100 EARLY O. I. C. SPRING PIGS

10 GOOD FALL GILTS

Guarantee and pedigree accompanies each sale. This herd has been exhibited at World's Fairs and State Fairs for years, so that most of our pigs have prize winners on both sides of their pedigrees. We can furnish pairs and trios, no kin. We are making bargain prices on early orders. Write us today. Address,

R. F. D. No. 1. GUTHRIE, MO.

MISSOURI NEEDS A STALLION LAW

It would seem rather a paradox that Missouri, one of the leading states in horse production, should be without the protection of a stallion registration law. Several efforts have been made to have such a law enacted by the state legislature, but each time the measure has been defeated. These past defeats can be traced to two or three sources, first, the owner of the grade stallion; the owner of the unfit stallion; the crooked stallion owner, the legislator who does not understand the need of such a law and who is therefore indifferent, and the legislator who is afraid that the folks back home do not want it.

There have been any number of arguments advanced against such a law —but as yet not one argument has been advanced that "would hold water" or that would do the opposition credit.

Perhaps most of the opposition comes from those who do not understand the purpose or the operation of such laws. Briefly there are two laws in operation in the twenty or more states that have registry laws. One requires that every stallion or jack standing for public service shall be advertised for just what he is. In other words if a stallion is a pure bred he can be so advertised, but if he is a grade or scrub he must not sail under the false colors of "Pure-bred." The other type of law embodies the above points but goes a step further and requires a certificate of soundness issued by a competent veterinairan, said certificate to be incorporated in the bill or advertisement announcing the service of the stallion or jack. Some states forbid a stallion or jack to stand for public service that has certain diseases or unsoundnesses.

Now Mr. Farmer, can you see any objection to such a law? Whenever you buy any article you want to know what you are paying for, do you not? Would you willingly buy an article that was not right? You are in favor of the law requiring the merchant to truthfully advertise his wares, are you not? Then why should you be indifferent about requiring the stallion owner to be honest with you? Why should you not exercise as much care in breeding your mare as in other business transactions? You breed your mare for the purpose of raising a colt, you want a good colt, you should want to know before-hand what sort of a stallion you are breeding to and the only way that you can be sure that you are being treated fairly is to know that his pedigree has been examined by the proper board and that he is what the license says he is.

The matter of securing a stallion registration law is practically entirely in the hands of the mare owners of the state, and the owners of sound, pure bred horses. The man who stands an inferior horse or a crooked owner will never come out as an advocate of such a law and whenever a man opposes such a law it is always well to ask the reason.

It is well to bear in mind that these laws do not work a hardship upon any one. It does not prevent a man from standing any sort of a stallion he has, except in cases where the horse has certain transmissable diseases or unsoundnesses, and of course, in such cases the horse should be eliminated from public service. The man with a good grade stallion, or even a scrub or mongrel horse, can continue to draw patronage, if the mare owner wants to breed to such a horse, but he can not draw patronage under the false statement that his horse is pure bred.

It is a notable fact that in twenty states which have enacted such laws, that the horse stock has shown a marked improvement, and the average value per head has increased. It is further noteworthy that no state has ever repealed a stallion registration law— which is ample proof that the law must be popular.

A further fact that should be of particular interest to Missouri mare owners is that every state that borders Missouri, with the exception of Arkansas, has a stallion law in operation. This condition has operated to make Missouri the dumping ground for a lot of unfit stallions that were driven out of the neighboring states. It would be humiliating to know how many such horses are now being patronized by Missouri farmers. How much longer will Missouri permit such a condition to exist? The answer will depend on how much interest the Missouri farmer will take in the matter. Until they exercise themselves over the situation and until they see to it that their representatives in the State Legislature take the matter seriously. They will pass the law if you want it —the question is do you? Or will Missouri mare owners continue to breed their mares to a lot of nondescript stallions that could not stand for public service in other states.

R. R. Royce.

More Shorthorns to Foreign Ports

In addition to the recent export shipment of Shorthorns to Argentina under the direction of Sec'y. Harding of the American Shorthorn Breeders' Association, an order has been placed with Frank Scofield, Hillsboro, Tex., by Brazilian parties for 25 head of tick-immune bulls for shipment by June 10th. The price is $500 per head. This is the largest individual foreign order ever placed for bulls from south of the quarantine line. Mr. Scofield is drawing upon the various Southern herds to complete the order. In addition, Mr. Scofield has sold a yearling bull to Casa Alemana, Governor of the Atlantic Coast of Nicaragua and two yearling bulls to Henry F. Springer, Bluefield, Nicaragua; a yearling bull and heifer to Senor Manual Estrado, President of Guatemala.

Another Argentina shipment includes twenty Shorthorn bulls of varying ages selected by W. A. Forythe & Sons, Greenwood, Mo., for J. N. Foley. This shipment is now en route and is due to arrive at the destination in August. This is a very important consignment including bulls of high individual merit and representing the progeny of the most noted sires of recent times. The selections were made with exacting care and the character of the shipment can scarcely fail to strengthen our business relations with the Argentina breeders.

It is apparent that our Southern neighbors are looking to this country for Shorthorn breeding stock. There is an unlimited field and we have an advantage now over breeders of the British Isles due to the European war conditions.—Frank D. Tomson.

Feed 3 Per Cent Grain Ration

Pigs on alfalfa pasture will return more profit per pig if fed a grain ration equal to 3 per cent of their weight, according to data of the Nebraska Experimental Substation. The pig is a pork-producing machine and like other machinery is most profitable when run at full capacity. A pig's stomach is so small that it will not digest enough alfalfa alone to make a profitable growth. Pigs cannot produce the best gain when on pasture alone or when on pasture supplemented by only a small amount of grain. Tests made at the North Platte Substation show clearly that two and one-half to three pounds of corn daily per 100 pounds of live weight of the pigs produced not only the greatest gain but the greatest profit. The higher the price of corn, the smaller the profit in favor of the heavier ration. However, on a market quoting corn at 70 cents and hogs at 7½ cents, the 3 per cent ration is still the most profitable.

What One Jersey Cow has Done

At the University of Missouri a record of the milk and butter production of a small Jersey cow was kept for fifteen years. The assistants who handled her have come and gone, but the Jersey cow is still on the job. In the fifteen years she has produced 108,968 pounds of milk and 5,000 pounds of butter-fat, equivalent to 5,882 pounds of butter. Her best year's record was 13,322 pounds of milk and 735 pounds of butter, authenticated under the rules of the American Jersey Cattle Club. During the fifteen years Grace Briggs has given birth to twelve calves. Her last calf sold for $300, and the average for the twelve is about $200. About $2,400 was obtained from the sale of all the calves. Figuring the entire milk production for fifteen years at eight cents a quart, the total would be $4,358.72. The approximate cost of keeping her was $50 a year, or a total of $750.

The average daily production of milk for fifteen years was a little more than nine quarts a day. During her best year she produced a little more than eighteen quarts a day.

If the butter was sold instead of the milk, at the price of thirty-five cents a pound, the total for the butter production from Grace Briggs would be $2,041.55.

Get Rid of WORMS and INDIGESTION

Do you know that ninety per cent of all live stock losses are caused by Worms and Indigestion and both these conditions are preventable? Get rid of the blood-sucking worms and you will remove the chief cause of losses. Wormy animals can't thrive; the food they eat is largely wasted; they run down in condition — become easy victims to diseases. Worms eat up your high cost feed — bring on indigestion — cause heavy loss. Get rid of the worms with—

The Great Worm Destroyer SAL-VET The Great Live Stock Conditioner

The medicated salt without Antimony. Give your animals free access to it; they'll rid themselves of worms. Costs only 1-12 of a cent a day for each sheep or hog and only 1-3 of a cent a day for each horse or head of cattle. SAL-VET will do the work; I'll prove it or no pay.

DON'T SEND MONEY—JUST THE COUPON

Fill in the coupon below — tell me how many head of stock you have; I'll supply you enough SAL-VET to last your animals 60 days. You pay the freight when it arrives; feed as directed, make a specific report at the end of 60 days. If SAL-VET does not do what I claim it will cost you nothing.

ABERDEEN-ANGUS BREEDERS' SALE!

65 Head of High-Class Bulls, Cows and Heifers

At the National Stock Yards Pavilion (Barn 5)

EAST ST. LOUIS, THURSDAY, JUNE 22

Without question it is one of the greatest offerings of Aberdeen-Angus Cattle that has been booked this season. Your last opportunity to make selections at your own price before the season closes.

40 Bulls of serviceable age, good individuals and teeming in the blood of the most renowned animals the breed has ever produced. HERD-HEADERS of top notcher kind. Bulls that will please the breeder, bulls that will please the farmer and cattleman who wishes to produce the steer that will top the market.

25 Cows and Heifers of superior individuality and blood lines. Cows with calves at foot. Some of the very choicest yearling heifers seen in any auction this season. Every female in this sale has superior value.

All the most fashionable families represented:—Blackbirds, Trojan Ericas, Pride of Aberdeen, Queen Mother, Jilt, Barbara and other popular tribes. The contributors are well known breeders and exhibitors whose herds are the very best in Illinois, Ohio and Michigan. **A. A. Armstrong,** Camargo; **J. Garrett Tolan,** Farmingdale; **A. Middleton & Son,** Assumption; **J. & D. W. Mobley,** Mt. Sterling; **F. A. Clark,** Mt. Sterling; **D. F. Jarrett,** Vandalia, Illinois, and **U. L. Clark,** Hunters Creek, Mich. and **F. B. Turnbull,** Cedarville, Ohio. Breeders of such reputation insure animlas of the right sort.

IF YOU ARE IN THE MARKET FOR HIGH-CLASS ABERDEEN-ANGUS THAT WILL MAKE GOOD DO NOT FAIL TO ATTEND THIS SALE. FOR A CATALOG AND OTHER INFORMATION ADDRESS

M. A. JUDY, Sale Manager,

817 Exchange Avenue, CHICAGO, ILL.

Col. W. W. COOPER, Auctioneer.

Suggestions for Concrete Tanks

A good mixture for a concrete tank may be made of one part Portland cement, two parts of clean, coarse sand, and four parts of screened gravel or crushed rock. Where neither gravel nor crushed rock is available use one part of cement to three of sand. If less cement is used than the amount given, the mixture will not wear.

The foundation should be about six inches thick, enough so that there will be no danger of heaving from frost. It should be reinforced with woven wire.

The sides of the tank may be reinforced the same as the foundation, care being taken that the reinforcement is placed near the outside wall. Only wire or iron of good quality should be used, as rusted material only fills space and does not reinforce.

There should be continuous reinforcement around corners. Where the wire or other material laps, the laps should be several inches.

The form for the tank should be so made as not to crack the cement when taken apart.

After the forms are removed, the inside of the tank may be waterproofed by applying a coat of concrete paste made of pure cement and water mixed to the consistency of cream.—Nebraska College of Agriculture.

East St. Louis Aberdeen-Angus Sale

On June 22nd at the East St. Louis National Stock Yards Pavilion, there will be a sale of high-class Angus cattle consisting of 25 cows and heifers and 40 bulls from the herds of such well known breeders and exhibitors as A. A. Armstrong, Camargo; J. Garrett Tolan, Farmingdale; A. Middleton & Son, Assumption; J. & W. D. Mobley, Mt. Sterling; F. A. Clark, Mt. Sterling; D. F. Jarrett, Vandalia, Ill; U. L. Clark, Hunters Creek, Mich., and Frank B. Turnbull, Cedarville, Ohio. The breeders and farmers should appreciate such an offering as may be expected by such a prominent lot of contributors. The offering is largely selected from the most fashionable families and they are backed by superior merit. Field Representative M. A. Judy of the Aberdeen-Angus Breeders Association is very much pleased with the animals listed and it is his opinion that there has been no bull offering this season that is the equal of this offering in blood lines and merit. More high-class herd headers can be secured in this sale than any sale of the year.

You will find bulls in this sale that have been in the show yard and made good. You will find bulls in this sale that will make good prospects for the fall shows. Breeders who may be in the market for a high-class top-notcher herd-header should by all means inspect this offering. The 25 cows and heifers listed for this sale are in the very pink of condition and every one wears the very stamp of approval. Several of the cows have calves at foot and every female of a breeding age has been bred. You will find females listed that should please the most exacting cattle buyer. All forecasts indicate higher prices for Angus cattle. All previous records of all beef breeds have been smashed within the last few months. The demand and prices are fast advancing. The wise will purchase while they yet remain within the price of the average man. The writer has visited and made sales in several states, and he is free to say that he never experienced such a demand before. The prospect for a bumper crop is good this year and we are sure to see a much greater demand for all kinds of good breeding animals. Send to M. A. Judy, sale manager, 817 Exchange Ave., Chicago, Ill., for a catalog.

Send us a dollar bill at our risk and we will renew your subscription for three years.

No More Flame-Blackened Cooking Utensils to Scour

Isn't that good news? Just think of the hours of work you won't have to do. Write today for booklet that tells about the different styles and prices of

NEW PERFECTION OIL COOK STOVES

The flame never reaches the utensil. It never creeps up or diminishes. It gives the maximum of efficiency.

This stove is easy to fill and is always ready. Makes summer cooking easy.

No smoke—no odor—no waste. Your curtains will stay clean longer.

Costs much less to burn than the coal or wood burning range. Does away with necessity of enduring excessive heat of the latter.

Get the oil cook-stove with the *Long Blue Chimney*. You can't afford to be without one this summer.

The Cripples

As I was walking along the street the other day there hobbled along some distance ahead of me a hunchbacked cripple and as I passed a group of idlers I heard one of them remark to the others, "Gee, wouldn't you hate to be a cripple like that fellow?" Now it happens that I know both of the parties in question quite well. It is true that the hunchback is tremendously handicapped in the physical sense of the word—so much so that most of the joys and pleasures incident to buoyant manhood have forever been denied him. But, for all that, he has long since become reconciled to his lot and instead of sulking and railing at an unkind fate which from early youth marked him for its victim, he makes the best of his situation. For some years he has filled an humble though menially responsible position and whether it rains or whether it shines he can be found at his post of duty — contributing what he can with his gnarled and twisted limbs to the thrift and industry of the community of which he is a part. And I know of no one whose smile, chastened by years of silently endured pain is more kindly and friendly. During his idle moments he reads the best of books and magazines and his mind is as alert and keenly interested in the things which go on in the World as anyone of my acquaintance—and when Sunday comes he hobbles into an obscure place in the rear of his favorite church and I doubt whether there is another individual in the congregation who gets as much real enjoyment out of the sermon as this little hunchback who is clean in thought and mind and who, for all his handicaps, finds the World a most interesting and beautiful place to linger in.

But how different is the picture of the young fellow who made the pitying comment referred to above? In the beginning, nature was exceedingly kind to him. It gave him indulgent parents, a splendid physical constitution, ample opportunity for a good education and a chance to take his place alongside of the best young men in the community. But all these things he has ruthlessly trampled beneath his feet. He has not appreciated the love of his parents nor sought to please their fond hopes by treading the path of useful manhood. He spent a couple of years in the first year of high school and then gave it up as a hopeless task—not because he didn't have the ability to learn but simply because he preferred the society of indolent, idling friends. His splendid erstwhile constitution is fast giving away under the strain of dissipation. His finger tips are yellow with the taint of the cigarette and I have no doubt that he indulges other habits even more deleterious to moral and physical health —for he has never been able to hold a position of responsibility and three-fourths of his time is spent in idleness with companions whose ideals are no higher than his own.

Under these circumstances, I leave it for the reader to say which of the two is the greatest cripple—the little gnarled and twisted hunchback whose heart and mind is clean and pure and who is trying to contribute his mite toward making the World better—or the shiftless young fellow who pitied him and who has wasted the splendid opportunities with which a kind nature had so generously endowed him—whose moral sense and appreciation of the things that are pure and splendid have become so dulled that he is destined to flounder along aimlessly until finally he will be swallowed up in that black night of despair which knows no sunrise? Verily my boy there are many cripples in the World. There are those who know no moment which is free from anguish. There are those who drag themselves through life upon crutches even as my little hunchbacked friend. But greater cripple than any of these is the man whose heart and mind have lost the power to love and strive for the things that are truly worth while and that stand for the best there is in clean, wholesome and useful manhood. Better far that your limbs should be mis-shapen than that your soul and vision should be tainted by a moral leprosy which neither sunshine nor physician can cure.

WANTS CONGRESS TO CONTROL THE PACKERS

To The Missouri Farmer:

Your recent article on a National Council of Agriculture exactly hit my views. Back in Illinois only a few years ago I knew a few farmers who organized a club of only 16 members but it has accomplished a great deal of good for that community. They handle their business together as one man and when their hogs were all sold in one lot they could get from 25 cents to 50 cents a hundred more than farmers who did not sell with the club. The same was true of the grain and other products that were sold. One year after outsiders had sold their corn for 40 cents a bushel, the club sold the corn for its members for 60 to 62 cents a bushel. Today the charter members of that club are nearly all dead but the descendants are well-to-do as a result of the better business methods of their fathers.

I have tried to organize the same kind of a farm club here in Macon County but so far have not been able to get more than three or four who will stay with it. Why it is I do not know. Farmers are the only class not organized and as a consequence the other fellow sets the price both ways. I know that for several years past most of our cattle and hogs have had to sell at a loss, sometimes at a sacrifice of one to two dollars a hundred and no discount to the consumer.

This whole thing of controlling the packers will have to be handled by Congress and your idea of organization is what we must take up in order to make Congress act.

I am pleased with the stand The Missouri Farmer has taken on this question and hope you will continue the fight until we get some action by Congress. I hope to be able to organize a club here as soon as I am able to get out. R. W. Dever.

FARMERS GIVE THE INFORMATION

Sometimes we hear people discredit the general information given out by the Department of Agriculture and while there may be a lack of accuracy in conclusions drawn by those who sit behind the desks in the department the figures upon which crop and live stock data are based are furnished by the farmers themselves. It is estimated that 770,000 farmers are in cooperation with the United States Department of Agriculture by furnishing information, demonstrating the local usefulness of new methods, testing out theories, experimenting and reporting on conditons in their districts—by helping, in short, in almost every conceivable way to increase the knowledge of the Department and to place that knowledge at the service of the people. This army of volunteers receives no pay from the Government. Many of these cooperators are actuated solely by a wish to be of service to their neighbors. Others take part in this work because of their own keen interest in testing new methods, or in trying out for themselves crops either new to their own sections or imported from foreign countries through the Department's plant explorers.

It is estimated that at least one farm out of every twenty is working in some way with the Department of Agriculture and thus has become a center of advaiced agricultural information for its community. In addition to the farmers who work directly with the Department of Agriculture, there are thousands of others who render a similar valuable service to the scientists and field workers of the State agricultural colleges and experiment stations.

With such a large number of farmers willing to work with the Department and the colleges and test out their recommendations, it is clear that a significant change has taken place from the day when the average farmer was decidedly skeptical about scientific agriculture and slow or unwilling to give attention to the recommendations of what many used to designate as "book farmers."

The wide use made by the Department of this large number of practical farmers indicates clearly how erroneous was the once prevalent idea that agricultural scientists held themselves aloof and that the Department of Agriculture consisted mainly of college-trained men, who were far more at home in their offices or laboratories than on actual farms. As a matter of fact, the scientific agriculturist today does not attempt to evolve theories in the seclusion of a Government building. It is true he may develop ideas in his laboratory, but before he is ready to advise farmers to adopt them he tries them out in actual practice on Government farms, and then calls on a large number of successful practical farmers to give these ideas an independent practical test on some of their own acres. In many other cases the scientist goes to the farmer both for his theory and practice. He studies and analyzes the practice of hundreds or thousands of successful farmers in an endeavor to find the scientific basis or underlying principle of farming methods which have, through long years of practical experience, been found to be most successful for their farms and neighborhoods. Frequently the scientist finds in one community certain farmers who are successful and others who are unsuccessful. He searches for the reasons for the success and failure of the two groups, and then endeavors to make clear to the successful ones the scientific reason for their success and to develop sound rules which will enable the unsuccessful to apply to their own farms the methods employed by their prosperous neighbors. In many cases, therefore, the scientist's recommendation represents the consensus of opinion of a large number of successful grain growers, truck raisers, dairymen, or other classes of farm managers.

Are Not Getting A Square Deal

To The Missouri Farmer:

I have been reading so much in The Missouri Farmer lately about farm organization and cooperation that three or four weeks ago I caught the spirit. And realizing the importance and absolute necessity of organization I called the dairymen together and said, "Gentlemen, we are not getting a square deal." They said, "We know it, but what are you going to do about it?" I said "Organize and stand together." They all said, "We are in." So we have organized and we met Friday night and organized another community and we are going to-night and organize another. Every place we have been or heard from is much interested. We are going to not just try but organize every dairyman around K. C. within a radius of twenty-five miles. That will be the bulk of Kansas City supply. And when we do that, don't you think we can have a say? There are about fifty dairymen in this organization and they are anxious that Mr. Hirth come and give us a talk on organization and they asked me to write you and find out if you would come, and when it would suit you to come.

We will have representatives here from the other organizations and try and have you a good crowd. We will be glad to pay your expenses. And personally, I will say this. That I will try to get every member of the organization to subscribe for your paper, for I really think if we could get The Missouri Farmer in every farm home in the state that it wouldn't be a year until the tide would turn.

V. C. Keer,
President of Organization,
Belton, Mo

Summer Handling of Meat

Meat that has been smoked slowly for at least four or five days is in the best condition for summer keeping. Ordinarily a smokehouse is the best place for storing meat until extreme hot weather sets in. Meat will keep in the summer where it is cool, dark, dry, well ventilated, and free from flies. It may be wrapped in paper and muslin and be buried in the oat bin. Some farmers have obtained satisfactory results by packing it unwrapped in clean, granulated rock salt. The smoked meat will take up little or no salt from the packing, and the rock salt does not collect the moisture that common salt does. Ventilation, dryness, and freedom from flies are the most important things to be considered in the successful keeping of smoked meat.—Nebraska College of Agriculture.

What To Do For Wormy Pigs

Little pigs become infected with worms by the litter picked up in old hog houses, pens, and pastures, eggs having been passed off by the older hogs. Sanitation, including freedom from dirt, drainage, sunshine, freedom from dust, and other disinfectants are the best preventives. The College of Agriculture suggests that santonin and calomel is the best means of ridding hogs of worms. Ordinarily five grains of santonin and three grains of calomel when mixed in a thin slop is sufficient for 100-pound pigs. Care should be taken to see that at feeding the pigs get a fairly equal amount. Fifty-pound shoats may be given four grains of santonin and two grains of calomel. Big hogs should be given six grains of santonin and four grains of calomel.

GALLOWAY

SECOND EDITION NOW READY

Ask for your copy today. A postal gets it. The first edition of this big, 250-page book of Galloway bargains was exhausted. Second edition just off the press. It describes the famous Galloway line of Sanitary Cream Separators, the Galloway gasoline and kerosene Engines, the new, modern Galloway Manure Spreaders, our new 12-20 h. p. Farmobile; Galloway Farm Trucks, all kinds of farm machinery, hay tools, ensilage cutters, power house accessories, grinders, buggies, wagons, harness, fencing, roofing, saddles, Galloway automobiles, stock tanks, corn tools, automobile accessories, sewing machines, household goods, carpets and rugs, furniture, and a complete line of clothing for every member of the family.

I WANT YOU TO HAVE YOUR COPY OF THIS BOOK

You can get it for a postal. If it guides your summer and fall buying it will save you from $200 to $500. It tells the the truth about cream separators, it gives engine secrets and facts, it tells how and why the Galloway manure spreaders made Galloway famous, fully describes my new 12-20 h. p. Farmobile or tractor. A copy of this book should be in your hands even if you are not now in the market for a single one of our bargains. Printed in four colors, handsomely illustrated. BUMPER GRAIN CROPS

GOOD MARKETS — HIGH PRICES

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. There is no war tax on land and no conscription. Send for illustrated pamphlet and ask for reduced railway rates, information as to best location, etc. Address

VOLUME VIII JUNE 15, 1916 NUMBER 12

The National Land Bank Plan

By Geo. B. Ellis, Managing Editor

At this writing the National farm loan bill has passed the U. S. Senate, passed the House with many changes and stands a good show to very soon become a law and in this article we want to acquaint our readers with the essential features of the plan.

But before we outline this measure we want to tell you again why we are so much in earnest about this matter of bringing about a system of better facilities for rural credits. Our readers know that for several years we have been urging the need of a system that would furnish farmers cheaper money on longer time than they can usually obtain it under present conditions and it is because we see a danger signal ahead for this country if the present tendencies of land tenure are not checked that we want to put all the facts before our readers.

A Danger Signal

The writer has reached the period where he can not hope to be personally benefitted by any farm loan plan but we have that abiding hope that this great country of ours shall live on and on until the end of time and not make the mistakes which have in the past caused the downfall of many nations. A recent writer says, perhaps more forcibly than I could say it "That one people after another, one civilization after another has culminated and decayed, need be ascribed to no mysterious decrees of fate or jealousy of gods fearful of being displeased by a more perfected human race. The reason is obvious and thoroughly well known, if not adequately recognized. Each people in turn became urbanized, lost its connection with the soil and departed out of its natural environment, so that its members no longer generally attained their full development of physical strength, mental energy and social efficiency." Are we not going in that direction? Did not the last Census show that the rural population of 70 counties of Missouri was on the decline? And the same is true of Illinois, Iowa and other agricultural states. The best farm lands are fast drifting into the hands of rich land lords and these rich counties everwhere show a rapid increase in land tenantry and the absentee land lord, and something must be done to stop this tendency else our country will fail just as other great nations have failed in the past.

More Capital Needed

We have said often that farmers need a great deal more money now to buy and to operate their farms than what was required a few years ago. Labor is higher in price and harder to keep so farmers must depend more on farm machinery. The land has grown poorer on account of long-time cultivation and soil washing and more fertilizers must be bought to make crops at all profitable. With the better standards of living demanded people will not remain satisfied on the farm unless they can have better buildings and modern conveniences which they see even some of the poorer classes of the cities enjoy and to keep the best people in the country, to keep the most enterprising and thrifty boys and girls away from the cities we must furnish them better homes on the farm. Farmers need to buy for cash rather than pay high prices for time purchases. How are you going to do these and many other necessary things without the use of more money than former generations have needed?

Cheaper Money Encourages Improvement

I know there are some who tell us that cheaper money means that land will go higher in price and that it will cause people to be more extravagant in their living expenses but the answer I make to that is that if those who argue thus are sincere why do they not try to have a law passed raising the rate of interest? Money spent for better living and better education so long as the expenditures are within the income is in no sense an extravagance. The farmer who builds a two-thousand-dollar house when money can be had at 5%, figures that his house rent costs $100 a year. But if he must pay 8 per cent his rent goes up 60 per cent higher and costs him $160 a year.

The U. S. Department of Agriculture after a thorough investigation has found that Missouri farmers pay an average interest rate on the money they borrow of 6.8 per cent, which includes the average commission charged by agents of .6 per cent. Estimating the farm loans of Missouri at $225,000,000 a reduction of the interest rate of only 1 per cent would save them $2,225,000 annually. If we save only the .6 of one per cent charged for commission there will be a saving of $1,350,000. Is there any one so blind he can not see that a million dollars or two million dollars expended for farm betterment, for better schools or for better roads every year will not soon tell on the country life of the state?

It Will Help the Lender

This scheme will help thousands of small lenders while helping the borrowers, paradoxical as that statement may appear to our readers. The money to be loaned on farms under either the Missouri plan or the Federal plan is not to be furnished by the government. Neither the State or the National Government proposes to loan any money and hence there will be no government competition with private money. The national and state plans propose to furnish the machinery for getting borrower and lender together and to reduce the expense in making loans. There is where the saving comes from. The committee in Congress having charge of this legislation says, "Of money seeking long-time investment at low rates there is an abundannt supply. It includes the ordinary savings of the school-teacher, clerk, minister, and wage earner; the proceeds of life insurance in the hands of widows and other beneficiaries; funds belonging to estates, minors, and wards in chancery in the hands of executors, guardians, and trustees; funds of insurance companies, benevolent orders, and societies of various kinds; endowments of colleges, hospitals, museums, and other institutions; and assets to be invested by receivers, courts, and governments. The aggregate of these is enormous. They require an investment that is absolutely safe and reasonably liquid in the sense that it may be converted into cash upon moderate notice; in other words, that it may find a ready market. A safe investment of this character need not carry a high rate of interest."

Borrower and Lender Not Acquainted

Under our present system the man who has a little money to loan does not know the borrower, does not know the value of the land he offers for security and he therefore prefers to put his money in the savings bank or some trust company. But with the Land Bank in operation the man with surplus money buys bonds drawing a low rate and absolutely safe and the bank looks after the title and value of the land offered as security. The government does this work without profit but adds enough to the interest charged the borrower to pay all necessary expenses. Then the average man with a little money to loan is not sure just when he will need it so these land bank bonds which will be bought and sold in all the money markets can be converted into cash most any time which together with their absolute safety make them a desirable investment.

The Plan Proposed

The plan before Congress and which seems likely to become a law very soon provides for a farm loan board to consist of three members, to be appointed by the President and not more than two shall be of the same political party. The first appointments are to be for three, six and nine years and the full term thereafter shall be nine years, which of itself largely divorces the institution from partisan interference. The members of this board can not hold any official connection with any bank, farm mortgage or trust company and their annual salary is fixed at $7,500. The bill when introduced provided for five members with a salary of $12,000. The farm loan board shall appoint a farm loan registrar in each land bank district to receive applications for issues for farm loan bonds and other duties prescribed by the board. The board shall also appoint one or more appraisers for each land bank district, and examiners, attorneys, experts, assistants, clerks and other employees as it may deem necessary to conduct the business. The salaries of all employees are fixed by the board. This national farm loan board will have power (a) To organize and charter Federal land banks and to charter farm loan associations, and joint stock land banks. (b) To review and alter the rate of interest to be charged by the land banks. (c) To grant or refuse Federal land banks and joint stock land banks authority to make any specific issue of farm loan bonds. There are other duties prescribed giving the board a very close supervision of the land banks and farm loan associations.

There is to be established in each of the twelve districts formed by the board a Federal land bank with not less than $750,000 capital stock, and shall designate the city where the bank is to be located, but these banks are authorized to establish branches in other cities within the district subject to the approval of the board. Each bank is temporarily organized with three directors, but after a complete organization there shall be nine directors, six of whom are local directors elected by the farm loan associations. The other three directors are appointed by the Federal Board.

The capital stock is divided into shares of $5 each and may be subscribed for and held by any individual, firm, or corporation, or by the Government of the United States. The stock held by the National Government shall receive no dividends, but all other stock shall share in dividend distributions without preference.

After the land banks are organized the bill provides for organizing national farm loan associations made up of ten or more persons who are owners or about to become owners of farm land which they can offer as security for loans to be made. Before any loan association can get a loan for any of its members it must subscribe for capital stock in the bank to the amount of one-twentieth (5 per cent) of the loan and this to be paid in cash. This amount of stock is held as collateral security by the land bank. The individual borrowers must subscribe for stock in his farm loan association to the amount of five per cent of the amount desired by him and this amount of stock is held as collateral security for his loan. This in fact makes his liability five per cent stronger than the value of his land and the improvements mortgaged but the borrower is entitled to his share of dividends whatever they may be.

Any one may borrow not more than $10,000 nor less than $100 and any association can not make application for loans which aggregate less than $20,000. Every shareholder is held "individually responsible, equally and rat-

ably, and not one for the other, for all contracts, debts, of the association to the extent of the amount of stock owned."

The interest rate charged borrowers shall not exceed six per cent but in fact the rate will be based upon the price that can be obtained for the bonds plus a margin for losses and expenses. In addition to the interest payment the borrower will be required to pay a small amortization payment which will extinguish the debt in the time agreed upon which shall be not less than five nor mor more than thirty-six years. The borrower may after the loan has run for five years make payment at any regular installment date of $25 or any multiple of that amount and thus reduce or pay off the entire debt.

The owner may borrow up to 60 per cent of the appraised value of the land and 20 per cent of the value of permanent insured improvements. As an example as we understand it a man owning 160 acres of land appraised say at $50 an acre ($8,000) can borrow $4,800. If the improvements are appraised at $2,000 and are insured for that amount he can borrow 20 per cent of that amount, or $400. This would make $5,200 loaned on a valuation of $10,000 or in fact approximately fifty per cent of the value of land and buildings.

The loans may be made for the following purposes and for no other:

a. To provide for the purchase of land for agricultural uses.

b. To provide for the purchase of equipment and live stock necessary for the proper and reasonable operation of the farm.

c. To provide buildings and for the improvement of farm lands. (The board may determine what is meant by equipment and improvements.)

d. To liquidate indebtedness of the owner of the land mortgaged, existing at the time of the organization of the first national farm loan association established in the county in which the land is situated, or indebtedness subsequently incurred for one of the purposes provided.

Thus it will be seen that the uses for which the money can be applied are about the same as under the Missouri Land Bank. In appraising the land its use for agricultural purposes is to be the basis of value and the earning value of the land is to be considered.

To prevent the use of the money in land speculation no loan is to be granted any one who is not at the time or shortly to become engaged in the cultivation of the land to be mortgaged. In case the land is sold the loan is to be paid unless the buyer is elligible and in no case can any one person have a larger loan than $10,000.

The bill provides for the exemption from Federal, state and local taxation the assets of these Federal land banks and farm loan associations, except any real estate held, purchased or taken to satisfy the mortgages. This is a necessary feature of all rural credit systems. One of the principal objects of land banks is to furnish farm home owners with cheaper money and one way to do it is to reduce the expenses of making loans and then by making such provisions that will make the bonds readily salable. The bill provides that no loans shall be made at a higher rate than five per cent interest plus one per cent for expenses. These are the maximum rates but in actual working, the rate of interest will be governed by the price of the bonds.

WANTS A STATE ORGANIZATION

The Missouri Farmer:

I am very much interested in your earnest appeal for farmers to organize and we have responded to the call in a small way. We have organized with 18 members and think many more will become interested and join the ranks in the near future.

I think it is time that farmers should wake up to a realization of the necessity for farm organization, for in unity there is strength.

We have ordered our twine from the state twine plant at Jefferson City and count on saving enough from our first order to pay well for getting together.

I think the farmers of every county should hold a two days meeting and picnic sometime during the year, when the rush of work is over, and have some good speakers present and try to interest more farmers in club work.

Fellow farmers let us all help The Missouri Farmer in the good work it has inaugerated. We should not stop with school-district organization but should go on to county and state-wide organization and when that is accomplished the farmers will command greater respect and reap a greater reward for their hard labor.

Aaron Bachtel, Brunswick, Mo.

LYONS PRACTICAL FARM PAPERS

I sometimes wonder what we know, and what we don't know, until I have my doubts as to whether we know half as much as we think we do. A recent article on asparagus culture says that a bed properly set, manured every year and well cultivated, will last twenty to twenty-five years.

About 1853, my father set an asparagus bed in his garden, about fifty feet north of the house and on the eastern slope of a mound builders' mound.

In 1865 the garden was moved, and ever since that date the mound has been in blue grass. Most of the asparagus bed was thrown into the pasture, and that is all gone, but there is one clump about two and a half feet square in the blue grass lawn, and that clump affords us more asparagus than double the space in the regular bed, where it is manured and cared for as per rule.

When setting a strawberry bed four years ago, I found that the plants I had bought were not sufficient to set the land I had prepared, so I went to where there were some fine plants that had escaped from a bed set many years ago and dug up fifty plants to finish my bed.

This original bed had probably been set fifty years ago, Burr Pine, Triumph De Gund, Wilson, Early Scarlet and other old time varieties, and, as the children always got a few quarts of small berries there every year, I reasoned that if I took up the plants, set them in good soil, cultivated and manured them, and did not allow too many new plants to set, I might get to compare the kind I remembered for fifty years with the newer varieties.

That was four years ago, and three fruiting seasons have shown us but little better berries from these cared for, cultivated and manured plants, then those which grew in the patch I got these from.

One thing, however, they had certainly gained in the ability to propagate the species, as they easily make half a dozen runners to one for the other sorts, and Beder Wood is good at plant making.

The next thing in mind, is the fact that some eminent veterinary authorities, have decided, that clover bloat in cattle is caused by the fermentation of the sugars in the bloom, and that formalin, in half ounce doses given in a quart of warm water is a cure.

We have found the formalin to act well in cases of bloat, better in fact than any other mouth-given remedy we have ever used, this whether the bloat is caused by sugar or not.

Now I remember very well, that when I was a small boy I heard my father and a neighbor say, that when the clover came in bloom most of the danger from bloating was over, and I have observed this to be true, or at least I have believed it to be true, yet here comes along a real scientist and tells me, sugar in the bloom causes the bloat.

I have an object in writing of these things, and that object is to set people to studying over such problems in every day life on the farm.

The asparagus has not degenerated in the sixty-three years it has stood in the same place, yet the strawberries, set in 1866 as I find from father's old records, have "run out," so that no amount of cultivation, manuring and thinning out, lasting through three or four seasons, will cause them to grow berries much larger than those in the bed they came from.

I am going to keep on trying to make them do better, and with that object in view, set out half a dozen plants of them this spring.

Most of us who are near sixty years old remember the old Blue Neshannock potato, a safe cropper, a fair yielder and of fine quality. It is said that this potato "ran out" until it would no longer produce even fair sized tubers, and the Peachblow, that came some forty-five or fifty years ago as an extra good late potato, has gone the same way.

Why should potatoes and strawberries do this, while asparagus does not? And while only mentioning asparagus there are other plants that have been grown from the same stock, with no especial care, for scores of years and that yield well.

June 1, corn all planted, excepting near river. Tobacco crop half set, plants scarce and wheat and oats poor, rye good.

Sam Jordan does well to warn against Red Sorrel. As for its being partial to acid soil, and lime being a probable means of combating it, Col. Waters and I found it growing right up to the edge of an old lime kiln, where the soil was half or more lime. I got rid of the few small patches on my farm, by heavy manuring and heavy grass seeding, but still a few plants crop out every season.

Cattle will scarcely eat it, but horses are very fond of it, and hereby hangs a tale.

Conrad had considerable red sorrel in his pasture, and Billy, right across the road, had none. The two men were in the habit of changing work in harvest, each taking a horse to assist in pulling the binder. Red sorrel began to come in Billy's fields, and being of a very investigating turn of mind, he traced it directly to the droppings of Conrad's horse, brought from a sorrel infested pasture.

Today I found a bunch in an old strawberry bed, and am confident that it was carried there, as a seed, in horse manure.

Crowding out blue grass timothy and white clover, as it does on any but very rich land, it is a weed to be feared as one of the worst we have to contend with.

Sam, if somebody was driving a herd of wild bulls down the road, I might stand on my rights as an American citizen and take a stroll right down that road bulls or no bulls, but people would call me a damphool as they went home from my funeral. That is just the way I look at the fellow who wants to go to Europe on a ship which stands a 3 to 5 chance of being blown up.

C. D. Lyon.

Farmer Girls Attention

We want every bright, ambitious farmer girl in whose home The Missouri Farmer is a visitor to read carefully our great free automobile offer on the back page in this issue. Here is a great opportunity to win a beautiful automobile all through your own efforts by a few weeks hustling—and why not put the summer to practical use? While the others are busy at home and in the fields, why not go out and win this splendid prize? Our plan will make it very easy for you. Especially is this true of any farmer girl who happens to live in Audrain, Monroe, Randolph, Marion, Shelby, Knox, Macon, Adair, Linn, Sullivan, Grundy, Daviess, Livingston, Caldwell, Putnam, Gentry, Nodaway, Atchison, Platte, Ray, Jackson, Henry, Cooper, Polk, Greene or Jasper Counties. We have quite a number of delinquent subscriptions in these counties which you will be able to renew as quickly as you get to them. Every farmer girl, young farmer's wife or young farmer owe it to themselves to investigate this great opportunity fully at once. If any reader of the paper knows of someone in his neighborhood who would likely be interested in this offer we will thank them to advise them. The party you have in mind may not be getting The Missouri Farmer.

CITY ABATTOIRS

In a recent article in "The Missouri Farmer" Mr. Ellis has brought up the subject of City Abattoirs. This is certainly an important and practical subject. It deserves further discussion and, in my opinion, some definite action should be taken looking to securing the building of city abattoirs all over this state. The city abattoir is the beginning of the solution of the question of the meat trust. As long as we continue to raise food animals and ship them all to the "big packers", the "big packers" will certainly fix the price to suit themselves. We may curse the packing trust and we may legislate against it, but we will never get anywhere with this fight as long as we diligently and systematically contribute to the success of the big packers by selling them everything that we raise and buying from them the most of the meat that we consume.

Mr. Ellis has pointed out that about nine tolls are taken on meat from the time it is produced until it reaches the consumer. Why should we continue to pay freight, yardage, commission, shrinkage, and other unnecessary tolls on livestock and meat? With proper organization, we can certainly kill enough of our food animals at home to supply the local needs. Where does the city abattoir come in? The city abattoir is the place to begin the development of home killing of food animals. Every town in the state which now has two or three butcher shops should build a city abattoir. The larger cities should build from one to a dozen according to their needs. The next Legislature ought, by all means, to pass a law authorizing all cities and towns to build these abattoirs. If

all the towns and cities in the Union would build a city abattoir, we would start so many little packing plants that the big packers could not smother the competition. We would let the big packers enjoy a fair share of the meat trade of this country and they would come in handy to work off our surplus products on foreign markets. But instead of the packers ruling the situation, the public would rule the packers and use them for a good purpose.

We may continue our tirades against the packer and we may spend the next fifty years trying to secure legislation that will curb the packers' trust, but we cannot materially change the present situation until we develop competition. The big packers are not afraid of the scolding they are getting through the farm papers and they do not appear to be alarmed about either State or Federal legislation. They are afraid of competition. The city abattoir is the beginning of a competition that will make it impossible for the big packers to fix the price of livestock. D. F. Luckey.

SAM JORDAN'S SENSE AND NONSENSE

Its mostly what a fellow don't know that gives him the least worry.

* * *

Helen Hiwater has new bo. Helen is a popular girl in some places.

* * *

I have never been much of a fighter, but there is one thing I never could whip. Its a bad egg.

* * *

Too bad that for the next few months we have to be pestered by seeing all partisan papers mud slinging against candidates for office. This dirty stuff is commonly credited to the "Press Bureau" of one political party or the other. The men who are nominated in all parties are almost without exception high class men, and it looks now like we ought to have sense enough not to tolerate the slush that goes the rounds of the partisan press in many cases. It did perhaps appeal to the lower classes several years ago, but surely at this time it does more harm than may be suspected.

* * *

The biggest success Charley Chaplin ever made was making a fool of himself.

* * *

Idiots, Indians, and your mother are not allowed to vote. Oh, you peanut!

* * *

When booze dealers complained that the movie was hurting their business by showing up the bad, it was suggested by one manager that he would be glad to put on the screen all the good things that booze accomplishes, if the booze interests would just furnish the material. It looks like those booze gents should now come across and get some free advertising. Some of the good things they could show would be fine mansions, beautiful clothes, and a great display perhaps of diamonds and jewelry. They would look nice to the most of us even if our money did help to buy them, but they need not say anything about that. The movie should of course say nothing about the poor devil in the ditch, nor starving women and children, inmates of prisons and crazy houses. That would spoil the show.

* * *

Are you as big as your mistakes?

* * *

Is it not funny how we get excited over things? Preparedness parades for instance. We get all "het" up just to please DuPont, and little Georgie Perkins, the boys that have powder and steel to sell. That's right boys, go to it. Holler your wheezers out. No war, no powder, nor guns, nor battle ships needed. Let's have war by all means. The folks then can sell steel, bullets, powder, guns, and build battle ships. We should want them to get rich even if we do have to be all shot up. Our hides and the hides of our boys are not worth so much to them as the cash. Then maybe most of us are going to hell anyway.

* * *

Did you ever notice that a man with the biggest fool nation on earth can get a lot of us into his "parade"? On preparedness, why not go about it in a sensible way, for so many of us lose our heads so easily, and the wise guys know it. They operate on our passions instead of our sense, and make a howling mob of us, then stand in the "steenth" story and look out of the window, and see us marching in their "parade," and how they do laugh, at us, and say, "Just watch those silly idiots." Get in the parade, boys.

* * *

Not long ago I was compelled to go to a town with but one (hotel?). It was that hotel or no breakfast, so I "attacked" the hotel. It was a little late and I saw no one but a girl about fourteen years old and asked her if I could get some breakfast. It was ready for me in a short time and consisted of a slice of bacon two inches long, and wide as the blade of a table knife, one cold fried egg, a dish of half done fried potatoes, bread, butter, and something she presumed, I suspect, was coffee, and such thin skimmed milk for it, that no self respecting cow would own. It had about the same amount of butterfat as March rain water would have. At the termination of the ordeal, I reached into my pocket to hunt for a quarter, and asked my bill. She said "fifty cents." She did not seem overly smart either.

* * *

Politics seems to be a great pastime now, but wait till dog-days.

* * *

I was on Salt River not long ago, and asked a native if he ever saw any of that long string of politicians that go up that river about every "so often." He said none had ever been shot that he had heard of.

Have You Got a Sweetheart?

Every man's wife ought to be his sweetheart just as much as when she was a red cheeked, fluffy haired girl—but in asking the above question we have in mind young farmers who look forward to the coming of Sunday which will give them an opportunity to spend a few hours with the "best girl in all the World" who someday will likely get the pie dough mixed up in your hair. Now wouldn't you like to take this girl out riding in a beautiful Overland car described on the back page in this issue rather than an old slow moving buggy? Why not write us today and let us tell you how you can win it?

Attention, Young Farmer Wives?

If you are so situated at home that you could go out among your neighbors and win the beautiful Overland car described on the last page, why not do it? You have no idea how easy our plan will make it for you—and you have all summer in which to do it? Why not at least investigate this splendid affer fully by writing us for full particulars today?

THE NATIONAL TRACTOR DEMONSTRATIONS

By J. B. Bartholomew, Chairman, Manufacturers' Tractor Demonstration Committee.

"Yes but what do the figures mean?" an expression credited to thousands of farmers who tried to study out the meaning of the Winnipeg Contest Score Sheets, was probably the nucleus of the idea that started the National Tractor Demonstrations in the United States three years ago.

If a farmer tried to study out the details of the Winnipeg Score Sheet he soon found himself mixed up in a mass of figures and per cents covering technical tests, with fuel and water consumption figured in pounds, which required further figuring on his part to reduce to gallons, and all based on work done under conditions he knew nothing about.

If he turned to the manufacturers' advertising for enlightenment he found to his surprise that apparently every body had won—at least something—and he was little better off than before.

But the Winnipeg Motor Contests had at least served a purpose—they had shown clearly what the farmers did not want. During all this time the idea as to what the farmer did want had been germinating and finally crystallized in a decision on the part of the Twentieth Century Farmer to promote a Tractor Demonstration at Fremont, Nebraska, based on these four fundamental principles—first, to show all makes of tractors manufactured; second, to show them under conditions about which the farmer knew; third, to show them all in one field at one time; and fourth, to let each farmer be his own judge as to the machine he wanted to tie the blue ribbon on.

Tractor manufacturers welcomed the new idea with great enthusiasm, particularly those who in the Winnipeg Contests had spent from three to four weeks waiting their turn to run off a few hours' test and then waited another week to get the reports.

Farmers welcomed the new idea with equally as great enthusiasm and flocked to the first Demonstration at Fremont by the thousands. They came and saw and stamped their approval by coming again in greater numbers the second year.

The third year, 1915, the Tractor Demonstration Bug had so infected the minds of manufacturers, farmers and farm papers that tractor demonstrations grew overnight all over the country like magic. Nearly every farm paper considered promoting one. Cities and towns everywhere decided to hold a demonstration. The demonstration idea had grown to full maturity and had likewise grown almost uncontrollable. Appeals to enter tractor demonstrations promised to swamp the manufacturers in 1916 unless some definite organized effort were made to control them.

And thus we come to the third and present stage—a National Tractor Demonstration Circuit, conducted under the direction of the National Tractor and Thresher Manufacturers' Association, in co-operation with the national, state farm and trade papers and the local newspapers and commercial clubs.

At the annual meeting of the Tractor and Thresher Manufacturers' Association last fall, the preliminary steps were taken. A Tractor Demonstration Committee was appointed consisting of the following:—

J. B. Bartholomew, of Avery Company, Chairman.
W. H. Haggard, of Emerson-Brantingham Co.
G. P. Alexander, of Aultman-Taylor Machinery Co.
P. J. Lyons, of Bull Tractor Co.
E. J. Gittins, of J. I. Case T. M. Co.
J. A. Everson, of International Harvester Co.
H. B. Dinneen, of Deere & Co.
Bradford Brinton, of Grand Detour Plow Co.
Geo. McFarland, of Peoria Tractor Co.
H. H. Bates, of Joliet Oil Tractor Co.

This Committee was given power to act under the following limitations:—

That no tractor demonstration be sanctioned where an entry fee was to be charged;

That no tractor demonstration be sanctioned where contest features were to be carried on;

That the number of tractor demonstration be limited to not to exceed one in a state.

After a thorough canvass of the country and repeated consultations and meetings of the Committee, it was decided to hold eight National Tractor Demonstrations this year at the following points:—

Dallas, Texas, July 17-21.
Hutchinson, Kansas, July 24-28.
St. Louis, Missouri, July 31-Aug. 4.
Fremont, Nebraska, Aug. 7-11.
Cedar Rapids, Iowa, Aug. 14-18.
Bloomington, Illinois, Aug. 21-25.
Indianapolis, Ind., Aug. 28-Sept. 1.
Madison, Wisconsin, Sept. 4-8.

Commencing at Dallas, Texas, the tractors entered in the Demonstrations will be loaded on special trains and shipped from point to point. Special trains of Pullman coaches will also be run for the accommodation of the exhibitors. Arrangements have been made for two sets of tents, one set to be shipped ahead and set up at the next point, in order to have everything in readiness when the special trains arrive. The rules under which the Demonstrations will be conducted have been provided by a Committee appointed by the American Society of Agricultural Engineers. The Demonstrations will be under the personal management of Mr. A. E. Hildebrand, who has had charge of the three tractor demonstrations held at Fremont, Nebraska, and who is conceded to be the best posted demonstration man in the United States.

This 1916 Circuit of Tractor Demonstrations promises to be the greatest educational event ever conducted by any organization of manufacturers. It will be a sight worth going hundreds of miles to see. The Demonstrations have been located by the manufacturers at the points thought to be the most convenient for everyone to reach. Through the co-operation of the manufacturers with one another it is thus possible for everyone interested to see practically all makes of tractors at one time at much less expense than would otherwise be possible. The limiting of the Demonstrations to one in each state likewise reduces the expense to the manufacturers to the minimum, enabling them to sell their machines at the lowest possible advertising costs.

While the previous demonstrations have been limited to plowing, the 1916 Demonstrations will not only cover plowing but other forms of field work as well, such as drilling, harrowing, seeding, spading, cultivating, packing, rolling, clod crushing, corn cultivating, etc.

The indications are at the present time that there will be a total attendance at the eight demonstrations of anywhere from one-half million to a million people. They will unquestionably be the greatest agricultural events ever held. No man interested in scientific methods of farming should fail to attend.

A Successful Horse Show

The Horse Show given in Columbia under the auspices of the College of Agriculture the first week in June was considered by competent judges to be one of the best ever held in the state. There are few people who do not take delight in watching good horses in action and perhaps an equal interest is shown in good drivers or riders.

The champion road horse of the show was Animation, owned by Miss Loula Long of Kansas City, who won the Columbia Commercial Club trophy. Champion harness horse was Illustration also owned by Miss Long was awarded the trophy offered by the Board of Curators. Champion five-gaited saddle horse was Ruth St. Denis, exhibited and owned by L. H. Ingram of Little Rock, Ark. The champion three-gaited saddle horse, Johnny Jones, owned by Colonel Paul Brown of St. Louis and exhibited by E. D. Moore of Columbia. Other exhibitors who won prizes were: J. T. Davis, Columbia; Miss Myrene Houchin, Jefferson City; E. F. Reuther, Columbia, Gerard Parsons and W. R. Bush, Benson, Vermont; August Busch and Adolphus Busch, St. Louis; Miss Burr, Bement, Illinois; J. T. Harris, Frank Harris, Jr., and W. R. Prather of Columbia.

The Dairy Cow More Efficient Than the Steer

(Abstract of an address delivered before the State Dairy Association of Kansas by President H. J. Waters of the Kansas Agricultural College. President Waters is not a stranger to the readers of The Missouri Farmer. He has made thorough investigation of both dairying and beef production in this country and in Europe and the facts he presents are founded on first hand information.)

This subject is not of my own choosing. I am not by birth, education or sympathy a dairyman. My sympathies and tastes are all in the other direction—the production of meat, and primarily in the production of beef. I like the Shorthorn, the Hereford, and the Angus much better than I do the Jersey, Holstein, and Guernsey. I like the beef business much better than I do the dairy industry. Nevertheless, I realize that the man who stands out against dairy and poultry husbandry as the basis of a permanent agriculture is standing out against an irresistible force, and he will in the end be as effectual as one who attempts to sweep back the ocean tide with a broom. Either this country is going to be an exception to all human experience, or we must ultimately surrender to the inevitable.

The beef business is primarily adapted to the newer conditions such as broad acres, cheap land, scarce and high-priced labor, and to the transportation of the products over long distances. As population becomes more dense, as land becomes more dear, as labor becomes more abuntant, and, therefore, cheaper, we shall produce on our farms products which will employ the maximum of human labor. The dairy cow, the pig, and the hen will be the last animals to be driven from our farms. We must not forget that human labor is the only exhaustless element in production. New York, Pennsylvania, Massachusetts, New Hampshire, and Connecticut were formerly the great beef-producing states of the Union. At that time the dairy industry was being nursed and carried along by its enthusiastic friends just as it was in Kansas a few years ago and as it yet is in some parts of the state. The beef business was able to take care of itself then as it is yet in Kansas. Now the dairy business dominates in the East and they are trying to coax back the vanished beef industry.

Dairying Builds Up the Farm

Thus, as the farm land of a community is divided into smaller farms, and as the people are forced to work on an economical basis and when their soil fertility has become so depleted by grain farming that they must conserve their resources, the beef industry is the first to wane and in its stead the dairy industry comes. First it is usually combined with beef, but later, especially in the vicinity of the large cities and in the most congested centers, it becomes a highly specialized industry. In the rural districts the combination of beef and dairy production, with dairying as the principal feature and beef as an adjunct, has remained stable in the oldest European countries.

Broadly speaking, the second class of meat animals to diminish outside of the mountain and other strictly grazing regions, is the sheep. Then follows the hog, although on account of the use to which the hog may be put as a consumer of waste products around the home, it remains a prominent feature in the agriculture of the most densely populated regions of Europe.

We have not yet, however, approached the most cogent reason for the elmination of the beef industry when great economy must be exercised in production and consumption.

Cow Eats Less, Produces More

The most striking fact in connection with this whole question is the inefficiency for the production of human food of the beef animal as compared with the dairy cow.

Let us assume that we full feed a steer for 300 days, and that his average daily gain for that time is two and one-fourth pounds, making a total gain or 675 pounds. In the same length of time a dairy cow of quality equal to that of the steer above assumed would produce, at the very least, 6,000 pounds of milk. The dairy cow will require for the production of her annual milk output less grain, less hay, less grass and less range than will the steer in the production of its 675 pounds of gain in weight.

Let us, however, inspect these total annual products more closely. The 675 pounds gained by the steer will contain ·286 pounds of water; 253 pounds of fat; 95.5 pounds protein; and 40.5 pounds ash; or a total of 389 pounds of dry matter.

The 6,000 pounds of milk produced by the cow in the same length of time might be safely estimated to contain 5,160 pounds of water; 276 pounds of fat; 285 pounds of sugar; 231 pounds protein; and 48 pounds ash; or a total of 840 pounds dry matter.

The water in the meat and in the milk is of no more value for food than that which comes from the cistern or spring, and we are, therefore, primarily interested in the quantity of dry matter produced.

Butter Worth More Than Tallow

A close scrutiny of the detailed figures given above will show that the whole story is not yet told. The steer's product will need to be still further reduced, because a portion of the gain made in weight of bone, hoof, horn, hide, vital organs, blood, etc. We have no reliable data from which to estimate the amount of the annual growth of this material on a steer, but it is certainly safe to assume that the amount of ash given could be classed as inedible and of use only for the manufacture of leather or fertilizer. On this basis there would need to be deducted 41 pounds from the total of 389 pounds of dry matter, leaving a total of 348 pounds of edible material produced by the steer, compared with 840 pounds produced by the cow.

There is yet a difference to be considered. The fat produced by the cow is the most digestible of all the animal fats. The sugar in milk is perhaps the most easily digested and assimilated of all sugars, and is assumed to be all available when used as food. In the case of casein and albumen—the protein of milk—it is practically completely digestible, and the same is true of the ash. Therefore, not only is the edible material produced by the cow more than two and a half times as large in amount as that of the steer, but it is a significant fact that practically all of this is digestible and easily asimilated by people of all years, from youth to old age.

Too Much Waste in Steer's Products

In the case, however, of the production of the steer, there is a further waste. For when the animal is slaughtered the butcher is compelled to trim the carcass of its excess of fat or tallow. In the average case this green tallow is not worth as much per pound as he has paid for the steer alive. This tallow has perhaps cost the feeder ten cents or twelve cents a pound to make, and it has a value when sold as such, and not attached to a steak or roast, of perhaps less than four cents. Furthermore, when the butcher divides this carcass into steaks and roasts, the customer is constantly insisting upon having the excess tallow trimmed off before it is weighed. All of this tallow must, like that which was trimmed from the carcass when the animal was killed, go into the tub as low-priced material. Furthermore, when the steak or roast is cooked, a considerable portion of the fat is fried or stewed out, and this is likely to be poured into the garbage can or sewer. Then, when the meat comes to the table, the first protest from the childern is against being given too much fat. The portion of the steak or roast that is left uneaten is the fat, and this is essentially wasted or fed to the dog, the chickens or the pigs.

Thus, this high-grade material—that is, material that is most expensive of all animal products to make, is really of least practical use for human consumption, because it, unlike butter fat, is of itself not especially palatable.

In New York City so much fat is poured into the sewers that recently the city authorities set about to recover it, and millions of pounds are thus taken from the sewerage and sold at a low price, chiefly for the manufacture of soap. This means that the corn of the Mississippi Valley is being converted into high-priced fat on our hogs, cattle and sheep, a portion of which finally finds its way into a soap factory through the sewers of our great cities.

Just what number of pounds of the annual production of the steer would be actually left as digestible material it is impossible to say, but it is perhaps not unreasonable to say that the amount of digestible matter produced by the cow is about three times as large as that produced by the steer in the same length of time.

Thus it is perfectly evident that the dairy cow is a very much more efficient machine for the manufacture of our grain, grass and hay into edible animal products than is the beef steer, or than is any animal producing meat, for that matter.

Cow Uses Cheaper Feed

Of equal importance is the fact that the cow will make the yearly product ascribed to her in the foregoing computations on grass alone without grain during the summer months. The rest of the year she will eat less grain per day than the steer will require. On the other hand, it will be necessary to feed the steer to the full limit of his appetite for each one of the 300 days figured in the foregoing tables in order to have him make the amount of gain credited to him. All these figures for the cow are in every way conservative. It is likely indeed that the amount of food consumed by the steer to make the gains used in our computations would produce fully one-third more milk and total solids than has been credited to the cow.

Little Fertility Sold With Butter

The economic advantages of using dairy animals as a market for farm-grown feeds, are most strikingly shown in the table on this page. The amount of butter sold in one year to other states is from actual figures secured from the creameries of the state. The feed required has been calculated on the basis of standard dairy rations and in placing a value on the feeds it has been assumed that they could be sold on the market as readily as the butter. The freight figures were supplied by one of the railroad companies of Kansas and represent actual conditions at the present time.

Foreign countries in making their purchases almost invariably buy raw material and in so doing fatten their soil at our expense. We sell annually twenty million dollars' worth of products to the little country of Denmark and buy but two million dollars' worth of products from that country. They buy enormous quantities of oilmeal, cottonseed cake, and bran. Their chief exports are butter, cheese, and bacon. In the past twenty-five years the Danish farmer has increased the acre yield of his land 50 per cent.

A farm used for dairy purposes should gain constantly in fertility because the manurial value of the feed grown on the farm is retained and that of purchased feeds is added. When milk products are sold from the farm only a small portion of the plant food contained in the entire crop, is sold.

***Saving Effected by Selling Butter Instead of Feed**

Butter sold to other states in one year	9,305,603 pounds	
Total feed required to produce this amount of butter	537,398,000 pounds	
Farm value of this feed		$1,768,065.57
Value of butter at 20 cents per pound	$1,861,120.60	
Value of skim milk at ¼ cent per pound	442,016.14	2,303,136.74
Excess value of butter and milk		$ 535,071.17
Value of fertility in butter at 51 cents a ton	$ 2,372.94	
Value of fertility in feed	1,236,714.64	
Saved to farm when marketed as butter		$1,234,341.70

Freight Balance Sheet

Freight on butter	$ 59,928.06	
Freight on feed	1,236,016.78	
Saving in freight by marketing butter instead of feed		$1,176,088.72
Total saving to state through selling butter instead of feed		$2,945,501.59

*This table prepared by President Waters is based on Kansas statistics but the same relative facts are true of Missouri.

FEDERAL LAND BANK ACT IN HARMONY WITH STATE LAND BANK ACT

Written by Frederick D. Gardner, Author of the Missouri Land Bank Act.

The enemies of rural credit in Missouri, who have at heart opposed cheaper money for the farmer, have used every argument possible to belittle and injure the Missouri Land Bank Act. One of their stock arguments has been their fake claim of "single tax." Now that the Congress of the United States and President Wilson have sanctioned every principle worked out in the Missouri Land Bank Act, the enemies of cheaper money for the farmer will now perhaps say that there is no need for a state land bank in Missouri as the Federal Government has passed a bill covering the needs of all states. But those who make such a statement do not understand the first principle of the Federal bill, nor do they understand the needs of rural credit.

There was no intention on the part of the Government to have the Federal bill take the place of individual states also supplying capital for land banks of their own. The Federal Land Bank is merely to assist, or work in conjunction with the state land bank, exactly as National and State banks work in harmony together.

The National rural credit bill is intended to embody and place the nation's stamp of approval on certain principles of rural credit which are safe and sound. Those principles are:

1st. That land credits should be handled through land banks.

2nd. That capital for these land banks must be furnished by the Government.

3rd. That the land banks must have authority to issue debenture bonds to secure additional sums of money to be loaned.

4th. That loans must be made for long periods—not less than 25 years, and be paid off in small installments, the payments to include interest and principal.

5th. In order that the farmers may secure the money at a low rate of interest, the bonds must be exempt from taxation, the farmer to have the money at the exact rate at which the bonds sell, thus giving him the benefit of the bonds being exempt from taxation.

All of the above principles were worked out in the Missouri Land Bank Act and have now been approved by the Federal Government. But the Federal bill does not provide for the full amount of money needed in Missouri. The Federal bill provides for twelve land banks to be established in the United States, with a capital stock of $750,000.00 each, which would be nine million dollars. It provides also for an issue of $180,000,000.00 worth of bonds, which would make a total of capital and bonds of 189 millions, this to be divided among the 48 States. This would mean an allotment to Missouri of about nine million dollars.

Now, when it is considered that we need $300,000,000.00 in Missouri to make the farmers' homes equal to those in the State of Iowa; and that we need $110,000,000.00 to make the farm equipment equal to that of North Dakota; when we consider that the bank deposits per capita in Missouri are only $20.00, and in Kansas $140.00; when we consider that the assessed pro-rated valuation in Missouri is $300.00 and in Kansas $1700.00 it must be apparent that the $9,000,000.00 which the Federal Land Banks will be able to loan in Missouri under the present government plan would be only a drop in the bucket. The great benefit to be derived from the Federal Land Bank is the fact that it establishes the principles and soundness of rural credits. From there on it must be taken up by each State. This is where the Missouri Land Bank will come into play. Under the Missouri Land Bank Act, during the first year we can place in circulation in Missouri $40,000,000.00 now lying idle in the great financial centers of New York, Boston and Philadelphia; and in a few years can have in circulation $100,000,000.00 in Missouri of new money brought into the State from the outside. No Federal Land Bank system could ever benefit the individual state to this extent.

The operation of the Federal Land Bank is much more complicated than the Missouri Land Bank. But this is only natural. There are to be twelve Federal land banks—one for each four states. Suppose one should be located in Columbus, Ohio, and one in Denver, Colo. The inaccessibility of a bank located at either of these points for the Missouri farmer is apparent, whereas a State Land Bank located at Jefferson City would be convenient and of easy access to the Missouri farmer.

The Federal Land Bank Act provides that an association of ten must be formed to borrow money; and that after loaning 50% on the farms 5% must be reserved by this association of ten to pay in as capital to the Federal Land Bank. From this it will be seen that the farmer gets 45% in cash and 5% in stock in the Federal Land Bank. The Missouri Land Bank makes no such provision. It gives the farmer the entire 50% and does not require him to take any stock in the land bank.

The Federal Land Bank provides that the farmer must pay the cost of appraisal. The Missouri Act provides for no cost of appraisal at the farmer's expense. The Federal Land Bank Act provides that he pay 1% each year for expenses. The Missouri Land Bank Act provides that he pay ½ of 1%; and that when the 25 years are up that this ½ of 1% be refunded him less expenses and losses; and there should be no losses and practically no expenses. Therefore, while the Federal Land Bank Act embodies the fundamental principles enumerated above, it is not so far reaching, nor is it so accessible, nor does it provide as cheap money as the Missouri Land Bank Act, and it will not furnish the great abundance of money which the Missouri farmer so badly needs as will the State Land Bank Act.

After all the vicious attacks made here in Missouri on this movement to give our farmers cheaper money it certainly is gratifying to me to see our principles now endorsed and approved by the National Government. Every farmer knows that for years I have been abused as a single taxer, Socialist, crank, etc., because I have night and day, in season and out of season, defended this great movement in their behalf.

You must not forget this is your opportunity. Go to the polls and vote for the Land Bank. It is your only hope of securing the use of the wealth which you create at as low rates of interest as enjoyed by the big cities.

Baled Hay at Lowest Cost

THE price of hay, and the profit in it for the grower, depends upon the condition in which the hay is marketed. Hay of the same quality, in tight, smooth bales, brings a higher price than when shipped in loose, ragged bales.

International Hay Presses, with their powerful toggle-joint plungers, produce tight, solid bales. The roller tucker makes the bales smooth. The bale chamber tension produces bales of uniform size. The presses work fast, the different sizes and styles baling from 6 to 35 tons per day.

The line consists of one and two-horse presses, motor presses, belted jack presses and fast power presses. The one-horse press is made in 14 x 18 size only—all others in 14 x 18, 16 x 18, and 17 x 22 sizes, the accepted standard. The capacities vary from a small horse power press for the man who wishes to bale a little hay, to the largest, fastest custom power presses ever required.

An attractive mailing folder, in colors, shows **International Hay Presses** as they are, and gives complete specifications. Write for it.

TO MEASURE THE COLLEGE OF AGRICULTURE

Is the university educating the boys away from the farm or is it sending them back to the farm better prepared to make a living and to serve their community better than they could have done had they not taken a course in scientific agriculture? This year there were graduated from the agricultural classes in the state university 93 as compared with a senior class of only two fifteen years ago. Is this great increase in the number graduating from the College of Agriculture of Missouri the result of the making good on the part of those who have in past years come out from the College of Agriculture or is it merely the increased interest among farm boys and girls to train themselves as efficiently as those are trained who enter the professions?

The growth of all the leading agricultural colleges during the last fifteen or twenty years is within itself pretty good evidence that the boys and girls who have graduated from these colleges and who have nearly all entered professional work have, as a whole been making good. Measured then by this test we would say the work in the colleges of agriculture has been a success. But what about the future? From now on will not a majorty of those who graduated from the colleges of agriculture fail to find places in professional work and will not most of them be compelled to return to the farms from which they came and there be forced to test their skill along side those who have spent their four years "learning to farm by farming"? In this try out between those who have had the training of the college and those who have had only the training of the farm will we find the true measure of the worth of the College of Agriculture.

Why would it not be a good thing both for the State and the State University to have a survey made of the work accomplished by all those graduates of the College of Agriculture who have been engaged in practical farming and compare this with a like number of farm trained farmers? Such a survey should be made by practical farmers who are not at all prejudiced against college made farmers. We believe the College of Agriculture will profit by this kind of a survey and we think it is the only standard of any value by which to measure the institution but whatever the results are let us have them made known by a committee of intelligent farmers.

For Greatest Satisfaction Use
DOUBLE SERVICE Automobile Tires
Guaranteed 7,000 Miles Service
Absolutely Punctureproof

Double Service Tires are made double the thickness of the best standard make tires.

This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof.*

These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.

They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.

Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an **Introductory Offer:**

PRICES

	Tires	Tubes		Tires	Tubes
30x3 in.	$ 8.60	$2.30	36x4 in.	$17.45	$4.65
30x3½ in.	10.85	3.10	35x4½ in.	21.20	5.60
32x3½ in.	12.75	3.20	36x4½ in.	22.50	5.75
33x4 in.	15.75	4.20	37x4½ in.	23.60	6.20
34x4 in.	16.70	4.35	37x5 in.	26.30	6.60

All other sizes not included in above list also furnished. Non-skids at 10% additional.

Terms: Payment with order at above special prices, a 10% discount allowed on orders for two or more tires. All personal checks must be certified.

Try these tires now and be convinced of their very high qualities. Sold direct to the consumer only.

Descriptive folder upon request. Write for it.

Double Service Tire & Rubber Co., Akron, O.
Dept. M T

DOUBLE THICKNESS OF TREAD AND RUBBER ABSOLUTELY PUNCTUREPROOF

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII June 15, 1916 No. 12

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

CATCH CROPS

Most farmers have a system of farming they have worked out to suit themselves but their plans are often interferred with by drouth, flood, or insects and some temporary change must be made. Because of the small acreage of wheat sown last fall there was a larger acreage for corn this spring but the excessive rains in many places has made corn planting impossible on some fields and has given a poor stand on others. For the man who keeps live stock and who can find use for a lot of forage we think it is always a safe risk to plant corn on good land up to July 1 and in some instances even 15 days later. In normal seasons this corn will produce some grain and in most all seasons it will make a lot of good forage. Sorghum may be safely planted for forage most any time in July and few if any summer crops will produce more feed per acre than sorghum. Early varieties of cowpeas may be safely planted up to July 15th or 20th and millet as late as the first week in August.

THE CROP OUTLOOK

This is the anxious season for farmers and while the individual knows what his own prospects are he is interested in many ways in the out-look for his own community and for the entire country. The volume of business in a good many lines is limited by the price and amount of the crop produced and so many of the large business concerns have their dealers report to them on the condition of crops in their trade territory. Then with the help of state and government crop reports these business men are quite often better posted on the crop prospects than farmers are.

The U. S. Government report issued June 8, estimates the winter wheat acreage at only 81.6 per cent of last year's crop and all wheat, spring and winter together at 84.9 per cent. The average condition of winter wheat on June 1 was 73.2 which is 9.2 below the ten-years average. For all wheat the condition was 77.7 or 8.5 below the ten-year average. Upon this basis the present prospects are for a crop of 715,000,0000 bushels of wheat which is only 13,000,000 bushels below the ten-year average but as there is a larger amount of wheat held over than usual there is no alarm about the prospects for bread.

For Missouri the government report indicates a wheat crop of 71.6 per cent of the total of last year, a total of 19,-453,000 bushels. The state report issued by the State Board of Agriculture estimates the crop at 15,000,000. The state report makes allowance for the acreage winter killed which probably makes the difference and we think makes it more reliable than the Government report.

The outlook for oats and meadows is good and corn is irregular but with good weather from now on there will be a full average crop of corn. Taking the situation as a whole the prospects are for about good average crop yields if all crops are considered.

THE ANGORA GOAT

A farmer in a Western Missouri county purchased about 200 high grade Angora goats a few weeks ago and turned them on some brush land that he wants to clear up for pasture. The first clip of mohair has already sold for a little more than one-third what the goats cost and he will have the increase of the flock to add to this income which will make a pretty nice profit. The goats will live very largely on briars, brush and weeds and where the owner has this kind of land to clear up the yearly cost of feed for a flock of goats will likely be balanced by the good they will do. The farmer who makes the most money is the one who adapts his practice to the conditions on the farm rather than merely following his own prejudices or fancies.

This is a pretty good time to get hold of a flock of goats or sheep. The prices are high now both for the animals and their wool but the chances are good that prices will continue high for sometime and these animals are mighty good soil builders any way and should be kept on most hill farms for that reason alone.

ORGANIZATION IN THE AIR

We have heard it said that farmers could be organized for any purpose and then duped by their leaders but this is a reflection on the intelligence of farmers, as a class. It is true farmers have joined in a number of organizations in the past and it is also true that they have been mislead by the leaders in many instances but when we study the results accomplished by farm organization in the past we find that a great deal of good has been accomplished.

The trouble just now is that there is too much organization from the top and the farmer who is out on his farm busy with making a living has not always been consulted. We admire the philanthrophy of business men who are willing to give of their money to organize farmers but let us warn them that if they would accomplish any real lasting good in this direction it must be by beginning with a few farmers out in the country districts. By getting the farmers in a district to working together at home, the benefits will be shared from the beginning and it will encourage farmers to hold on and to work for bigger results through a larger organization.

A recent National body has been formed to be known as the National Agricultural Society and ex-secretary James Wilson has been chosen president. There is no man we could name in the United States who is better fitted by sympathy and training to lead a real farmers' organization than is Mr. Wilson but we think he is making a great mistake in thinking he can organize farmers from the top and do their thinking for them. The avowed purpose of the association will be to serve as the mouthpiece of the farmers of the United States in agricultural questions of nation wide interest. The subjects already suggested to be taken up by the society include rural credits, uniform agricultural legislation, the promotion in congested centers of population of an interest in rural activities, cooperation in the conservation of our natural resources and cooperation among faremrs in establishing better methods of marketing farm products.

Some splendid and successful business men have joined in the movement and will contribute to its support, among whom are Theodore N. Vail president of the American Telegraph and Telephone Company, T. Coleman du Pont, and others just as prominent in the business world. Head quarters have been located for the present in New York City but it is intended to eventually establish them in Washington, D. C.

Another organization has been announced growing out of the Southern Commercial Congress, with Charles H. Thorne of Chicago as chairman and Dr. Clarence J. Owens, managing director of the Southern Commercial Congress as one of the controlling figures. The scope of the work for this National Chamber will be to work for the improvement of the economic conditions of American agriculture. Mr. Thorne the chairman has had twenty-five years experience with one of the largest mail order houses in the country.

The third annual meeting of the National Conference of Marketing and Farm Credits which met last winter in Chicago created what is to be known as the National Agricultural Organization Society which we are reliably informed has been partly financed by some who are deeply interested in bettering farm conditions. As we understand the object of this society is to aid in the proper organization of all kinds of rural societies, both state and local. Its principal work will be advisory and not executive. It has employed able attorneys who will assist state organizations in drafting state laws concerning agriculture and especially laws governing cooperative soceities. Perhaps our readers are not aware that a real cooperative society can not be organized and operated under the laws of many states. This is true of Missouri. Upon request from the farm organizations of the state this society would help to draft a law governing real cooperation. Then there is the form of organization and the system of book keeping to be adopted for each society, whether local or state, that is very important. This N. A. O. S. as it will be called will have a force of expert bookkeepers, men who have studied the best and simplest methods adapted to farm clubs and they will help start the local and state organizations along the right line. It seems to us this is a very important line of work.

The Grange, the Society of Equity, the Farmers' Union and hundreds of independent farm clubs have been doing a lot of good but have lost half their power because they were not all brought together, at least coordinated in one powerful federation. The U. S. Department of Agriculture estimates that the business done in one year by cooperative agricultural organizations already amounts to $1,400,000,000. This society proposes to further the work of societies working for the improvement of transportation, imports and exports of farm products, cold storage for farm products, the creation of uniform packs and grades, the inaugeration of State Market Commissions, the creation of credit facilities for land purchase and for financing the farm business, representation before the Federal Trade Commision that involve unfair discrimination and many other ways of serving the farmers. This seems to have a more comprehensive plan of organization than any of the others and yet does not seem to conflict materially with any of them.

Out of all these efforts to help farmers and correct some of the evils which have grown up under our go-it-alone system much good will finally result but we fear many mistakes will be made and valuable time lost by beginning too much at the top. Somewhere and somehow there must be a directing force for the organization of the local units such as neighborhood clubs, local cooperative creameries, grain ware houses, fruit and live stock marketing associations, etc. If we can get one great National Council of Agriculture to direct all of this work it will bring order and effective results.

ATTENTION FARMERS

Those of our readers who will need binder twine should send their orders to the Penitentiary Twine Plant at Jefferson City at once. The price on 1000 lbs. or more is 9c per lb. while on lesser quantities the price is 9½c per lb. This will save you a considerable margin over the ordinary local price and since the Twine Plant was started for the benefit of the farmers of this State it should have their support. On all ordinary commercial necessities The Missouri Farmer believes in giving the local merchant the preference but in view of the efforts of certain interests to form a "Twine Trust", farmers are not to be blamed for defending themselves as best they can on this item. Your twine can be ordered now and paid for when delivered later on. The best way is to get your neighbors to act with you and make up a 1000 lb. order and thus save the extra half cent. There is no time to lose for the supply may be exhausted at any time.

NATIONAL RURAL CREDITS

There is a strong probability that the rural credit law now before Congress will be enacted into law before adjournment, possibly with some important changes. We give a synopsis of the features of the law we think farmers are most interested in without going into the details of organizing and operating the Federal Land Banks found on page 3 of this issue.

We think in many particulars the Missouri Land Bank is a better plan than the Federal plan. We propose to charge the borrower only one-half of one per cent annually on his loan to pay expenses, losses and create a reserve and it is thought this will be ample because the Missouri plan is so

simple that there should be very little expense in operating it.

The feature of the Missouri law which has been fought the hardest is the exemption of the assets of the Land Bank from taxation and this has been endorsed by the Federal law which makes the same exemption. There should be no double taxation in this country but that is what we have when we tax both the land and the mortgage against it and the farmers pay both when they are forced to pay a higher rate of interest. Rural credit laws are on the way and the debt ridden farmer will have some relief from his heavy load of debt.

BARNYARD GOSSIP

How much would it add to the price of your farm if you had a good road leading in every direction from it? We have made some observation along this line and have talked to many men familiar with farm land values and it is safe to say that a farm located on a nicely kept dependable road will add from $5 to $10 an acre to the selling value of the land. In some instances a thoroughly good road will add $20 an acre to the selling value but the former figures are in the conservative class. It may not add anything at all to the productive value of the land but most men are willing to pay something for the pleasure of riding over a good road. With money worth 6 per cent the man who is willing to pay an increased price of $5 an acre for a 200-acre farm home figures that it is worth $50 a year to his family to have a good road and don't you think he gets his pleasure at a reasonable price?

When we look at it right good roads will not appear as an expensive luxury but as one of the necessities for the best enjoyment of life. It is generally agreed that about the only way to have good country schools is to make the districts larger and more wealthy so that better teachers may be employed, better equipment may be purchased, and better classification provided. But large districts are impossible without good roads. Some people think it is impossible to build good roads in every neighborhood but I think what Indiana has done ought to convince us that it is entirely feasible to do it. Indiana is no better agriculturally than Missouri and they have built a system of good roads covering about 60 per cent of the total mileage and now about half their schools have been consolidated and the farm boy or girl can live at home, be under the parental guidance and get a high school training. They can do this and be at home to help with the work on Saturdays and vacations and not lose their interest in farm life as so many of them do when they go away to the city to attend school.

The good road and the good school adds much to the value of the neighborhood and not only makes outside people want to buy a farm in that neighborhood but it gives the home people a better opinion of themselves and encourages them to do better work. In every way communities are like individuals they need encouragement, they need leadership and they need more—they must have the community spirit, community pride, community team-work if the neighborhood is made a really desirable place to live.

A few days ago I was in conversation with a real estate man who has bought and sold a lot of land in the last fifteen or twenty years. Like all other dealers of this kind this man was in the business for the commission he got on sales, but he had a good opportunity to find out what it was that made land valuable. He said there was one class of men who bought land for the money they could get out of it by growing crops. This class of buyers looked only at the profits and would as soon buy a farm in the river bottom, or some swamp district where there was no school, no church and no society as to buy it in the most up-to-date neighborhood in the land, but, said the real estate dealer this class of buyers make up not more than one in fifty of the hundreds of men I have dealt with. The other forty -nine want to buy a farm for a home as well as for the profit and these men will ask about the roads, the schools, the churches and the community spirit and good fellowship of the neighborhood. He mentioned a neighborhood where they built a modern rural school and where they have for several years maintained a social and educational club and it was this man's opinion that a farm in that district would easily sell for $500 to $1000 more than the same kind of a farm in some other places. This shows the community value of a farm home or rather upon what that value rests.

In trying to bring about this harmony of effort, the team-work for the public good, people must be willing to sacrifice some of their own personal notions and they must get rid of their jealousies and prejudices and try to find a common ground to work on. Through the efforts of The Missouri Farmer more than 200 farm clubs have been organized in the last few months and we hope not one of these will be allowed to die out because of a lack of the right community spirit and good fellowship.

WILL YOU HELP US?

Before The Missouri Farmer can win in the great fight it has undertaken to perfect a Farm Club in as nearly as possible every school district in Missouri it must be introduced into thousands of farm homes in which it is a stranger at this time. Hundreds of these Farm Clubs have already been organized and collectively they have already saved their members many thousands of dollars—and yet they haven't gotten fairly started. Wherever our paper has a strong circulation there you will find a Farm Club—and sometimes a half dozen clustered close together. On the other hand take a community in which we have little or no circulation and there you are mighty apt to find farmers drifting along in the same old "everybody for himself and the devil take the hindmost" fashion.

This shows the necessity of placing The Missouri Farmer in as nearly as possible every farm home in your community and if your heart is with us in this great fight we wish to appeal for your earnest co-operation in putting us in touch with some bright, young, ambitious farmer's daughter who you think would be interested in the splendid Overland car which we offer as a subscription prize on the back page of this issue. It is exceedingly difficult to find solicitors who will go after subscriptions on a commission basis—but surely there is some young woman in your neighborhood who would be interested in this fine offer if she knew about it? In any case, she will receive a good commission on every subscription she turns in—so she can't lose. In the meantime, she has just as good a chance to win the car as anybody. If there is a daughter in your family who would like to take advantage of it, so much the better. It will brighten her wits to put in a few weeks telling farmers about the great fight The Missouri Farmer is making. It will enable her to take better cafe of herself in the years to come because it will make her more self reliant.

Should there be no one in your family in position to take advantage of it, then try to think of some neighbor's daughter who is bright and popular and who might wish to avail herself of this splendid opportunity. Call her up over the telephone and ask her to write us right away. You can't appreciate how easy and fine our offer is until we have a chance to explain the full details. Now please give us your help in this matter if you really want to see The Missouri Farmer made a power in your neighborhood. It may seem like a small matter to you—but it is heartfelt co-operation of this kind which really counts because it enables every friend of the paper to lend a helping hand and collectively this kind of help means everything. For one dollar farmers get the paper for three years—and the right sort of farmer girl, young farmers' wife or young farmer will place The Missouri Farmer in scores of splendid homes in your community where it has never had a chance to preach its gospel of good farming and farm organization before. You know the paper well enough to know that we wouldn't make anything but a fair offer and we trust to have the aid therefore of every true friend of the fight we are making—for upon this depends the future well-being of our farm homes.

Read this Carefully

We want every farmer girl or young farmer who would like to own a beautiful five passenger Overland automobile to read carefully our announcement on the back page and then send us their name and address. You have no idea how easy our plan will make it for you to win this splendid car. It costs $695 at the factory. If you could win it by a couple of months hustling it would be equal to a salary of $347.50 per month—and that much hustling is almost certain to land it. You at least owe it to yourself to investigate this great offer carefully for you will be surprised at our great plan. Be sure to write to us today.

Does this Strike You?

If you are a young farmer and have a young wife and some "little shavers" at home, don't you think you and they would get more enjoyment out of life if you owned the beautiful Overland which is described on the back page of this issue? Well, when the rush of corn plowing and harvest is over, why not take a few weeks off and go out and win it? Our plan will make it mighty easy for you and you should write us for full particulars at once.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER II

A few days before the time set for his departure David set out on a round of farewell visits to the country folk. It was one of those cold, cheerless days that intervene between the first haze of autumn and the golden glow of October. He had never before realized how lonely the shiver of wind through the poplars could sound. Two innovations had been made that day in the country. The rural delivery carrier, in his little house on wheels, had made his first delivery, and a track for the new electric-car line was laid through the sheep meadow. This inroad of progress upon the sanctity of their seclusion seemed sacrilegious to David, who longed to have lived in the olden time of log houses, with their picturesque open fires and candle lights. Following some vague inward call, he went out of his way to ride past the tiny house he had once called home, and which in all his ramblings he had steadfastly avoided. He had heard that the place had passed into the hands of a widow with an only son, and that they had purchased surrounding land for cultivation. He had been glad to hear this, and had liked to fancy the son caring for his mother as he himself would have cared for his mother had she lived.

As he neared the little nutshell of a house his heart beat fast at the sight of a woman pinning clothes to the line. Her fingers, stiff and swollen, moved slowly. The same instinct that had guided him down this road made him dismount and tie his horse. The old woman came slowly down the little path to meet him.

"I am David Dunne," he said gently, "and I used to live here. I wanted to come to see my old home once more."

He thought that the dim eyes gazing into his were the saddest he had ever beheld.

"Yes," she replied, with the slow, German accent, "I know of you. Come in."

He followed her into the little sitting room, which was as barren of furnishings as it had been in the olden days.

"Sit down," she invited.

He took a chair opposite a cheap picture of a youth in uniform. A flag of coarse material was pinned above this portrait, and underneath was a roughly carved bracket on which was a glass filled with goldenrod.

"You lived here with your mother," she said musingly, "and she was taken. I lived here with my son, and—he was taken."

"Oh!" said David. "I did not know —was he—"

His eyes sought the picture on the wall.

"Yes," she replied, answering his unspoken question, as she lifted her eyes to her little shrine, "he enlisted and went to the Philippines. He died there of fever more than a year ago."

David was silent. His brown, boyish hand shaded his eyes. It had been his fault that he had not heard of this old woman and the loss of her son. He had shrunk from all knowledge and mention of this little home and its inmates. The country folk had recognized and respected his reticence, which to people near the soil seems natural. This had been the only issue in his life that he had dodged, and he was bitterly repenting his negligence. In memory of his mother, he should have helped the lonely old woman.

"You were left a poor, helpless boy," she continued, " and I am left a poor, helpless old woman. The very young and the very old meet in their helplessness, yet there is hope for the one —nothing for the other."

"Yes, memories," he suggested softly, "and the pride you feel in his having died as he did."

"There is that," she acknowledged with a sigh, " and if only I could live on here in this little place where we have been so happy! But I must leave it."

"After my Carl died, things began to happen. When once they do that, there is no stopping. The bank at the Corners failed, and I lost my savings. The turkeys wandered away, the cow died, and now there's the mortgage. It's due to-morrow, and then—the man that holds it will wait no longer. So it is the poor-house, which I have always dreaded."

David's head lifted, and his eyes shone radiantly as he looked into the tired, hopeless eyes.

"Your mortgage will be paid tomorrow, and— Don't you draw a pension for your son?"

She looked at him in a dazed way.

"No, there is no pension—I—"

"Judge Thorne will get you one," he said optimistically, as he rose, ready for action, "and how much is the mortgage?"

"Three hundred dollars," she said despairingly.

"Almost as much as the place is worth. Who holds the mortgage?"

"Deacon Prickley."

"You see," said David, trying to speak casually, "I have three hundred dollars lying idle for which I have no use. I'll ride to town now and have the Judge see that the place is clear to you, and he will get you a pension, twelve dollars a month."

The worn, seamed face lifted to his was transfigured by its look of beatitude.

"You must n't" she implored. I didn't know about the pension. That will keep me, and I can find another little place somewhere. But the money you offer—no! I have heard how you have been saving to go school."

He smiled.

"Uncle Barnabas and the Judge are anxious to pay my expenses at college, and—you must let me. I would like to think, don't you see, that you are living here in my old home. It will seem to me as if I were doing it for my mother—as I would want some boy to do for her if she were left—and it's my country's service he died in. I would rather buy this little place for you, and know that you are living here, than to buy anything else in the world."

The old face was quite beautiful now.

"Then I will let you," she said tremulously. "You see, I am a hard-working woman and quite strong, but folks won't believe that, because I am old; so they won't hire me to do their work, and they say I should go to the poor-house. But to old folks there's nothing like having your own things and your own ways. They get to be a part of you. I was thinking when you rode up that it would kill me not to see the frost on the old poplar, and not to cover up my geraniums on the chill nights."

Something stirred in David's heart like pain. He stooped and kissed her gently. Then he rode away, rejoicing that he had worked to this end. Four hours later he rode back to the little home.

"The Judge has paid over the money to Old Skinflint Prickley," he said blithely, "and the place is all yours. The deacon had compounded the interest, which is against the laws of the state, so here are a few dollars to help tide you over until the Judge gets the pension for you."

"David," she said solemnly, "an old woman's prayers may help you, and some day, when you are a great man, you will do great deeds, but none of them will be as great as that which you have done to-day."

David rode home with the echo of this benediction in his ears. He had asked the Judge to keep the transaction secret, but of course the Judge told Barnabas, who in turn informed Uncle Larimy.

"I told the boy when his ma died," said Uncle Larimy, "that things go 'skew sometimes, but that the sun would shine The sun will allers be a-shinin' fer him when he does such deeds as this."

CHAPTER III

The fare to his college town, his books, and his tuition so depleted David's capital of one hundred dollars that he hastened to deposit the balance for an emergency. Then he set about to earn his "keep," as he had done in the country, but there were many students bent on a similar quest and he soon found that the demand for labor was exceeded by the supply.

Before the end of the first week he was able to write home that he had found a nice, quiet lodging in exchange for the care of a furnace in winter and the trimming of a lawn in other seasons, and that he had secured a position as waiter to pay for his meals; also that there was miscellaneous employment to pay for his washing and incidentals.

He didn't go into details and explain that the "nice quiet lodging" was a third-floor rear whose gables gave David's six feet of length but little leeway. It was quiet because the third floor was not heated, and its occupants therefore stayed away as much as possible. His services as waiter were required only at dinner time, in exchange for which he received that meal. His breakfast and luncheon he procurred as best he could; sometimes he dispensed with them entirely. Crackers, milk, and fruit, as the cheapest articles of diet, apperaed oftenest on his menu. Sometimes he went fishing and surreptitiously smuggled the cream of the catch up to his little abode, for Mrs. Tupps' "rules to roomers," as affixed to the walls, were explicit: "No cooking or washing allowed in rooms." But Mrs. Tupps, like her fires, was nearly always out, for she was a member of the Woman's Relief Corps, Ladies' Aid, Ladies' Guild, Woman's League, Suffragette Society, Pioneer Society, and Eastern Star. At the meetings of these various societies she was constant in attendance, so in her absence her roomers "made hay," as David termed it, cooking their provender and illicitly performing laundry work in the bathtub. Still, there must always be "on guard" duty, for Mrs. Tupps was a stealthy stalker. One saw her not, but now and then there was a faint rustle on the stair. David's eyes and ears, trained to keenness, were patient and vigilant, so he was generally chosen as sentinel, and he acquired new caution, adroitness, and a quietness of movement.

There had been three or four close calls. Once, she had knocked at his door as he was in the act of boiling eggs over the gas jet. In the twinkling of an eye the saucepan was thrust under the bed, and David, sweet and serene of expression, opened the door to the inquisitive-eyed Tupps.

"I came to borrow a pen," she said shamelessly, her eyes penetrating the cracks and crevices of the little room.

David politely regretted that he used an indelible pencil and possessed no pens.

In the act of removing all records and remains of feasts, David became an adept. Neat, unsuspicious looking parcels were made and conveyed, after retiring hours, to a near-by vacant lot, where once had been visible an excavation for a cellar, but this had been filled to street level with tin cans, paper bags, butter bowls, cracker cases, egg shells, and pie plates from the House of Tupps.

His miscellaneous employment, mentioned in his letter, was any sort of work he could find to do.

David became popular with professors by reason of his record in classes and the application and concentration he brought to his studies. His prowess in all sports, his fairness, and the spirit of camaraderie he always maintained with his associates, made him a general favorite. He wore fairly good clothes, was well groomed, and always in good spirits, so of his privations and poverty only one or two of those closest to him were even suspicious. He was entirely reticent on the subject, though open and free in all other discourse, and permitted no encroachment on personal matters. One or two chance offenders intuitively perceived a slight but impassable barrier.

"Dunne has grown a little gaunt-eyed since he first came here," said one of his chosen friends to a classmate one enevning. "He's outdoors enough to counteract overstudy. But do you suppose he has enough to eat? So many of these fellows live on next to nothing."

"I shouldn't be surprised if he were on rations. You know he always makes some excuse when we invite him to a spread. He's too proud to accept favors and not reciprocate, I believe."

David overheard these remarks, and a very long walk was required to restore his serenity. During this walk he planned to get some extra work that would insure him compensation requisite to provide a modest spread so that he might allay their suspicions. Upon his return to his lodgings he found an enormous box which had come by express from Lafferton. It contained Pennyroyal's best culinary efforts; also four dozen eggs, a two-pound pat of butter, coffee, and a can of cream.

He propitiated Mrs. Tupps by the proffer of a dozen eggs and told her of his desire to entertain his friends. It would be impossible to do this in his room, for when he lay in bed he could touch every piece of furniture with but little effort.

David had become his landlady's confidant and refuge in time of trouble, and she was willing to allow him the privilege of the dining room.

"I am going away to-night for a couple of days, but I would rather you wouldn't mention it to the others. You may have the use of the dining room and the dishes."

David's friends were surprised to receive an off-hand invitation from him to "drop in for a little country spread." They were still more surprised when they beheld the long table with its sumptuous array of edibles, —raised biscuits, golden butter, cold chicken, pickles, jelly, sugared doughnuts, pork cake, gold and silver cake, crullers, mince pie, apple pie, cottage cheese, cider, and coffee.

"It looks like a county fair exhibit, Dunne," said a city-bred chap.

Six healthy young appetites did justice to this repast and insured David's acceptance of five invitations to dine. It took Mrs. Tupps and David fully a week to consume the remnants of this collation. The eggs he bestowed upon an anemic-faced lodger who had been prescribed a milk and egg diet, but with eggs at fifty cents a dozen he had not filled his prescription.

At the end of the college year David went back to the farm, and a snug sense of comfort and a home-longing filled him at the sight of the old farmhouse, its lawn stretching into gardens, its gardens into orchards, orchards into meadows, and meadows into woodlands. Through the long, hot summer he tilled the fields, and invested the proceeds in clothes and books for the ensuing year.

There followed three similar years of a hand-to-mouth existence, the privitations of which he endured in silence. There were little occasional oases, such as boxes from Pennyroyal, or extra revenues now and then from tutoring, but there were many, many days when his healthy young appetite clamored in vain for appeasement. On such days came the temptation to borrow from Barnabas the money to finish his course in comfort, but the young conqueror never yielded to this enticement. He grew stronger and sturdier in spirit after each conflict, but lost something from his young buoyancy and elasticity which he could never regain. His struggles added a touch of grimness to his old sense of humor, but when he was admitted to the bar he was a man in courage, strength, and endurance.

CHAPTER IV

It seemed to David, when he was at the farm again, that in his absence time had stood still, except with Janey. She was a slender slip of a girl, gentle voiced and soft hearted. Her eyes were infinitely blue and lovely, and there was a glad little ring in her voice when she greeted "Davey."

M'ri gave a cry of surprised pleasure when she saw her former charge. He was tall, lithe, supple, and hard-muscled. His face was not very expressive in repose, but showed a quiet strength when lighted by the keenness of his serious, brown eyes and the

sweetness of his smile. His color was a deep-sea tan.

"It seems so good to be alive, Aunt M'ri. I thought I was weaned away from farm life until I bit into one of those snow apples from the old tree by the south corner of the orchard. Then I knew I was home."

Pennyroyal shed her first visible tear.

"I am glad you are home again, David," she sniffed. "You were always such a clean boy."

"I missed you more'n any one did, David," acknowledged Miss Rhody. Ef I had been a Catholic I should a felt as ef the confessional hed been took from me. I ain't hed no one to talk secret like to excep' when Joe comes onct a year. He ain't been fer a couple of years, either, but he sent me anuther black dress the other day —silk, like the last one. To think of little Joe Forbes a-growin' up and keepin' me in silk dresses!"

"I'll buy your next one for you," declared David emphatically.

The next day after his return from college David started his legal labors under the watchful eye of the Judge. He made a leap-frog progress in acquiring an accurate knowledge of legal lore. He worked and waited patiently for the Judge's recognition of his readiness to try his first case, and at last the eventful time came.

"No; there isn't the slightest prospect of his winning it," the Judge told his wife that night.

"The prosecution has strong evidence, and we have nothing—barely a witness of any account."

"Then the poor man will be convicted and David will gain no glory," lamented M'ri. "It means so much to a young lawyer to win his first case."

The Judge smiled.

"Neither of them needs any sympathy. Miggs ought to have been sent over the road long ago. David's got to have experience before he gains glory."

"How did you come to take such a case?" asked M'ri, for the Judge was quite exclusive in his acceptance of clients.

"It was David's doings," said the Judge, with a frown that had a smile lurking behind it.

"Why did he wish you to take the case?" persisted M'ri.

"As near as I can make out," replied the Judge, with a slight softening of his grim features, "it was because Miggs' wife takes in washing when Miggs is celebrating."

M'ri walked quickly to the window, murmuring some unintelligible sound of endearment.

On the day of summing-up at the trial the court room was crowded. There were the habitual court hangers on, David's country friends en masse, a large filling in at the back of the representatives of the highways and byways, associates of the popular wrongdoer, and the legal lore of the town, with the good-humored patronage usually bestowed by the profession on the newcomer to their ranks.

As the Judge had said, his client was conceded to be slated for conviction. If he had made the argument himself he would have made it in his usual cool, well-poised manner. But David, although he knew Miggs to be a veteran of the toughs, felt sure of his innocence in this case, and he was determined to battle for him, not for the sake of justice alone, but for the sake of the tired looking washerwoman he had seen bending over the tubs. This was an occupation she had to resort to only in her husband's times of indulgence, for he was a wage earner in his days of soberness.

When David arose to speak it seemed to the people assembled that the coil of evidence, as reviewed by the prosecutor in his argument, was drawn too closely for any power to extricate the victim.

At the first words of the young lawyer uttered in a voice of winning mellowness, the public forgot the facts in the case. Swayed by the charm of David's personality, a current of newborn sympathy for the prisoner ran through the court room.

David came up close to the jury and, as he addressed them, he seemed to be oblivious of the presence of any one else in the room. It was as though he were telling them, his friends, something he alone knew, and that he was sure of their belief in his statements.

"For all the world," thought M'ri, listening, "as he used to tell stories when he was a boy. He'd fairly make you believe they were true."

To be sure the jury were all his friends; they had known him when he was little "barefoot Dave Dunne." Still, they were captivated by this new oratory, warm, vivid, and inspiring, delivered to the accompaniment of dulcet and seductive tones that transported them into an enchanted world. Their senses were stirred in the same way they would be if a flag were unfurled.

"Sounds kind o' like orgin music," whispered Miss Rhody.

Yet underneath the eloquence was a logical simplicity, a keen sifting of facts, the exposure of flaws in the circumstanstial evidence. There was a force back of what he said like the force back of the projectile. About the form of the hardened sinner, Miggs, David drew a circle of innocence that no one ventured to cross. Simply, convincingly, and concisely he summed up, with a forceful appeal to their intelligence, their honor, and their justice.

The reply by the assistant to the prosecutor was perfunctory and ineffective. The charge of the judge was neutral. The jury left the room, and were out eight and one-quarter minutes. As they filed in, the foreman sent a triumphant telepathic message to David before he quietly drawled out:

"Not guilty, yer Honor."

The first movement was from Mrs. Miggs. And she came straight to David, not to the jury.

"David," said the Judge, who had cleared his throat desperately and wiped his glasses carefully, at the look in the eyes of the young lawyer when they had rested on the defendant's wife, "hereafter our office will be the refuge for all the riffraff in the country."

This was his only comment, but the Judge did not hesitate to turn over any case to him thereafter.

When David had added a few more victories to his first one, Jud made one of his periodical diversions by an offense against the law which was far more serious in nature than his previous misdeeds had been. M'ri came out to the farm to discuss the matter.

"Barnabas, Martin thinks you had better let the law take its course this time. He says it's the only procedure left untried to reform Jud. He is sure he can get a light sentence for him—two years."

"M'ri," said Barnabas, in a voice vibrating with reproach, "do you want Jud to go to prison?"

M'ri paled.

"I want to do what is best for him, Barnabas. Martin thinks it will be a salutary lesson."

"I wonder, M'ri," said Barnabas slowly, "if the Judge had a son of his own, he would try to reform him by putting him behind bars."

"Oh, Barnabas!" protested M'ri, with a burst of tears.

"He's still my boy, if he is wild, M'ri."

"But, Barnabas, Martin's patience is exhausted. He has got him out of trouble so many times—and, oh, Barnabas, he says he won't under any circumstances take the case! He is ashamed to face the court and jury with such a palpably guilty client. I have pleaded with him, but I can't influence him. You know how set he can be!"

"Wal, there are other lawyers," said Barnabas grimly.

(To be continued.)

LETTERS FROM BOYS AND GIRLS

We have had a number of nice letters from some of our boys and girls who are reading the story "David Dunne" and we hope more of them will write. In writing do not follow the style of other letters but write in your own way because it will do little good for you to write after the copy of other letters.

We asked you in our first request to tell us which character in the story you liked best and when you do that we want you to tell us why you like him or her as the case may be. Pick out some of the incidents in the life of some character and tell us why you think they show the marks of a good boy or girl.

HOW MUCH PROFIT

is there in a pig? That depends on the man, on the feed, and on the pig. But how do you know when the combination is right to produce best results? **Keep a Farm Account Book and let it be**

Dec. 10	"	80 bus. corn @ 64 ¢						51 20	

Charge the pigs with the corn they eat and then—

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK is a splendid 176 page book, well bound and ruled on extra quality ledger paper. It is designed to contain the accounts of the average farm for five years. This is especially desirable for the purpose of comparison. The book also contains forms for crop, stock, employment, and insurance records.

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK

Complete Account of Corn Crop , 19 14

Date	Person, Firm, or Account	Item, Description, Price	Cash Received	Cash Paid	Labor Hours Man	Labor Hours Horse	Labor Hours Tractor	Amount Charged	Amount Credited
Nov. 1	Hog Account	100 bus. corn @ 60¢							60 00
Dec. 10	" "	80 bus. corn @ 64¢							51 20

Give the corn crop credit and that transaction is closed. Remember that in farm bookkeeping perhaps the greatest number of transactions will be between accounts on your farm.

We will give **The Missouri Farmer** for 3 years, either renewal or new subscription and a copy of **The Practical Farm Account and Record Book** for $2.25.

The Missouri Farmer, Columbia, Mo.

Several of our little folks say they do not like "Jud" because he is mean to David but after all can you not find something good even in Jud? The Editor has never in all his life seen a boy or girl who did not show some good somewhere or sometime and while we do not want you to overlook the bad in anyone we want you to be able to find the good that may be there.

We do not confine you to the story but if you are doing something for yourself, or to help father and mother write us about it. Have you a garden, some fruit, a pig, a colt, a calf, a pet lamb or pony that you are caring for and from which you hope to make some money, or get some pleasure? Just write us a story about what you are doing to enjoy yourself or to make some money for your own. Then what are you going to do with the money when you make it?

About the most fun I had when a boy was with two calves my father gave me to pay me for a summer's work. I had a small truck wagon and I trained those calves to work and I could do a lot of light hauling with them. Sometimes they would run away with the wagon and spill the load and the driver but by being kind to them and feeding them a little salt and meal occasionally I soon had them so they were very gentle and would mind when I wanted them to stop or to start. I sold the calves for $40 when one year old and with the money bought a colt which soon grew into a fine riding horse and I think that was my first liking for the live-stock business which I have never lost.

Do not make your letters too long but try to make every word tell something of interest. Now, let us have your letters.—The Editor.

A Letter from Ollie

Sedgewickville, Mo.

To the Editor:—

I have noticed in The Missouri Farmer that you want to know what some of your boys and girls that read your paper think of the story, "David Dunne." I'm always glad when the paper comes and I think David is the main, and best character.

I hope this will be printed in The Missouri Farmer as this is the first letter of this kind I have written.

Ollie.

Jessie Likes Good Stories

To the Editor:—

I think the story "David Dunne" is just fine. It takes an awfully good story to interest me but this one suits my fancy. I do not like a story that is not moral and that teaches a good lesson. I can read every word of "David Dunne" and find a lesson worth while in every chapter.

Jesse Baldwin, Maple Grove.

To the Editor:—

I have read the request for letters from boys and girls telling what they think of the story "David Dunne." I am a little 9-year-old girl and I am always glad when the paper comes so I can read the story. I like David best of all the boys and girls in the story but I am very much interested in Joe Forbes, Miss Rhody, M'ri and Janey. I don't like Jud much because he is not kind to David and Janey. This is my first letter to a paper and I hope it will be printed in The Missouri Farmer.

I would like to correspond with some of the nice boys and girls who read this paper. Ethel VanVacter, Laddonia.

A Little Irish Girl

To the Editor:—

I am a little "Irish" girl of eleven summers, with light complexion, dark blue eyes and brown hair. I live on a farm of two hundred and forty acres with my father, mother, four brothers, and four sisters.

I am very much interested in the story "David Dunne." I think David is the most interesting character, although I like all of the story fine. I am always anxious for the next paper to come. I hope we will see lots of letters for the "Boys" and "Girls" page in The Missouri Farmer.

Kathleen, Conception Junction.

Another Friend of David

Jamesport, Mo.

Dear Editor:—

I am a boy twelve year's old. I live on a two-hundred-acre farm, northwest of Hickory. I think your story of David Dunne is a good story. I do not think Jud is a good character. I will be glad when the next paper comes. Cleo Buster.

BEAUTY AND EGG PRODUCTION

Can utility and beauty be combined in the same fowl, or in other words is it possible to combine egg production and Standard requirements? If not, we had better change the Standard where necessary. It is said that the life of the average fancier is three years. If this be true it is our duty to get busy and help him develop ways and means by which he will be enabled to make more dollars and cents and thus stay longer in the business which he has chosen and in which we are all pleased to have him engage.

Some are still arguing the momentous question of "Which was created first, the hen or the egg," and also that perplexing question of "Why a black hen lays a white egg." Could they not better spend their time trying to produce the hen and to get the egg? We also see many arguing for and against the question of combining "utility and beauty." Instead of saying it cannot be done, had we not better be trying to harmonize and combine these two desirable qualities? We all admit that they are desirable, then lets quit trying to discourage those who are making the effort, and find out on what basis or to what extent and to the highest degree that they may be combined.

A hen that never laid an egg would naturally be expected to score some higher than a hen of the same variety that laid a great many eggs, but we would rather have a hen that scored 90 and laid 200 eggs than to have one scoring 94 that laid only 90 eggs. The man is either prejudiced or narrow minded who would attempt to discourage the breeders from making an attempt to combine these two qualities in all varieties of poultry. The Standard of Perfection calls for 100 points for each variety. No one ever saw a bird or perhaps ever will see one that is perfect or would score 100 points. But that is no reason why we should discourage breeders in their efforts to breed more perfect specimens. It is just as sensible to do that, however as it is to try to tell them they cannot combine utility and beauty to a greater degree than they are found in the average flock at the present time. The thing to do is to make the effort and quit arguing about it. We are convinced that it can be done. If it can not be then it is high time we begun to discover the changes necessary to make in the Standard requirements so that it may be done.

A prominent breeder of Buff Leghorns has had first prize winners at the World's Fair at San Francisco, and at the Chicago Poultry Show hatched from birds with records as high as 215 eggs. Prominent Barred Rock breeders to our knowledge have had hens lay as many as 250 eggs and still score high enough to win first prizes in strong competition. If this can be done with these two varieties, it can be done with most any other. There is no use to put goggles on our eyes and blind ourselves to the truth, the thing to do is to get busy and turn the trick. The breeders who are making the effort are those who are going to stay in the business when he who hesitates will long be forgotten.

The time to score a pullet is just before she has laid her first egg. It has been long admitted by all fanciers that this is the period in the life of the average female when she is considered in "full bloom." This is when you can get the best check on her from a fancy or Standard point of view. After she has been trap-nested and gone through a hard year's work and the strain of laying a large number of eggs, it is not to be expected that she will retain quite the same beauty of plumage and shape that she had just previous to laying her first egg. But her value and true worth from a fancy standpoint and for breeding purposes may be there just the same. A certain lady may be considered the most beautiful woman in your community, but after that lady has spent a hard day's work in a hot kitchen she may come out with flour and smut on her face and clothing and not look quite as attractive as she does in her evening clothes with her drug store complexion, but the natural beauty and good qualities of the real woman will be there just the same, though they may be temporarily hidden by flour and smut from the pots and kettles.

The various egg laying contests which are being held are doing much to aid the breeders of the country in their efforts to combine egg production and beauty or Standard requirements to the greatest possible degree. The American School of Poultry Husbandry has arranged to establish an American Egg Laying Contest on their own experimental grounds near Kansas City, where all of these points are to be given due consideration, and entries are now being received for this contest. Prizes will be offered, not only for the greatest number of eggs laid by both pens and individuals, but for the greatest weight in eggs and also for the pen showing the greatest net profit. Winter layers will count here.

Each bird scoring 90 or more points and laying 120 or more eggs will be awarded a handsomely engraved certificate to that effect. Here is where beauty and utility will be combined and certified to. Each bird will be officially trapnested and that record certified. Each will be tested for White Diarrhea and that certified. Each will be scored and a Standard score card by a Licensed Judge furnished. If you had a pen of such hens, that had met the test, that had made a good record and you were furnished an official registration certificate to that effect, would not those birds be worth a great deal to you as breeders? Would it not be a great thing to advertise such stock? Would your customers not be pleased to buy eggs and stock from birds which they knew had met the test at the trap nest, met Standard requirements, and which they knew to be free from White Diarrhea? You would certainly have great advertising advantages and great pulling power over the careless breeder who had no such record back of his stock. It would not take such long winded letters to land sales. Your certificates of registration, your score cards and your trap nest records would speak for themselves.

Today, eight or more of our leading State Colleges of Agriculture and Universities are putting on Contests and hundreds of progressive poultrymen are having their birds officially trapnested. The breeder who has a good egg record and a good show record back of his birds is the one who is getting the business. This contest is to be held by the Amercan School of Poultry Husbandry on their own grounds near Kansas City.—T. E. Quisenbery, President Armerican School of Poultry Husbandry.

THE EGG LAYING CONTEST

The Fifth National Egg Laying Contest, 104 pens of five hens each, is making a fine record, all hens in the contest making the highest record of any contest for the first seven months. The averages of all hens in each contest for seven months are as follows: First Contest, 80 eggs each; second contest, 85.6; third contest, 97; fourth contest, 83; and fifth contest, 99.6.

Nine thousand four hundred seventy eggs were produced during May which is an approximate average of 18.22 eggs each.

The averages for the month of May in each of the contests are as follows: First, 17.5; second, 17.5; third, 19; fourth, 17; fifth, 18.2.

There were 207 broody hens recorded during the month.

All prizes for May were won by S. C. White Leghorns. Pen 24, S. C. White Leghorns, from England, won the cup for May by laying 133 eggs.

The five highest pens for May are as follows:

S.C.White Leghorns, England, 133 eggs
S.C.White Leghorns, Missouri, 131 eggs
S.C.White Leghorns, Missouri, 129 eggs
S.C.White Leghorns, Ohio, 127 eggs
S.C.White Leghorns, Missouri, 126 eggs

Hens making the five highest records for the seven months are equally divided between the Plymouth Rocks and Leghorns. They are as follows:

White Rocks, Washington.....176 eggs
S. C. White Leghorns, Washington .....163 eggs
White Rocks, Washington.....160 eggs
S. C. White Leghorns, New Jersey (Tie) .....157 eggs
Barred Rocks, Missouri, (Tie) 157 eggs
S. C. White Leghorns, Washington .....155 eggs

Six breeds share in the honors for ten highest records for the seven months. The five hens in the leading pen have made an average of 12 dozen eggs each in seven months. The pens making the ten highest records for seven months are as follows:

White Rocks, Washington.....721 eggs
Barred Rocks, Missouri.....716 eggs
R. C. Reds, Missouri.....704 eggs
S. C. White Leghorns, Washington .....697 eggs
Black Orpingtons, Indiana.....670 eggs
S. C. Reds, Iowa.....659 eggs
Oregons, Oregon .....648 eggs
S. C. White Leghorns, Texas....637 eggs
White Wyandottes, Michigan....631 eggs
S. C. White Leghorns, Kansas 628 eggs

Thirteen hens have already laid over 150 eggs each.

C. T. Patterson, Director,
Mountain Grove Mo.

MISSOURI STATE POULTRY SHOW

The Twenty-fourth Annual Show of the Missouri State Poultry Association will be held in the Auditorium in St. Joseph, Mo., December 5, 6, 7, 8, 9, 1916. The judges already secured are

Thos. W. Southard, Kansas City, Mo.
D. E. Hale, Chicago, Ill.
Russell F. Palmer, Kearney, Neb.
Adam Thompson, Amity, Mo.

Arrangements have been made with two of the judges to be in attendance from the time the show opens until it closes, affording an opportunity for all exhibitors and visitors to consult the judges relative to any subject affecting Standard-bred poultry. This particular feature should increase interest in the show.

The Missouri State Poultry Experiment Station will have their usual exhibit from the different departments, and a poultry institute will be conducted during the show, under the direction of Prof. C. T. Patterson, Director of the Missouri State Poultry Experiment Station.

Every year shows an increase in number of exhibits of eggs, and this year should bring out the greatest display of eggs ever brought together in Missouri. Competition is open to the world.

For further information, please address. Fred Crosby, Secretary,
Mountain Grove, Mo.

Egg Candling Made Easier

In order to tell, without breaking them, whether eggs are good or bad, candle them. The poultrymen at the Wisconsin Experiment Station are recommending this method of candling:—

"Get a box large enough to hold a lantern on the inside. Either heavy pasteboard or wood boxes will do. Cut a small opening in the top of the box for ventilation; fix the back as a door or slide so that the lantern can be put out and in easily. Then cut a hole about the size of a half dollar in the front of the box at a height just above the lantern flame.

"If the box is not tight, cover it with black paper to keep the light from shining out. A heavy coat of black paint helps materially where the box is made of thin wood or pasteboard. Light the lantern, set it inside the box, and the machine is ready for business. A dark room is the best place to use it.

"To find out what eggs are fresh and which are old or poor one should learn to compare the two. A fresh egg, when placed before this light is clear, with a small air cell. A fertile egg that has been under a hen for a week or so, will show very plainly the developing chick with veins running through the yolk. An infertile egg will show its yolk darkened more than a fresh egg, and its air-cells enlarged. In some fresh eggs little black or dark spots can be noticed near the yolk. these are tiny blood clots on the yolk, and eggs having them are not the best for hatching. Other defects like meat spots will be easily told and can be discarded. They should be used for cooking or some other purpose."

Remedies for "Chiggers."

Washington, D. C.

If a bath in hot water, or in water containing salt or strong soap, is taken within a few hours after exposure in shrubbery and weeds infested with "chiggers," or "red bugs," no ill effects will be experienced. After a long exposure, however, a bath has practically no effect, and direct remedies are necessary.

After irritation has set in, and small red spots appear, the application of a moderately strong solution of ammonia to the affected parts is recommended by the Department of Agriculture's entomologists. A supersaturated solution of bicarbonate of soda, or common cooking soda or saleratus, will afford relief. Liberal applications should be made until the irritation subsides. If the suffering is severe, a dilute tincture of iodine or collodian should be lightly applied.

By Old Jim Riley

I've been sizin' up this Hughes feller that th' republicans nominated in Chicago th' other day and I've made up my mind about just one thing—and that is that I'd just about as leave undertake to tickle a catamount under th' chin as to slap him on th' back and call him "Charlie."

Farm Club Saves $200 on Binder Twine

To The Missouri Farmer:

On receipt of my Missouri Farmer today, and seeing that you call for Farm Club attention, and I being Secretary of our club, I will give you a short report of our Club, as I think it is only fair in return for the favors you have extended us. We organized our club the 1st of February, with ten members, we have at present 38 and expect more yet. We meet regularly every two weeks, and discuss some subject of importance to farmers at each meeting. We thought when we first organized that we would only meet regularly until spring work opened up, and then perhaps once or twice through the summer and then tide over until fall or winter, but no, not so. At our meeting April 24th a vote was taken and carried unanimously that we keep meeting right along regularly all summer. I am sure there is a friendlier feeling, a more neighborly spirit, more co-operation among the farmers of our community than ever before, and I think we have the Editor and Publisher of The Missouri Farmer principally to thank for it. One way I see more co-operation is in road work. I am and have been road overseer for a number of years and I have less trouble getting my help on the road this spring than ever before, so something has been accomplished for good roads.

Our club ordered me to send and get a blank Land Bank petition, which I did and we filled same and returned to Mr. A. T. Edmondson.

I sent off an order today for our club for 4100 pounds of binder twine to our State Prison which is costing us nine cents per lb. plus freight. Our dealer here has sold some already at 14c per pound which makes a saving of about two hundred dollars to our club members.

I shall make an endeavor soon to get some subscriptions and renewals to your paper. Thanking you for past and future favors, I remain,

A. M. Fry, Tipton, Mo.

Look at the yellow lable on your paper and if your time has expired we will be pleased to have you send a dollar bill addressed to The Missouri Farmer, Columbia, Mo., and for it we will set your time ahead for three years.

BUCKSHOT BY THE PROFESSOR

The retired farmer is not necessarily a poor husband. Some, intent upon saving, husband practically their entire incomes.

Farmers may be divided into three classes, tired, retired and rubber tired.

A lot of modern folks poke fun at the old parlor that was open only on Sunday when the preacher came. Is the church that is open only under such circumstances much better?

With many of us it would make for better travel both here and hereafter if our religion and our road tax receipt could be made out in the wife's name.

Every farmer should make his farm a demonstration farm, not an experiment farm.

About the only noticeable difference between some so-called farmers and city folk is that one class gets milk from cows while the other gets its out of cans.

It often happens that the end of the rainbow is on the old farm home. Digging there, we find the fabled pot of gold.

The early settler bought land by the section or "quarter." Now we buy it by the inch—or quart.

Every country boy has a chance to rise—in summer, as early as four o'clock.

Times have changed. As a boy, we didn't get "our jacket dusted" with a vacuum cleaner.

Only the commencement orator hitches his wagon to a star, as Emerson advised. Most of us prefer a Missouri mule.

There's a lot of difference between living in the country and on it.

Own your farm, but don't let your farm own you.

The country, in the main, makes neither millionairs nor mendicants—just men.

The best soil testing "machines" ever put into the ground are the plants that grow out of it.

More men have been kicked by cows than by mules—only they are ashamed to say so.

In finding fault with people and mules the wise plan is to look 'em in the face.

The college of today is teaching of everything from the milk pail to the milky way.

When it comes to real success, we have seen an A. B. C. farmer outstrip a Ph. D. agriculturist.

It is bad to settle in the wrong state but infinitely worse to get in the wrong state of mind—and stay there.

So you are not satisfied with the work of the preacher whom you employ one Sunday in the month? Well, what kind of a showing would you make if you had to farm four farms to make a living?

Smut in oats isn't half so serious a matter as smut in the paper that is read by the boys and girls.

It is charged that the motion picture heroine has alienated the hired man's affections for the farm. Why not, then, moving pictures in the country?

The size of the farm isn't half so important as the size of the farmer.

Acid souls are responsible for more failures than are acid soils.

Rotation is alright, but the country has suffered because of too much rotation among renters, preaches and teachers.

Modern farm methods demand that we trap-nest "Bossie" as well as "Biddy."

Why shouldn't our congressmen send us free records for our victrolas instead of free seeds for the garden? We would actually try the records.

A silo is a monument that the progressive farmer builds during his own lifetime.

If perchance the farm boy should fail to make the forks and spoons come out right at a seven-course dinner, this is no reflection on his ability. He has never had to take his meals on the installment plan.

You can no more make money on scrub cattle than you could operating an ice plant at the North Pole or conducting a fur store at the equator.

It's hard to break away from habit. For instance, there's the retired farmer living in town, but who continues to salt the stock (the lone family horse) on Sunday morning.

It is a great mistake for a farmer to retire and go to town, there to spend his last days—and nothing else.

In a season of protracted drouth—when there are no clouds—it's an optimistic farmer that is able to see the proverbial "silver lining."

TIME AND LABOR SAVERS ON THE FARM

Farmers have plenty of work to do—some never "catch up." However, the busy farmer can take advantage of home made time, step and labor savers. With a few boards and a hand full of nails it is easy to construct hundreds of helpful articles for use about the farm, home and barn. They are all practical for they have been worked out and used by farmers. They can be made at any time and at small cost.

Labor can be saved by using home made tools and implements. One man cut roots for twenty cows all one winter with a home made root cutter. Practical harrows can be made to fit your own needs. A sled corn harvester is a labor saving device for the man with a small corn patch. Besides there are corn shellers, stone drags, husking tables, farm levels, vegetable washers and a host of other handy things easy of home manufacture.

Almost every farm in this country has several racks or troughs in use. Are they the right kind to best serve the purpose? Perhaps one of these would be suitable: a portable feeding rack, a feed rack for roughage, a combined shed and feed rack, an alfalfa feeding rack, a movable hog house and hay rack or a self feeder. There are many kinds of troughs—a weaning trough for hogs, an adjustable hog trough, an ensilage feed box and a wooden water trough. There are these wagon racks: a rack for hauling hogs, a hay rack, a calf moving rack, a float type rack and a dozen others. The small "A" hog house is a valuable aid at farrowing time. Then there are portable hay roofs, hay covers of wood dehorning chutes, tobacco frames, seed corn racks and salt boxes for sheep and cattle.

Time can be saved by using ltitle labor savers that are very easy t make. There is a contrivance that facilitates the slopping of hogs, a rack that unloads or loads a heavy farm rack and a wagon box storage rack.

Every work shop should have a good bench, a bolt and nut cabinet and a handy mail box with a handle on it so that it may be carried from place to place. There are hundreds of other labor savers such as milk stools, wagon jacks, ensilage trucks, wire stretchers and time saving stiles.

One class of farm helps might be called step and back savers. They are designed for the home. Remember that your wife helps you make a living—she is your business partner—and she may work at a disadvantage, taking thousands of useless steps and bending her back until she is so weary at the end of the day that she can hardly stand. It is easy to remedy this waste of energy—just get a few boards and some nails and you can make anything from a small kitchen shelf to a complicated kitchen cabinet. The following list may suggest what you can do to make your wife happy her work easier or your home life more comfortable: a porch swing, a plate rack, a clothes rack, a good quilting frame, a book case, an iceless refrigerator, a tea wagon, a wood box that can be filled without coming into the house, a disappearing ironing board, an up-to-date wash bench, a door stop, a hanging shelf, a clothes box, a dish pan rack that will raise the dish pan so that mother will not have to bend so much when washing the dishes, a sunning rack for milk cans, a folding table for a small kitchen or a bread board.

If the chickens are properly housed and fed they will prove to be the best paying investment on the farm. Of course, you will have a good poultry house and equip it with hinged nests and movable roosts. Then there are coops for hen and chicks, chicken feeders, brood coops and home made brooders.

These are just a few of the possible uses of wood on your farm. You can make everyone of these articles yourself. Naturally, the question will arise, which is the best wood to use in making them?

Southern Yellow Pine has gained the name of "the farmers wood" because of its great use on American farms. It has thousands of uses, and more of this wood is consumed each year than any five other woods combined. Or, in other words, 39% of the total lumber production for 1914 was Southern Yellow Pine. Any wood to gain such large use and favor must have superior qualities. And this is true of Southern Yellow Pine—it proves its remarkable adaptability in many ways. It is the great all-purpose wood. Its all-embracing usefulness is not equalled by any other wood that grows. It has a striking figure and a beautiful texture. It is bright and attractive in color and its general beauty and utility is surpassed by no other wood, not even the most expensive hardwoods. It takes stains, varnishes, hard oil and paint perfectly. Characterized by the workability and moderate weight that give it rating as a softwood, it shoulders its way into the field of the hardwoods, and in many classes of construction where great strength, toughness and durability are essential, thrusts aside the oaks, hickories and ashes, and in their native territories. In the Government Bulletin, "Uses of Commercial Woods of the United States", it is said of Southern Yellow Pine:—"In a large part of the country it is so universally used that there are few places of importance it does not fill."

The service qualities of Southern Yellow Pine, combined with its low cost, availability and easy working nature, make it the ideal general purpose wood for the farmer and amateur mechanic in the home. For farm building and repairs it is readily procurable everywhere in standard grades, and is perfectly adapted to the construction of barns, silos, granaries, garages, cribs, ice houses, feed racks, tanks, troughs, poultry houses, sheds, gates, fences, well tops and implement repairs—all of the many building tasks, large and small, that the farmer finds need to turn his hand to.

Knowing and using the material best suited to your needs, great and small, means maximum service at minimum cost. It will pay you to get acquainted with Southern Yellow Pine if you are not already using it, for it meets every farm building need from a small kitchen shelf to the largest barn. It is "the wood of service." W. J. F.

WILT DISEASE OF WATERMELON

The watermelon crop of Missouri brings in a great many thousands of dollars every year and in some parts of the state it is the leading industry. From Scott, Mississippi and other Southeast Missouri counties watermelons are shipped by car loads and train loads and the crop brings a lot of money to the farmers of those counties.

A disease known as the wilt has for many years been prevalent in some of the Southern States and is now getting a start in many other states, including Missouri.

According to the U. S. Department of Agriculture watermelon wilt is caused by a fungus which lives in the soil and enters the roots, plugging up the water-carrying vessels and preventing the rise of moisture, thus causing the wilting and death of the plant. The leaves of affected plants first droop, then rapidly wilt and soon die, the runner dying with them. Upon cutting the main tap root across near the surface of the ground it will be found to present a yellow color in the wood, making a distinct contrast with the white color of the healthy plant. This yellowing, together with the wilted appearance of the vine, makes the identification of the disease possible, and the further fact that a field once infected shows the same trouble in succeeding years in the same or an extended area is an additional recognition mark. All commercial varieties of melons appear to be very susceptible to the disease.

The disease is spread in a number of different ways. (1) By particles of earth carrying spores of the fungus, which are easily scattered by the wind, by implements used in cultivating, and by the feet of men and work animals or stray stock passing from one field to another. (2) By infected stable manure. The fungus lives in the dead vines and the practice of cutting hay from watermelon fields results in some watermelon vines being harvested with the hay and this leads to the presence of the causal fungus in the stable. When the fungus once gains entrance to the barnyard, or compost heap, it remains there for years and all the manure taken from such a yard is likely to be infected. (3) By drainage water, flowing from infected to uninfected fields.

There is nothing that can be done to save a field of melons when once attacked by the wilt, but the disease may be avoided by the following precautions:

1. In infected districts, watermelons should never be planted on land where watermelons have been grown within ten or twelve years, more or less, depending on soil conditions, as experiments have shown that the fungus causing the disease is able to live a long period in the ground. As a matter of practical experience, it is usually possible to secure enough fresh land, so that an adequate supply of watermelons can be grown in any large district without need of recourse to old fields.

2. Stable manure which has become infected by the use of melon hay or refuse containing melon vines should never be applied to the watermelon crop, or to land where it is desired to plant watermelons later.

3. Fields which have received the drainage water from infected fields must be considered and treated as if infected. This means that the farmer having two fields, one of which is on higher ground than the other, should plant the lower field first.

4. As far as possible live stock should be prevented from passing from infected to uninfected fields.

5. Breeding resistant varieties. It has been demonstrated by the Department of Agriculture that varieties of watermelons resistant to wilt can be bred. The strains thus far produced are not recommended for general planting, but it will be worth while for interested localities to have wilt-resistant varieties adapted to their conditions bred.

We would like to get some good letters from our poultry readers on their success in handling turkeys, ducks, geese and chickens. Write and tell us how you handle them, feed and house them.

Billy Sunday's Kansas City Revival

Will Begin in April and Last Eight Weeks

His sermons in full, and every detail of his tabernacle meetings, the greatest evangelist of the world in action, all fully illustrated, true to life, as real as if you were there to see and hear it all, will be printed in

The Weekly Kansas City Star

The greatest farm paper—Best market reports—Farm questions answered by experts—the news of the world condensed.

East St. Louis Angus Sale

Our readers who are in the market for Angus cattle should keep in mind that on June 22 a very attractive lot of bulls, cows and heifers will be sold at East St. Louis by a number of leading breeders of Illinois, Ohio and Michigan. The sale will consist of 65 head, including 40 young bulls of servicable age and 25 young cows and heifers. This lot was gotten together under the supervision of Field Representative M. A. Judy of the Aberdeen-Angus Breeders Association, and Mr. Judy gives it as his opinion that this sale will afford a rare opportunity to select unusually strong herd bulls. A number of the bulls have been shown and have made good and others look very promising for fall shows. The female end of the offering is particularly attractive and breeders and farmers in search of cows to add to their herds will not be disappointed. Several of the cows will sell with calves at foot and all of breeding age have been bred.

Breeders from all sections report a heavy trade and many of them are completely sold out; it would therefore seem advisable for our readers who are planning to purchase to attend this sale.

For catalog and further information write M. A. Judy, Sale Manager, 817 Exchange Ave., Chicago. Mention this paper when writing and you will confer a favor on both the advertiser and the publisher.

FIRST ANNUAL NATIONAL SWINE SHOW

The organization of the National Swine Growers' Association in December, 1914, brought up for consideration a number of matters of importance to swine growers of this country.

One of the first things to claim attention was a national swine show. This proposition from the first appeared to have the almost unanimous approval of swine breeders representing all breeds of swine, and the cordial support of the record associations.

At the second annual meeting of the National Swine Growers' Association a committee was appointed to make arrangements for and have charge of a national swine show. After considerable investigation, Omaha, Neb., was decided upon as the most suitable place for holding the first national swine show. The dates for this show are October 2 to 7, 1916. The show will be held in the horse sale barn of the South Omaha market. The building is admirably suited for holding an exhibition of this nature, and exhibitors and visitors can be certain of accommodations that will be in every way satisfactory.

The premium fund amounts to $11,000. In addition to this, there will be a number of special prizes, cups and trophies. Five breeds will have a cash prize fund of $2,000 each. These are the Berkshires, Hampshires, Poland Chinas, Duroc Jerseys and Chester Whites. The Spotted Polands will have a cash prize fund of $1,000.

The premium fund of $11,000 is contributed, 60 per cent by the record associations representing the various breeds, 40 per cent by the commercial interests of Omaha. It has been agreed that the cash for this premium fund will be paid into the treasury of the National Swine Growers' Association on Thursday of the national swine show, so that the entire fund will be available for paying each exhibitor in full on Friday, October 6, the closing day of the show.

Selection of judges has been made for each breed by the record associations, and the names will be announced in this premium list.

Eevry effort will be made to have this initial show everything that it should be, as representing the swine industry of the greatest hog growing country in the world. The committee appreciates the substantial and enthusiastic support rendered the proposition by the various swine record associations. It is certain, too, that the city of Omaha will do everything possible to insure the success of a national swine showe.

It is hoped and expected that there will be gathered together the greatest show of high-class swine thoroughly representative of the entire hog growing country that has ever been brought together, and that this will make it possible for the national swine show to become an annual event.

Should the national swine show grow and expand as the importance of the swine industry demands, it will undoubtedly come to be one of the greatest show events of America.

W. M. McFadden,
E. C. Stone,
L. E. Frost,
Committee.

RULES GOVERNING THE NATIONAL SWINE SHOW

1. All exhibitors will be required to purchase an exhibitor's ticket at the price of $1. Helpers to care for the exhibit will be furnished free tickets by the general superintendent.

2. Charges for pens will be as follows: All pens 5x9, $1; pens 10x9, $2. All applications for pens and space must be made to E. Z. Russell, general superintendent, 103 Bee Building, Omaha, Neb. Fees for pens must be paid at the time application is made. Pens may be secured at any time upon application to the general superintendent.

3. Entries shall be made with the secretary, and must be addressed to James J. Doty, secretary, Bee Building, Omaha, Neb.

4. Entries close Wednesday, September 20. No entry accepted unless mailed on or before closing date.

5. An entry will not be accepted for any animal for which the exhibitor does not furnish a certificate of registry at the time of sending the entry. The certificate of registry for each animal must be sent with the entries, so as to have the necessary information from which to print the official catalog of the show.

6. In case an animal entered dies or is injured so that it cannot be exhibited, another may be substituted by a proper showing.

7. No person will be allowed to see the entries or have access to the entry books until after the entries have closed. No entries are necessary for championships.

8. Competition open to the world except that no institution will be permitted to compete that is supported wholly or in part by state aid or taxation.

9. All animals shown must have been the property of the exhibitor thirty days prior to the opening of the show. Firms or copartnerships entering animals for exhibition must have been in existence at least thirty days prior to the opening of the show, and in all cases must be bona fide as shown by the certificates of registration. If it be ascertained that any exhibitor has made or caused to be made any false statement in regard to any animal exhibited or the ownership of the same, or if any exhibitor shall attempt to interfere with the judge in the performance of his duty in any manner or shall refuse to accept the awards made, he shall be disqualified from further competition and shall forfeit any premiums already awarded.

10. Animals on exhibition must remain in the space assigned them on the grounds until the close of the show, except by permission of the president of the association upon the recommendation of the general superintendent.

11. All possible diligence and care will be used to prevent the loss or injury to animals on exhibition, but it is hereby expressly stipulated that the National Swine Growers' Association or anyone of the management of the show, will in no wise be re responsible for a loss or injury of any kind to any animal.

12. All hogs for exhibition must be in place by 10 a. m. Monday, October 2, 1916, ready to be driven into the show ring at 1:30 p. m. Monday, if called.

13. An exhibitor will be permitted to show three animals in each class, but cannot be awarded more than two prizes in any class.

14. Sows two years old or over to be eligible to show must have produced living pigs within twelve months preceding September 1, 1916, and all boars of like age must have sired pigs farrowed within the same time.

15. All swine exhibited at the national swine show must be accompanied by the certificate of a qualified veterinarian, stating that they have been immunized, or the sworn statement of the owner may be sent instead of the veterinarian's certificate, saying the animals have been immunized by either the double or single method. If by the double method, it must have been done more than twenty-one days prior to date of shipment; if the single method was used, it must have been less than twenty-one days prior to date of shipment.

16. In case of dispute as to the age of an animal, its certificate of registry will be evidence of the age and the owner will be required to file with the general superintendent an affidavit that it is the identical animal therein described.

17. Protests designed to affect the awards must be made by an interested party. This protest must be in the form of a written statement, verified by affidavit, setting forth the reasons for protesting, and must be filed with the secretary of the National Swine Growers' Association on the day the

Eight Choice High Grade Holstein Cows

To reduce my herd I offer eight high grade, high producing Holstein cows. All are sired by a son of Missouri Chief Josephine and are bred to Campus Josephine Lad, a son of Pontiac Gerben De Kol. Guaranteed free from tuberculosis and contagious abortion. Price reasonable.

19. Pigs farrowed the property of the exhibitor may be shown as bred by exhibitor.

20. The general superintendent shall have authority to require each attendant showing animals to dress neatly and in a manner that shall meet with his approval. The general superintendent shall have authority to prevent any attendant who does not comply with his orders from exhibiting an animal.

21. Exhibitors may have their mail addressed in care of the secrtarv of the National Swine Growers' Association, Omaha, Neb.

22. Moneys paid for pens will be refunded by the general superintendent if application is made for such refund by September 1, 1916.

23. Carload shipments for exhibition should be consigned to the owner at the national swine show, Union Stock Yards, South Omaha, Neb.

24. Animals for exhibition sent by express must have express prepaid and consigned to care National Swine Show, New Horse Barns, Union Stock Yards, South Omaha, Neb.

25. The right is reserved by the National Swine Show Committee appointed by the National Swine Growers' Association to revise, correct, add to or interpret these rules as the interests of the national swine show may require, and all entries are to be understood as being made or exhibited only upon this basis.

Definition of Ages

Aged animals must have been farrowed before September 1, 1914.

Senior yearlings must have been farrowed on or after September 1, 1914, and before March 1, 1915.

Junior yearlings must have been farrowed on or after March 1, 1915, and before September 1, 1915.

Senior pigs must have been farrowed on or after August 1, 1915, and before February 1, 1916.

Junior pigs must have been farrowed on or after February 1, 1916.

Old herd must consist of boar and three sows farrowed before September 1, 1915.

Young herd must consist of boar and three sows farrowed on or after August 1, 1915.

Herd bred by exhibitor must consist of boar and three sows of uniform age. That is, all farrowed previous to September 1, 1915, or all farrowed on or after August 1, 1915, and before February 1, 1916, or all farrowed on or after February 1, 1916.

Get of sire must consist of four animals, any age, sired by one boar, and owned by exhibitor.

Produce of dam must consist of four animals, any age, farrowed by one sow, but not necessarily of one litter, and owned by exhibitor.

Senior champion boar or sow must have been farrowed before September 1, 1915.

Junior champion boar or sow must have been farrowed on or after September 1, 1915.

THE MODERN HORSE

In more than 100 great factory buildings in the middle west are stabled great herds of modern horses. These things of burden differ from the original animals in many particulars, and resemble them in few. The modern horse eats only while it works; the one of flesh and blood eats alike when it labors and when it rests. The modern horse is made of steel and iron; the original of the same elements from which man was created. The modern horse consumes gasoline, or kerosene, with a desert of lubricating oils and tonics of electric sparks; the original horse is fed hay, oats, corn and green stuff from the fields. The modern horse is given life from cylinders, the original from a single heart. The modern horse has a draft power of many tons; the original but one. Like the original horse the modern one requires but a single person to control. Both have pedigrees; both are greatly responsible for the development of our great agricultural resources.

The modern horse is known as the farm tractor. It is the offspring of the automobile, but is bred for performing burdensome tasks, rather than for speed and pleasure. The tractor is the Percheron of the mobile class; the auto the carriage and saddle types. The tractor has been brought to its present stage of developement by the inventive genius of myriads of men in many localities.

The modern horse, or tractor, as it stands on the floor of the factory; in the place of business of the seller; or under the protecting roof of the user, is an inert, inanimate thing of many parts, assembled by skilled mechanics for a purpose. A touch of a small lever, and it responds to the wishes of the driver to do things which have in the past been put upon the willing shoulders of man's most faithful friend—the horse. The farm tractor represents the most modern ideas in the application of power to the service of mankind, with special adaptation to the needs of agriculture, in the plowing of the fields, the cultivation of the soil, harvesting the crops, and transporting them to market.

By a shifting of a gear the modern horse loses the use of its legs—if the wheels which propel it may be called such. Now it relieves the horse of its labors in the tread mill to operate the threshing machine, the huller, ensilage cutter, feed grinder, or for operating any machine which requires the application of power by the belt.

The predominating idea in the modern horse is the elimination of the need of surplus horses as animal work, upon the farm and the substitution of the internal combustion engine, using gasoline or kerosene power in farm work.

Comparing the farm tractor of today to a horse is not a fanciful idea. It is in reality, and in its many adaptabilities, a mechanical horse. It has the power of many horses and the facilities of one. It may be hitched to anything that is to be drawn and operated economically and with efficiency impossible with the use of animal power. If the farmer wishes to plow his fields he hitches two, three or four plows behind his tractor, instead to his plow behind two horses, and the tractor will pull them over the level land, up hill and down, plowing deep or shallow, wide or narrow, as the farmer desires. If the farmer decides that time is short in which to complete his work, he will place behind the plows the harrows which chop up and pulverize the soil. Then behind the harrows he may attach his seeding machine so that the land is plowed, harrowed and planted all at the same time. To do this by horse power would be impossible except in unit teams, and then at the expense of operating ten or more horses at the same time.

The farmer may attach a mower to the tractor to cut his hay, or a harvester to harvest his wheat. He can hitch a corn harvester behind his horse of steel and in a few hours the corn is cut, bundled, tied, and stacked without man assistance. When his crops are ready for market he will hitch a train of wagons or trucks to his tractor and haul them to market. When his corn is ready to shread, or his silo to fill, he slips a belt on to the pulley and the tractor performs its work without attention. He can pump water if he chooses, draw hay or provide fodder for his cattle and do everything which he can do with horses at less expense and much less trouble. The modern farm tractor is a one man outfit for every farming operation.

These wonderful modern horses of steel and iron, fed with gasoline or kerosene and the spark of life provided with small electric magnetos furnishing the exhilarative power, will be shown to the farmers of the great Mississippi Valley during the National Tractor Farming Demonstration in St. Louis on July 31 to August 4 inclusive. Not only one tractor but more than 50 tractors of different makes will demonstrate their abilities to do everything needed on a farm on these dates. This demonstration will be a campaign of education to acquaint the farmers with the new order of things and show them collectively in a few days what they cannot see individually in as many years.

Frank E. Goodwin.

Most Profitable Cattle Ration

Shelled corn, alfalfa hay, and cottonseed meal gave the fastest gains and greatest profit of any of the six rations fed in the recent cattle feeding experiment at the Nebraska Agricultural Experiment Station at Lincoln. The other rations fed the different lots in the experiment were: Shelled corn and alfalfa;; ground corn and alfalfa; shelled corn, alfalfa, and silage; shelled corn, alfalfa, silage the first four weeks, and Tarkio molasses feed the last fourteen weeks; and shelled corn, alfalfa, and cottonseed meal the last six weeks.

The 60 head of two-year old steers used in the experiment were bought for $6.75 and were sold at prices ranging from $9.50 to $9.75; or at a net profit of over $1,100. The cattle were tied in an open lot and under conditions similar to those found on the average corn belt farm.

Get Rid of WORMS and INDIGESTION

Do you know that ninety per cent of all live stock losses are caused by Worms and Indigestion and both these conditions are preventable? Get rid of the blood-sucking worms and you will remove the chief cause of losses. Wormy animals can't thrive; the food they eat is largely wasted; they run down in condition — become easy victims to diseases. Worms eat up your high cost feed — bring on indigestion — cause heavy loss. Get rid of the worms with—

The Great Worm Destroyer **SAL-VET** The Great Live Stock Conditioner

The medicated salt without Antimony. Give your animals free access to it; they'll rid themselves of worms. Costs only 1-12 of a cent a day for each sheep or hog and only 1-3 of a cent a day for each horse or head of cattle. SAL-VET will do the work; I'll prove it or no pay.

DON'T SEND MONEY—JUST THE COUPON

Fill in the coupon below — tell me how many head of stock you have; I'll supply you enough SAL-VET to last your animals 60 days. You pay the freight when it arrives; feed as directed, make a specific report at the end of 60 days. If SAL-VET does not do what I claim it will cost you nothing.

THIS BEAUTIFUL CAR FREE!

Don't You Want To Win This Car?

IN ORDER to increase its subscription list, **The Missouri Farmer** has concluded to give away this beautiful five passenger **Overland** automobile under conditions which place it within easy reach of any bright young farmer girl or young farmer in the state. Everybody almost wants to own an automobile and the wish is an entirely normal one. In the first place, the automobile wipes out distance. If an emergency of any kind arises, the automobile "goes there and back" in the length of time that it takes to hitch up and get started with a team which is frequently tired out from work in the fields.

The Pleasure of Owning a Splendid Car

BUT WHAT normal human being doesn't want to own a beautiful automobile because of the pleasure it gives and who is entitled to this pleasure more than those who live upon the farm? Just think of how gladly you will look forward to Sunday with this splendid car standing ready to glide away at the touch of a button! You can pile in the whole family and go to church on Sunday morning. Then, when dinner is over, you can take a 40 or 50 mile spin into some neighboring county and get back again by supper time. Think of the exhiliration out in the fresh air, the pleasure of seeing growing crops upon every hand and the visits you can pay to relatives and friends!—**and all this accompanied by a riding luxury not excelled by a Pullman Palace car!** Again, during week days when the days work is over you can pile in the "whole bunch" and take in a picture show in town. **Truly, is it any wonder that everybody wants to own an automobile?**

You Can Win It if You Try!

AND THIS beautiful car is within easy reach, as we said above, of any bright farmer girl or young farmer in Missouri. All that is required to win it is first, the **desire**—and then the willingness to do a few weeks **hustling!** Get a bunch of sample copies of **The Missouri Farmer** together with a subscription pad and then "hit the trail." We give three years subscription for one dollar and when you show your neighbors what a splendid paper **The Missouri Farmer** is—when you tell them that it is leading the fight for Farm Club organization throughout Missouri—**and that you want them to help you win this beautiful car!**—hardly a single one of them will turn you down. The renewal of old subscriptions will count the same as new—and should you fail to win the car we will nevertheless give you a **substantial commission on every subscription you send in—so in any case you will make a lot of money!**

Send Us Your Name Today

NOW WE WANT every farmer girl or young farmer who reads this advertisement and who would like to win this magnificent car to send us their name and address today. **Don't be afraid of not winning!** "Faint heart never won fair lady." Again, you don't know how **easy** our plan is for a real hustler. There may be some reason why it would be particularly easy **in your community!** We intend to help everybody who gets into this fight. We will tell you just how to conduct your campaign from start to finish. If there are a bunch of old subscribers in your neighborhood which need renewing we will send you their names. You will have little difficulty in getting **practically every one of them!** You owe it to yourself to find out all about our plan—**and your failure to write us may deprive you of this beautiful car!** If, after you understand our plan fully you do not care to go into the fight you will merely be out a postage stamp. **Isn't such an offer worth at least an investigation?**

THE PEOPLE WHO WIN

THE PEOPLE who win in this World are those who have faith in themselves and who are not afraid to hustle. Somebody who has this kind of will power and ambition is going to win this splendid five passenger OVERLAND. It might as well be you as somebody else. It is for you to say. It costs $695. Why not let THE MISSOURI FARMER buy it for you? And remember that in any event we will pay you handsomely for every subscription.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

For The Flag

As this issue of The Farmer goes to press, war with Mexico seems inevitable. As a matter of fact, the open declaration from Congress is hourly expected—and until the job is finished, every good citizen, irrespective of party, will stand behind the President. Whether the Mexican situation could have been handled more successfully in some manner other than that adopted by the administration is now a matter of unavailing discussion. At last we are confronted by a definite crisis and we must choose between the continued murdering of innocent American men and women or, by force of arms, put an end for all time to this intolerable situation. In such an hour every good citizen will take his place beside the flag as we have done upon other occasions when its honor was trampled in the dust.

If we have erred in our attitude toward the people of Mexico, it is that we have been too patient and long suffering. Possibly if, during the last two years, we had taught them a greater respect for the prowess and certain vengeance of American arms, such a conflict as is now in prospect might have been avoided. And yet even this conclusion is without warrant. In any event it is useless to discuss the past at this late day. Rather must we do our duty clearly and fully by the future.

In the meantime, for Mexico it means certain disaster—for however ill prepared we may be for the task upon which we are about to enter, in the end it means the certain crushing of the tattered and half starved legions which follow the standards of Carranza and Obregon. By this I don't mean to say that it won't cost many American lives before, the struggle has ended—but cost what it may, certain defeat is in store for the Mexicans who present one of the most pitiful spectacles ever recorded in history. Hopelessly ignorant as a people, they have been the victims of unscrupulous leaders who drive them like so many cattle in whatever direction they please. Yesterday they followed the leadership of Madero and shouted for "Constitutional Liberty"—a phrase which less than 5% of the motley aggregation of 15,000,000 souls understood. Today they cry with equal ardor for the blood of the "gringo"—the only Nation which has tried to honestly befriend them. Driven to bay by rival leaders, Carranza hopes to restore himself to popular favor by provoking a war with the United States—a course which is as mad for him as it is for the future of his people.

As a matter of fact, such a course gravely menaces the future integrity of the Southern Republic—for who knows whether, once the flag is run up over the Palace in Mexico City it will ever come down again? I know that at this hour we have no designs upon Mexican territory—but suppose we lose thousands of splendid American lives in the struggle upon which we are about to enter, saying nothing about hundreds of millions of dollars—and suppose that after we have done this, chaos still prevails? And suppose that in view of our insistence upon the Monroe Doctrine, European Nations demand that we stand responsible for the future conduct of the Mexican people? Truly Carranza is playing with dynamite and if there were a half dozen big, patriotic statesmen in all Mexico their voices would ring out above the clamor of the mob against the folly of the things which are now transpiring. We said we didn't want new territory when we entered upon the Spanish-American war—but by the time the cannons had ceased roaring we changed our minds. Who can say now what our attitude will be toward Mexican territory in a year from now?

In the meantime, our lack of preparedness for the coming conflict is a matter of National humiliation. If we were prepared to cross the border with 200,000 well equipped, well trained, seasoned soldiers the struggle would be over in short order. As it is, we will sacrifice as many lives to a lack of preparation as those who will fall through the stern exigencies of normal warfare. And such a state of preparation would be the highest humanitarianism not only for us but for the Mexicans who are headed for the shambles of certain defeat. I want our Country to continue to be the greatest advocate of peace in the World—and yet I don't want us to pursue a policy of unpreparedness from this time forward which actually invites attack and therefore leads to the very opposite of that for which we are striving.

—By the Author of After-Thoughts.

THERE IS DAIRY ROOM IN MISSOURI

A few weeks ago a committee was sent from Ft. Scott, Kansas to Wisconsin, to buy a few loads of dairy cows. One of the committee sent happened to be an editor and while the rest of the members were buying cows the editor was taking notes on what he saw and here is what he wrote when he got home: "Eight miles over the lofty hills north of this rich little city in Wisconsin, nestled in a deep valley and in a comparatively sparsely settled country, the delegation of cow buyers today was entertained in a modern stucco house, lighted by electricity, heated throughout by steam, with its delightful library, sleeping porches, with hot and cold water at high pressure in every room, the kitchen and bathroom, and surrounded by an elaborate set of barns, outbuildings, and silos.

"In the cow barn were 51 head of pure bred Holstein cows, and not a grade was kept on the place. The land throughout this entire neighborhood would be considered in Kansas far too rolling for plowing, yet none of it can be bought for less than $110 an acre, and prices ranged from that minimum up to a $300 maximum nearer town.

"Only fifteen years ago the owner moved onto the farm, which was then considered almost worn out and valueless. He engaged in dairying and has always sold his milk to cheese factories at a maximum of 11½ cents a gallon. He has built up the farm and made the improvements and has $20,000 worth of personal property on it today. We counted four gas engines in different buildings, one busy generating electric current and storing it for a week's lighting and water pressure.

"This farmer is satisfied with an average annual production of $100 a year by each of his pure breds.

"A community cheese factory, a quarter of a mile from his place, is the market for his milk, and it operates throughout the winter months. He employs but one hand and has a 16-year-old daughter and 12-year-old son, who are given practically every social and educational advantage enjoyed by Fort Scott boys and girls."

"It is a common sight in Wisconsin dairy barns to see a young man in his twenties—the son of a dairyman who has acquired a competency, sold his farm to the boy and moved to the village—measuring out grain feed to the cows according to their milking capacity, measuring out skim-milk to the calves according to their age, weighing each cow's milk morning and evening, judging his cows by the score card and keeping a herd of say thirty head with not more than ten acres of pasture on the place by feeding alfalfa and ensilage throughout the summer as well as winter.

"This young man gets up about 5:30 to 6 o'clock and doesn't work any harder than the average Kansas farmer. From thirteen cows we saw one boy selling about $6 worth of milk a day to a creamery and getting his skim-milk back, pasteurized. He had sold $1,600 worth of cows and calves from his pure-bred and grade herd from Nov. 1, 1914, to Nov. 1, 1915. He had an automobile, a furnace-heated house, both hot and cold water, water in every cow's stall and an attractive bride of four weeks, who knew as much about cows and 'short courses' as he and was as much interested in them. He had a 100-acre farm and was selling corn and alfalfa because he had too much feed. Only a few acres of waste land on the place were in red clover and blue grass pasture. He hired one hand.

"This is a fair specimen of a dairy-bred man, which is possibly, as essential in successful dairying as dairy-bred cows."

Here in Missouri we have a better climate and just as good markets and why is it we cannot have thousands of just such farm homes paid for and supported by good dairy cows?

How can a farmer with the help of only a daughter, a 12-year-old son and only one hired man manage to milk and care for, for 51 cows and do the other farm work? The answer is by using labor saving machinery. You will note that there are four gasoline engines on the farm. The milking machine run by electricity solves the problem of getting help to do the milking.

There is a fine opportunity for the development of a great many dairy farms in Missouri equipped like this Wisconsin farm and which would pay as well here as there with the same kind of management. The trouble with too much of our Missouri dairying is that it has been done in a half-way sort of fashion and with poor equipment and poor cows there has been a lot of extra hard work about it and little profit. But for those who make dairying a business as this man has done and who will use good cows and labor-saving machinery there is both profit and pleasure in the business.

SILO FILLING POWER COSTS LESS NOW

ED. H. WITTE

Read These New Engine Prices:

2 H-P, $29.95; 4 H-P, $64.75; 3 H-P, $47.85; 6 H-P, $89.90; 8 H-P, $129.80.

Write for Prices on 12, 16 and 22 H-P,

YOU are sure my prices are LOWER. I am sure my engines are BETTER. Don't you think it would be good business to at least write me before buying any engine at any price?—Ed. H. Witte.

YOU need **dependable** power for silo filling. You need an engine that can be **depended** upon to stand up during the hard pulls. You need an engine that is guaranteed to use not more than one-tenth of a gallon of fuel per H-P. per hour.

That's why you need a WITTE engine.

WITTE engines are built in all styles; Stationary, Hand Portable, Portable and Saw-Rigs, and to operate on Kerosene. Gasoline, Naphtha, Distillate, Gas etc.

Built by experts and sold direct. You have 90 days in which to try one. Cash or easy payments. Established 1870. Largest exclusive engine factory in America.

WITTE ENGINE WORKS,

1849 Oakland Avenue, Kansas City, Mo.
1849 Empire Building, Pittsburgh, Pa.

For Greatest Satisfaction Use

DOUBLE SERVICE Automobile Tires

Guaranteed 7,000 Miles Service

Absolutely Punctureproof

Double Service Tires are made double the thickness of the best standard make tires.

This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof.*

These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.

They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.

Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an Introductory Offer:

PRICES

	Tires	Tubes		Tires	Tubes
30x3 in.	$ 8.60	$2.30	36x4 in.	$17.45	$4.65
30x3½ in.	10.85	3.10	35x4½ in.	21.20	5.60
32x3½ in.	12.75	3.20	36x4½ in.	22.50	5.75
33x4 in.	15.75	4.20	37x4½ in.	23.60	6.20
34x4 in.	16.70	4.35	37x5 in.	26.30	6.60

All other sizes not included in above list also furnished. Non-skids at 10% additional.

Terms: Payment with order at above special prices, a 10% discount allowed on orders for two or more tires. All personal checks must be certified.

Try these tires now and be convinced of their very high qualities. Sold direct to the consumer only.

Descriptive folder upon request. Write for it.

TO GET RID OF WILD ONIONS

The wild onion or wild garlic is a very troublesome weed to get rid of when once well established on a farm and every farmer should if possible fight it from the start when, because of its small area most drastic means are possible. Aside from its injury by crowding out grains and grasses it causes loss to dairymen because of the very objectional flavors it gives to the milk, cream and butter.

The Department of Agriculture gives this method for getting rid of this very bad weed: The wild onion ripens in June or July and produces on the top of the stem, 1½ to 3½ feet high, a cluster or clusters of aerial bulblets, sometimes erroneously called seeds. The underground portion contains from two to six newly formed bulbs located at the base of a plant. The aerial bulblets have soft shells and germinate in the fall. Some of the underground bulbs have soft shells and germinate in the fall, while others have hard shells and remain dormant through the winter months, germinating the following spring.

In Cultivated Fields

To rid a cultivated field of wild onions the work must be started in the fall. The object of this work is to destroy the plants from the soft-shell bulbs before they have advanced far enough to produce new bulbs. As soon as the new plants are 12 to 15 inches high, or during October and November in the South and November and December in the North, the owner should plow his land fairly deep, being careful to turn under all the onion tops. A plow with a jointer attached to the beam will be found convenient for this operation. Disking the land before it is plowed also helps to bury the tops. This method will get rid of the plants which have grown from the soft-shell bulbs.

It now remains to get rid of the next crop that may be expected from the slower germinating, hard-shell bulbs during the coming spring and summer. Next spring, therefore, the field should be planted in a cultivated crop, corn in check rows being best. Another shallow plowing may be necessary in the spring, but ordinarily a disking or two previous to planting will suffice. From the time the farmer is able to go on his land in the spring he should make every effort to keep the garlic from making top growth. The best way to do this is to cut off the tops with a cultivator of the sweep type.

There still may be a few plants carried over by hard-shell bulbs which have been very slow in germinating. The farmer, therefore, should be prepared to repeat the deep plowing late in the fall and to use a cleanly cultivated crop the second spring. This treatment, which can be carried out with little extra labor and expense, has proved in practice an almost certain method of eradicating wild onions in two years.

Late Plowing for Small Grains

Experience has shown that in the case of small grains on infested fields if plowing is delayed until a late date in the fall and the land is then planted to small grain, only a few onion plants will ripen their early bulblets by harvest time the following summer. Since the plowing to be effective against the onion must be done at such a late date as to interfere with the best development of fall-sown grains, spring grains should be planted where it is possible. If fall grain must be sown the farmer should bear in mind that the delayed planting probably will reduce the yield.

Grain raisers in wild-onion districts should be particularly careful to keep their seed free from the bulblets. This can be accomplished by thorough drying before cleaning, as the bulbs when dry are lighter than the grain and can be winnowed out. The safest way, however, is to obtain seed from an outside source where no onion exists or to produce seed grain on a separate patch kept absolutely free from the onion.

Lawns and Pastures

In lawns the aerial bulblets are seldom produced because the tops are kept cut back with the lawn mower, but the plant propagates by producing underground bulbs and is most often found growing in clusters. To eradicate from lawns where the onions are not too plentiful, a good plan is to dig out the entire cluster with the mattock when the soil is soft. The hole thus made should be filled with soil and planted to grass seed. Another successful method for killing onions in lawns is by the use of chemical plant poisons, as coal-tar creosote oil or carbon bisulphide. A small amount of the poison should be applied directly to each cluster. This can best be done by using a small spring-bottom oil can. After the onions are dead the bare spot left should be seeded to grass.

In pastures where there are only a few clusters, the same treatment recommended for lawns is the most advisable. Where the pastures are badly infested, however, and cultivation is practical, it is often more satisfactory to plow and cultivate as recommended for cultivated fields. Pasturing with sheep sometimes proves effective.

Engine "WHY?" Book

One of the cleverest little books on engines that has ever been published, has just been printed by Mr. Ed. H. Witte, a Kansas City engine expert. He says that while the supply of books lasts, he will be glad to send anyone who is interested a copy of this book, which is called "Why?" Just write "Why" with your name and address on a postal or scrap of paper and address Mr. Witte, 184 S. Oakland Ave., Kansas City, Mo.

It sometimes pays the farmer to hold his grain for a higher price, but he does not want to get too greedy. We know a number of men who have wheat in the bin that they were offered $1.50 a bushel for but held for more. That price would look good to them now.

The Missouri Farmer

VOLUME VIII JULY 1, 1916 NUMBER 13

The Story of a Farmer Who Makes Farming Pay

BY W. L. NELSON

A big man—big of body and big of vision—is H. G. Windsor, champion Missouri corn grower and meat maker.

First of all, inheriting from his father 250 acres of choice farming land, which in that day and place was a fair fortune, Mr. Windsor did not allow his wealth to act as a weight or to prevent him from proving his real worth. This may seem a queer statement, but it is a fact that about the worst thing that could be left some folks, naturally contented and self-centered, would be a fortune. To many folk, such a gift would only guarantee failure.

Not so with this man Windsor, who while familiar with a costly eight-cylinder car—a 1916 model bought some time ago, but not paid for with a 1916 note—is alike familiar with his cattle, so much so that he "knows each steer by his first name."

In other words, this eight-cylinder farmer is a farmer in fact. Were this not true he would not have increased his land holdings from 250 to 650 acres and increased the value of each acre in much greater proportion; would not have erected a commodious farm residence with modern heat, lighting and water systems; would not have built good barns, machine sheds and other outbuildings, and would not have been able to "walk away" with the first premium on country-cured hams and the sweepstakes awards on yellow corn at the Farmers' Week state meat and corn shows held at the Missouri College of Agriculture in January of this year.

A good many years ago Mr. Windsor made up his mind that he and his family were entitled to more comforts than were then possible in his part of the county, in his own home or those of his neighbors. Did he sell or rent his farm, "pull up" and go to town, leaving the home community a little poorer for his going? No, instead of going to town to get the things he wanted, he proceeded to bring them to the country. Soon there was a farmers' mutual telephone line connecting with the county seat system, and with a telephone in the house there was less of isolation. Later came the R. F. D. mail route over which six days in the week the mail was delivered almost right at the Windsor door. In the mean time there had been erected a modern farm house with all "city conveniences." With all these improvements naturally came a demand for better roads, so a special road district was organized with Mr. Windsor as president, and the roads improved. With this 365-day road, which brought school, church and town within easy reach, there seemed but few things to be desired. But with the much that he had, Mr. Windsor wanted more—more knowledge as to how to farm well. True, he had gone often to the College of Agriculture for information, had seldom failed to register for the short course offered during Farmers' Week, and had been active in the State Corn Growers' Association and in other agricultural organizations. Still, he was not satisfied. He wanted a county agent or farm adviser for his county. He got him—that's the Windsor way. When three years ago, all the necessary funds were not available for employing this official Mr. Windsor was one of the leaders who pledged the money required. From that day to this there has never been a moment when he doubted the wisdom of his investment. He is enthusiastically for a better agriculture in his home county, and he makes his enthusiasm count. Nor is he narrow. His interests are state wide. For two years he has served as president of the Missouri Corn Growers' Association and under his leadership the work has prospered as never before.

"Yes," you say, "all this is very well, but is this big farmer in the farming game for pleasure or profit, is it a case of hobby or of have to? Of course he could afford all the things you've mentioned."

Yes, H. G. Windsor can afford these things. If not, he wouldn't have them. His system of farming is such as to make possible these improvements and still leave some profits. He likes a dollar just about as well as most folks and can make it go as far as the other fellow. He's no spendthrift. Few men study their business more carefully or keep more complete accounts of receipts and expenditures. He's a real farm management farmer.

First of all, Mr. Windsor is not a one-crop farmer; he has no hobbies. If his study of markets and of conditions tells him that sheep feeding is the thing, then he goes in strong for sheep. If he sees a keen future demand for cattle, he is not long in getting a good drove of steers on grass. If the market generally is "acting queerly" he dares pen his corn and wait; he's no man to purchase a pig in the poke. Gambling and guessing he would leave to the other fellow.

Of course every farmer has his preferences or specialties, and to this rule Mr. Windsor is no exception. He is strong for sheep. During the last ten years he has fed an average of 1,000 head per year. These have been western sheep purchased on the Kansas City market—and just here it may be said that he knows just how to handle these sometimes "finicky muttonheads." That's why he succeeds with sheep. He holds that while there is no kind of stock that will fatten as fast and so readily respond to good treatement, there is no stock that will so easily go to pieces under bad treatment. "Feed what you please," said he, "silage, clover hay, alfalfa, oats, corn, cotton seed meal or linseed meal, but don't feed too much at one time. Keep the feed and feed troughs fresh and clean. The water supply, too, should be ample and good. Fresh running water is best. And don't neglect salt. It is essential. Sheds are not necessary, but I always choose a southern exposure."

H. G. Windsor, a big farmer who makes farming pay big.

Bluegrass has always been a prime factor in the Windsor sheep feeding operations. During the last two or three years, though, cowpeas have played what is perhaps a more important part. This is due to the fact that lambs, rather than older sheep, have been fed. Last fall, Mr. Windsor purchased 1,200 head of Utah lambs on the Kansas City market and shipped them to his Cooper County farm, a distance of 150 miles. These lambs cost $6.80 per hundredweight and after making a gain of 12 pounds per head on cowpeas grown in corn, sold on the St. Louis market at 8½ cents per pound.

One reason why Mr. Windsor likes sheep is that they are constantly adding to the fertility of his farm. Next after sheep, and for the same reason, he prefers cattle. Except during the last two years, "when the cattle feeding game didn't look good," from 100 to 200 head of cattle have each year been fed on the Windsor farm. Generally these have been Pan-Handle yearlings bought on the Kansas City market after careful personal selection. For several years only yearlings have been handled, and always these are "fed out" on grass. In this way the largest and most economical gains are realized. The cattle are started on grass in the spring and are finished for the October market.

"I think too much of my corn, and it is too valuable by far to pour it into cattle without making every ear count. That's why I am an advocate of grass with grain," said the Big Farmer, who is something of a corn king.

Last year (1915) Mr. Windsor grew 70 acres of pure Reid's Yellow Dent corn, the kind he won on at the state show, that averaged almost 100 bushels to the acre. These figures sound big, but actual measurements made in three different parts of the field show yields of 112, 104, and 115 bushels to the acre. Of course it was good ground, made good by the constant feeding of sheep and cattle, coupled with right rotations. Forty per cent of this corn was good enough for seed and found ready sale at from $2.50 to $4.00 per bushel. Forty bushels at from $2.50 to $4.00 per bushel would mean returns of $100 to $160 per acre, with 60 bushels of corn for feed, worth, at market prices $42 per acre. In addition (as if this were not enough) soy beans drilled in with the corn made an estimated yield of five to six bushels to the acre, with a feeding value of $1.20 per bushel when consumed by hogs.

In another 30-acre field, on a distant part of the farm, there was grown Cob Pipe corn which yielded 75 bushels to the acre, and 1,000 bushels of this corn sold at $1.50 per bushel, for seed. The largest cob pipe factory in the world being within five miles of the Windsor farm, an offer of $30 per acre for the cobs alone has been refused.

Another field on the Windsor farm consisted of 100 acres and the yield of corn was 60 bushels per acre. All this corn will be fed to live stock, much of it to cattle on grass.

Hogs are not extensively fed, being principally confined to those that help harvest the corn crop in the fall or that "run after" cattle fed ear corn in open troughs.

The prize ham which Mr. Windsor exhibited in the 1916 State Ham and Bacon Show was from a 220-pound Duroc. This hog was a little past a year old when slaughtered, but had never been pushed except for just a few weeks at the end of the feeding period.

"We get the best of our living at home," said Mr. Windsor, and to look at this prosperous farmer is to be convinced that he lives well. "We enjoy life and have never felt that we had to move to town to get the best that life gives."

THAT "NEW BREED" OF WAGON HORSES

A number of our readers have recently written us in regard to the advertisement appearing in certain farm papers announcing that a new record association had been formed, the purpose of which was to develope a type of horse to be known as the "Wagon Horse." No doubt a great many readers have seen the same advertisement and we desire this opportunity to urge that our readers use caution before they take the matter seriously enough to send in the stipulated "registration fee."

At the outset we will admit that there is a fair demand for wagon horses, that on the leading horse markets buyers are looking for horses suitable for handling single delivery and express wagons and that they prefer a horse around 15:3 to 16:2, weighing 1200 lbs. to 1500 lbs., well made, showing good quality, particularly good, clean feet and legs and with fair snappy action—in other words a good, big, handy horse. So far, there has been little or no difficulty in filling this demand. Most of these horses have come from the middle western states and represent one or more crosses of draft blood on native mares carrying considerable light horse blood. In many cases the horses sold to this demand have been big, active horses carrying mostly the blood of the American Trotter. As a matter of fact, most of the wagon horses are "misfits," that is, they were too light for drafters and too heavy for the light horse trade. There has always been a sufficient number of horses of this type and we see no particular reason why we cannot reasonably expect the future to produce the usual quota. At best, the demand is not sufficient to warrant the establishment of a new breed. In noting the "requirements" for registration in this new association we find that mares 15:1 to 16 hands, weighing 1100 lbs. to 1400 lbs. with plenty of quality are eligible to registry regardless of ancestry. Imagine for a moment the vast number of native mares that are at once eligible —and then try to imagine the poly glot of breeding behind these mares.

It is proposed to mate these mares with registered Percheron stallions 15:2 to 16:2 hands, weighing 1400 lbs. to 1700 lbs. and the result of such a mating will be the wagon horse. The absurdity of such a plan is at once apparent to any one who will give the matter any thought at all. Breeding is not such an exact science as the above plan would indicate. Even with the oldest established breeds there is considerable variation of type after years and years of careful selection and to imagine that a new breed can at once be established by such methods is a falacy beside which the dreams of Don Quixote were profound facts. As long as we cannot expect larger or smaller stallions to breed true to type what reason is there to expect horses of the above mentioned heights and weights to breed them? None. The young stuff produced within an association founded on the filmy plan of the one proposed, will show the widest of variation. Some will develope into ton horses, others will be little undersized chunks, yet all will be "registered wagon horses" and be privileged to have a registry number. Again, suppose that most of the foundation mares carry one or two top cross of Percheron blood—they are grade Percherons and when mated to Percheron stallions the offspring will be a higher grade and in the course of a few generations the wagon horse will be a very high grade Percheron.

The whole plan is fundamentally wrong and is simply a case of "taking the longest way home." The outcome, provided this scheme of breeding is carried on for a number of generations will end in the production of something we already have. It is proposed to start with Percheron sires and end with nearly pure bred Percherons. Why not save a lot of time by simply insisting that the mares be very high grade Percherons? Or simplier still, providing there was a real need for such a type, why not select light weight pure bred Percherons.

A further fact to consider, every record association of standing has been developed after the type had become fairly fixed and was started for the sole purpose of restricting the future development of the breed to certain limits. In other words the breed came first and then the record. To build anything of permanence the start must be made at the foundation and built up. Viewing the proposed plan in the light of past experience we feel constrained to warn our readers to investigate before they send in the registry fee to an association founded on the whim of a single man and based on no more firm foundation than height and weight with the preference given to mares with a star and one white fott.

R. P. Royce.

MAKING THE 1917 WHEAT CROP

Wheat was grown in China several thousand years before the Christian era but there has been a great improvement in the quality, yield and the methods of growing it. Wheat is the world's great bread crop and one year's failure of the crop would cause thousands to starve and millions to go on scant daily rations. The farmer who grows wheat successfully not only has the profits from the crop but has the sentimental reason that he is helping to feed the world.

For the last three years the average wheat crop of the world has been approximately four billion bushels. The difference between the highest and lowest crops in the three years has been only about 16 per cent. Nature has given the people a great protection against famine in the great diversity of soils and climates of the different countries and so even with a failure in any single country it is always possible to get enough to tide them over temporary deficiencies.

During the last three years the United States has grown a total crop amounting to 763,380,000 bushels in 1913, and 871,017,000 bushels in 1914, and the largest crop in our history 1,011,505 bushels last year. This large yield helped to keep the price of flour down and has been of great relief to the millions in the war stricken countries of Europe.

But I am not going to write about the history of wheat growing or try to analyze wheat statistics as interesting as they might be made. I have in mind the 80,000 farmers who annually sow from a few acres to a few hundred acres which make up the wheat crop of Missouri. Fewer than one-third of all Missouri farmers grow any wheat at all and there are many farms where wheat is seldom if ever grown, but in more than half the counties of the state it is an important crop and a failure is seriously felt not alone by farmers who raise wheat but by all others.

There have been few years when there was greater damage to the wheat crop by winter-killing than there has been this year and for the cause or at least a large part of it we must go back to time of seeding last fall. On account of wet weather last year there was a very rank growth of summer grasses and weeds and this was turned under too late to decay last fall and too late to get a firm seed bed worked down. The result was that the large cavities in the plowed land furnished storage room for a lot of water and when this froze after the snow was off it lifted the soil up and the wheat was killed. Once in many years it may work all right to plow the ground late and sow the seed immediately but the rule should be to plow early and work into a fine and firm seed bed before sowing.

In plowing stubble land for wheat, if the land can be plowed in July or early in August we would plow pretty deep but later plowing should be more shallow. The reason for this is that the early plowing has time to settle down and the working and the rain together will firm and pulverize the soil particles to the bottom of the furrow. On good land 7 or 8 inches is not too deep for early plowing but for September or October plowing about one-half that depth will prove better for the average year.

While the turning under of a heavy growth of weeds and grass is a good thing for the land at any season it is not the best thing for the next wheat crop to turn under this vegetation so late in the season that it has no time to decay. A better plan where it can be followed and where the plowing is delayed is to pasture the field closely with sheep. We have seen this practice followed in Western Indiana where a large acreage of wheat was sown and it proved successful. Farmers who owned no sheep would borrow a large flock from some sheep owner and turn them on a field when in a few days the field was eaten bare. It is better to do this than try to pasture the weeds off with a small flock. After the weeds are eaten off in this way the ground will plow much better because the weeds are not drawing the water out of the soil and it will also take less work to get the seed bed in condition.

But whatever plan is used every wheat raiser should endeaver if possible to have all his wheat ground plowed by August 15 and as much sooner as it is possible.

It is not necessary in this article to discuss the methods of working down the seed bed more than to say that if there are frequent rains after the ground is plowed it will only be necessary to cultivate the surface enough to keep down any growth of weeds. With a reasonably dry year it will be best to use some implement like the weighted disk to fine the soil to the bottom of the furrow. If no disk is on the farm a good cultivating with a corn cultivator with the long narrow shovels is a very good substitute for the disk.

In the selection of seed it is usually best to take one of the standard varieties which has proven itself in the neighborhood. The Missouri Experiment Station recommends the two old

(Continued on page 12)

ATTENTION FARM CLUBS!

From the records on file in our office we estimate that there are nearly 500 Farm Clubs in existence in Missouri at this time—and the most of them are the direct result of the great fight which The Missouri Farmer has made for farm organization. As soon as the rush of corn plowing and harvest is over we believe that the Farm Clubs in the different counties should plan a big two days, county-wide farmers' mass meeting. On the first day splendid speakers can no doubt be obtained from the Agricultural College and from the State Board of Agriculture. On the second day I will try to be present at as many meetings as possible to discuss the subject of Farm Organization and on that day a powerful County Farmers' Ass'n should be formed and the work of perfecting school district Farm Clubs pushed with renewed vigor until the farmers of the entire county have been banded together.

In other words, this two days' mass meeting should be made the greatest farmers' "Love Feast" and picnic that has ever met in the history of your county. The discussion of partisan politics by candidates for political office should be barred. In other words, the entire time of the two days' meeting should be devoted to the discussion of Agricultural problems and Farm Organization. In order that the various speakers may address three or four such county mass meetings per week, the various dates will have to be arranged on the "circuit" plan in the same section of the state. In the meantime, a powerful committee of farmers should be appointed reaching into every township in your county. If the matter is handled in the right way it will "set your county afire" for this great movement upon which depends the future of our farm homes. I trust this matter may be taken up immediately by every Farm Club in the state and I will gladly help in every way possible.

William Hirth, Publisher,
THE MISSOURI FARMER, Columbia, Mo.

Co-operation That Works

By J. W. SHORTHILL,
Secretary Nebraska Farmers' Co-operative Grain and Live Stock State Association, in an address before the Kansas Board of Agriculture.

Co-operation is an idea that is ancient in its origin and vast in its scope. Some seem to think it is a name for something new. Nothing could be farther from the truth. Co-operation is as old as society. It is as old as the human race itself. It is co-operation that has brought society to its present high development. The civilization of a race or a people is accurately measuerd by the co-operation found among them.

It is vast in its scope. It touches every phase of our social and business life. It enters into the most commonplace of our activities and the most simple of our relations to those about us. Imagine a man living in any community and not co-operating with the people of that community. Imagine the impossible proposition of a man trying to be a member of society and refusing to co-operate with the other members of society about him. Imagine a man trying to conduct any kind of a business enterprise without co-operating with any of his fellows in business.

Must Co-operate in Neighborhood Work

What would you think of a farmer who lived seven miles from town and who refused to co-operate with the other farmers who lived along the way in keeping up the road to town, or who would not assist in keeping up the public schools and churches or other public institutions of the community, or who would not assist with enterprises for the benefit of the community in any way? You would think of him exactly as the city man is thought of who shirks his duty in assisting in support the institutions for the upbuilding of the city.

And suppose that some bright morning this good farmer living seven miles from town should find that his good neighbors had all left him in the night; that he could not find a single one of them working in their pleasant fields or hear them as they went whistling about their well-stocked barnyards. What a change would come over him when he found that he had no neighbors left, none with whom he could co-operate and none to assist him in building up the community! How it would be brought home to him that after all we live very largely for each other!

And how could this same good farmer maintain the roads, support the schools and successfully conduct them with the vital interest in their work that comes from the association of the children of his neighbors with his own, and how could he hold up his church and social ife where the real foundation had been the very presence of his good neighbors? And what would be the effect on the value of his farm land, no matter how fertile its soil, how copious the rains or how lifegiving the sunshine? How such an event would take the real life out of his living!

Let me illustrate the vital nature of co-operation as it touches our social, political and business life. Suppose that I became dissatisfied with the service of the telephone system of which my telephone is a part. I decide to quit using the system. I decide to make one of my own. I purpose to control it all myself. I will invest all the capital and assume the entire management. I am going to have a system that I can use without interruption or interference; and as I find that the present interruption and interference come largely, if not entirely, from the other people who are using the system, I decide that I will not allow any one but myself to use my system. But I find that I can not talk over my system unless it connects with other telephones, unless they are on my line, unless I have the use of the connecting wires. I find that my ideal telephone system would be entirely useless, and I find that if I want to use a modern telephone system I must be willing to allow others to use it the same as I do. If I have my telephone on a workable system it must be connected up with the network of wires that cover the community and make rapid communication possible, and I must be content to adjust my use of the system to the needs of others who use the same system. My messages over my system without connecting wires will not go far, but they will go as far as the achievements of my social, political and business life will go if I take out of them the maze of threads of co-operation that connect my interests in the community with those of all my fellows.

Co-operative institutions can always succeed, because co-operation will always work. They may also fail, but only because their members fail to co-operate. With real co-operation there is no failure; it always works. But co-operation will not work in the sense of doing the work itself. It is only a means and not an end, and it is just as essential, yes, even more essential, that good judgment, modern business methods and live energy be the controlling elements in the operation of a co-operative business institution as in any other business institution.

Allow me to suggest that co-operative institutions must do three things if they succeed, and I will give some illustrations of actual conditions that they must remedy. The prime object of co-operation is to do business more directly and thereby more economically. It then appears that the ideal condition would exist when the producer deals directly with the consumer. Let us see what are the results of such attempts.

A renter moved to a new community. It was necessary for him to buy supplies. He needed corn. He went to his neighbor just across the road who had a big crib of corn and tried to buy. But the deal could not be made, and finally the renter went seven miles to the elevator, bought his corn and hauled it home, and later the neighbor shelled his corn and hauled it the same seven miles to the same elevator and sold it. The same thing has often happened with the feeder of live stock in a grain-growing community. Farmers of Missouri have wanted to buy hay from the farmers of Nebraska, but they did not get together, and the Nebraska farmers went to the central markets to sell their hay and the Missouri farmers went to the central markets to buy.

Co-operation Simplifies Business

Just why did not the renter and his neighbor get together directly? For two reasons: first, the neighbor did not want to open his crib for a single load and sacrifice the time it would take to do it; and second, he was not ready to sell his corn. The same things prevent feeders and farmers from getting together, and force the feeder to usually pay over the market price for his grain. The Missouri farmers did not get together on hay business with the Nebraska farmers, for two reasons, first, the Missouri farmer wanted to buy for less than he must pay in the central market, and the Nebraska farmer wanted to sell for more than he could get in the central market; second, the Nebraska farmer was not ready to sell just at the time when the Missouri farmer wanted to buy.

From these illustrations it may be plainly seen that the three things that a co-operative business institution must do for its members, in order to assist them in dealing as nearly direct as it is practical to do, are these: first, a supply that is fairly uniform must be maintained; second, a demand that is sufficiently uniform to care for the supply must be found, third, it must establish the price that the seller must take and the price that the buyer must pay. The three things might be summed up in two statements, as follows: the co-operative institution must render a service in getting the original seller and the final buyer together at the time that is suitable to the convenience of both of them, and it must set the margin between the price the one receives and the price the other pays.

All of which means that the co-operative institution must become nothing more nor nothing less than a middleman. It must collect a supply and find a demad to consume it, and it must retain a margin for performing that service that individuals can not perform for themselves. If the institution is truly co-operative in spirit and practice it will perform the service with the highest possible efficiency and establish a margin that is entirely just.

Co-operative institutions cannot successfully operate with the same objects in view that other business of a corporate nature has in view. Private corporations operate to make good markets. Individuals invest in private corporations for profit on the investment. They invest in co-operative corporations for the benefit of the members. In private corporations the prime idea is the dollar, the man is an incident; but in co-operative institutions the prime idea is the man, the dollar is an incident. In private corporations the profits are unlimited. In co-operative institutions they are limited.

Co-operative institutions must deprive their members of two things that the private corporations guarantee them. They must not allow unlimited profits and they must not allow money to vote. This does not mean that the investor in a co-operative institution must be deprived of profit on his investment. He must have it. The investment must be safe and the returns reasonable. The stock of a co-operative company that pays no dividends will go down in the market just as surely as the stock of any other company or corporation that pays no dividends. Co-operative institutions must pay interest on the investment, but the rate must be reasonable and must be positively limited. Since the prime idea of the co-operative company is the individual, it must be the individual that votes.

Co-operative institutions must take a margin for transacting business just the same as other business institutions. They must make a margin that will create a surplus corresponding to the profits of other institutions, and it is just as vital that they create such a surplus as it is that any other business institution make a profit. Co-operative concerns that close a year with a deficit will find the market value of their capital stock declining just as rapidly as will the market value of the stock of any business concern that loses money.

When a margin is accumulated by a co-operative company one of the vital elements in the success of the company depends on the method of the distribution of the accumulated surplus. The surplus should be used, first, to pay expenses; second, to pay depreciation; third, to pay interest on the investment; and lastly, the remainder should be returned to the members in proportion to their business transactions with the company.

Co-operation will work for any company that will use good judgment, good business methods and apply energy to the execution of the co-operative plan of doing business. No co-operative company can succeed in retaining all of the benefits of the operation of the company, both direct and indirect, for its members. The establishment of a co-operative company in any community will in an indirect way benefit every member of that community, but the direct benefits should go to the members of the company, otherwise it will be difficult to obtain and retain membership.

The Proper Lubricating Oil for Your Tractor

is highly important.

You have no single piece of farm equipment which costs more, or which performs such an important service. To use an inferior lubricating oil on these machines is poor management. Get an oil that is manufactured by reliable, experienced refiners, and made expressly for the lubrication of tractor engines.

Stanolind Gas Engine Tractor Oil

is the oil to use in tractors where kerosene is used as fuel.

It is made to withstand high temperature conditions. It adds power and life to your engine. It eliminates the trouble of scored cylinders. It reduces friction to a minimum. Where friction is minimized, repairs and exasperating delays are minimized.

It is highly efficient for lubricating the bearings of all harvester machinery, and for heavy gearings of tractors.

Standard Oil Company

Bigger Crops Better Farms

Ditching and Terracing

MADE EASY. Bigger crops, better farms and better roads assured if you use the

Martin FARM DITCHER AND ROAD GRADER

10 days' trial
Money-back guarantee
Thousands in use
All Steel Lasts a Lifetime

Cuts V-shaped ditch to 4 feet deep. Builds levees; grades roads; cleans out old ditches and laterals. Cuts and works out dirt at same time. SIMPLE—PRACTICAL. No wheels or levers. Adjustable and reversible.
Does work of big machines. Write for free book and introductory proposition.
OWENSBORO DITCHER & GRADER CO., Inc., Box 837, Owensboro, Kentucky

MORE ALFALFA LESS TIMOTHY

The leading hay crop of the United States is timothy but in the light of our present knowledge of the feeding value of different kinds of hay we can not see how timothy can continue to hold first place much longer. Timothy and a mixture of timothy and clover constitute the bulk of Missouri's hay and timothy makes a most excellent roughage for horses and because of its adaption to nearly all our soils and because it is so easily made into hay it may continue to be an important hay crop for years to come but if farmers fully understood the advantages of alfalfa and clover particularly for dairy cows and all cattle as well as a part feed for horse and mules much more of it would be grown.

Any man who is milking surely knows that he can get more milk from feeding a ton of clover or alfalfa hay than he can get from the same amount of timothy. If he has had any experience in growing clover or alfalfa he knows that he can grow more hay to the acre with these crops than he can with timothy. A mixture of timothy and clover will produce a great deal more and better hay than timothy alone. When we add to the bigger yield and better quality that these crops will make over what timothy will do the value of alfalfa and clover to the land they grow on we are at a loss to know why any farmer will continue to grow straight timothy unless it is on land too sour to grow the legumes.

The average composition of alfalfa and timothy hay according to Henry is as follows:

	Timothy Hay	Alfalfa Hay
Water	13.2	8.4
Ash	4.4	7.4
Protein	5.9	14.3
Fiber	29.0	25.0
N. free Extract	45.0	42.7
Fat	2.5	2.2

It will be seen that unless something is fed to make up the deficiency when feeding timothy that there will be a shortage of milk because the solids not fat in the milk come from the protein. There is nearly twice as much ash or mineral matter in alfalfa as there is in timothy and hence its greater value for feeding growing animals which must have food for bone making.

When fed with corn silage either to milk cows or to young growing animals bright alfalfa or clover hay is worth a great deal more than timothy and the farmer who has this class of stock to feed or who has old land to build up had better study up on these two legumes.

WHY PEOPLE LEAVE THE FARMS

To The Missouri Farmer:

One reason why so many farm women do not like the farm and farm life is because the home is not provided with even the simplest conveniences and comforts. Many a young wife and some older ones has literally dragged her husband and family away from the farm to town where house work would be easier for her. The husband in most cases being skilled in farming and unskilled in other lines could make twice as much clear money on the farm with crops and live stock as he could working at a mechanic's trade or clerking in a store, but so many young people think to live in town is to be somebody while to live on the farm is simply to be common farmers. Men with muddy boots and women with calico dresses.

One of the most disquieting features of the social condition of our times is the rush of young men to the cities, resulting from this is the weakness and instability of the farming population as compared with the same class half a century ago. Many young people go to the cities to get positions at big pay but when they get there they find those places already taken and they take the first opening they can get that offers wages and most compaines keep them at the same wages as long as possible even though they are worth more.

As matters are, the cities are great destroyers of human life. A tour of the principal streets, halls and meeting places on Sunday evenings in any city will show how terribly true this is. Certainly, one-fourth the population of many of the cities has no real business there. These people are doing nothing that is effective for themselves or helpful to others.

Every farmer should take some good farm papers for his boys and girls to read for they cause them to think more about the farm and to see more pleasure in country life. Boys and girls should not be made to work too hard on the farm. All young people are pleasure loving and enjoy some kind of entertainment. Many boys and girls have been made to work on the farms in a way that has caused them to hate the farm and farm life and the first chance they get they go to the cities.

Many people move to town where they can send their children to high schools, this could be checked by having one well equipped school in each township. At present a very large percent of the business men are men who were reared on the farms and the indications are that a very large percent of the leaders of the future will come from the same source, therefore it is necessary that the children in the rural schools should receive better training than is being given them now.

Many of the ablest men of today have been hampered by lack of early training and nothing can ever make up for the lack of this training. If the state wants its citizens to be successful in the future it must no longer neglect the early training of those who are to bring about the conditions which will accomplish the desired results.

A good high school located in each township presents the opportunity. The school rooms should be thrown open for social functions, holiday celebrations, lectures, musicals and for all kinds of meetings of social or educational character.

At every school house there should be organized a farm club so the farmers could cooperate and enable them to sell their products at more profit and buy their goods cheaper.

Wilbur L. Siddens,
Albany, Mo.

SAM JORDAN'S SENSE AND NONSENSE

I saw where a fellow in Kansas City was arrested for trying to get a ticket agent at the Union Station to hurry a little in selling him a ticket that he might catch a train. Will say that that Kansas City town has a reputation for pretty good speed but it is not with reference to speed at the ticket office at their Union Station. I have been about a bit and I have never yet seen so aggravating a place as that ticket office. Many train connections are very close, and more than once I have had less than ten minutes to leave a train, get to the ticket office, buy a ticket and try to catch the train out which I have done a few times by making a run part of the distance.

Great crowds are at the few ticket windows that happen to be open, and it is surely disgusting as well as aggravating to watch those fellows selling tickets move. They rush (?) around fully as fast as snails. Of course they should be excused for their labors are no doubt very arduous, and back breaking, and nerve racking, and the patrons should be entirely willing to miss a train now and then rather than complain and get arrested. Any way, when people buy tickets it is not for the accommodation of the railway companies, but solely for the accommodation of the party buying the ticket, and rather than ask those over-tired agents to speed up a bit, the patron should be willing to miss a train or even get arrested. Great old speed boys in that ticket office.

* * *

Not long since a lady bought a ticket at the Union Station in St. Louis, and asked the agent when the first Wabash train was out to the west, and the agent made reply that his job was to sell tickets. For her to go to the place provided for information. That must have been a very imprudent lady. All ladies should be familiar with the rules and regulations, for there are only a few thousand of them. All ladies should also be supposed to know all about all train schedules, so as not to annoy these over burdened ticket agents, by asking any such foolish questions about train information.

* * *

Courtesy is the one most valuable asset in any kind of business. It is always the cheap employee that practices any thing else. The time was when it was a dangerous thing to ask a depot agent a question, and little less menacing to ask a question of a railway conductor. The business of the one was to sell tickets, and that of the other was to collect them, and it was presumptious for any one to ask for any information since it ought to be the duty of all who travel to know all train connections, and such, and not bother these distinguished gentlemen.

Such is not the case now very often, yet we older ones who have had it "slammed" into us so often in former years are yet shy on asking questions of railway employees. It is now commonly the case that the railway men have turned down these important gentlemen and put in their places men who know and practice the most courteous manners in their attitude toward their patrons.

* * *

Not long ago a man who had been stopping at a certain hotel more or less for eight years happened to be short of money to make the next town, and he had reached the town late in the night and had to make an early train so that he had no chance to get to a bank as he commonly did in that town. He asked the night clerk if he would cash a small check, and the clerk replied "We never cash checks." The customer said, "very well, it is the last chance this house will ever get from me." Had this little important hotel clerk had just fairly good sense, he might have said, "I am only a clerk, and am instructed not to cash any checks. I would be glad to help you if I dared do it," I am sure the guest would have taken no offense, but the clerk would have it appear that he himself was boss of the hotel, and to have admitted that he was a clerk would have been very humiliating. The guest did in no way blame the clerk for obeying rules, but he did blame him for a lack of common courtesy, and should the proprietor ask that guest to return he might make it conditional that the clerk be discharged or at least reprimanded. Business houses of all sorts at this age of civilization, are using great care in the selection of their hired help, to see that they have this one great asset, and business houses are often blamed for either carelessness or indifference in this matter. Many young folks have not yet found out that this is an all-important matter, until a dismissal or some such severe lesson has taught them.

* * *

I saw where some doctor guy said that Americans eat too much salt. That the cannibals of the South Sea Islands will not eat an American because of the salt flavor of the meat. It would seem to indicate that we are not treating these cannibals right.

* * *

One of the worst mistakes that one can make is to assume some authority he does not have.

* * *

It seems though, that a lot of us don't do much but growl, anyway.

WHEN TO CUT TIMOTHY

The value of timothy hay on the market will depend largely, as the farmers of the state well know, upon the degree of ripeness of the timothy when cut. The farmers of the corn belt generally follow the practice of cutting the hay July 1-15 when the timothy is nearly or quite ripe. This gives a large yield, the weather is rather settled, and the hay cures better in this mature stage and is regarded as better for horses. Moreover, this is a convenient season for haying from the standpoint of corn cultivation.

Investigations at the Missouri Agricultural Experiment Station show that with all the above mentioned advantages in this time for the haying season that this is not the time to obtain the best hay for all kinds of stock. The earlier that the timothy is cut the more digestible and also more palatable will be the hay produced. That is to say, by actual test the cattle not only prefer it to riper hay but they receive more nutrition for growth than from an equal weight of riper hay. Timothy cut from June 20 to July 1 or from the time when in blossom to the time when the bloom is shed will give a higher yield of digestible nutrients than if cut when the timothy is ripe.

Moreover, the records show that weather conditions on the average are as good for fair weather about June 20 as they are from July 1 to July 15. In five years of harvesting in the Station's experiments only one cutting of timothy made about June 20 was damaged by rain. There was also one cutting of the ripe hay made about July 15 which was so damaged in these same years.

It is well known that timothy cut about June 20 will have a bright green color and better aroma than the riper hay which usually has a faded yellow color and an odor of dried dead grass. To sum up, cut the timothy about June 20 for large yields of nutritious, palatable and high grade hay of good color and aroma.—L. D. Haigh, Missouri Agricultural Experiment Station.

SIZE AND EFFICIENCY OF TRACTORS AS RELATED TO NUMBER OF ACRES

The following data as to the relation between the size of the farm and the size and efficiency of a tractor are based on an analysis of reports on tractors from nearly 200 farms in Illinois which employ tractors of different sizes. These reports, which were collected by the department, have been carefully studied and the opinions and actual experience of individual users have been analyzed and condensed into tables and certain conclusions in Farmers' Bulletin 719, "An Economic Study of the Farm Tractor in the Corn Belt." The authors, after pointing out that every improved farm machine permits one man to accomplish more work, call attention to the obvious and well-known fact that a farm business must be of sufficient size to permit of the economic use of such a machine to justify investment. In consequence, many small farms either must use the old methods or must hire a modern outfit, as the amount of work to be done each year may not warrant owning a machine.

Among the more important facts disclosed by a study of the use of the tractor for farm work, are those relating to the increase in the acreage which can be farmed by one man, when a tractor is used in connection with horses, over that farmed with horses alone. Approximately 75 per cent of tractor owners in Illinois state that the tractor has proven a profitable investment to them. Of this number one-third, after the purchase of the outfit, increased the acerage which they were farming, the increase averaging about 120 acres per farm. On the other hand, of the men who found the tractor unprofitable, only one-twentieth increased their acreage after purchasing the tractor.

Minimum Acreage

The acreages given in the following table are the figures furnished by nearly 200 farmers in reply to the question, "What do you consider the minimum size of a farm on which a tractor the size of yours can be used profitably in your section?"

Size of tractor.	Minimum size of farm on which it is profitable (owners' estimate).
2-plow.....	140 Acres.
3-plow.....	200 Acres.
4-plow.....	250 Acres.
5-plow.....	320 Acres.

The average size of farms on which tractors of the different sizes are being used, however, are considerably above the minimum figures as given, the average size of farm employing a 2-plow tractor being 270 acres and a 5-plow tractor 420 acres. A few of the larger outfits are reported as being used, but the numbers are not large enough to furnish reliable figures. In many cases these larger tractors were bought principally for custom work, and had no relation to the size of the owner's farm.

One hundred and forty-six tractor owners in Illinois who had bought outfits of widely varying sizes, asked to recommend sizes of tractors best adapted to their size of farms, reported as follows:

Acres cropped.*	Average acres cropped.*	Total number of recommendations.	Percentage of different sized tractors recommended. 2-plow tractors.	3-plow tractors.
			Per ct.	Per ct.
200 or less.....	156	39	25	41
201 to 300.....	252	50	14	32
301 to 450.....	361	39	8	21
451 to 750.....	503	18	0	11
All recommendations....	...	146	13	29

Acres cropped.*	Perectages of different sized tractors recommended. 4-plow tractors.	5-plow tractors.	6-plow tractors.	8-plow tractors.	10-plow tractors.
	Per ct.	Per ct.	Per ct.	Per ct	Per ct.
200 or less	31	2	2	0	0
201 to 300	46	2	4	2	0
301 to 450	38	13	10	10	0
451 to 750	39	22	6	22	0
All recommendations...	39	8	5	6	0

*Includes only land actually tilled and planted to crops.

From this it will be seen that the 4-plow tractor is recommended by a larger perecentage of experienced owners than any other size, although many of these men at present own outfits either larger or smaller than this.

Sizes for Different Acreages

In deciding as to the size of outfit to purchase, careful consideration should be given to the various jobs for which the tractor will be used and care exercised to obtain one with ample power for the heaviest work which will be required of it. This may be either field or belt work; probably it will be the latter more often than the former. Quite frequently the work of a tractor in driving a grain separator or ensilage cutter requires more power than the plowing, and in such cases the tractor bought should be powerful enough to handle the belt work properly.

On the other hand, if the belt work which will be required of the tractor will not demand a great deal of power, while there may be considerable amount of plowing it will be desired to complete within a limited season, the tractor should be capable of pulling enough plows to enable the work to be performed within the time available.—Weekly News Letter.

THE VALUE OF SWEET CLOVER

The chief value of sweet clover for Missouri conditions is as a green manuring crop. Being a legume, it has the power of gathering nitrogen out of the air and storing it in the soil by means of the bacteria which live upon its roots. Since it makes such a heavy growth and does well on thin lands, it makes a good crop to turn under to improve the soil.

The value of sweet clover as a pasture or hay crop is much disputed. Some farmers regard it as practically worthless and consider it a weed, while others apparently have had good success with feeding it. Its foliage has a bitter taste due to the cumarin it contains and its stems have a tendency to become woody as they mature. If not allowed to become too rank before pasturing, or if cut for hay before the first bloom buds appear, these two objectionable features may be avoided to a considerable extent and very good feed obtained. It has been found, too, that stock will learn to eat it, and after being fed or pastured on it do not object to the bitter taste as at first.. Since it is a biennial, sweet clover may take the place of red clover in the rotation on those lands where the latter does not thrive well, but on the best lands it cannot compete with either red clover or alfalfa for hay.

The fact that the bacteria in the nodules on its roots are capable of inoculating alfalfa has led to the idea that it is a valuable crop to occupy the land immediately before seeding alfalfa. This may sometimes be done, but usually lands that have never grown sweet clover need inoculation for it as well as for alfalfa. It has been found necessary to inoculate the soil on the Experiment Station field at Columbia for sweet clover, and even with this precaution, considerable difficulty has been experienced in getting a stand. It is evident, then, that it is frequently more difficult to obtain a good stand than one might expect from a general survey of the habits and characteristics of the plant.

The Long, Blue Chimney
of the
NEW
PERFECTION
OIL COOK STOVES

is the key to perfect combustion. This most desired of cook stoves is easily filled and is always ready.

Think of the comfort of touching a match to a wick and in a minute having any kind of a fire you want.

Think of doing away with excessive heat of a coal or wood-burning range, and at about one-third the cost.

Think of no blackened cooking utensils to scour.

You can't afford to be without one this summer. Write for booklet giving full description and prices of the various types.

For best results use Perfection Oil. 35

THE AMERICAN HORSE THROUGH ENGLISH EYES

The following article which appeared in a recent issue of the London Livestock Journal will no doubt be read with interest by Missouri horsemen. It constitutes an unusually frank appreciation of the American horse. While no doubt a great deal of credit is due the Percheron we believe that considerable credit must be given the American Trotter, the American Saddle Horse and the Thoroughbred for the quality remarked by the English writer. Beyond doubt, the dams of a great number of the very horses in question carried considerable blood of the above breeds.

"Close observers of the heavy army horses that have been brought over to England from U. S. A. must surely have been struck with their tremendous bone and scale, blended with a quality, at times, that appears quite startling in such massive animals. We particularly refer to gun teams, big, wide, heavy, intelligent, docile horses, with the unmistakable stamp of quality marked on their contour, both over their tops and below the knee. Inquiry elicits the fact that the American preference for the Percheron and the cross of that breed is responsible for the big proportion of all the draft horses imported being of the stamp we speak of—a foreign and unfamiliar look about the heavy frame, but a thoroughbred, or, say, a bloodlike, appearance ever and anon peeping out of the horse at some point of its make-up. We now have it on the authority of a Chicago expert that this preference for the Percheron horse is largely due to the "freeness" of hair on the limbs. The American breeder, especially in his rainy season, cannot be bothered with a lot of hair, conducive to a great deal of trouble in the way of scratches or grease.

"Whence comes this 'breedy' look about the Percheron stock now in this country on war duty? The answer is quite easy. It emanates from a Thoroughbred stallion fatefully named Gallipoli, who, when crossed on the French draft mares of his day and generation, impressed himself to a remarkable degree on his progeny, and on that progeny the Percheron breed of horses was founded. After he had served his refining process the French breeders established the undoubted heavy weight that the Percheron now boasts of by continually selecting horses with weight to breed from. The premier Percheron stallions at the moment in U. S. A. weigh practically as much as the Shires and the Clydesdales over there, and their limbs are much more free from feather or hair.

"The cross of the Percheron stallions imported from France and bred in the U. S. A. on the native mares has undoubtedly produced a very useful general-purpose horse, which gives every satisfaction to the English government buyer where the animal has sufficient weight for heavy draft work. The medium-sized horse, weighing from 1,250 pounds to 1,500 pounds have been the most useful general-purpose horses. They are very tractable, active, and maintain themselves on less food than many other types or breeds of horses. This class of animal has supplied our Government with some of the best gunners they have had from any source. In short, quite 60 per cent of the gun teams that we possess today are bred on Percheron lines, and the Thoroughbred cross in the French breed has been wonderfully potent, and has produced a horse with very much the same breeding as the heavy gunner that at one time came from Ireland. The stallion Gallipoli, therefore, possesses the key to the secret which puzzled us not a little when we first saw a string of Royal Field Artillery horses marching through London, boasting weight, clean limbs and heels, the intelligent look-out, the well-set-on head and neck of the Thoroughbred, but the limbs of a Harold, a Premier or a Vulcan!"

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII July 1, 1916 No. 13

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

MOW THE WEEDS

We know of nothing much more unsightly about the farm than roadsides and fence rows overgrown with brush, biars and weeds, but in some neighborhoods, we are sorry to say, this is the rule and not the exception, as it should be.

There are plenty of reasons for keeping the weeds along the roadside cut down. These are economic, sanitary and esthetic but in some neighborhoods the reasons have not yet been found out. If weeds are cut twice a year it will prevent most of them from seeding and will prevent these weeds spreading all over the farm. It always did look to us like there was something wrong with the man who kept his fields well cultivated but permitted the weeds along the roads and in waste places to grow and yearly reseed the farm. Then if the weeds are kept down two or three years a stand of grass can be obtained that will furnish hay or pasture and bring a little return for keeping the roadside in order. It is a well known fact that rank growing vegetation allowed to grow and decay is contributory to miasmatic diseases, hay fever, etc., and they also furnish harboring places for reptiles, rodents, insects and other pests the farmer must fight against.

The esthetic value on any community of good fences and well kept roadsides is wonderful. We think a farmer will work just a little harder to clean up the waste places, and to keep his crops clean of weeds, and to keep his cattle and horses in good condition when he knows there is no screen of brush and weeds to keep out the view of the passer-by. He will not want the unsightly old straw pile, or manure heap to stand all summer, an eye-sore to the beauty of the farm, if he knows it is in plain view every time a neighbor passes.

There is yet another great advantage in keeping the roadsides clean and that is in the better work that can be done on the roads. How often we have traveled over roads ruined for the time being by having a lot of weeds dragged into the middle of the road and left in great irregular piles to obstruct the travel. We have seen roads thus destroyed that it would take six or eight months time before the weeds would decay so the road surface could be leveled down again. Then many times we have seen the roadside weeds fill the ditches, throw the water into the center of the road and the washing of one big rain would cause more damage to the road than it would have cost to cut the weeds for two or three years. Let us again remind you to cut the weeds along the roadside.

DRAG THE ROADS

The most useful road tool ever invented is the road drag but unfortunately it is not an automatic implement but it requires a good team and a boy or man with some judgment to use it. The striking difference between the enterprise and public spirit of the citizens of various neighborhoods is shown more clearly in the way the roads are dragged than in most any other way we know. D. Ward King, the Holt County farmer who is the father of the road drag idea when once asked how he would use the drag to fill a mud hole, replied, "I would use the drag before there was any mud hole." An ounce of prevention in road dragging is worth several pounds of cure. Where the drag is used often the little holes and little ruts are filled when it takes but little lose dirt and the tramping soon has these places solid and so when the next rain falls the water runs off the road quickly, and without water there can be no mud.

In a year like this the roads need dragging often to stop the little ruts before they deepen into ditches and the frequent dragging will cost less than it would to fill a bad ditch in the fall, besides when the dragging is kept up you have what you need—a smooth, dependable road every day when you want to use it.

It may be a little discouraging to farmers who live off the inter-county-seat highways to see their neighbors drawing $15 a mile from the state to pay them for dragging their roads while those who are unfortunate enough to live off such a political preference route must drag the road without pay but that does not alter the fact that the road drag is a good thing and will keep most any road in good repair if it is used after every rain .

The work done with the drag is cumulative and the longer time a road has been kept in order with the drag the harder the road will be, the smoother its surface and of course the easier it can be kept up. Then the dragging becomes a habit after a while and it is not hard to find the time to do it and traveling the smooth road becomes a facination that is good for the "blues."

POLITICS AND THE LAND BANK

There should never be any partisan politics injected into an important economic question like rural credits. Up to this time it appears that there has been very little effort made to mix political discussion and rural credits in Congress and possibly that is because both political parties are bound by their platforms to favor better credit facilities for farmers. But in our efforts to get a system of farm loans adapted to Missouri it has been a hard matter to keep the demagogue from dragging the question into what we might call personal politics.

Our readers know that we never permit the discussion of partisan questions in our columns but on the other hand we can not abandon any important economic question because politicians differ about it.

A reader of The Missouri Farmer has sent us a clipping from an editorial in one of the St. Louis papers and has asked us to reply to it. We are not seeking controversy with any one on this subject but have from time to time given reasons in favor of the adoption of the amendment to the state constitution which will authorize the establishment of a rural credit system in this state and most of our readers are no doubt familiar with these reasons.

But to show that those who are attacking the Missouri plan for rural credits are using assertion without argument we quote from the editorial of the St. Louis paper as follows:

"It is regretable that initiative petitions for the purpose of amending the constitution of Missouri so as to make void the establishment of a state land bank, along lines outlined by the last General Assembly, have been filed, necessitating a vote in November. Aside from the legal question as to whether such an amendment would be effective and aside from the merits or demerits of the measure itself, standing by itself, Congress in making the establishment of a land bank by Missouri entirely unnecessary. Whatever may be said in opposition to the national rural credit legislation, and it is open to attack in many places, no one questions the value of the securities that will be offered under it. There will be no hesitancy on the part of investors. It will require no great expense to sell the bonds, based on farm mortgages, issued under federal supervision. They should sell as readily as government bonds.

"All the expense of selling bonds based on farm mortgages must ultimately be paid by the borrowers. Should Missouri adopt a system of its own, its land bank bonds would have to compete with those issued under the national system. It would have the task of convincing the investors of the country that the securities of the Missouri system were as good, if not better, than those issued under the national system. This would require wide advertising and the services of expert salesmen, who would receive large salaries and incur large expense bills. This extra expense would have to be borne by the Missouri borrowers. It is even doubtful if investors could be made to take the Missouri bonds, in preference to those issued under the national system, at the same rate of interest. What possible inducement could Missouri offer?

"If there had been no prospect of action by Congress, the merits of the Missouri plan might be discussed. But the establishment of a national system makes the attempt of any one state to run a system of its own in competition a flagrant piece of folly. The voters should not be annoyed with such a frivolous proposal."

How "regretable" to be sure to those who are opposed to any form of relief for borrowing farmers to allow the people the privilege of voting on the question. It is pure subterfuge to contend that a measure passed by Congress will so completely supply the needs of farmers that action by the state is unnecessary. Why not say that with national banks that we have no need for banks and trust companies incorporated under state laws? Why does not the author of the above attack on the Missouri Land Bank go to work and have all banks and trust companies organized under state laws legislated out of business. These institutions are filling a valuable and necessary place in the financial world in spite of a splendid national banking system.

Then as to finding sale for the bonds issued under a state system why should there be any confusion because bonds are offered from both state and national institutions? Do we not now find sale for state, county and other bonds? Our state capitol bonds sold on the basis of about 4 per cent and the Missouri Land Bank bonds based on farm lands of double the value of the bonds ought to find as ready buyers as our little school district or road district bonds have found, thousands of dollars of which have been sold at no higher rate than that proposed for the Land Bank bonds. If bonds of the Federal Land Bank will sell as readily as government bonds then why not say that bonds issued under state supervision will sell as readily as state bonds? And that is just what the friends of the Missouri Land Bank are expecting and that is the "Why" of the opposition. It is not because they are afraid it will fail that they are opposing it but it is because they want it to fail—and to be sure of that they want it to fail of adoption.

All the opponents of the Missouri Land Bank use the same threadbare argument that there will be too much expense in making loans and too much expense in selling bonds and they work themselves into a hysterical love for the poor borrowers unequaled by any, save possibly the money lender (?) himself. No system can entirely dispense with the expense of making loans and selling bonds but a study of the Missouri Land Bank will show that it has reduced the expense to the minimum. For all expenses and for creating a reserve fund the Missouri law provides for not more than one-half of one per cent annual payment while the measure now before Congress provides for twice that amount.

Any one who will study the two plans together will easily see why the state law can be operated at less expense. The whole plan is more simple and there will be no high salaried officers to pay in the Missouri plan. Under a law very much like the proposed Missouri law. Australia has accumulated a reserve of more than half a million dollars on a charge of one-half of one per cent. Let no one deceive themselves by believing that the Missouri Land Bank is an impractical plan. We have the evidence furnished by the best countries of Europe to guide us in voting for the amendment at the next election.

We do not want any one to get alarmed about there being any possible confusion or conflict between the Missouri Land Bank and the national system which is reasonably certain to be authorized by Congress before adjournment. The states of New York and Wisconsin already have rural credit plans in operation and it is well enough to have more than one plan to furnish competition to insure more efficiency in the management.

THE WAGON HORSE

In another column in this issue, Mr. Royce the live stock representative of The Missouri Farmer has very clearly discussed the proposed plan for establishing a new breed of horses and in calling attention to what Mr. Royce has to say we want to emphasize the fact that all breeds of live stock have been gradually developed by the farmers beginning at the bottom. No kind of propaganda emanating from one man is a safe foundation to build on. Whether those responsible for the different representative farm breeds of horses have made mistakes in breeding too large or too small had better be left to the farmers themselves and if they find a change is needed they can soon bring it about by selection within the breed. By this method they have only one factor to control, that of size while by starting a new breed with foundation stock representing all kinds of miscellaneous breeding it will take many years to establish enough uniformity to merit the distinction of a new breed.

BARNYARD GOSSIP

Some of us have talked peace—some have favored war and today as I write this war seems inevitable. The fact is war is on now with Mexico but diplomats do not call it war but so far as you and I are concerned it is war when the soldiers of one country meet the soldiers of the other country on the battle field as they did at Carrizal and kill and wound and take prisoners. In this first real engagement the Mexicans fired the first shot and now our national honor has been assailed and whether we are "jingo" or "pacifist" we should first be patriots and if events culminate in war with Mexico the American people will respond to the call for arms just as quickly and patriotically as they did for Washington, Jackson, Lincoln and McKinley.

The other day we heard a big athletic looking American say "This is no fuss of mine. I did not help to make it, I never was asked anything about it and I am not going to help settle it. If I go they will take me by force—but I'm not going, I tell you." We like to see a man think more of his country than that. The United States is not the aggressor in this matter. For years our people who live along the border and in Mexico have had their property destroyed or stolen, the sacred rights of their homes have been violated and outraged and their lives endangered and many of them lost and we think this country has shown great forebearance to put up with these things so long as it has. A war against Mexico will not be for plunder nor for the domination of the rights of that country by this country, but it will be for the protection of the lives and property of American citizens now and in the future. I detest the "bully" and I have just as little use for the coward who is not willing to do his part whatever that may be to defend his own home, his family, his honor, his country and its glorious flag. A row starts on the street which threatens the peace and the lives of the citizens of the town and the policeman or the sheriff is not able to put down the riot and calls for aid, this man who says "it is not my fuss" and runs to cover while other men risk their lives or lose them, and order is maintained, the coward's home as well as those who fight for peace is protected and he enjoys the rights, privileges and protection of organized society. Shame on the coward, and disgrace for the traitor.

Missouri now has mobilized at the state encampment grounds at Nevada nearly 5,000 of her young men ready to do their duty. (Doubtless before the reader gets this paper most of the Missouri troops will be on the Mexican border.) These young men come from all classes, the rich and the poor alike, and they are leaving their various occupations, and endangering their lives to defend the honor and integrity of this country. That means they are ready to fight for my rights and the protection of my family just as much as that of their own. And so it is, my fellow citizen, that whether you are a so-called pacifist or a jingo this is your war, it is my war, and we are in duty bound to give the army which goes forth to defend the flag both our moral and if necessary our material support.

After this war is over the people of Mexico will understand the American people better than they do now and they will be our friends. We must remember that more than 80 per cent of the people of that country are illiterate. Most of them have been deprived of their lands, not by right, but by might, and it is their firesides they have been fighting for. In their ignorance it is very easy to inflame their minds against the people of this country and make them believe we want to take whatever they may have left. But when our armies conquer their armies as they are as certain to do as it is that the sun shines and when those ignorant but generally home loving, quiet people find that we are there for their good and our protection—that we are there to restore to the people justice—there is little doubt that they will respect the American flag and look upon us as friendly neighbors.

We who have been left at home must not forget our duty. Where men with dependent families have gone to the front it is the duty of the people who are left at home to care for the dependent ones.

THE RURAL CHURCH AND THE YOUNG MAN

Everybody seems to be more or less so consumed by the desire to do something for somebody in some way, that they forget at times the inevitable law, that an improvement in conditions is the result of an inner spirit and not of an outer form. Put in another way, the rural problem is to be worked out by the rural community. If in any rural community there develops a dissatisfaction with things as they are, and an almost resistless desire to transform them into things as they ought to be, the problem of that community is in a fair way of being solved.

In any event the real problem is the young man. If in some way he can be brought to feel that his surroundings furnish opportunities for worthy achievement, that honest toil will reap rewards not only in a monetary way, but also in reputation and standing; that his horizons are wide, his outlooks as uninterrupted as those of urban communities, the first step in advance will have been taken. Many young men in rural communities have a dissatisfaction with things as they are, but lack the eagerness to make them as they ought to be. This dissatisfaction then finds expression in the cityward movement.

The material with which we deal is the young man. The tools with which we are working at present are the school and the church. Thus far the results have been far from satisfactory. Perhaps some of the underlying conditions may be recognized, which should give direction to the activities of the rural church.

In the first place the church must realize that the young man is a "gregarious animal"—so that the problem becomes one of young men, instead of the young man; social instead of individual. Every club in the city, every gang in the slums, represents the struggle for the satisfaction of this instinct. Thus far the rural community has not adequately provided for this absolutely vital necessity. What the young men desire is the opportunity for self-expression and if they cannot find the possibility in the rural community they will leave it in the future as they have left it in the past. It is here that the rural church has an unrivalled opportunity to come into close and sympathetic touch with young men. Why should that church be closed save for four or five hours a week? Do you imagine that community life is influenced by such slight service? Can you wonder that such apparently scant activity makes but little appeal to young men who are anxious to see things in action?

In dealing with young men we must realize the fact that the physical is to them the supreme part of their nature, and certain it is that the church in the rural community has lost its grip upon young men because it has failed to reach after them through the physical body. Some provision for exercise indoors, as well as an outdoor athletic field are surely possible in our broad and spacious land. Think of the appeal that it would make to the young men of any community, that one church at least cared for their bodies. Still better, if in a community of two or three churches a common athletic plant could be kept up it would go far toward eliminating the annoyances which are inevitable where unoccupied young men gather. If the church reaches young men it must have a message for them appealing primarily to their physical and intellectual needs and suited to their developmental stage. Through conduct based on convictions we reach our theology and we fail of full success if we attempt to revise this order.

The young man is also a hero worshipper, he is an idealist, almost a sentimentalist. Here then is another means of laying hold of young men and giving them correct ideals. The moral of all biography is that what man has done, man can do. For this reason every rural church should have some kind of arrangements for a library. The books should be carefully selected, not merely because of their purpose, but almost equally because of their style and interest.

Young men are strong, and being strong they are eager to test their strength in the work of their day. Men grow into manliness and into fine characters more certainly and more swiftly under the load of responsibility than in any other way. However, today we treat them as if they were weak and are constantly devising methods to keep them from falling. It is the mission of the church to use the strength of the young men in its work for community uplift. The older members can safely content themselves with counsel and advice, trusting the leadership to them. These young men are in turn the natural leaders of the younger boys and unless they lead in clean paths and to worthy conduct the results are most disastrous, and the community quickly loses moral tone and fibre. Back of all this, however, handicapping every endeavor, stemming enthusiasm, and crushing hopes for the future is the great inertia of those who have reached or passed middle life. It will be necessary that they be continually dominated by high and pure ideals so that the work may not be retarded or defeated.

The rural church, then, has its opportunity with young men as it works with, rather than for them. If it does this it will lay hold in a directive and controlling way of the universal characteristics of youth. If the church has lost its grip it has done so because it has studied the problem rather than the young man. The young man is after all a singularly uncomplicated human being. His needs are fairly simple, indeed they are somewhat elemental, but if we direct him we must meet these needs. We must dignify his personal strength and aid him in its development in the best and wisest way; we must turn his hero worship into worthy directions; and we must recognize his strength and enthusiasm, his desire to do, and place upon him some of the burdens in the great task of uplifting community life and ideals—Stanley Coulter, Dean of the School of Science, Purdue University.

Cut Your Corn With Horses or Tractor

OF all cornfield work, harvesting is the hardest. Your horses, or your tractor, prepare the seed bed. The cultivating is horse work. Let the horses or tractor finish the job. Let them draw an International Harvester corn binder through your cornfields, cutting clean and binding neatly the long rows that fall so slowly when you tackle them with a corn knife.

A **Deering, McCormick, Milwaukee** or **Osborne** corn binder, besides saving an enormous amount of hard work, makes possible an extra profit of from $12 to $15 an acre from your corn. It cuts 5 to 8 acres a day. It saves the wages of 4 or 5 extra men. It gets the crop in when the feeding value of the stalks is at its best. It does away with a lot of waste. It saves handling, whether the corn is delivered to ensilage cutter or husker and shredder. A corn binder pays.

Local dealers near you will show you anything you want to know about these machines, or, you can get full information by writing for corn binder catalogues to the address below.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

David had remained silent and constrained during this conversation, the lines of his young face setting like steel. Suddenly he left the house and paced up and down in the orchard, to wrestle once more with the old problem of his boyhood days. It was different now. Then it had been a question of how much he must stand from Jud for the sake of the benefits bestowed by the offender's father. Now it meant a sacrifice of principle. He had made his boyish boast that he would defend only those who were wrongfully accused. To take this case would be to bring his wagon down from the star. Then suddenly he found himself disposed to arraign himself for selfishly clinging to his ideals.

He went back into the house, where M'ri was still tearfully arguing and protesting. He came up to Barnabas.

"I will clear Jud, if you will trust the case to me, Uncle Barnabas."

Barnabas grasped his hand.

"Bless you, Dave, my boy," he said. "I wanted you to, but Jud has been—wal, I didn't like to ask you."

"David," said M'ri, when they were alone, "Martin said you wouldn't take a case where you were convinced of the guilt of the client."

"I shall take this case," was David's quiet reply.

"Really, David, Martin thinks it will be best for Jud—"

"I don't want to do what is best for Jud, Aunt M'ri, I want to do what is best for Uncle Barnabas. It's the first chance I ever had to do anything for him."

When Judge Thorne found that David was determined to defend Jud, he gave him some advice:

"You must get counter evidence, if you can, David. If you have any lingering idea that you can appeal to the jury on account of Barnabas being Jud's father, root out that idea. There's no chance of rural juries tempering justice with mercy. With them it's an eye for an eye, every time."

David had an infinitely harder task in clearing Jud than he had had in defending Miggs. The evidence was clear, the witnesses sure and wary, and the prisoner universally detested save by his evil-minded companions, but these obstacles brought out in full force all David's indomintable will and alertness. He tipped up and entrapped the prosecution's witnesses with lightning dexerity. One of them chanced to be a man whom David had befriended, and he aided him by replying shrewdly in Jud's favor.

But it was Jud himself who proved to be David's trump card. He was keen, crafty, and quick to seize his lawyer's most subtle suggestions. His memory was accurate, and with David's steering he avoided all traps set for him on cross examination. When David stood before the jury for the most stubborn fight he had yet made, his mother's last piece of advice—all she had to bequeath to him—permeated every effort. He put into his argument all the compelling force within him. There were no ornate sentences this time, but he concentrated his powers of logic and persuasiveness upon his task. The jury was out two hours, during which time Barnabas and Jud sat side by side, pale and anxious, but upheld by David's confident assurance of victory.

He kept his word. Jud was cleared.

"You're a smart lawyer, Dave," commented Uncle Larimy.

David looked at him whimsically.

"I had a smart client, Uncle Larimy."

"That's what you did, Dave, but he's gettin' too derned smart. You'd a done some of us a favor if you'd let him git sent up."

CHAPTER V

"Dave," said Barnabas on one memorable day, "the Jedge hez hed his innings trying to make you a lawyer. Now it's my turn."

"All right, Uncle Barnabas, I am ready."

"Hain't you hed enough of law, Dave? You've given it a good trial, and showed what you could do. It'll be a big help to you to know the law, and it'll allers be sumthin' to fall back on when things get slack, but ain't you pinin' fer somethin' a leetle spryer?"

"Yes, I am," was the frank admission. "I like the excitement attending a case, and the fight to win, but it's drudgery between times—like soldiering in time of peace."

"Wal, Dave, I've got a job fer you wuth hevin', and one that starts toward what you air a-goin' to be."

David's breath came quickly.

"What is it?"

"Thar's no reason at all why you can't go to legislatur' and make new laws instead of sett in' in the Jedge's office and larnin' to dodge old ones. I'm a-runing politics in these parts, and I'm a-goin' to git you nominated—so 't will be up the ladder and over the wall fer you, Dave."

So, David, to the astonishment of the Judge, put his foot on the first round of the political ladder as candidate for the legislature. At the same time Janey returned from the school in the East, where she had been "finished," and David's heart beat an inspiring tattoo every time he looked at her, but he was nominated by a speech-loving, speech-demanding district, and he had so many occasions for oratory that only snatches of her companionship were possible throughout the summer.

Joe came on to join in the excitement attending the campaign. It had been some time since his last visit, and he scarcely recognized David when he met him at the Lafferton station.

"Well, Dave," said the ranchman, "if you are as strong and sure as you look, you won't need my help in the campaign."

"I always need you, Joe. But you haven't changed in the least, unless you look more serious than ever, perhaps."

"It's the outdoor life does that. Take a field-bred lad, he always shies a bit at people."

"Your horse does, too, I notice. He arrived safely a week ago, and I put him up at the livery here in Lafferton. I was afraid he would demoralize all the horses at the farm."

"Good! I'll ride out this evening. I have a little business to attend to here in town, and I want to see the Judge and his wife, of course."

When the western sky line gleamed in crimson glory Joe came riding at a long lope up the lane. He sat his spirited horse easily, one leg thrown over the horn of his saddle. As he neared the house, a threshing machine started up. The desert-bred horse shied, and performed maneuvers terrifying to Janey, but Joe in the saddle was ever a part of the horse. Quietly and impassively he guided the frightened animal until the machine was passed. Then he slid from the horse and came up to Janey and David, who were awaiting his coming.

"This can never be little Janey!" he exclaimed, holding her hand reverently.

"I haven't changed as much as Davey has," she replied, dimpling.

"Oh, yes, you have! You are a woman. David is still a boy, in spite of his six feet."

"You don't know about Davey!" she said breathlessly. "He has won all kinds of law cases, and he is going to the legislature."

Joe laughed.

"I repeat, he is still a boy."

On the morrow David started forth on a round of speech making, canvassing the entire district. He returned at the wane of October's golden glow for the round-up, as Joe termed the finish of the campaign. The flaunting crimson of the maples, the more sedate tinge of the oaks, the vivid yellow of the birches, the squashes piled up on the farmhouse porches, and the fields filled with pyramidal stacks of cornstalks brought a vague sense of loneliness as he rode out from Lafferton to the farm. He left his horse at the barn and came up to the house through the old orchard as the long, slanting rays of sunlight were making afternoon shadows of all who crossed their path.

He found Janey sitting beneath their favorite tree. An open book lay beside her. She was gazing abstractedly into space, with a new look in her star-like eyes.

David's big, untouched heart gave a quick leap. He took up the book and with an exultant little laugh discovered that it was a book of poems! Janey, who could never abide fairy stories, reading poetry! Surprised and embarrassed, after a shy greeting she hurried toward the house, her cheeks flaming. Something very beautiful and breath-taking came into David's thoughts at that moment.

He was roused from his beatific state by the approach of Barnabas, so he was obliged to concentrate his attention on giving a resume of his tour. Then the Judge telephoned for him to come to his office, and he was unable to finish his business there until dusk. The night was clear and frost touched. He left his horse in the lane and walked up to the house. As he came on to the porch he looked in through the window. The bright fire on the hearth, the soft glow of the shaded lamp, and the fair-haired girl seated by the table, needlework in hand, gave him a hunger for a hearth of his own.

Suddenly the scene shifted. Joe came in from the next room. Janey rose to her feet, a look of love lighting her face as she went to the arms outstretched to receive her.

CHAPTER VI

David went back to Lafferton. The little maid informed him that the Judge and his wife were out for the evening; but there was always a room in readiness for him, so he sat alone by the window, staring into the lighted street, trying to comprehend that Janey was not for him.

It was late the next morning when he came downstairs.

"I am glad, David, you decided to stay here last night," said M'ri, whose eyes were full of a yearning solicitude.

She sat down at the table with him while he drank his coffee.

"David."

She spoke in a desperate tone, that caused him to glance keenly at her.

"If you have anything to tell," he said quietly, "it's a good plan to tell it at once."

"Since you have been away Joe and Janey have been together constantly. It seems to have been a case of mutual love. David, they are engaged."

"So," he said gravely, "I am to lose my little sister. Joe is a man in a thousand."

"But, David, I had set my heart on Janey's marrying you, from that first day when you went to school together and you carried her books. Do you remember?"

"Yes," he replied whimsically, "but even then Joe met us and took her away from me. But I must drive out and congratulate them."

M'ri gazed after him in perplexity as he left the house.

"I wonder," she mused, "if I ever quite understood David!"

Miss Rhody called to David as he was passing her house and bade him come in.

"You've hed a hard trip," she said, with a keen glance into his tired, boyish eyes.

"Very hard, Miss Rhody."

"You have heard about Janey—and Joe?"

"Aunt M'ri just told me," he said, wincing ever so slightly.

"They was all sot on your being her sweetheart, except me and her—and Joe."

"Why not you, Miss Rhody?"

"You ain't never been in love with Janey—not the way you'll love some day. When I was sick last fall Almiry Green come over to read to me and she brung a book of poems. I never keered much for po'try, and Almiry, she didn't nuther, but she hed jest ketched Widower Pankey, and so she thought it was proper to be readin' po'try. She read somethin' about fust love bein' a primrose, and a-fallin' to make way fer the real rose, and I thought to myself: 'That's David. His feelin' fer Janey is jest a primrose.'"

David's eyes were inscrutable, but she continued:

"I knowed she hed allers fancied Joe sence she was a little tot and he give her them beads. When Joe's name was spoke she was allers shy-like. She wuz never shy-like with you."

"No," admitted David wearily, "but I must go on to the farm now, Miss Rhody. I will come in again soon."

When he came into the sitting room of the farmhouse, where he found Joe and Janey, the rare smile that comes with the sweetness of renunciation was on his lips. After he had congrtulated them, he asked for Barnabas.

"He just started for the woods," said Joe. "I think he is on his way to Uncle Larimy's."

David hastened to overtake him, and soon caught sight of the bent figure walking slowly over the stubbled field.

"Uncle Barnabas!" he called.

Barnabas turned and waited.

"Did you see Janey and Joe?" he asked, looking keenly into the shadowed eyes.

"Yes; Aunt M'ri had told me."

"When?"

"This morning. Joe's a man after your own heart, Uncle Barnabas."

"It's you I wanted fer her," said the old man bluntly. "I never dreamt of its bein' enybody else. It's an orful disapp'intment to me, Dave. I'd ruther see you her man than to see you what I told you long ago I meant fer you to be."

"And I, too, Uncle Barnabas," said David, with slow earnestness, "would rather be your son than to be governor of this state!"

"You did care, then, David," said the old man sadly. "It don't seem to be much of a surprise to you."

"Uncle Barnabas, I will tell you something which I want no one else to know. I came back last evening and drove out here. I looked in the window, and saw her as she sat at work. It came into my heart to go in then and ask her to marry me, instead of waiting until after election as I had planned. Then Joe came in and she—went to him. I returned to Lafferton. It was daylight before I had it out with myself."

"Dave! I thought I knew you better than any of them. It's been a purty hard test, but you won't let it spile your life?"

"No, I won't, Uncle Barnabas. I owe it to you, if not to myself, to go straight ahead as you have mapped it out for me."

"Bless you, Dave! You're the right stuff!"

PART THREE

CHAPTER I

In January David took his seat in the House of Representatives, of which he was the youngest member. It was not intended by that august body that he should take any role but the one tacitly conceded to him of making silver-tongued oratory on the days when the public would crowd the galleries to hear an all-important measure, the "Griggs Bill," discussed. The committee were to give him the facts and the general ine of argument, and he was to dress it up in his fantastic way. They were entirely willing that he should have the applause from the public as well as the credit of the victory; all they cared for was the certainty of the passage of the bill.

David's cool, lawyer-like mind saw through all these manipulations and machinations even if he were only a political tenderfoot. As other minor measures came up he voted for or against them as his better judgment dictated, but all his leisure hours were devoted to the investigation and study of the one big bill which was to be rushed through at the end of the session. He pored over the status of the law, found out the policies and opinions of other states on the subject, and listened attentively to all arguments, but he never took part in the discussions and he was very guarded in giving an expression of his views, an attitude which pleased the promoters of the bill until it began to occur to them that his caution came from penetration into their designs and, perhaps, from intent to thwart them.

"He has ketched on," morunfullstated an old-timer from the third district. "I'm allers mistrustful of these young critters. They are sure to balk on the home stretch."

"Well, one good thing," grinned a city member, "it breaks their record, and they don't get another entry."

David had made a few short speeches on some of the bills, and those who had read in the papers of the wonderful powers of oratory of the young member of the eleventh flocked to hear him. They were disappointed. His speeches were brief, forceful, and logical, but entirely barren of rhetorical effect. The promoters of the Griggs Bill began to wonder, but concluded he was saving all his figures of speech to sugarcoat their obnoxious measure. It occurred to them, too, that if by chance he should oppose them his bare-handed way of dealing with subterfuges and his clear presentation of facts would work harm. They counted, however, on being able to convince him that his future status in the life political depended upon his cooperation with them in pushing this bill through.

Finally he was approached, and then the bomb was thrown. He quietly and emphatically told them he should fight the bill, single handed if necessary. Recriminations, arguments, threats, and inducements—all were of no avail.

"Let him hang himself if he wants to," growled one of the committee. "He hasn't influence enough to knock us out. We've got the majority."

The measure was one that would radically affect the future interests of the state, and was being watched and studied by the people, who had not, as yet, however, realized its significance or its far-recahing power. The intent of the promoters of the Griggs Bill was to leave the people unenlightened until it should have become a law.

"Dunne won't do us any harm," argued the father of the bill on the eventful day. "He's been saving all his skyrockets for this celebration. He'll get lots of applause from the women folks," looking up at the solidly packed gallery, "and his speech will be copied in all the papers, and that'll be the reward he's looking for."

When David arose to speak against the Griggs Bill he didn't look the youngster he had been pictured. His tall, lithe, compelling figure was drawn to its full height. His eyes darkened to intensity with the gravity of the task before him; the stern lines of his mouth bespoke a master of the situation and compelled confidence in his knowledge and ability.

The speech delivered in his masterful voice was not so much in opposition to the bill as it was an exposure of it. He bared it ruthlessly and thoroughly, but he didn't use his youthful hypnotic periods of persuasive eloquence that had been wont to sway juries and to creep into campaign speeches. His wits had been sharpened in the last few months, and his keen-edged thrusts, hurled rapier-like, brought a wince to even the most hardened of veteran members. It was a complete enlightenment in plain words to a plain people—a concise and convincing protest.

When he finished there was a tempest of arguments from the other side, but there was not a point he had not foreseen, and as attack only brought out the iniquities of the measure, they let the bill come to ballot. The measure was defeated, and for days the papers were headlined with David Dunne's name, and accounts of how the veterans had been routed by the "tenderfoot from the eleventh."

After his dip into political excitement legal duties became a little irksome to David, especially after the wedding of Joe and Janey had taken place. In the fall occurred the death of the United States senator from the western district of the state. A special session of the legislature was to be convened for the purpose of pushing through an important measure, and the election of a successor to fill the vacancy would take place at the same time. The usual "certain rich man," anxious for a career, aspired, and, as he was backed by the state machine as well as by the covert influence of two or three of the congressmen, his election seemed assured.

There was an opposing candidate, the choice of the people, however, who was gathering strength daily.

"We've got to head off this man Dunne some way," said the manager of the "certain rich man." "He can't beat us, but with him out of the way it would be easy sailing, and all opposition would come over to us on the second ballot."

"Isn't there a way to win him over?" asked a congressman who was present.

The introducer of the memorable measure of the last session shook his head negatively.

"He can't be persuaded, threatened, or bought."

"Then let's get him out of the way."

"Kidnap him?"

"Decoy him gently from your path. The consul of a little seaport in South America has resigned, and at a word from me to Senator Hollis, who would pass it on to the President, this appointment could be given to your young bucker, and he'd be out of your way for at least three years."

"That would be too good to be true, but he wouldn't bite at such bait. His aspirations are all in a state line. He's got the usual career mapped out,—state senator, secretary of state, governor—possibly President."

"You can never tell," replied the congressman sagaciously. "A presidential appointment, the alluring word 'consul,' a foreign residence, all sound very 'enticing and important to a young country man. The Dunne type likes to be the big frog in the puddle. This stripling you are all so afraid of hasn't cut all his wisdom teeth yet. It's worth a try. I'll tackle him."

The morning after this conversation, as David walked down to the Judge's office he felt very lonely—a part of no plan. It was a mood that made hime ripe for the purpose of the congressman whom he found awaiting him.

"I've been wanting to meet you for a long time, Mr. Dunne," said the congressman obsequiously, after the Judge had introduced him. "We've heard a great deal about you down in Washington since your defeat of the Griggs Bill, and we are looking for great things from you. Of course, we have to keep our eye on what is going on back here."

The Judge looked his surprise at this speech, and was still more mystified at receiving a knowing wink from David.

After some preliminary talk the congressman finally made known his errand, and tendered David the offer of a consulship in South America.

At this juncture the Judge was summoned to the telephone in another room. When he returned the congressman had taken his departure.

"Behold," grinned David, "the future consul of—I really can't pronounce it. I am going to look it up now in your atlas."

"Where is Gilbert?" asked the Judge.

"Gone to wire Hilliard before I can change my mind. You see, it's a scheme to get me out of the road and I—well I happen to be willing to get out of the road just now. I am not in a fighting mood."

"Consular service," remarked the Judge oracularly, "is generally considered a sort of clearing house for undesirable politicians. The consuls to those little ports are, as a rule, very poor."

"Then a good consul like your junior partner will loom up among so many poor ones."

Barnabas was inwardly disturbed by this move from David, but he philosophically argued that "the boy was young and it wouldn't harm him to salt down awhile."

"Dave," he counseled in farewell, "I hope you'll come to love some good gal. Every man orter hev a hearth of his own. This stretchin' yer feet afore other folks' firesides is unnatural and lonesome. Thar's no place so snug and safe fer a man as his own home, with a good wife to keep it. But I want you tew make me a promise, Dave. When I see the time's ripe fer pickin' in politics, will you come back?"

"I will, Uncle Barnabas," promised David solemnly.

The heartiest approval came from Joe.

"That's right, Dave, see all you can of the world instead of settling down in a pasture lot at Lafferton."

GALLOWAY

SECOND EDITION NOW READY

Ask for your copy today. A postal gets it. The first edition of this big, 250-page book of Galloway bargains was exhausted. **Second edition just off the press.** It describes the famous Galloway line of Sanitary Cream Separators, the Galloway gasoline and kerosene Engines, the new, modern Galloway Manure Spreaders, our new 12-20 h. p. Farmobile; Galloway Farm Trucks, all kinds of farm machinery, hay tools, ensilage cutters, power house accessories, grinders, buggies, wagons, harness, fencing, roofing, saddles, Galloway automobiles, stock tanks, corn tools, automobile accessories, sewing machines, household goods, carpets and rugs, furniture, and a complete line of clothing for every member of the family.

I WANT YOU TO HAVE YOUR COPY OF THIS BOOK

Four low prices and four good sizes of Galloway Separators

You can get it for a postal. If it guides your summer and fall buying **it will save you from $200 to $500.** It tells the the truth about cream separators, it gives engine secrets and facts, it tells how and why the Galloway manure spreaders made Galloway famous, fully describes my new 12-20 h. p. Farmobile or tractor. A copy of this book should be in your hands even if you are not now in the market for a single one of our bargains. Printed in four colors, handsomely illustrated. Ask for your free copy today. Address

WM. GALLOWAY COMPANY, Mfg. Specialists
537 Galloway Sta. Waterloo, Iowa

Gasoline or kerosene engines from 1 3-4 to 16h.p.

D-32

Seven Styles: Farm trucks from 750 lbs. to 3 ton capacity

Galloway's new 12-20 Farmobile. Low price.

Equal to 3 men and 3 teams

These Manure Spreaders made Galloway famous. Big, free book gives details of size and style.

The Wheat Yield Tells the Story of Western Canada's Rapid Progress

160 ACRE FARMS IN WESTERN CANADA FREE

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th,

upwards of four and a quarter million bushels being exported in less than six weeks,

and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common.

Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc.

There is no war tax on land and no conscription.

Write for illustrated pamphlet, reduced railroad rates and other information to

LETTERS FROM BOYS AND GIRLS

Dear Mr. Editor:

I like the story you are giving us in The Missouri Farmer just splendid. When the paper comes and the work is all done for that day (you know farmer's work is never done) we gather in the living room, or if light enough on the front porch and one of us reads the story for all. By "us" I mean, mother, daddy, Janey, Jack and myself. You see we have a Janey, too, but she is not "sweet" on any one yet as Janey of the story is, but if she ever gets old enough to love a boy I hope it will be one as nice as David.

Mother usually does the reading, for daddy most always says he is too tired, and as she reads, any one is permitted to ask a question to refresh his or her memory on the story but we do not discuss anything in the chapter until the reading is finished. Then we talk about what has been done and make guesses on what the outcome is going to be. Often we find ourselves referring to something that is related in the story and it may lead to quite an argument.

Josie, Cass County.

Likes The Missouri Farmer

Fortuna, Mo., June 6, 1916.

The Missouri Farmer:

I like the story, "David Dunne" fine. I think it is one of the best stories that I ever read and I think David is the best character in the story.

We live on a farm of one hundred and sixty acres, southeast of Latham. I will be glad when the next paper comes. I wish it came once a week.

Elbert Dobson.

Admires Boys who Obey their Mothers

Marshall ,Mo.

To the Editor:

I am deeply interested in the story "David Dunne." I like all of the characters very much, especially David. I feel very sorry for Jud. He will learn a very dear lesson I fear. I didn't read the first of the story as I wasn't at home when the paper arrived. Some of my people consider story papers good fire starters. I read your last story and like it very much.

Build Your WORN OUT SOIL SWEET CLOVER

The great crop for soil fertility and animal feed. Exceptionally rich in nitrogen and humus. Higher protein content than alfalfa. Sow in spring, summer or winter. Write for prices.
Bokhara Seed Co., Box F, Falmouth, Ky.

HOW MUCH DO YOU EARN?

We offer you an opportunity to make $40 to $135 weekly accepting orders for our household necessities. Big Sellers. We teach you how. Pleasant, permanent employment. Free booklet and sample to earnest men and women. Secure your territory quick! FORD MF'G CO., Boxe 9011. Columbia, Mo.

I live on a farm five miles east of Marshall. I certainly enjoy the other letters, especially Ralph's. If all boys did nothing they were ashamed to have their mothers know, we would have a better world to live in. I will be twenty-one next October, but this letter doesn't sound like it, does it?

Best wishes to all. Bess.

He's Good To The Poor

Dear Editor:

I am a little girl of 9 years. My papa takes The Missouri Farmer. I read "David Dunne" and I like it fine, I like Davey the best and I also like Janey but I like David the best, because he is so good to the poor.

Lois Johnson.

Cowles, Nebr.

Mr. Editor:

I am carefully reading the story "David Dunne" and I like it very much, am interested in all the characters, though I am most interested in David Dunne and Janey.

Hope that a boys and girls page will be started soon.

I hope my letter will meet with your approval. Am watching for the next paper. Wilma Flemming.

We wonder where our boys and girls are who are reading "David Dunne." We have some nice letters this ime. Where is yours?

MAKING THE 1917 WHEAT CROP

(Continued from page 4)

varieties, Fultz and Poole as the best all round smooth wheats and I find both these are among the leading varieties recommended for Eastern Kansas by that station. If bearded wheat is desired the Fulcaster and Mediterranean are the standard. The Missouri Station has developed some superior strains of some of the standard wheats and for the last few years has been selling this improved seed to farmers and where this wheat can be obtained for seed we would advise our readers to buy it. We understand a small amount of seed will be available for purchase at the station this year.

No matter where the seed is obtained it is always advisable to screen the wheat before it is sown. Running through a good fanning mill takes but little time and will remove the dirt, straw, and cheat which will make the seed drill more evenly. There is no money in sowing dirt or cheat anyway and then the selection of only the heaviest, best seed is always advisable and the way to get it is to run the seed through the fanning mill with a good strong wind to blow out all light grains.

In a subsequent article we will take up other questions such as the use of commercial fertilizers, wheat in rotation and would specially like to have our readers give us their experiences in growing wheat, and what they think about it as a money crop on Missouri farms.

GROW BUCKWHEAT

Buckwheat is at present grown in this country almost wholly in the States east of the Mississippi River and north of the cotton belt. About seven-tenths of the crop is sown in the two States, New York and Pennsylvania, but it is important in several other States, principal among which are Michigan, West Virginia, Virginia, Wisconsin, and Ohio. In the more northern States buckwheat can be sown over practically the entire area without reference to elevation, but farther south it is confined to the uplands and mountainous sections.

Buckwheat should be sown on land prepared as for corn. It is an excellent crop to sow where corn has been planted but where a stand has not been secured. Best results are obtained where the land is plowed early and is well prepared, but fairly good results can be obtained by soming immediately after plowing and harrowing.

Buckwheat should generally be seeded at the rate of 3 or 4 pecks per acre. If the soil is fertile and a drill is used and the seed is of good vitality, as little as 2 pecks may be sufficient. As much as 5 pecks are sometimes sown. It is best to use a grain drill, but this is not essential, as the seed can be broadcasted and harrowed in with satisfactory results. It should be sown from one-fifth of an inch to 2 inches deep, depending on the condition of the soil.

Best Crop for Poor Land

There is probably no other crop that will produce better on infertile, poorly tilled lands than will buckwheat. It is well suited to light well-drained soils, such as sandy loams, and to the silt loam soils. It needs but little lime, growing well in acid soils without lime, where alfalfa and red clover would not succeed. When the soil is poor, it is profitable to use fertilizer, but where good wheat or corn crops can be produced without fertilizer, it is unnecessary for the buckwheat crop. On the poorest hill land a small application of nitrogen and phosphorous is advisable, but generally nitrogen is not needed. The plant responds very readily to applications of phosphates, however. Low-grade fertilizers containing phosphorous and a small amount of potassium can be used to advantage on the crop where the land is poor.

Three varieties of buckwheat are commonly grown in the United States, Japanese, Silver Hull, and Common Grey, the first two being most generally used. Japanese has a large dark-colored seed, while the Silver Hull has a smaller seed, glossy or silvery in appearance. These two varieties are of about equal value, when yields are considered.

A Cool-Weather Crop

Buckwheat is very sensitive to cold and is killed by the first heavy frost. It fills best in cool weather, however, and so the sowings are deferred to allow only time for the crop to mature before frost occurs. Under the most favorable conditions a buckwheat crop will mature in 10 weeks, but the average time is about 12 weeks. When seeded the last week in June or first week in July in New York and Pennsylvania and about a week earlier in Michigan and Wisconsin it is most likely to escape injury from hot weather, which, with drying winds and hot nights, causes the flowers to blast and fail to produce seed. The seeding time for any locality is determined fairly accurately by allowing it a period of 12 weeks for growth before the first killing frost is expected.

The farmer does not need expensive machinery for harvesting the buckwheat crop. An old-fashioned cradle, although it requires hard labor, does the harvesting well. The drop reaper, however, is one of the most satisfactory machines for harvesting. Many farmers use the ordinary binder, which practice is advisable where it can be followed. Cutting is begun as soon as the first lot of blossoms have disappeared, or often just before the first frost is expected. Buckwheat will mature its seed in a few days, if, after cutting, the crop is left in loose bundles where they are dropped from the cradle or reaper. It should then be set up in small shocks and tied near the top with some strands of the staw bent upward from the sides of the shock. The cut buckwheat is usually left in the field in the shocks until threshing time, when it is drawn in and threshed either with the flail or by machinery.

The farmer need generally have no fear of this crop being damaged by either insect enemies or fungous diseases, as the buckwheat plant is but little affected by either of these. It is an excellent crop for destroying weeds and for renovating and putting the soil in fine mellow condition.—Weekly News Letter.

RED ANT KILLER

Did you ever hear of a household that didn't have an ant remedy? How many of these same households are not looking for a remedy that will really work? L. Haseman of the Missouri Agricultural Experiment Station has been giving special attention to the little red ant that usually causes more trouble than any other and has been able to kill it with the syrup made from half a pound of sugar and a fortieth of an ounce of sodium arsenite. The syrup should be made in a double boiler because if it is scorched the ants will not eat it and the poison must be carefully weighed by the druggist and no more than this must be added for two reasons. (1) It is a deadly poison and will be more likely to be dangerous to animals or persons who get it by mistake if less diluted. (2) If any more of it is used, the ants detect the taste and will not eat it.

Professor Haseman says that the ant has a very keen sense of taste and is a most contrary creature refusing to eat many of the things usually used in trying to get rid of him. In fact he finds that the little red nuisance eats this arsenic syrup better if it is put on sponges, rags, or blotting paper so it is seemingly harder to get than if in an open dish. If the soaked sponges or rags are put into tin cans or glass jars closed up except for a little crack as though put over to avoid the ants they seem to make special search for it and pass by open dishes of it in favor of the closed vessel.

Professor Hasseman recommends this poison especially for the little red ants and says that the real way to get rid of any kind of ants whose nests can be found is to destroy the entire colony with boiling water or by pouring on carbon bisulphide which will choke or suffocate them if placed so that its poison gas can settle down into the nest.

THE DOG AS A CARRIER OF DISEASE

Few persons ever stop to consider what it means to handle a dog or cat, for these animals may be the means of conveying diseases into homes and among children, that would not otherwise gain entrance.

It is not the purpose of this article to destroy the usefulness of these animals, but to call attention to the dissemination of infectious material by them. These animals are most useful in many ways, but should be managed in such a manner as not to convey diseases.

The dog in the country is a useful and pleasant helper for the farmer if he is properly controlled and cared for, but when neglected, may readily become a carrier of disease to stock, in addition to gaining opportunity to kill sheep and destroy gardens and other property. Dog ordinances, as a general rule, have been intended chiefly to curb the dog's power of doing harm by attacking, biting, killing or running sheep or stock. The part that he plays as a carrier of diseases to animals only recently has been recognized according to the zoologists of the Department of Agriculture, who believe that when this is better understood, rural ordinances and laws which lessen this danger will gain the support of the community.

Of the diseases carried to stock by dogs, the foot-and-mouth disease is probably of the greatest interest at this time. In this case the dog acts as a mechanical carrier of infection. The dog which runs across an infected farm easily may carry in the dirt on his feet the virus of this most contagious of animal diseases to other farms and thus spread the disease to the neighborboring herds. In infected localities it is absolutely essential, essential, therefore, to keep all dogs chained and never to allow them off the farm except when in the company of the owner.

It should be remembered and noted, however, in this connection that there are certain classes of healers who are spreading a false and dangerous doctrine among the people to the extent that all diseases are caused by displacements of certain bones of the spinal column, and that diseases are not caused by germs. Men who have spent their whole lives in the study of the causation of diseases have sought to give to an intelligent public the important truths that diseases are caused by germs, and with the destruction and elimination of these germs, the diseases caused by them will disappear; hence, the cure lies in the prevention of the creation of all disease germs, and not in the treatment of the spinal column.

Besides the foot-and-mouth disease, there are, however, many other maladies in the spread of which the dog takes an active part. In Bulletin No. 260 of the United States Department of Agriculture, "The Dog as a Carier of Parasites and Diseases," it is pointed out that rabies, hydatid, ringworms, favus, double-pored tapeworm, roundworm, and tongueworm are often conveyed to human beings in this manner. It occasionally happens also that the dog helps fleas and ticks in transmitting bubonic plague or the deadly spotted fever.

The writer, after visiting on a farm for a short time recently, had these impressions come to him from observation, that prevenetion on the farm, as well as in cities and towns, consists in so restraining the dog that he cannot get a carrion or raw viscera. Viscera should be boiled before being fed to dogs and should never be thrown on the fields, in lots, streets or alleys. If not cooked and fed, viscera and carcasses should be burned, buried with lime, or so disposed of as to be inaccessible to dogs. Proper feeding of the dog is essential, and the owner who does not feed his dog properly, has no right to keep one.

Among the external parasites which dogs may carry to animals, fleas and the various kinds of ticks are both troublesome and dangerous. The ownermust keep his dog clean, not merely for the comfort and happiness of the dog, but to prevent the dog from becoming a carrier of disagreeable and dangerous vermin.

These reasonable measures, important to the stock on the farm, have a direct connection with the health of the family. Where ringworm or other skin diseases break out among the children, or the worm parasites develop, it is well to determine whethera dirty or uncared-for dog may not be carrying infection on his skin or hair, or be conveying disease from carrion directly to the food and persons of his friends. Even if no one is infected with disease, the folly of allowing a dog, or even a cat, to remain dirty and have the freedom of a home where personal cleanliness and hygiene are respected, is apparent.—G. H. S., Iowa State Board of Health.

AN OFFER TO FARMER BOYS

After thinking over the matter for some time we have concluded to make the farmer boys who belong to our "Big Family" the following proposition: For $50.00 worth of subscriptions to The Missouri Farmer we will ship to every boy who procures them for us, a bred gilt, selected from one of the best pure bred Poland China, Duroc, Chester White, Hampshire or Berkshire herds in the state. There won't be any "contest" about it. Farmers receive The Missouri Farmer three years for one dollar—and 50 such subscriptions will win this fine bred gilt. That is all there is to it. All your neighbors will be glad to give you a dollar for three years' subscription to a paper like The Missouri Farmer. They will do it first, because the paper is more than worth the money and because it is fighting their battles. Secondly, they will be glad to help you win this splendid prize.

If you will take good care of the gilt and her litter it will start you in the pure bred hog business and if you will go in "halvers" with your Father you are sure to make some money. We are making this offer not only because we are trying to place The Missouri Farmer in every good farm home in the state but because we want to get our boy friends genuinely interested in the farm. In order to do this we want to help you earn some money. Now we can make this offer to only one farmer boy in each community—so there is no time to lose. You have all summer in which to work—and should you finally fail to get the required number of subscriptions, we will nevertheless pay you a substantial commission on all you do get. So you can't lose. Why not make this gilt and her litter the beginning of a fund which in a few years will pay your way through the Agricultural College or through some other good educational institution? The boys who take advantage of this fine offer will be among the "big farmers" of the futre.

William Hirth, Publisher,
THE MISSOURI FARMER, Columbia, Mo.

Poultry and Pet Stock Show

There will be held in St. Louis during Thanksgiving week on November 24 to 30 inclusive, what the officers hope to make the best poultry show of the season. Henry Steinmesch, president and Jas. J. Long, secretary.

By Old Jim Riley

Its pretty tough for a feller to have to git shot up by a "greaser" and a whole lot tougher when you think that he does it with American made bullets. But it's alright I guess. Anyway I am in for cleanin' 'em out just as quick as possible and when its all over I want old Carranzy's whiskers to look like they'd been in a cyclone.

SOME BUSINESS ABOUT MISSOURI

Missouri has more farm homes owned and unincumbered than has Iowa, Illinois, or Kansas.

Missouri is a state of home owners. She has fewer rented farms that Illinoise, Iowa, Nebraska, Kansas, or Oklahoma.

In number of hogs Missouri, with 4,505,000 head, ranks second among all the states. The Missouri hog is not a "hazel splitter," but an "institution," with hams and history.

During the last census decade the value of Missouri lands doubled, and correspondingly increased more than those of any state to her west, or any state bordering her on the north or south.

Missouri is a great corn state. According to the last census, the leading states in the production of corn were Illinois, Iowa, Indiana, and Missouri. These four states together reported more than two-fifths of the total production of the United States.

Missouri is truly a center state. Here is the heart of the great corn belt. Here is the center of farm values, and also the center of improved acreage. The statement is also made that in Missouri is the cattle center, the hog center, the horse and mule center, and the center of farm production for the United States.

Missouri live stock is remarkably free from disease. Texas fever, sheep scabies, and glanders are practically unknown. During the foot-and-mouth outbreak there was not one case in Missouri. The result of the work of providing a pure milk supply for Missouri cities, and of keeping healthy the herds of the state, is a striking story of progress and efficiency.

Missouri has a splendid system of public schools. Ours is not an illiterate state. Taking her population as a whole, Missouri is not as illiterate as New Hampshire, Massachusetts, Rhode Island, Connecticut, or New York. Furthermore, in some of these states illiteracy is decreasing but little, or is actually increasing, while in Missouri our limited illiteracy is rapidly decreasing.

For the average farmer to invest nothing in live stock in order that he might have more to expend for buildings would represent poor business judgment. It does not follow, that because the average Missouri farmer chooses to invest $1,031 in live stock and only $975 in buildings, that he is less efficient than the Massachusetts farmer, who puts $2,401 in buildings and only $562 in live stock.

Missouri is a great fruit state. In 1915 we were excelled in apple production by but one state, and in peach production by but four states. In combined apple and peach production Missouri was second among the states. In blackberries and dewberries Missouri ranks first among the states. At the Panama-Pacific Exposition Missouri was awarded more medals on apples than were awarded any other state or country.

Missouri is a leader in live stock. In number of registered cattle of the four beef breeds, Missouri is outranked by no state. In Angus, Missouri is second; in Herefords, third; in Galloways, third; in Shorthorns, fourth. Ours is a state of great breeders and of long established herds. Missouri has recently established records in the sale, both of Hereford and Shorthorn cattle, Herefords averaging $1,246 and Sharthorns, $1,083.

The statement has been made that Missouri ranks forty-first among the states in average acre production of all farm crops. Suffice it is to say that at the head of the column cited to prove the inefficiency of the Missouri farmer stand Massachusetts, Rhode Island and Connecticut. Who is so foolish as to say that these little states, with their abandoned farms, are greater agricultural states than Nebraska, Oklahoma, or Kansas, ranked, respectively, forty-fifth, forty-sixth and forty-seventh?—W. L. Nelson, Missouri State Board of Agriculture.

DESPURRING MALE BIRDS

Nature has seen fit to provide animals with some means of defense—dogs bite, cats scratch, mules kick, cows use their horns, and male birds use their spurs. It is a common practice among cattle breeders to dehorn their cattle so they cannot injure each other. It is just as imporant but not so extensively practiced, to remove the spurs from the male birds if two or more are to be kept together.

Those who have made a study of the actions of a male bird while fighting, tell us that the male does not strike his enemy bird with his wings intending for the stroke from them to affect any injury upon the enemy, but that the bird strikes simultaneously with the feet and wings and that the bird strikes the enemy on both sides at the same time, and the wings strike on the outside of each leg, which drives the spurs into the enemy. Therefore, the best way to control the fighting among male birds is to remove the spurs.

A group of male birds in their summer quarters. Each one has had his spurs removed. Both birds and spurs are shown in the picture.

There is no quarreling or fighting and each one seems to be contented.

Their spurs were removed and the birds placed in these quarters on "Swat the Rooster Day," May 20th.

Another danger is that the male birds with spurs tear the skin on the backs and sides of the females. While part of this is done with the nail on the hind toe of the male, yet if the spur is removed, this danger is lessened.

The spur of a bird is made in very much the same manner as the cow's horn, having a hard, bony shell around a more porous bony structure and the same principles may be observed in despurring fowls as are observed in dehorning cattle. One of the principal points to be observed is to take off all the spur, cutting close to the shank. If the spur is not cut off close to the shank, the injury does not heal so readily and is not generally satisfactory as cutting close.

The spur is much easier to remove from a young bird than from an old one. The spurs may be taken off with a fine saw, a knife, or a pair of pruning shears.

On "Swat the Rooster Day" at the Experiment Station, fifty-eight male birds which were to be kept for next year's breeding pens, were despurred and placed in a pen together. Of this number, only one bird was lost from either fighting, handling, or despurring.

Many valuable birds, both males and females, will be saved if the despurring of male birds is more generally practiced.

A number of males placed in a pen together without females seldom fight.

HOW MUCH PROFIT

is there in a pig? That depends on the man, on the feed, and on the pig. But how do you know when the combination is right to produce best results? **Keep a Farm Account Book and let it be**

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK

Complete Account of Hogs . . . . , 19 14

Date	Person, Firm, or Account	Item, Description, Price	Cash Received	Cash Paid	Labor Hours Man	Labor Hours Horse	Labor Hours Tractor	Amount Charged	Amount Credited
Nov. 1	Corn Account	100 bus. corn @ 60 ¢						60 00	
Dec. 10	"	80 bus. corn @ 64 ¢						51 20	

Charge the pigs with the corn they eat and then—

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK is a splendid 176 page book, well bound and ruled on extra quality ledger paper. It is designed to contain the accounts of the average farm for five years. This is especially desirable for the purpose of comparison. The book also contains forms for crop, stock, employment, and insurance records.

THE PRACTICAL FARM ACCOUNT AND RECORD BOOK

Complete Account of Corn Crop , 19 14

Date	Person, Firm, or Account	Item, Description, Price	Cash Received	Cash Paid	Labor Hours Man	Labor Hours Horse	Labor Hours Tractor	Amount Charged	Amount Credited
Nov. 1	Hog Account	100 bus. corn @ 60¢							60 00
Dec. 10	" "	80 bus. corn @ 64¢							51 20

Give the corn crop credit and that transaction is closed. Remember that in farm bookkeeping perhaps the greatest number of transactions will be between accounts on your farm.

We will give **The Missouri Farmer** for 3 years, either renewal or new subscription and a copy of **The Practical Farm Account and Record Book** for $2.25.

The Missouri Farmer, Columbia, Mo.

Caponizing Young Roosters

Farmers know the value of desexing the young males of cattle, hogs, sheep and other animals but there seems to be very little knowledge of the profits on young roosters. The caponized fowls make better fowls for eating and are much quieter to handle and more easily fattened. A rooster caponized when it will weigh two or three pounds will grow to be two or three pounds heavier than one that is let run. The capon is worth two or three times as much per pound as the rooster in any market where the capon is well known. The operation is not difficult to learn and the information about how to do it may be had by addressing the State Poultry Plant at either Mountain Grove or Columbia.

Ridding Hens and Chicks of Lice and Fleas

Lice live and breed on poultry and can be exterminated by greasing each fowl with 33 per cent mercurial ointment which can be bought at a drug store. The grease is placed on the flesh below the vent, covering a space not larger than a 25-cent piece with a small amount of the ointment. This ointment poisons the lice and it is necessary to apply it only once a month.

Sitting hens can be greased before the commencement of the hatch and when the chicks are dry. If the latter peep and stand with their eyes closed, examine the head minutely, and you will probably find one or more large head lice. Anoint the head and the part under the beak with carbolized vaseline, or one part of the 33 percent mercurial ointment and four parts of grease.

Fleas.—Fleas attach themselves to the side of the face and under the beak of the fowls and chicks. They are brown in color and can be removed with one greasing of 33 percent mercurial ointment. They breed in the sand where the chickens are accustomed to gather, and to rid the premises of fleas it is necessary to saturate their breeding places with a solution of one part of cresol (or similar disinfectant) and 20 parts of water.—Press Bulletin.

THE WOMEN ARE ORGANIZING

The Missouri Farmer:

Must tell you how nicely our Farmers' Club is getting along. We meet regularly every two weeks, the club is interested.

We have organized two other districts. One (Coleman), has over 30 live members, have others on the way, last Wednesday we ladies organized a ladies Farm Club, had a splendid meeting, everyone very enthusiastic. It takes time and hard work to get people out of their old ruts especially those who are well to do We have your paper and think it is the very best farm paper printed. We feel like we have a true friend in The Missouri Farmer. I was elected President of the Ladies Farm Club. Can you send me some literature that will help us along? Topics for discussion, etc., anything that will help me to push the good work along. Any suggestions you can make me will certainly be appreciated. If you have an outline of the meetings, how to proceed, order of business, etc., would like to have a copy. Thanking you in advance for any favors,

I am, yours truly,
Mrs. E. A. Williams,
White Oak Farm, Greene Co.

Fine Farm for Sale

One mile from corporate limits of Columbia, Mo., 90 acres. Practically all tillable; 50 acres in bluegrass; 10 acres in clover, balance in oats. Good 8-room house, with basement; good barn 36x50; well fenced; 3 wells, 2 good springs. On gravel road. No trade; easy terms. This is within a half hours walk of the University of Missouri and will afford buyer an opportunity to send his children to this great school. Address Clark Robinson, Columbia, Mo.

For Sale or Exchange

Three first class carriages for sale cheap, or will trade for any kind of live stock. L. G. Courts, Columbia, Mo.

Live Stock Notes

R. P. ROYCE, Fieldman

CUURENT NEWS OF INTEREST TO LIVESTOCK MEN

In 1897 the top price for native steers sold in Kansas City was $5.40; the top price for hogs, $4.27½, and the top price for sheep, $5.10.

* * *

On June 5, a shipment of 32 head of 1,586-pound steers sold on the St. Louis market at 11 cents per pound. Yes, they were "from Missouri' —from Benton county.

* * *

A young farmer from Southwest Missouri made an early June sale of 59 head of 774-pound heifers at 10 cents per pound, on the Kansas City market. Not so many years ago the Ozark country produced but few finished cattle.

* * *

Reports made to the Missouri State Board of Agriculture tell of the loss of many cattle from clover bloat. White clover was never so plentiful as it is this season and it is causing most of the trouble.

* * *

In the Bellows Bros. sale of Shorthorns held at Maryville, Mo., June 14th, 42 head sold for an average of $1,083.45. Three cows brought $2,000 or more, one selling for $2,250, the top of the sale. Twenty-four females sold for $1,000 or better. Three bulls brought $1,000 each.

* * *

Prof. L. A. Weaver, of the College of Agriculture, recently purchase 60 Poland China spring gilts from H. S. Williamson, Centralia, Mo. The gilts are to be used in an extensive experiment planned to determine the most satisfactory method for developing brood sows. Later, Prof. Weaver will select from this lot a number of sows to retain in the college herd.

* * *

An apparently insignificant bruise or collar sore may cause the death of a valuable horse or mule. A Cooper county farmer reports the loss of a young stallion from lockjaw (tetanus) caused by a bruise on the foot. A neighbor on an adjoining farm lost a $225 mule a few days later from the same cause, lockjaw being brought about by a slight collar sore.

* * *

The value of pure-bred sires—bred in Missouri—is more and more coming to be recognized. Bulls from Missouri are largely responsible for the high quality of cattle on the western ranges. Nobody knows this better than does the western cattle king himself. Proof of this is seen in the recent purchase of 30 head of young Hereford bulls, at a cost of $7,500, by a Rio Grande Valley stockman.

* * *

The officials of the International Live Stock Show have announced that they will offer a $1,000 classification for fat barrows of the various breeds provided that the breed associations will give one-half the prize money. Such a classification will insure the greatest fat barrow show ever held in this country and the various record associations will no doubt see that their particular breed is represented.

* * *

The International Live Stock Show will be held at the Union Stock Yards, Chicago, December 2 to 9. The show of breeding and fat cattle as planned for 1914, will be carried out. According to Secretary B. H. Heide the premium list will be ready for distribution about August 1. Owing to foot-and-mouth disease, the International has played in hard luck. It is hoped that nothing will interfere with putting on the present ambitious program.

* * *

Live Stock receipts at the Kansas City stock yards, during May, 1916, were as follows: Cattle, 128,199 head, a gain of 97,808 head as compared with May, 1915; calves, 5,696 head, a gain of 1,416; hogs. 274,151, a gain of 61,717; sheep, 173,996, a gain of 37,-898. Some top prices were: Steers, $10.80, as compared with $9.15 in May, 1915; stockers, $9.10, as against $8.60; feeders, $9.10, as compared with $8.40; cows, $8.75, as against $7.75; hogs, $10.05, instead of $7.80; sheep, $11.00, as compared with $9.80; spring lambs. $12.40, as against $11.35.

The Southwestern Dairy Show Association is planning for a great show in Convention Hall, Kansas City, September 18 to 23, 1916. The show will include dairy products and dairy machinery as well as dairy cattle of the leading breeds. The officials of the Southwestern Dairy Show Association are R. A. Long, Kansas City, president; C. W. Kent, Kansas City, vice president; P. P. Lewis, Crescent, Missouri, vice-president; W. E. Skinner, Chicago, vice-president; J. H. Tschudy, treasurer; J. G. Watson, until recently connected with the Extension Department of the Missouri College of Agriculture, secretary-manager. The executive committee is F. J. Bannister, C. F. Holmes, E. H. Witte, H. A. Kennedy, L. J. Chapman, E. E. Knoche.

* * *

Missouri stockmen not only breed the best but they also buy the best. "No animal too good to head a Missouri herd" seems to be the motto of more than one Missourian. At the C. A. Saunders sale of 50 Shorthorns, at Manila, Iowa, on June 1, the average was $1,046, and it was the Missouri firm of Bellows Brothers, of Maryville, that bought the highest priced bull. paying $2,600. Remember, too that this calf, a son of Cumberland's Type, will not be a year old until October 1. On the same date as this sale there was held a breeders' sale of Herefords in Kansas City, in which 61 head sold for $48,460, an average of $794.42. In this sale, too, Missourians bought the best bull, O. Harris and Sons, of Harris, paying $11,100 for the 3-year-old show bull Bonnie Brae 60th. No wonder that Missouri leads all other states in number and quality of registered cattle of the beef breeds.

* * *

One hundred and forty Holstein bulls, cows and heifers sold in the D troit sale June 8 and 9 for a total of $155,090, an average of $1,107.78 per head. King Champion Rag Apple, a seven-month-old bull calf sold for $20,000. The calf was bred by Oliver Cabana Jr., Elma Center, N. Y., and was purchased by A. W. Green, Middlefield, Ohio. However, far more important than the above sensational sale was the fact that, for the most part, the offering sold for fairly uniform prices. The sale was held in connection with the annual meeting of the Holstein Friesian Association of America, and will undoubtedly serve to place all Holstein values on a new high level.

SOUTHEAST MISSOURI CATTLE MEN MEET

"More and better catle for Southeast Missouri" was the spirit of the Cape Girardeau Beef Cattle Breeders' Association which met at Jackson recently.

Although organized less than a year ago this organization is making itself known by its stand for more and better cattle. Furthermore the trade of southeast Missouri appreciates its stand and is coming to Cape Girardeau County for more cattle than ever before. New as this Association is with its limited publicity, the demand for breeding stock has steadily grown. Not a member of the Association of which there are more than twenty, has a bull of breeding age for sale and the present supply of females is limited. It is gratifying to note that the majority of the surplus cattle sold have remained in Cape and nearby counties all of which will tend to develop the demand and draw future trade to home breeders. With this increased demand in view members of the Association plan to increase their herds in the near future and show a disposition to supply the present demand with their present herds.

The Association sees a great opportunity for beef producers in the Southeast Missouri country and propose to have a hand in starting the cattle men in the right direction by supplying their demands at reasonable prices.

S. T. Simpson of the Missouri College of Agriculture addressed the Association on "Herd Improvement." In part he said—"No breeder should expect every calf dropped to develope into an animal suitable for the breeding herd. Too many breeders insist on selling every male calf as a bull. The breeder who will ultimately produce the best cattle, command the highest prices and satisfy customers must keep his knife sharp and use it freely. We have too many scrub bulls in Missouri already and are not ready to have this number swelled by "scrub pure breds." We need more pure bred steers."

Following his address the Association voted to hold a sale of pure bred cattle at Jackson next October and discussed the exhibition of cattle and cattle classifications at southeast Missouri fairs.

Wash Miller of Oak Ridge, Missouri is secretary of this association.

CATTLE FEEDS WASTED

A vast quantity of feed available for cattle is now either wasted absolutely or put to some less profitable use, says a recent report which the Department of Agriculture has just published as Part IV of a comprehensive survey of the entire meat situation in the United States. Failure to utilize the full value of this material has increased unnecessarily the cost of producing meat, has diminished the profits from cattle feeding, and has discouraged many farmers from engaging in an industry essential to their permanent prosperity.

According to the report already mentioned, the loss in grain, straw

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.

BENNETT BROS. R. 5, LEE'S SUMMIT, MO

Spring Boars by the Grand Champion.

A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.

WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns

Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.

H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS

We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.

W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands

I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.

H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.

EDGAR DOOLEY, - Etterville, Mo.

DUROC JERSEYS

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.

A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

BIG EARLY DUROC SPRING PIGS

Pigs with size, lots of bone and quality sired by our big prize-winning boars, Col. Wonder II., Merry Chief, and Rexall Col., and out of big prolific sows. None from litters of less than 11. Spring pigs are cheapest to buy, costs practically nothing to ship them, and they can be grown cheaply.

R. L. (BOB) HILL ADENHILL FARM, - - COLUMBIA, MO.

Aberdeen-Angus

I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.

J. D. Blackwell - Fayette, Mo.

and corn stover amounts to more than $100,000,000 annually. Both of these products are disposed of most economically when fed to cattle in connection with some form of concentrated feed. Straw is especially valuable in carrying the breeding-herd through the winter, in wintering stockers, and as a supplementary roughage for fattening cattle. Stover, too, is an excellent feed for wintering cattle, especially mature breeding cows. Nevertheless, in many sections of the country where these products are abundant, little attempt is made to take advantage of their value for these purposes.

Of an annual straw crop of approximately 120,000,000 tons, it is estimated that only two-thirds is put to its best use—live stock production. Of the remainder a little more than one-half is sold or turned under and the rest—15 per cent of the total crop—is burned. Burning is practically an absolute waste and although plowing under does contribute something to soil fertility, the benefit to the land is less than that which would be derived from the use of the straw to produce manure. "Of all systems of obtaining permanent soil fertility," says the report, "none is so practical or as easily available as that of feeding live stock."

The average value of all kinds of straw is placed at about $5 a ton. In many sections, of course, no such price can be realized for it, and as a matter of fact only about 8 per cent of the crop actually is sold. The figure mentioned, however, may be taken as representing the value to the farmer of straw if he will use it properly in his farming operations as feed or bedding. In order to ilustrate how this may be done the report gives three sample rations for wintering a breeding herd of beef cattle on straw combined with silage, shock corn, and cotton seed or linseed meal. Any one of these rations, it is said, will prove economical. They are as follows:

Rations for Wintering Breeding Cows

	Pounds.
Ration 1.	
Straw	10
Silage	20
Cottonseed meal or linseed meal	1½
Ration 2.	
Straw	20
Cottonseed cake or oil cake	2
Ration 3.	
Straw	10
Shock corn	10
Cottonseed meal	1

In this connection it is pointed out also that feeding straw in the winter will insure under certain circumstances the full utilization of summer grass. In a number of western States it frequently happens that grass goes to waste because feeders are unwilling to pay the high prices asked for steers in the spring. With an abundance of straw on hand to lessen the cost of wintering, feeders can take advantage of the lower prices for stocker cattle in the fall to secure on reasonable terms at that time enough stock to pasture all the grass the following year.

The production of corn stover is about twice that of grain straw, amounting to approximately 245,000,000 tons a year. A larger percentage —81.5—of this is fed than of the straw but the waste is nevertheless astonishing. For this, poor methods of feeding are largely responsible. By far the most economical method of handling corn is by ensiling, but as a matter of fact onlf 8.1 per cent of the acreage was put in the silo in 1914, the year in which these investigations were made. About 11 per cent was cut for green feed and 81 per cent allowed to mature for grain. It is in last portion of the acreage that the greatest waste occurs. Stripping the leaves from the stalks which are subsequently burned, removing the stalk above the top ear only, leaving the stalks to stand in the field until the loss of leaves and leaching have removed much of their fertilizing value, are all unthrifty methods. Furthermore, almost four per cent of the stover is burned, as though, instead of being a potential source of revenue, it was merely a nuisance to be gotten rid of as a preliminary to plowing. In some States the percentage of stover that is thus thrown away is as high as 7 or 8 per cent and the total loss to the country from the practice is estimated at nearly $15,000,000 a year.

To obtain satisfactory results from the feeding of farm roughages such as straw and stover, they must be combined with some form of concentrated feed. At the present time large quantities of such feed, in the form of cottonseed meal and cake, corn, molasses, peanuts and beans are exported for the use of European feeders. If the straw and stover that are now wasted were employed to feed more cattle, these concentrates could be consumed at home. The result would be a tremendous saving not only in the cost of producing beef, but in the cost of enriching the soil as well. In 1914, for example, about 1,000,000 tons of cottonseed meal—half the total production—were applied directly to the soil as fertilizer. If this had been fed to cattle instead, three-quarters of the fertilizing value would have been returned to the soil as manure. The loss of the other fourth would have been far more than counterbalanced by the profit on the meat produced economically by the meal and the necessary roughages. Much the same thing is true of the other oil meals.

The value of these meals is far better appreciated in Europe than here. Denmark, for example, feeds annually 478 pounds of oil cake to each of her mature cattle. The United States approximately 24 pounds. Furthermore, the European feeder is aware of the fact that the high-protein meal, while more expensive to buy, is more economical to use. Meal of this quality is seldom sold on the domestic markets because the American farmer has not yet learned its value. Cottonseed and linseed are perhaps the best known of the oil meals but there are others the use of which as feed could be profitably extended. Both peanut and soy bean meal and cake, for instance, are in good demand in Europe.

$75,000 LOST BY GRADE SIRES' USE

Hundreds of farmers are wasting time, money, feed and labor by breeding to grade stallions each year. The difference in service fee between a good, purebred and a common grade sire is seldom more than $10 and often not more than $5. The difference in the value of the colt when three years old is from $25 to $100, though the cost of feed and care is about the same.

The average value of horses on Minnesota farms is $109.80 a head, which is not enough to pay for producing them. By the use of sound, purebred draft sires, the average farm mare can be made to produce a colt worth $200 at working age and the better farm mare will produce foals to make $250 or $350 horses.

There are 1,896 grade sires licensed for service in the state. Now, counting that the "get" of these sires will return a profit $25 less than the get of a purebred sire, which is a conservative estimate, the use of the common sires is costing the farmers of Minnesota from $40,000 to $75,000 a year.

That the farmers are realizing the value of the purebred stallion is shown by the fact that the number of such horses registered has increased more than 50 per cent since 1910 and that the number of grade stallions registered has decreased more than 14 per cent in the same time.

The Minnesota stallion law requires that every horse that stands for public service must be licensed. It further provides that every bill, poster or advertisement of the horse must contain an exact copy of his state license and that a copy of the license be posted on the door of every barn or building where the horse makes a stand. Misleading illustrations, pedigrees, and other untruthful matter are forbidden on the advertisements.

Any stallion owner who does not comply with the provisions of the stallion regulations has no legal right to collect service fees.—J. S. Montgomery, assistant secretary, Minnesota Stallion Registration Board.

Youthful Stockman's Future is Bright

The young chap who stands at the parting of the ways between boyhood and manhood is a surveyor. He surveys what he thinks he wants do do. Shall he enter a profession, engage in business, do this, that or the other, or be a farmer? At once he comes flatly up against the question of estimating the "future" which each occupation holds for him.

If he can then confer with men engaged in the various classes of the world's work he may conclude where opportunity lies thickest-spread. In this connection the following, from an address by the late Dr. Henry B. Favill (a native of Wisconsin) only a short time before his death, is enlightening:

"The future before the young breeder who has respect for his general agriculture, and is willing to protect it, and who wants good animals, and who will let the speculative part alone —the future of that man is the brightest future that I know of anywhere."

If a young man can see his way clear to stand firm on this advice then he has the word of the great doctor-farmer for it that there lies before him a bright future.—Wing.

PARTIAL LIST OF MISSOURI COUNTY FAIR DATES FOR 1916

County and Town	Name of Fair	Secretary	Date
Audrain, Mexico	The Mexico Fair	L. M. White	Aug. 8-11
Bates, Amsterdam	Amsterdam St. Fair Ass'n	J. D. Sage	Not Set
Bates, Butler	Bates Co. Fair Ass'n	Grover Gilbert	Sept. 5-8
Boone, Columbia	Boone Co. Fair	R. L. Hill	July 31-Aug. 4
Buchanan, Easton	Buchanan Co. Fair	C. S. Brown	Sept. 6-9
Cooper, Bunceton	Bunceton Fair Ass'n	Edgar Nelson	About Aug. 20
Callaway, New Bloomfield	Callaway County Fair	S. D. Waggoner	July 25-27
Chariton, Prairie Hill	Prairie Hill Fair	C. L. Sear	Aug. 31-Sept 2
Clay, Smithville	Smithville Horse Show & Fair Ass'n	E. P. Mitchell	July 18-21
Clark, Kahoka	Clark Co. Agr. & Mech Soc.	P. I. Wilsey	Aug. 29-Sept. 1
Daviess, Pattonsburg	Pattonsburg Fair Ass'n	R. E. Maupin	Aug. 29-Sept. 1
Dade, Lockwood	Dade Co. Agr. & Mech. Soc.	R. A. Frye	Sept. 19-22
DeKalb, Maysville	DeKalb Co. Agr. & Livestock Ex.	J. B. Mayse, Jr.	Not set
Dunklin, Kennett	Dunklin Co. Fair & Livestock Co.	L. R. Jones	Not set
Franklin, Sullivan	Sullivan Tri-Co. Fair Ass'n	J. T. Williams	Sept. 12-15
Franklin, Washington	Franklin Co. Fair	H. H. Thias	Sept. 8-9
Greene, Springfield	Springfield District Fair	J. McClain	Oct. 3-7
Harrison, New Hampton	New Hampton Harvest Home Festival	A. L. Clabaugh	Aug. 30-Sept. 2
Hickory, Hermitage	Hickory Co. Fair Ass'n	Ross Coon	Aug. 29-Sept. 1

JERSEY CATTLE

JERSEY CATTLE

Bulls ready for service. They are sired by the Owl's Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

JERSEY BULL CALVES

I have three extra fine ones for sale. Sired by Stockwells Champion. He has won 29 first and Champion ribbons at the leading State Fairs. Calves are out of very high producing cows. For breeding, etc., writ.

J. B. SMITH Platte City, Mo.

SUNSET CORRECT TYPE JERSEYS

To keep our herd within 100 head we will offer at private sale fifty Jerseys, consisting of cows, bred and open heifers, young bulls, heifer and bull calves. Can fit out small herds for beginners. 125 head to select from. The famous Blue Belle-Golden Rosebays. Send for special circular before buying elsewhere. Bargains. Mention your wants.

THE ENNIS STOCK & DAIRY FARM, Horine, Mo. (Just south of St. Louis.)

HOLSTEIN CATTLE

Dutchland Sir Hengerveld Rag Apple 99771

A few choice bull valves out of heay producing dams sired by the above famous bull for sale.

BLACK AND WHITE FARM
Baden Station, Mo.
Tel. Colfax 1812 R. R. 30

IN MISSOURI

Eight Bulls, 2 to 8 months, $100 to $175 each. Always have a few good cows and bred heifers for sale. Nothing but registered Holsteins.

S. W. COOKE & SON, MAYSVILLE, MO.

HOLSTEINS

Young bulls and heifers from A. R. O. cows. Sired by Sir Korndye Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.

M. E. MOORE & CO., Cameron, Mo.

Reg. Shropshire rams, yr's and twos. Square built, rugged hardy bucks with weight, bone and heavy fleece. Quick shipping facilities & priced cheap. 412 head. Above Kansas City.

HOWARD CHANDLER, Chariton, Iowa.

THIS BEAUTIFUL CAR FREE!

Don't You Want To Win This Car?

IN ORDER to increase its subscription list, **The Missouri Farmer** has concluded to give away this beautiful five passenger **Overland** automobile under conditions which place it within easy reach of any bright young farmer girl or young farmer in the state. Everybody almost wants to own an automobile and the wish is an entirely normal one. In the first place, the automobile wipes out distance. If an emergency of any kind arises, the automobile "goes there and back" in the length of time that it takes to hitch up and get started with a team which is frequently tired out from work in the fields.

The Pleasure of Owning a Splendid Car

BUT WHAT normal human being doesn't want to own a beautiful automobile because of the pleasure it gives and who is entitled to this pleasure more than those who live upon the farm? Just think of how gladly you will look forward to Sunday with this splendid car standing ready to glide away at the touch of a button! You can pile in the whole family and go to church on Sunday morning. Then, when dinner is over, you can take a 40 or 50 mile spin into some neighboring county and get back again by supper time. Think of the exhiliration out in the fresh air, the pleasure of seeing growing crops upon every hand and the visits you can pay to relatives and friends!—**and all this accompanied by a riding luxury not excelled by a Pullman Palace car!** Again, during week days when the days work is over you can pile in the "whole bunch" and take in a picture show in town. **Truly, is it any wonder that everybody wants to own an automobile?**

You Can Win It if You Try!

AND THIS beautiful car is within easy reach, as we said above, of any bright farmer girl or young farmer in Missouri. All that is required to win it is first, the **desire**—and then the willingness to do a few weeks **hustling!** Get a bunch of sample copies of **The Missouri Farmer** together with a subscription pad and then "hit the trail." We give three years subscription for one dollar and when you show your neighbors what a splendid paper **The Missouri Farmer** is—when you tell them that it is leading the fight for Farm Club organization throughout Missouri—**and that you want them to help you win this beautiful car!**—hardly a single one of them will turn you down. The renewal of old subscriptions will count the same as new—and should you fail to win the car we will nevertheless give you a **substantial commission on every subscription you send in—so in any case you will make a lot of money!**

Send Us Your Name Today

NOW WE WANT every farmer girl or young farmer who reads this advertisement and who would like to win this magnificent car to send us their name and address today. **Don't be afraid of not winning!** "Faint heart never won fair lady." Again, you don't know how **easy** our plan is for a real hustler. There may be some reason why it would be particularly easy **in your community!** We intend to help everybody who gets into this fight. We will tell you just how to conduct your campaign from start to finish. If there are a bunch of old subscribers in your neighborhood which need renewing we will send you their names. You will have little difficulty in getting **practically every one of them!** You owe it to yourself to find out all about our plan—**and your failure to write us may deprive you of this beautiful car!** If, after you understand our plan fully you do not care to go into the fight you will merely be out a postage stamp. **Isn't such an offer worth at least an investigation?**

THE PEOPLE WHO WIN

THE PEOPLE who win in this World are those who have faith in themselves and who are not afraid to hustle. Somebody who has this kind of will power and ambition is going to win this splendid five passenger OVERLAND. It might as well be you as somebody else. It is for you to say. It costs $695. Why not let THE MISSOURI FARMER buy it for you? And remember that in any event we will pay you handsomely for every subscription.

The Farmer

Every reader of this paper knows that we regard a "square deal" for the things produced by the toil and sweat of the farmer as the overwhelming economic issue of the hour. In taking this position we do not claim that the farmer as an individual is entitled to special privileges apart from the masses of other citizens who compose our mighty Nation. But the fact remains that Agriculture is the great fundamental industry upon which the well-being of all our other industries depends. There isn't a towering sky scraper, a great factory or a great bank in the land which does not owe its existence either directly or indirectly to the toil of the farmer. But for him the history of Wall Street with its good and its bad would never have been written. The farmer toils not merely that the teeming millions in our great cities may be fed and clothed but that he in turn may be able to buy generously the things produced by our great factories—and thus he not only feeds the Nation but is likewise the greatest and best customer of its varied industries. Endless columns have been written in recent months concerning our tremendous trade balance against Europe—a golden stream which has grown larger and larger and which promises to shift the future financial center of the World from London to New York. But analysis shows that it is the surplus Wheat, Beef, Pork, Cotton, Horses and Mules of the American farmer rather than war munitions which are responsible for this new conquest over Nations which find themselves in the midst of the most tragic struggle in all human history.

In view of these facts, the welfare of the farmer is the welfare of the Nation and the past and present power of great "Combines" to set an arbitrary price upon what the farmer produces is not only sapping the life blood out of American Agriculture and driving thousands of our brightest boys and girls to the already overcrowded cities but the same power which robs the farmer has likewise created a "high cost of living" which is absolutely false and which is fast driving both producer and consumer toward an abyss that is certain to end in National disaster. That the one and only remedy for this deplorable state of affairs is farmer organization such as the country never dreamed of before—this is a self-evident fact to all thinking men. Not only must the farmer work out his own salvation in these respects, but he is also the only one to whom the millions who toil in our great cities can look for deliverance from a living cost which is the creation of a group of conscienceless conspirators and which is compelling them to struggle as never before to keep body and soul together. Like a gigantic industrial devil-fish the Food Combines have fastened their tentacles upon the throats of the farmer and the consumer alike—and until their hold is broken this Country can never become wholesomely or dependably prosperous.

But there is still another reason why the American farmer must arouse himself and begin to take a real part in the affairs of Government. Through organizations whose power has become so great that they can strike paralysis into a number of the great vital industries of the Nation, certain aggregations of labor are permitting selfishness to more and more control their actions. Thus we are at this moment on the verge of a Nation-wide railroad strike—the possible consequences of which are beyond computation. Already among the best paid employees of the Country, the Railway trainmen are demanding a new wage increase which it is estimated will amount to $100,000,000, per year. We are not here assuming to pass upon the merits of this controversy. We concede the right of labor to organize and to demand fair wages—but if the increase is granted it is the American public and not the railway managers who will finally have to foot the bill and it is high time the farmer threw himself into the breach and demanded a "square deal" for the masses and put an end to the selfishness of the classes—whether that selfishness emanates from Wall Street or from the council room of a labor union which believes that "might makes right." The farmer alone has the voting power to do it. Upon him therefore depends not only the future of our farm homes but the future of the Republic.

See the Real Kerosene Tractors

Of course you are going to attend one of the tractor demonstrations this year.

Before you go, get the local prices of gasoline and kerosene, so that you will have the difference clearly in mind, because, at any demonstration you will be shown two kinds of tractors—those that operate on gasoline and those that operate on kerosene.

The kerosene tractors can be divided into two classes. One class consists of engines originally designed for gasoline. To these, special attachments have been added, and, under favorable circumstances they will operate on kerosene, or gasoline mixed with kerosene, but they require so much kerosene that there is no economy over gasoline.

The other class are the real kerosene tractors. They are designed throughout to operate on kerosene without special attachments, and do operate on the cheaper fuel so successfully that they pay for themselves with the fuel they save.

Moguls and Titans Are Real Kerosene Tractors

Remember the difference in the prices of the two fuels. Remember that a tractor uses two or more gallons of fuel every hour it works. **See the kind of work Mogul and Titan tractors do on the cheaper fuel.** Compare their work with that of any tractor, either for quantity or quality. **Compare the amounts of fuel consumed in doing equal work.** Then decide which of all the tractors you see will give you the most value for your money.

In preparation for your visit to the demonstration, let us send you our horse and tractor book, "Farm Power." It contains almost a hundred pages of closely packed, verified information about power on the farm.

INTERNATIONAL HARVESTER COMPANY OF AMERICA
(INCORPORATED)
CHICAGO U S A

LYONS PRACTICAL FARM PAPERS

We have had more than our share of rain, as well as some hail and heavy wind. In our immediate section we have fared well so far as wind and hail are concerned, but it has been entirely too wet for farm crops to do well. Most of the corn has been cultivated once, all of our own having been harrowed once and cultivated once so we are in good shape.

Clover hay making will be in order June 20—July 1, with the best crop of clover in years, timothy meadows very poor, oats the same and few fields of wheat above 10 bushels per acre.

We used 100 pounds of 16 per cent acid phosphate per acre on one field of corn. Through the field from east to west, is a strip where a fence stood, 1845-1890, and in planting this strip we cut out the fertilizer for six rows each 50 rods long.

With two neighbors, I went to see this corn on June 18, and we all agreed that the corn plants on this strip were not half as large as those on the fertilized, thinner soil, on each side.

One of the neighbors said that it was an extra plain demonstration of the value of fertilizer, and suggested to me, that if I caught him planting corn without it next year, to take him to the probate judge, be appointed as his guardian, buy the fertilizer and make him use it.

In exactly forty years use of commercial fertilizers, there have been but few years when their use did not pay several times their cost, and no year that they did not pay it back twice.

I have a most striking example of the after effects of fertilizers in a two acre patch of rape sown by my son-in-law in a piece of land upon which he grew corn with fertilizer. Where the corn rows stood, 42 inches apart, the rape is three times as large as it is in the middle between the rows, the strip of large rape being about six inches wide. The fertilizer was a "12-2," 12 per cent phosphoric acid, 2 per cent potash, the land below medium fertility, the corn crop around 35 bushels per acre.

We sowed an acre of rape for hog pasture June 6, five pounds of rape seed, two pounds of Sudan grass seed and four or five pounds of cowpeas, and all are up fine. We put on a few pounds of soy beans left over from last year, 1913 seed, and not one germinated. The plot is 5x32 rods, we plan to fence it in two strips, 5x16 rods each, and pasture the strips alternately a week at a time with ten 100 to 150 pound hogs.

Last June we sowed an acre of rape and vetch, on a plot of rough land that we could not break very well, and the rape gave us an enormous amount of hog pasture, but the vetch was the winter type and did not do much. The plot is not in use this year, and I had not seen it for two months until some two weeks ago when I found it a mass of vetch vines and clover, and a pretty fair stand of tame grass in it.

After trying various methods of seeding sweet clover, without much success, we put a bushel of unhulled seed on three acres of oats this spring, broadcasting after the oats were harrowed in on disked corn stubble, and harrowing again. It is all there, as fine a stand as I ever saw, some six inches high, right on those clay points where Sam Jordan saw my foxtail corn last year. Sam and I found a nine foot stalk of yellow sweet clover last summer, and I have found quite a plot of this variety that grows much more upright than the average.

Our Fair Board met the 17th of June, and asked me to meet with them to revise the premium list on fruits, grains, vegetable, etc.

I put the 50 cent premiums up to $1, and in some cases to $3, cut out a lot of stuff that is of little interest or value, and, when we were through, the man who was figuring it up said that in a $250 list I had saved $28. It never seemed fair to me, to pay $4 in premiums on corn, and $35 in each of six breeds of sheep or $45 on each of four breeds of hogs, and when I presented this matter to the board, they agreed with me to a man.

We have 7,000 to 9,000 people at our Fair on Thursday and Friday, 25 cents admission and no racing. The fair is sixty-seven years old and one of the best in Ohio. C. D. Lyon.

MEAT PRODUCTION AND THE DEMAND

That meat production has not kept pace with the increase in population and that its failure to do so, combined with increased cost of production and diminished purchasing power of the money unit, has contributed to higher prices not only in the United States but all over the world is stated in Part I of the exhaustive report on the meat situation in the preparation of which specialists of the U. S. Department of Agriculture have been engaged for some time. This country, it is said, is participating in a world-wide movement and it is not expected that the situation will undergo any radical change in the immediate future. On the other hand, it is believed that there will be a gradual growth and expansion in the world's production of beef, mutton, and pork which may or may not equal the rate of increase of the meat-eating population.

In America this gradual expansion appears to have begun already. Between 1907 and 1913 there was a marked decline in the number of cattle in the country but in the last two years this has not only stopped but has given way to a perceptible increase. The estimated number on farms and ranges on January 1, 1916, 61,441,000, is, however, still much below the corresponding figure for 1907, 72,534,000. With the exception of temporary checks due to losses from hog cholera, there has been in recent years a persistent increase in the production of swine. On January 1, 1916, the number in the country was estimated at 68,000,000 as compared with 58,200,000 in April, 1910. On the other hand, the number of sheep declined during this period from 52,500,000 in 1910 to 49,200,000 in 1916. As the decrease, however, is not sufficient to offset the increase in cattle and swine it may be said that the total production of meat in the United States is increasing but that this increase is not yet proportionate to the growth in population.

The available supply of meat would be much greater if it were not for the enormous losses caused by disease and exposure. Since 1900 it is estimated that from 1,100,000 to 1,475,000 cattle have died each year from disease and from 600,000 to 1,500,000 from exposure. With sheep, the losses from disease have been about the same, but from exposure much larger.

With swine the relative prevalence of hog cholera is perhaps the determining factor in the annual loss. In 1894 this was as low as 2,200,000, but in 1914 it amounted to 7,000,000. If these 7,000,000 hogs had been saved, it is said, they would have produced enough meat to furnish every family in the United States with 40 pounds of pork.

Despite these facts the United States remains the greatest meat eating as well as the greatest meat producing nation in the world. Approximately twice as much meat is consumed in this country as in Germany before the war and the total normal consumption in Russia, Great Britain and France is less than in Germany. The per capita consumption is also far greater in this country than anywhere else with the exception of Australia and New Zealand.

Our own exports now consist largely of pork and pork products and these are derived to a great extent from corn. In the fiscal years 1914 and 1915 we imported more fresh, chilled and frozen beef and mutton than we exported, and more beef of all descriptions was imported in 1914, than was exported. In this limited respect we have joined the great majority. Practically the whole of the world's export trade in meat is maintained by nine countries—Argentina, Australia, Canada, Denmark, Mexico, under normal conditions, New Zealand, the United States and Uruguay.

Better arrange now to go to the St. Louis Tractor Demonstration July 31-Aug. 4 and sse the machines in operation.

The Missouri Farmer

VOLUME VIII JULY 15, 1916 NUMBER 14

The Coming of the Tractor

BY W. L. NELSON

It is a far cry from the methods of the pioneer period to those of the present—as far as from ox-cart to auto; from cow camp to crowded city; from trail to trolley; from "soddie" to silo; from lynch-pin to liomusine.

"The prairie schooner" it has been said, "has faded from the grassy seas and is at rest in the dim haven of lost ships." Men no longer skim the cream off of 160 acres of land and move to a new quarter-section. There is no more free land, no "Wild West" to be discovered. The farmer no longer fights savage Indians, or in the pursuit of his daily duties fears the attack of wild animals. The enemies which he must now meet are drouths and floods, the Hessian fly, the chinch bug, and blights and diseases which attack his fruit and grain crops. He must also safeguard the health of his herds.

The farming methods of today are not those of our forefathers. It is well that this is true. Virgin soil and cheap land, together with an abundance of cheap labor, perhaps amply justified the methods of the past. The wheat cradle was an efficient piece of farm machinery in its time, yet few farmers there are who would today value highly the most expensive cradle to be found on the market. The ox-cart served a useful purpose and in a large measure made possible the settlement and development of the central and western country, yet the ox-cart would today be looked upon as a very inefficient part of farm equipment. With the great advance in the price of land, the growing scarcity of farm labor, and the correspondingly increased necessity of time saving, the demand is for the two-row cultivator, the self binder, and other time-saving and labor-saving machinery.

Tractors Are Coming

Enter, then, the tractor. Many there are who believe that the tractor will be slow to find favor on the average farm. It should be remembered, though, that there are right here in the corn belt country, thousands of men who have cast only one vote for president, yet who can remember when the automobile was a curiosity to be viewed with interest and often with alarm. Even ten or a dozen years ago the automobile was looked upon as a rich man's luxury. Today it is serving a distinct and useful purpose, not only in the city, but on the farm. Whether or not this will be true of the tractor will depend in large part upon the efficiency which the tractor manufacturers are able to develop in their machinery. If they are able to make the same rapid progress that the automobile manufacturers have made, and will give to their product corresponding measure of publicity, there is every reason for believing that the tractor is very soon to occupy an important place in farm progress. Unlike Topsy, the successful tractor cannot "just grow." It must be made to fit the farm. It must meet every reasonable demand of the farm, and represent an all-the-year-round piece of farm machinery, capable of converting time into dollars. While it cannot, like the horse, "eat its head off," it can stand idle too many days in the year. The tractor also differs in growth from most machinery in that the problem has largely been to make it grow smaller rather than larger—in other words, to meet the demands of smaller farms rather than of the great wheat farms of the west and northwest only.

The St. Louis Demonstration

But these questions are all such as will be brought out in the tractor demonstrations scheduled for the present season. Eight such demonstrations are advertised to take place, the locations being Dallas, Texas; Hutchison, Kansas; St. Louis, Missouri; Fremont, Nebraska; Cedar Rapids Iowa; Bloomington, Illinois; Indianapolis, Indiana, and Madison, Wisconsin.

Of the tractor demonstrations referred to, Missourians naturally will be most interested in the great tractor show to be held in St. Louis, July 31 to August 4. This demonstration will really be a valuable week's course in power farming. In this connection it might be said that it seems most appropriate that such a contest should be held in Missouri, where demonstrations calculated to aid agriculture have long found favor. In 1869, for instance, in a field two and one half miles southeast of Sedalia, there was held a memorable reaper and mower trial under the management of the Pettis County Agricultural Society, with the encouragement of the Missouri State Board of Agriculture. In this contest an entrance fee of $60 for every machine or every combination, and $15 for each separate combination, was made. Forty machines were entered, and the trial in which the old Marsh binder did such "execution" was a most exciting one. Encouraged by the success of the trial of harvesting machinery, the Board of Agriculture at a meeting held on September 9, 1876, authorized a "field trial of ground stirring and seeding implements duly classified, to be held in St. Louis County as near the fair grounds as possible in the forenoon of each day during the time of the St. Louis fair, under the auspices of the Board of Agriculture." A few years later a plow trial was held at Columbia, and on April 6, 1882, a public sheep shearing took place at Sedalia. A trial of road graders was held at Mexico on September 15 to 17, 1891, and on December 7 and 8 of the same year a dehorning contest was conducted at Marshall in connection with the farmers' institute work. So it may be seen that the spirit of looking into things, of making personal inquiry, of first-hand study, is one that has long characterized the Missouri farmer.

Opportunity To Study Tractors

It is this same spirit that has made the automobile show at the Missouri State Fair, and similar shows in Kansas City an elsewhere decidedly popular. The average man is not satisfied with pictures or descriptions. He wants to go and see for himself. It is this spirit of inquiry, this desire to be shown, that insures the interest and attendance of the Missouri farmer at St. Louis on July 31 to August 4.

In the tractor demonstrations no spectacular stunts are scheduled. Instead, the visitors are to be given a really worth while demonstration as to the real worth of the machines. Durability and simplicity of construction, capacity and cost, will all be among the items considered. While the demonstrations in plowing will, perhaps, be the most interesting, it cannot be said with certainty that they will be the most valuable. The prospective purchaser will be quite as much interested in knowing the cost of operation, and also in acquainting himself with the general adaptability of the machine for other farm work as he will be in the plowing. Perhaps he will want a machine most capable of rendering direct assistance in such work as hauling a manure spreader, drawing a harrow over the fields, or a drag or grader on the roads. It may be that he will have in mind a tractor capable of furnishing power for sawing wood, pumping water or other farm labor where power is a consideration. Another item in which he will be interested is the amount and kind of fuel required to do a certain piece of work. This farmer will also figure on how many days he might possibly be able to keep the tractor busy, and also what the value of the work turned out would represent in man and horse wages. In this connection it may be said that the average farmer does not figure the cost of keeping a horse. The reason for this doubtless is that he raises his own feed instead of having to buy it. Consequently the cost of horse keep is seldom figured as it should be. If, as has been said by those who have carefully studied farm management problems, it costs from $6 to $8 per month to keep horses on the average farm, the saving possible from an efficient tractor must be considerable. On the other hand, it must be understood that it is just as easy for the farmer to get "skinned" in a tractor trade as in a horse trade. No doubt there are "gold brick" tractors on the market, and oily-tongued salesmen to dispose of them to the uninformed farmer. A great advantage, then, comes of a tractor demonstration, in that it gives a decided advantage to the tractor of real value, while disclosing the weakness of the inefficient competitor.

The size of the farm and the kind of work should determine the size of the tractor

A "Fit-the-farm Tractor" Needed

"A silo for every farm" is a catchy slogan, but it does not represent an ideal condition. It is not every farm that needs a silo. Just so may it be said that it is not every farm that needs a tractor. On many a farm "Old Dobbin"—or the Missouri mule—will continue to do duty and to do it at the saving of dollars. On the other hand, the addition of a fit-the-farm tractor will make more prosperous thousands of farm owners and operators. In deciding the question as to whether a tractor is best, the wise farmer will secure all possible information on the subject, then adapt it to meet his own conditions. He will not find fault with the tractor because it is new, nor will he for the same reason take to it without due thought. The tractor that will pay on one farm might prove a failure on another. For this reason it may be said that there is no one "best" tractor. So, then, a visit to a tractor demonstration is valuable in that it will help the man who is going to buy a tractor to select the right one for his farm. It will also help him to determine whether it will really pay him to buy a tractor. As we see it, there are but few farms where the tractor can entirely take the place of the horse. Yet there are

thousands of farms where the tractor can profitably be used to supplement the work of the horses.

With reference to tractors, as with all other farm machinery, it may be said that efficiency on the farm is marked not so much by the value and extent of implements and machinery as by the manner in which such implements and machinery are used and how cared for when not in use. No man can afford to keep a tractor just for the looks of the thing no more than he can afford to keep about him a lot of surplus work horses "simply for the sake of their society." On the other hand, no farmer can afford to do without a farm tractor if he really needs it and can make it make him money. This is the point that each prospective purchaser must decide for himself.

SOME ADVANTAGES IN STACKING SMALL GRAIN

By W. D. McKee, Ray County, Mo.

This is a subject upon which the writer has said much and written much, trying at all times to record his own experience, his observations and to reflect the cold calculating judgment of the most successful small grain growers.

Let it be said once for all that what will be said in regard to stacking small grain in this article will have to do largely with grain in the humid regions, and with the wheat crop in particular.

We know full well, that there are regions like the winter wheat belt of Oklahoma, Kansas and Nebraska and the spring wheat sections of Minnesota and the Dakotas where wheat is grown in such large areas and help is so scarce it is almost out of the question for these farmers to stack their grain. Yet the very reasons why these farmers should thresh out of the shock intensifies the arguments and the reasons why the corn belt wheat grower should stack their small grain. Out in the arid and semi-arid districts much of the small grain is dry enough to thresh just as it comes from the header and it is the common practice to thresh and haul from the machine to market. This throws all of these millions of bushels on the market immediately after harvest when the small grain in the humid regions should be tucked away in well built stacks going through the sweat, abiding its turn to come on the market when there is a brisk demand, the bulk of the western small grain having passed out into the great channels of trade. This is one of the arguments (and it is sound to the core) that all students of a better marketing system for the products of the farm have urged with a vengeance. **Avoid a glut,** should be penned to the front mass of every marketing carrier whether that carrier be of land or water, and is today the slogan of every marketing organization, county, state or government.

Small grain stacked in symetrically built stacks allows the grain to go through the sweat in the stack instead of the bin as when threshed out of the shock. Improves the berry, there-by improving the grade, and remember that all small grain is sold by grade. The higher the grade the higher the selling price. The higher the selling price the greater the profit and the greater the profit the greater the spending power of the farmer, which after all is the true standard or measuring power of the farmer to contribute to the cause of better schools, better church conditions and better roads, and all things whatsoever, that go to make up a well regulated community, a desireable place in which to live. These well built stacks also preserves the straw. Straw, as a feed is growing more and more in favor day by day. Many text book writers and sound articles in the agricultural papers are emphasizing the feeding value or straw. Its feeding value is greatly increased when fed in connection with silage, cow-pea, soy-bean or alfalfa hay.

Then why not stack this small grain secure this bright palatable straw and thus utilize one of the valuable by-products of the farms and eliminate waste and banish from your farm one of the most pernicious practices (burning strawstacks) of modern farming? It is estimated that six million dollars worth of straw was burned or allowed to go to waste in Missouri in 1914.

Much of this straw was burned because it was permitted to bleach and blacken in the shock before being threshed, for believe me it requires a well developed faculty of destructiveness, coupled with a spirit of daredevil recklessness to set fire to so precious a treasure, as a well cared for stack of bright straw.

The stacking of small grain enables the farmer to thresh, when owing to weather conditions, it would be impossible to thresh out of the shock. This grain can be stacked with the force usually at the command of the farmer, utilizing his own wagons and teams at a time when farm work is lax, thus avoiding an outlay of cash, which should always be done when possible. Stacking the small grain makes it possible to pasture the stubble before early plowing for a succeeding crop which is always helpful and some seasons indispensible. The practice of stacking small grain relieves the congestion at the time of threshing. The crew necessary is not so large as when threshing out of the shock and the women folks are not burdened with the rush and suffocating task of preparing meals and caring for multitudes when by a little good management much smaller numbers can and will suffice.

These are a few out of the many good and sufficient reasons why the farmers in the humid regions should stack their small grain.

You ask, if there are so many outstanding advantages in stacking small grain why is it not more universally practiced? While it is not practiced as much as it should be, yet, there are communities in Missouri where the small grain is not only stacked but the straw after being threshed is equally well stacked and just as well cared for as the grain itself. The bold fact that such communities exist answers some of the stock-in-trade arguments against stacking.

We are told that stacking is a lost art. Will we ever rediscover that art by threshing out of the shock? I have never been in a community yet, nor have you, but what there was some farmer that could stack small grain and do it well, and this same farmer could and would with great pleasure and much delight, teach the young men to do that, which their fathers did well, and upon which they justly prided themselves.

Here is an opportunity, yea, a Golden opportunity to put into practice that sound and wholesome doctrine that has caused the columns and pages of The Missouri Farmer at each and every issue, to bristle with the spirit of real, true, genuine, unalloyed community co-operation.

Separate and apart from the financial benefit, will be a start on the road to community betterment and working together. Get together and stack and thresh your small grain, and let the star of co-operation in your community shine with lustre and effulgence

THE STORY OF AN OLD FARM

By C. D. Lyon

(Editorial Note: We think 100 years continuous cultivation a pretty fair test of any system of farming and so when our regular contributor Mr. S. M. Jordan, after visiting the farm of C. D. Lyon in southern Ohio, about a year ago wrote The Missouri Farmer, "It was interesting to know that while his (Lyon's) farm has been in cultivation for over one-hundred years, there is no 'worn out land' on it. Yet the hills are so steep that I would not know how to go about it to farm them. That part of the country sure stands on edge. His system has and is producing gratifying results," we thought the story of how this farm has been maintained would make valuable reading for Missouri farmers. Mr. Lyon has promised to tell this story in three or four papers in The Missouri Farmer and if any of our readers are interested enough to discuss Mr. Lyon's methods as we progress or after he has finished we will be very glad to have them do so. If you have a question to ask to bring out anything not made clear to you do not hesitate to ask it.)

NUMBER I

A request comes from the editor of The Missouri Farmer, for a short series of papers, telling his readers how we have maintained, and even increased, the fertility of our farm, much of which has been under cultivation for more than 100 years.

In order to make the matter more plain to the general reader, I think it best to give a history of the farm, of the system of agriculture which has been practiced, of the crops grown, a desription of the lay of the land, and other things bearing upon the case.

The farm is part of a tract of 600 acres, and was bought in 1795 by my great grandfather, descending from him to his only son, and to my father, one of my grandfather's six children.

It was originally heavily timbered, waltnut, hickory, beech, hard maple, ash, basswood and buckeye being the chief forest trees, but there was a dozen or more varieties in lesser numbers.

About 70 acres of the farm is fairly level, rolling enough to drain well, and not so steep that the use of any improved farm implement, binder, sulky plow, riding cultivator is prohibited, and all are in general use.

On perhaps fifteen other acres of the farm, it is possible to use all these implements, by exercising extreme care, and the rest of the 103 acre tract is too steep to admit of the use of anything more modern than a two horse welking plow, a harrow, or a one horse five hoe cultivator.

I am told that the system under which the land was cleared, was to deaden the trees on eight or ten acres, and every second year to burn a "deadening" of this extent, and this timber destroying process was carried on until the level and more easily cultivated parts of the land was cleared leaving the timber which I remember back as far as 1860, on the steeper hillsides of the farm.

The pioneer farmer of the Ohio Valley grew but two crops as a business proposition, up to perhaps 1836, those two crops being corn and wheat, every bushel of these that could be spared being sold to flat boatmen to go "down the river," to feed, the slaves in the cotton and sugar growing districts.

The old Lyon farm was large enough to grow a small boat load each year, and after seeing to the growing of the crop, my great grandfather would load corn, flour, meat and perhaps a few barrels of whiskey on a flat boat, float through to New Orleans, sell boat and cargo, then walk back home a nice little trip of 1400 miles.

Older men have told me that no attention was paid to the matter of soil fertility, and, when after fifteen or twenty years constant cropping in corn and wheat, a field began to produce poor crops, the pioneer farmer said the land was "tired," and it was given a rest of a few years, then broken up again.

Some clover was sown, as a forage or hay crop, as early as 1830, but was very unpopular owing to clover bloat among cattle in the spring, and did not figure much as a field crop until ten years or more later.

Cattle and hogs were raised on the free range in the woods more than in the fenced fields, and as for horses the pioneers of the first period of thirty years, only kept enough to do the work of the farm.

I once asked a very old man who had spent nearly all of his life in this country about the use of manure in early days, and he said that few farmers paid any attention to manure making or its application excepting perhaps a load or two on a garden or truck patch, until after he was a grown man, and this was about 1825.

Thus it may be seen that one-third of a century elapsed before any attention was paid to keeping up soil fertility, and I may well say, that for at least twenty years longer or up to 1850, the system of agriculture here amounted to nothing but soil robbery.

If the readers of this will keep their papers until a series of three or four articles to follow are published, they will have some idea of the difference between the agriculture of today and that of the early times, as I want to give, in detail, an account of the way, our farm lands were depleted of fertility, and how it has been restored.

CO-OPERATIVE LIVESTOCK SHIPPING ASSOCIATIONS

By Geo. B. Ellis, Managing Editor

Co-operation expressed in its simplest terms means that a group of men are doing for themselves what other groups are allowing some one to do for them and incidentally we may say are paying a good price for having it done. The marketing of livestock is a pretty big business in Missouri. It is estimated that we produce yearly approximately 5,000,000 hogs and that about 1,000,000 are consumed on the farm thus leaving about 4,000,000 to be sent to market. Something like 1,000,000 sheep are sent to market yearly and approximately 500,000 cattle Then we might add the millions of pounds of poultry and dozens of eggs that may properly be classified with the livestock in the consideration of this subject.

Creating A Capital Fund

If all the livestock producers of the state were acting co-operatively and managing the selling of their own products a very small saving on each animal would soon create a large operating capital that could be used in the interest of the producers. Suppose a charge of twenty-five cents a head was made on every hog marketed, that would mean a million dollars in the capital fund each year. One dollar a head for cattle would add a half million dollars more and twenty-five cents for sheep, a quarter million which would give the farmers $1,750,000 every year that they could use for

the establishment of markets, obtaining information, prosecuting violations of the law in the state and Federal courts and maintaining a committee to constantly look after legislation.

The reason packers have accumulated so many millions is that they have used the profits on a large volume of business to get control of the marketing of nearly everything the farmer has to sell. If they controlled the marketing of meat only it would not be so bad, but they now have a large control of the marketing of cream and butter, of oleomargarine, of poultry and eggs, of fruit, of hides and leather, of cotton seed meal and cotton seed oil and various other products. Every dollar the packers add to their present holding of hundreds of millions of dollars increases their power over the farmers as well as over the consumers of this country.

Farmers Must Control the Marketing of Their Products

Does the manufacturer who makes farm machinery turn the selling over to some one else? Is it not a fact, Mr. Farmer, that the maker of practically every thing you can mention save farm products, looks after the selling of his products? Then why should the farmer be the only exception? They tell us that the farmer is not a trained business man and therefore should not attempt to control the business of selling his products. But how did the manufacturers become expert in selling their wares? Cannot farmers learn the business in the same way? We learn to do by doing and farmers are no exception to the rule. The reason they are nct expert in selling their products is because they have always let some one else do it for them. We do not mean by this that the man who produces corn or wheat or other products to sell should always follow his stuff to market but as a class farmers should be willing and ready to co-operate and by acting together they employ their own agents, direct them in their own interests and get a square deal in the bargain.

Are Missouri Farmers Ready for Co-operation

Why should the farmers of Missouri be different from the farmers of other states? If the farmers of Nebraska, Iowa, Minnesota, Wisconsin and other states can profit by co-operation why cannot the farmers of Missouri do likewise? They can, and we believe they are getting ready for this movement and The Missouri Farmer is ready to blaze the trail that can be followed to success.

The people of Missouri have become proverbial in their conservatism but, after all, this "show me spirit" may be a good thing if we do not carry it too far. The time is ripe now for action and enough experimentation and pioneering has been done by the farmers of other states to furnish us a sure and safe basis for the operation of co-operative marketing of all our products, so now let us profit by what others have done and are doing and let us take our own business into our own hands and get a fair wage for our labor.

I started out in this article to tell our readers something about the co-operative marketing of livestock and as an example I will tell you something of the success and the plan of operating co-operative livestock marketing associations in Minnesota, where this business has been developed to large proportions during the last six or seven years.

Pick the Size AVERY Tractor to Fit Your Size Farm

THESE six sizes of Avery Tractors make Tractor Farming a success on any size farm—large, medium or small. Avery Tractors are built in sizes for pulling any number from two to ten plows. You can get an Avery Tractor in the size that exactly fits your size farm. The Avery line of Tractors in six sizes, Plows in six sizes and Separators in seven sizes, gives you the opportunity of selecting a complete Plowing or Threshing Outfit in a size to exactly fit your needs, from the most complete and up-to-date line of Power Farming and Threshing Machinery built.

THE five larger size Avery Tractors shown here have exactly the same design. Here are six special reasons for their success: Slow speed special opposed tractor motors; renewable inner cylinder walls; two-speed, double-drive transmissions; sliding frames which eliminate the intermediate gears; no pumps or fan; double carburetors for burning either kerosene or gasoline. Avery Plows are the original "Self-Lift." Avery Threshers have made the best proven grain saving records threshing on canvas ever made.

No Other Outfits Have Met Such Tests

Avery Tractors and Plows have been entered in every important Contest and Demonstration ever held. Avery's are the only make entered in every Winnipeg Motor and Plow Contest. They were introduced by being sold on approval. Proven successful by thousands of owners. They have been put to the hardest tests known and have proved by every kind of test known that they are successful machines.

Sold at Low Prices

Avery Tractors are sold at these low prices: 5-10 h. p. $365 cash; 8-16 h. p. $795 cash; 12-25 h. p. $1195; 18-36 h. p. $1775; 25-50 h. p. $2190; 40-80 h. p. $2625. All built and backed by an established company owning a large factory and many branch houses, which insure your getting well-built machines and prompt and permanent service after you get them. Write for latest free complete Avery Tractor, Plow and Thresher Catalog and Get ALL the Facts about Tractor Farming, Threshing, Road Building, etc., with an Avery Outfit.

AVERY COMPANY
1367 Iowa Street
Peoria, Illinois

AVERY

All six sizes of Avery Tractors will be shown at all eight of the National Tractor Demonstrations.
See them there and pick the size to fit your size farm. Stop at the Avery Bull Dog Tent

Why Co-operative Livestock Marketing

If livestock producers get all the profit they are justly entitled to have out of growing livestock they must find a way to market their stock at the lowest possible cost, and furthermore they must secure a reasonable amount of competition in the selling markets. If they fail in either of these their profits are cut down and in the past they have surely failed in both the cost of marketing and in fair and legitimate competitive selling. Only a very few farmers produce live stock in a large enough way to do their own shipping. This condition has given opportunity to the development of the country buyer and shipper. Often the local buyer is merely the agent of the commission firm at the big markets and for the last few years the big packers are trying to eliminate even this much competition by sending their own buyers out to the big feed lots to buy direct from the feeder. As a matter of course these direct buyers never deal with the small farmers who feed but a few hogs or cattle and as we have already stated these constitute the larger part of the livestock producers.

Two or more farmers may sometimes join and make up a car load or more and this is sometimes done to advantage but the trouble with this kind of co-operation is that the shipments are not made often enough for the men to know very much about the marketing end of the business. Then another disadvantage is that the local buyer who is shipping to a commission firm every week will certainly receive better attention than a farmer or a group of farmers who send in only a load or two once or twice in a year.

To overcome the above disadvantage the co-operative shipping association must be organized and then by its regular shipments the consignments will receive as much attention from the commission men as those of the local buyer will receive.

Little Capital Required

According to the plan recommended by the Experiment Station of Minnesota there is very little capital required for the successful operation of a livestock marketing association. The association does not buy any stock but acts merely as the agent for the farmers in getting the stock together and shipping the animals, and as the returns are made to the local bank there is no necessity for an elaborated system of bookkeeping in conducting the business.

A manager is necessary who looks after the details of the shipping just as a local buyer does but as it requires very little time he is not usually employed on salary. The managers of co-operative shipping associations in Minnesota get an average of $15 a car for their time in looking after the shipments of stock. As the association pays the same freight, the same commissions and other expenses at the stockyards as the local buyer must pay it is clear that the saving will be the difference between what the local buyer exacts for profit and the amount paid to the manager. In Minnesota this is estimated to amount to $50 or more per car. In discussing this subject, Mr. E. Dana Durand of the Minnesota Experiment Station says "The possible saving to farmers of co-operative livestock shipping associations is not, however, limited to reduction of local expenses. Such associations may be so conducted as to enable farmers to dispose of their livestock at more favorable times and at more favorable points than when acting individually. The manager of such an association should become an expert in judging the tendency of prices, and the relative advantages of the different markets. Such expert knowledge is out of the question for the majority of farmers. By advising members of the association when and where to sell, the manager should be able materially to increase the average price received."

Membership of Associations

It is important to have as large a membership as possible for the more business transacted the more expert should the manager become and then the more desirable will the business be for the commission men at the stockyards and very naturally a little better sales may be expected. In Minnesota the membership ranges from 22 members, the smallest reported up to a membership of 1,500. There are from three to seven associations organized in a county and the shipments from each association amount to from about 20 cars up to several hundred cars. The total amount of business done ranges from a few thousand dollars up to $200,000 and over.

Most of the associations create a re-

(Continued on page 12)

SENSE AND NONSENSE

By Sam Jordan

Many beautiful and true and touching things are now being said about the beautiful heroism of mothers when they bid their boys possibly a last good bye, and with breaking heart bid them God speed, sending them to the front to do and to die if need be for "Home and Native Land." The many things said are not too many, but have you seen the other side of the picture?

Your beautiful brave boy goes to the front to shoot down some other mothers' boy. Some mother loves him just as much as you love yours. Some mother bid him a last farewell with the same grief and aching heart as you did yours. Some mother bid him God speed, to do and die if need be for "Home and Native Land."

Some other mother whose boy your son went to kill, will sit and wait and long and look for her loved one who "went away" following the flag, the "highest duty of man."

That other mother will weep over her dead the same as will you over yours. That other boy was fighting for principle, the same as was your boy. Death is their portion, and wounded and broken hearts and bitter tears, and lonely hours are yours and hers. War! It's wrong, its wrong.

* * *

To make one's living is commonly his biggest job or ought to be. If you are a farmer, what did your country school teach you about the philosophy of farm matters? Don't all speak up at once. Your country school fitted you for the town school, and not more than one in ten went to the town school to learn things about the business and affairs of those who live in town. Some of the nine who did not go to town school, made good on the farms and stayed with them. Others possibly did not have enough capital to begin farming, so went to town while others failed or did not like the work on the farm, and they went to town. Some who failed on the farm or who did not like the farm, went to town that his wife could run a hotel, or he could run a dray or a soup house or for office. A lot of us work mighty hard trying to escape work.

* * *

The other day, I heard a man tell about what fine corn he grew by mixing an early, small ninety day corn, with a big late white corn. Do you believe his story? I did not.

He also condemned the silo and a good many other things in general, and incidentally told how much he had learned and how smart he was.

When he had passed on down the street I made inquiry as to his farming business, and was informed that he was a hired hand on a farm near town.

* * *

Isn't it funny how selfish we sometimes are? We often see some traveling man put his grip on a seat in the chair car, then go in the smoker to smoke, and remain there allowing his grips to "hold" the seat, that he does not need, preventing its use by some one who does need it. Some times he will turn one seat forward and use two, and how sour he looks if some one turns it back.. This selfishness is by no means confined to men. Women, if any difference are the worse. She will use one seat for herself, and three others for her bundles, grips, bandboxes, cloaks, and umbrellas, and the few other articles "too numerous to mention."

If some one comes in, removes the baggage from the seat and occupies it, and the owner of the baggage comes in he would make it appear that some one had "usurped" his seat, and watch him look sour. A grip no more holds a seat, when its owner is not in the seat, that a trunk in the baggage car would hold a seat in the coach.

Once in awhile a grip in the rack has caused its owner to be deluded with the notion that it held his seat while he stepped in the smoker to smoke.

* * *

Evidence of better farming that any man can see are, that fifteen years ago the average corn field was a cocklebur field as well. Now you will not find one bur in ten corn fields.

From careful observation it seems evident that there is not one farm implement left standing in the field taking all sorts of weather for every ten that might be seen ten years ago.

Crop rotation is a great factor in weed control as well as in soil betterment. Weeds are the biggest farm mortgage.

* * *

If I were asked what one piece of farm work in Missouri is most inefficient, I think I would say that the handling of pastures is the worst.

Once in a great while a good pasture scheme is found, but on an average the poorest returns per acre are from pastures in proportion to what their returns ought to be. I have seen many pastures that bring gratifying returns but these are too few.

A bulletin by the State Board of Agriculture is promised in the near future. Since there is something to do to the pasture at most all seasons of the year, a bulletin on this subject will be opportune at any time.

* * *

The man who keeps his soil fertile usually finds his pocket book getting thicker from year to year.

* * *

Not long ago, I spent the night and part of the morning at the farm of W. B. McKee, near Polo. It is splendidly managed farm, and speaking of pastures will say it is one of the best managed I have seen. No rag weed, iron weed, dock, sorrel, buckhorn, buckbrush, but blue grass, white and red clover. Of course, I have my own ideas as to where the credit should go, because I saw that young man of his taking hold a good deal like he might be largely bossing the job, then when one puts his feet under the table you can just make up your mind that Mrs. McKee is largely to "blame" for many of the things that are really classy about that farm. I think, tho, that Mc., is doing part to supply the raw material and later, incidentally, dispose of it.

* * *

Us boys make a lot of cheap sport about the girl's fashions and fads, but can you suggest a more silly, foolish, insane, end-of-the-limit, fad than the men's high, tight, hot, suffocating crazing collar?

Some guy objected the other day to the low, turn-down, cool, comfortable, soft, easy going collar, because he thought it looked "girlish." Now, wouldn't that give you thumps or something? If it is girlish to be comfortable, then I say, look girlish, it may not hurt much. I suspect that "fellah" smokes cigarettes, chews long green, gets full (of beans of course), wears whiskers, a high collar, and an overcoat in August just thinking it looks "manly."

Of course the girls who wore furs last August may have wanted to look "manly," but they did not stay with the fad long. I wear that eternally hot collar myself, I guess just because "other boys," mostly do. Then, I suspect we fear we might shock some lady unless we were as nearly covered up as possible.

* * *

I took a friend for a joyride the other morning just to show him our town. He lives in a remote part of the state, and he had a lot to say about so many poorly kept lawns, and so many weeds in so many places.

I tried to lie out of it for the folks, and counted myself lucky that I have no lawn to mow,—fortunate as the fellow who has no taxes to pay.

Patrick Henry Addressing the First Continental Congress, Philadelphia, 1774

One Nation; One People

WHEN Patrick Henry declared that oppression had effaced the boundaries of the several colonies, he voiced the spirit of the First Continental Congress.

In the crisis, the colonies were willing to unite for their common safety, but at that time the people could not immediately act as a whole because it took so long for news to travel from colony to colony.

The early handicaps of distance and delay were greatly reduced and direct communication was established between communities with the coming of the railroads and the telegraph. They connected places. The telephone connects persons irrespective of place. The telephone system has provided the means of individual communication which brings into one national family, so to speak, the whole people.

Country wide in its scope, the Bell system carries the spoken word from person to person anywhere, annihilating both time and distance.

The people have become so absolutely unified by means of the facilities for transportation and communication that in any crisis they can decide as a united people and act simultaneously, wherever the location of the seat of government.

In the early days, the capital was moved from place to place because of sectional rivalry, but today Independence Hall is a symbol of union, revered alike in Philadelphia and the most distant American city.

CONCRETE WATER TANK

A good sanitary water supply is necessary on every farm. Where springs and running water are not present it is necessary to rely on wells and a tank big enough to hold 3 or 4-days' supply. Concrete is good material for such tanks. It is easy to handle, can be made in any shape or size, and is easily waterproofed. The sand and gravel necessary for constructing the tank are often found on the farm and if such is the case, the cost of constructing is materially reduced.

A good mixture for concrete tanks is one part cement, two parts sand, and four parts broken stone or gravel. If neither gravel nor broken stone can be obtained, a mixture of one part cement and three parts of coarse sand can be used. The cement and aggregate should be thoroughly mixed and the resulting mixture well tamped or shaded when placed in the forms. After removing the forms the sides of the tank may be flushed with a mixture of cement and water to smooth up any little irregularities.

Heavy woven wire fencing may be used to reinforce the tank. Lap the ends of the reinforcing at least six inches. The reinforcing for the walls should be placed near the outer side and well covered with concrete.

It is preferable to have the forms of green lumber. If seasoned lumber is used, it should be dampened with water before the concrete is poured into the forms. This will prevent the dry boards from absorbing the moisture from the concrete which, if permitted, would cause the walls of the tank to crack.

Make the bottom of the tank smaller than the top by sloping the inner walls. This will prevent ice from breaking the walls. The inner forms should be built so that they may be easily removed. A wedge can be used to advantage if the forms swell and are difficult to remove. Avoid heavy pounding and prying as green concrete is easily cracked.

While it is less difficult to build a

rectangular form for the tank, the round type is stronger and calls for less concrete.

A band saw is best for cutting out the ribs for the round form, although a hand saw will do very well. As it is a difficult task to cut them out in a circle, saw out a triangular piece removing as much material as possible. Finish the circle by cutting out the remaining material with a good sharp hand ax.

The material needed for the construction of a six-foot concrete tank which will hold 400 gallons of water includes: for outer form ribs, 3 pieces 2 inch by 10 inch by 14 feet; for inner form ribs, 9 pieces 2 inch by 8 inch by 12 feet; for outer form sides, 18 pieces 1 inch by 4 inch by 10 feet; for inner form sides, 14 pieces 1 inch by 4 inch by 12 feet; 10 sacks of cement; 20 cubic feet of sand; 40 cubic feet of gravel; and 36 feet of 30 inch heavy woven wire fencing.

Missouri College of Agriculture.

GETTING SOMETHING OUT OF IT

By W. L. Nelson

How often, after a county fair, a farmers' institute, an agricultural lecture course or other community managed movement, do we hear the remark, "I didn't get anything out of it." Usually, too, this statement is true insofar as it applies to the speaker. Always, regardless of the merits of the movement there are those who fail to "get anything out of it." This is due to the fact that they fail to put anything into it.

Generally speaking, the movements that are of the greatest benefit to a community are those that actively interest the largest number of people. It is also true that when the meeting is over the men and women who feel that they got the most out of it are the ones who worked hardest to insure its success.

It's the "we" that's the winner; the "our" that bespeaks optimism. Is it the county fair that is under discussion—or perhaps it is a local corn show, colt show or a big get-together meeting for farm folk,—and are you one who talks in terms of "they" and "their"? If so, you are not in the best way to get the most out of it.

The world needs workers—and there are as many little "worlds" as there are neighborhoods and communities. Perhaps unconsciously we fall, first, into the habit of letting other folks look after all community movements. Then, just as unconsciously, we may, because we feel that it is not our work, come to criticise. We don't mean to shirk or to find fault, but because we come in time to feel that we "are not getting anything out of it," we naturally conclude that either the movement is without merit or the management is in error.

Why not a determination that in things worth while we will be found in the "we" and "our" crowd instead of in the "they" and "their" group. It might seem a little awkward at first, but not for long. Then as we became interested we might feel that we were "getting something out of it," that, after all, there was more in the movement than we ever imagined.

One result would be more happiness for the individual worker. The great big result would be realized, though, in the new community ideas and ideals, in the awakening enthusiasm and work of a large number of people. Whenever the whole community is aroused success is assured—and it is no trouble to repeat a success. There is no one to say, "I didn't get anything out of it."

The man who fails to sow cannot hope to reap. No more should we expect large benefit from a community movement to which we have given little or nothing. Putting in our best, we may reasonably hope for satisfactory returns.

BEAUTIFYING THE FARM GROUNDS

Nature has been almost too bounteous in her gifts of beauty, so bounteous, in fact, that many of us do not realize the wealth of beauty which we may own but for the asking and for the trouble of bringing it into our dooryards. Home beautification is not a difficult nor an expensive task and even the most humble farm home can revel in the beauty of its surroundings with the aid of a few trees and shrubs.

Native species of plants are the best for the home beautifier. These thrive in the soil and climate of their natural habitat whereas foreign species are apt to be much less hardy and adaptable to their new environment. The selection of the materials to use in painting the landscape picture is fully half of the task and it is an easy matter for the amateur to make a poor selection from the galaxy of wonders which the nurseryman's book contains.

Of the native trees none is better adapted to home planting than is our American Elm. Best liked of all of our shade trees, it makes a rapid growth and pleasant shade from the heat of the summer sun. Next to the elm in popularity comes the sugar maple and this as well makes a most desirable tree for home beautification. The one precaution where this tree is planted is to keep the branches thinned. The sugar maple is a rank grower and unless thinned will grow up to a dense head filled with many dead branches and twigs.

Our old friend the tulip tree rivals even the elm and the sugar maple for a place in the hearts of our country folks and will always remain a favorite with the people of our countryside. With its thousands of tuliplike blossoms in the early spring and its rich, cooling shade through the heat of the summer, it is indeed a desirable tree for home planting. The maples, the American linden, the white ash, and the pin oaks are other trees worthy of a place on the farm lot and may be used to good advantage in the planting plan.

These trees may be used in groups or singly with good effect but the one main thing which must be remembered in planning the farm beautification is that the lawn is the canvas upon which the landscape gardener paints his picture. Nothing is more beautiful than is a broad open expanse of lawn framed in by a border of trees and shrubs and open sky.

Freaks are good examples of what not to plant, especially where the planting is to be rather limited in amount. What is more hideous than the little weeping mulberry which we see so commonly set out with its writhing agonies of a single species grafted upon the straight and upright stock of another sort. Some sorts of odd plants may, however, be used to good advantage along with other trees and shrubs to secure contrasts of texture and color. In this manner the gingko, the weeping willow, and other such oddities may be used to good advantage, whereas the same trees used alone would present a most woeful example of an unsuccessful attempt to imitate nature.

Shrubs may be used for connective purposes along the house foundations, as borders to walks and drives and to screen unsightly objects. In fact, there are but few places where shrubs cannot be used to good advantage. The spireas, the snowballs, and the old fashioned mock orange can all be used with good effect and many of the newer sorts as well may be used.

The barberries, the golden bell, and the hardy hydrangeas are all desirable shrubs and bear alike their loads of summer foliage and winter snows. In winter as well as in summer the grays and browns and reds of the bark will show up in pleasing contrast with the colors of the landscape.

Many plants may be dug up from the woods and the fence corners when it is not possible to buy these from the nursery. Where the home beautifier can afford the expense of a few dollars, however, it is much more advisable to purchase the plants needed from some reliable nurseryman. Nursery grown trees and shrubs will withstand the harsh treatment of transplanting much better than will plants grown by nature's plan. Plants produced by the nurseryman are grown in such a manner as to cause them to develop strong, compact root systems. Thus, in transplanting, the greater part of the root system is taken up along with the plant and when set out a vigorous development of new feeding roots will take place at once.

Home beautification is something which can be undertaken by even the most inexperienced, provided he is willing to take a little time and forethought in planning his planting. The main things to remember are that the best plan for developing the home planting is to follow nature as closely as is possible. Nature has never been found guilty of unharomnious contrasts or of rigid lines in her landscape work. Good choice of materials and the proper grouping of these about a broad expanse of open lawn are the two great fundamentals in the development of that simple art known by the rather long and sonorous term of landscape gardening. Applied to the farm the result is an attractive home, and attractive homes are a pretty good indication of contented occupants.—Purdue Agriculturalist, Indiana Experiment Station.

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from $12 to $30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. **There is no war tax on land, nor is there any conscription.** For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII July 15, 1916 No. 14

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

ST. LOUIS TRACTOR DEMONSTRATION

We know of no other farm machine that has more quickly found favor than has the tractor. This would not be so if there were not a special need for mechanical power to take the place of animal power. Who is it who has not cut his task short on a hot summer day because of sympathy for his overworked and overheated horses. The writer has worked in the field many a day when because of the dry, hard soil and the excessive heat every step taken by the faithful old horses was a physical punishment to them and a mental torture to the driver.

What a difference it is to mount the mechanical horse, rest comfortably under the shade of a canvas top and to have no scruples about the old fellow getting tired or too hot.

Tractor manufacturers have learned what The Missouri Farmer tried to point out to them that tractors must be built to suit the needs of different size farms. As W. L. Nelson so aptly puts it in the leading article in this issue, "the addition of a fit-the-farm tractor will make more prosperous thousands of farm owners and operators."

The leading manufacturers are now making tractors to suit the needs of the average size farm as well as the big farms and that more than anything else is extending the usefulness of the tractor. We are not alarmed about the tractor displacing the horse as some seem to fear but whether it does or not, if the use of the tractor adds something to both pleasure and profit we need not worry over the loss of the horse.

Those who have a humane feeling for their horses should welcome the tractor because it will relieve the horse of much of the unmerciful overwork that horses must do under the old methods. But farmers have been skeptical about all these things because they have not had the opportunity to see the tractor at work. They have read about it in the farm papers but they have felt skeptical about the economy of the tractor because they believed that writers were usually telling the story in their own interest.

The leading makers of farm tractors knowing that the final test of the usefulness of their machines must be made in the fields under normal conditions and in the presence of prospective buyers have wisely decided to put on a number of practical tests in different states so that farmers may see for themselves just what kind of work a machine will do. The only demonstration within reach of Missouri farmers will be held in St. Louis, Missouri, lasting five days, from July 31 to August 4. A large tract of land has been secured and the leading manufacturers will be there with their various machines to demonstrate the quality and variety of work they will do. Any farmer who has found horse power expensive or unsatisfactory will find this demonstration his opportunity to get information that will help solve the problem. Many farmers find that it pays to make a trip to St. Louis every year for business as well as pleasure and we are sure no more opportune time can be chosen than the week of the tractor demonstration.

DO YOUR PATRIOTIC DUTY

Most every voter keeps in mind the coming of the first Tuesday in November when he will exercise the privilege of an American citizen and cast his vote for his choice for President, Congressman and other officers of lesser importance. But have our readers ever thought of the more important duty of attending the state primary election held in this state this year on August 1 for the purpose of choosing the candidates to represent the different political parties at the general election. Men sometimes get very much excited over the election of a Congressman and pay little or no attention to who is chosen for members of the county court, legislature and other offices which in fact are much closer to the average man's interests than the higher offices. We do not minimize the importance of trying to get good men for national offices but if we do fail in a place like Congressman, for instance, there are so many men in Congress that one very bad man can not have the effect on public policy that a miss-fit selection can have in our county court where but three men are to be chosen.

There are no more important offices than that of county court and county clerk because they handle by far more of our tax money than any higher officer does and yet many men often do not even try to find out who they are voting for to fill these places.

In any county with bad roads, poor bridges and old dilapidated infirmaries for the dependent you may charge the fault up to ignorance or avarice of the county court. We know the county judges are not very well paid for their services but when any man accepts such an office he ought to be willing to make some personal sacrifice for the good of his county.

The political press scavengers go to an extreme to ridicule and to villify members of the state legislature who do not do their biddings and it is for this reason that many a good man has refused to serve his state in that capacity. If we will only stop to think that the last General Assembly of Missouri appropriated some four or five million dollars more than the state revenues amounted to we will at once see that it is important to elect good, careful men to the Legislature.

Our state institutions and ambitious politicians are to blame for this condition of things but the people, you and I, dear reader will be to blame if we allow such a condition to continue. You may ask how are the state institutions to blame? The managers of every state institution are ambitious to make progress and to expand and that takes money. So they play politics when opportunity offers and they help to name candidates for the Legislature and for Governor, and when the committees are appointed they help to select men for the appropriation and other committees who will zealously support their favorite institution. When the Legislature is finally organized there is no one on guard for the state—all are representing a pet institution or project and so it is that millions of dollars are appropriated that never materialize.

The way to put a stop to all this is to elect successful farmers or business men to the Legislature and stop voting for third-rate lawyers and scheming politicians who care little for the state and much for themselves. We do not need orators in the Legislature as much as we need men of plain business sense. Three-fourths of the work of the Legislature is handling the finances of the state and even for law making we would rather depend upon patriotism than politics to get good, wholesome laws, anyway.

So whether you go to the general election or not, do not fail to inform yourself of every man to be voted for at the August primary and if every good citizen will do that it will make little difference who you vote for in November, for only good men will be on the various tickets.

ATTENTION FARMERS

We have just received word that the Farm Clubs of Lafayette County expect to hold a monster two days Farmers Picnic along from the 7th to the 12th of August and in order that the various speakers many not be compelled to make too long jumps, they are anxious that the farmers in some of the nearby counties plan big meetings at about the same time. At least two other close by counties ought to get busy at once and plan for a similar occasion during the same week in which the big Lafayette County Picnic is to be held and we trust that our friends in that part of the state will get to work on this project at once.

As was suggested in a recent issue of The Missouri Farmer, these meetings should mark the coming together of the greatest crowd of farmers that has ever assembled in the history of the respective counties. It should be a great two days "Farmers Love Feast" at which politics is absolutely barred and at which Farming and Farm Club organization—together with the perfection of a County Farmers Ass'n—should be the sole topic of discussion. Suitable speakers can be procurred without cost from the Agricultural College and from the State Board of Agriculture and on the second day I will be present at as many meetings as possible to discuss the question of Farm Club organization. Let's literally set Missouri "on fire" with this great movement before the snow flies. While I am anxious that several nearby counties should join hands with Lafayette, yet this is no reason why other counties should not begin to line up. I want to see Missouri lead this great fight upon which depends the future of our farm homes.

William Hirth, Publisher,
THE MISSOURI FARMER, Columbia, Mo.

THE WAUKEGAN IDEA

Have you ever heard of Waukegan? It must be an old Indian name but anyway it is the designation of a nice little city over in our sister state of Illinois. But it is not of the city we want to write but of an idea, the "Waukegan Idea" that Edward Amherst Ott has given to the world and then very kindly in his own interest had the "idea" copyrighted. Perhaps he has a copyright only on what he has to say about the idea but anyway we think the idea has some merit in it. The idea is to be named the "Universal Employment Service." The object is to get rid of the natural causes of unemployment and to stabalize labor and trade. In citing natural causes of unemployment Mr. Ott points out that "A canning factory needs a thousand employees for three months. It is important to all society that it secure the help it needs. It would make canned food prohibitive if that industry had to employ those thousand helpers the year, and yet they should be employed the entire year. * * * The harvest fields of Kansas present the same problems. Thousands of men are needed for a few weeks. The bread of the country demands this army but it should not be an army of tramps. Waiting for two weeks' work in the harvest fields does not suggest social sanity or individual thrift." But where is the remedy? It is in a mobile army of labor. Mr. Ott thinks that the stability of trade and the employment of labor can be met by recognizing the fact that the hazards of unemployment are natural instead of personal and should be born by the public and not by the individual as it is now. If we can stabilize credit by establishing a system of regional banks then why not stabilize employment by establishing a system of "Regional Camps of Surplus and Supply of Labor"? These camps should be organized in the different states by a national commission of industrial experts. In these camps, organized in a kind of military fashion, the unskilled labor could be efficiently trained but would be in such camps only when there was no demand for their work in the industrial world.

These regional camps as we understand the plan would be operated as a social service and not for charity, neither for profit, simply to stabilize labor by providing public work at a fair wage and only when the labor could not be utilized to advantage by private enterprizes. The improvement of our water ways, the irrigation of our desert lands, the reforestration of millions of acres of devastated hill sides, the building of good roads and other public enterprises could thus be carried on to the great advantage of the states and the Nation and at the same time get rid of the army of tramps and soup house patrons that curse our country annually and replete the ranks of the criminal classes and keep our prisons full.

In this scheme chronic vagrancy would be made a social crime and the habit of industry made a social necessity. Vagrancy is a serious evil that ought to be stamped out in this country.

We are spending according to the best estimates over six hundred million dollars in this country for criminal prosecution and protection. If

every man had to account for himself in some useful employment for twelve months in the year most of this crime would disappear and most of the six hundred million dollars could be used to better purpose by maintaining these regional labor camps.

Yes, we think the "Waukegan Idea" has merit, real merit in it and if the thought of this country can be turned toward such questions in a real positive force there is no reason to doubt that the curse of unemployment can be wiped off the social map of the Nation.

BARNYARD GOSSIP

It is not what we know that bothers most of us, for really I think we know so little when we realize how much there is to know in this big wide world that the little knowledge that is stored away in one man's cranium ought not be very much in the way. But sometimes we think we know a thing, when it has no reason in it or no fact about it save that we have given the idea a place in our head and the longer it stays there undisturbed the harder it is to get rid of it.

It is a mighty good plan for a man to overhaul his ideas occasionally, very much like he does his old papers and to get rid of those he finds are out of date. The world is moving about pretty fast in its development and a good farm practice this year may be a poor one next year. The grain cradle was a big improvement over the reap hook but the world would face a famine today if we had to harvest our wheat with the cradle.

A few days ago we heard three "had been" farmers discussing the merits of the experiment station and they all agreed that this institution was impractical and of little or no use to farmers. In discussing particularly the experiments that are being carried on in Missouri and many other states to find the best and most economical rations for hogs, one of these men remarked, "Why, I can feed hogs and put as much fat on them as any one, if some one will furnish me the feed. These boys at the Experiment Station can feed hogs because the state buys the feed and they have nothing else to do only to shovel the feed into the troughs." This was the gist of the conversation I listened to without permitting myself to be drawn into the conversation. The idea of these men without exception was that experiment stations were run as business institutions. But it would be hard to get them to understand that an educational plant and a business plant are quite different things. How could this man feed hogs intelligently without either experience or the guidance of someone who had gained knowledge in some way? These men all agreed (?) that feeding hogs as well as other farm operations was a business proposition. That farmers fed hogs and cattle, and raised corn and wheat for the profit they could get out of the operation and the more profit the better it pleases the farmers. They also agreed that some farmers were more successful than others, and that while some might be good cattle feeders, others were better handlers of horses or mules, or better corn or wheat growers. And, pray, Mr. Three Farmers what makes that difference? Is it not in the doing as well as in the knowing? Some men have many talents but use them very little other men have few talents but add to that which they already have by using them.

But I am getting away from the thought I wanted to bring out and that is the prejudice some men have against any idea emanating from an experiment station or other educational institution. How are we to know the best way to do a thing until some one has tried out the different ways side by side? Would the farmer who said he knew how to feed hogs as well as any one if some one would furnish the feed, know what to buy when he had feed to buy. Of course this farmer could take corn and shipstuff and tankage and fatten his hogs but how is he to know which to buy when prices go up or down. In other words when corn is 50 cents a bushel, shipstuff $1.25 a hundred and tankage $50 a ton what proportion of these feeds will he use to get the most profit out of the operation? Then if corn goes up to 60 cents a bushel and shipstuff down to $1.10 what change will he make in the feeds? The chances are this man would go right along feeding in about the same way.

We happen to know about these three has-been-farmers. One of them whose father gave him a 100-acre farm failed to make a living on it, said there was too much hard work about it and is now working as a day laborer on the Experiment Station farm at $1.50 a day. Another quit farming because it did not pay and is doing street work at $1.75 a day when he can find work to do. The third is running a corner grocery which barely makes him a living. And these men know how to farm! Well that is the trouble with too many of us we think we know. A better way is to open our minds and be sure about it.

THOSE "DANGEROUS" FARM CREDITS

It is gratifying to know that many business men, bankers and professional men realize that a grave crisis faces the future of agriculture in America and when that is said it means that a grave crisis is facing the country itself for without agriculture this country can not live long or prosper. The saddest thing about the whole proposition is that so many farmers are asleep to the danger that confronts them and not only farmers but many of those who are holding places of honor and supposed to be "on the job" in the interest of the farmers of the country.

We take pleasure in reproducing below an editorial from the July number of "Current Opinion" one of the most popular magazines of the country which shows the views of an able editor on the need for rural credits as a step in the direction of stabilizing agriculture and restoring the balance between agriculture and other industries if this country is to continue its existence and progress:

"No better example was ever given of how completely citified we have become mentally as a nation than the political and editorial comment on the Farm Credits Bill as it worked its way through the committees.

"In a word, we were told that this bill set a dangerous precedent of taking the money out of one class of pockets to subsidize another class of pockets. We were given to understand that 'Rube was pilfering us bad.' We were going 'straight to the bow-wows on socialism' with this bill. Even such staunch old supporters of the Democratic Administration as the New York Times read us deadly solemn lectures on 'the farmer picking the lock off the national till.' Naughty, naughty farmer! He is clearing $300 a year in many sections—the Federal Government figures. And, Rube looks so hay-seedly innocent. Let us hold our breath till we bust and pray for the rascal's reform!

"It's all right for the farmer to pay a tariff of 10 to 60 per cent. out of his pocket into the pocket of the manufacturer on everything he buys—machinery, steel, clothing, leather—but it's awful and 'combusting of the constituion' for the farmer to ask tariffs kept on the things he raises to sell so that he may take a little out of the consumer's pocket and put it in his own. Milk for instance! Free milk means a cent a quart off every quart of milk sold in cities within 48 hours of the Boundary.

"It's all right for Uncle Sam's Treasury to come behind the Federal Reserve Banks of the financial centers special aid—as it did in the War month of 1914—but it's 'robbery and socialism and state paternalism' for Uncle Sam to give his support to Farm Banks selling farm bonds secured by first mortgage loans.

"It's all right to squander $600,000,000 as we have in twenty years on rivers and harbors 'pork' for towns and cities, where the politicians round up carpet-bag and boarding-house ward votes; millions on which no interest is paid; millions which are not a loan but a hold-up for hogs and pirates and thieves; but it's a 'subversion of the constitution'—whatever that is, the editors said so—for Uncle Sam to permit Treasury funds as a loan secured by double-barreled collateral of a bond and land to launch a system of Farm Banks and Credits.

"It's all right to spend millions financing public highways. Of course, the highways aren't for motor cars! They are for farmers; but it is dangling danger above the inferno, to finance the farmers, who use the highways.

"It's all right to appropriate millions to tell farmers what to do; but it's catastrophic to finance farmers in the doing thereof.

"Farmers don't say all this; but the editors do; and it all depends on the point of view; and if each man could stand on his own stomach as a point of view, he might modify his judgment There is no use telling a farmer what to do, if he can't finance himself doing it; and for every farmer put out of business because he can't finance farming, the cost of living to the city man is increased just by that decrease of farm produce. We are a nation with 40 per cent. feeding 60 per cent. of the population now. If farms continue to be abandoned, the proportion will continue to shift from country to town. Within twenty years, the price of food has increased four-fold. With population increasing and farms decreasing, the cost of food will still further rise. That is why a workable system of Farm Credits is as vital to the nation as Federal Reserves or armaments."

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER II

Gilbert, complacent and affable, returned to Washington accompanied by David. A month later the newly made consul sailed from New York for South America. He landed at a South American seaport that had a fine harbor snugly guarded by jutting cliffs skirting the base of a hill barren and severe in aspect.

As he walked down the narrow, foreign streets thronged with a strange people, and saw the structures with their meaningless signs, he began to feel a wave of homesickness. Then, looking up, he felt that little inner thrill that comes from seeing one's flag in a foreign land.

"And that is why I am here," he thought, "to keep that flag flying."

He resolutely started out on the first day to keep the flag flying in the manner befitting the kind of a consul he meant to be. He maintained a strict watch over the commercial conditions, and his reports of consular news were promptly rendered in concise and instructive form. His native tact and inherent courtesy won him favor with the government, his hospitality and kindly intent conciliated the natives, and he was soon also accorded social privileges. He began to enjoy life. His duties were interesting, and his leisure was devoted to the pursuit of novel pleasures.

Fletcher Wilder, the son of the president of an American mining company, was down there ostensibly to look after his father's interests, but in reality to take out pleasure parties in his trim little yacht, and David soon came to be the most welcome guest that set foot on its deck.

At the end of a year, when his duties had become a matter of routine and his life had lost the charm of novelty, David's ambitions started from their slumbers, though not this time in a political way. Wilder had cruised away, and the young consul was conscious of a sense of aloneness. He spent his evenings on his spacious veranda, from where he could see the moonlight making a rippling road of silver across the black water. The sensuous beauty of the tropical nights brought him back to his early Land of Dreams, and the pastime that he had been forced to relinquish for action now appeared to him with overwhelming force and fascination. But the dreams were a man's dream, not the fleeting fancies of a boy. They continued to possess and absorb him until one night, when he was looking above the mountains at one lone star that shone brighter than the rest, he was moved for the first time to give material shape and form to his conceptions. The impulse led to execution.

"I must get it out of my system," he explained half apologetically to himself as he began the writing of a novel. To this task, as to everything else he had undertaken, he brought the entire concentration of his mind and energy, until the book soon began to seem real to him—more real than anything he had done. As he was copying the last page for the last time, Fletcher sailed into the harbor for a week of farewell before returning to New York.

"What have you been doing for amusement these last six months, Dunne?" he asked as he dropped into David's house.

"You'd never guess," said David, "what your absence drove me to. I've written a book—a novel."

"Let me take it back to the hotel with me to-night. I haven't been sleeping well lately, and it may—"

"If it serves as a soporific," said David gravely, as he handed him the bulky package, "my labor will not have been in vain."

The next morning Wilder came again into David's office.

"I fear you didn't sleep well, after all," observed David, looking at his visitor's heavy-lided eyes.

"No, darn you, Dunne. I took up your manuscript and I never laid it down until the first streaks of dawn. Then when I went to bed I lay awake thinking it all over. Why, Dunne, it's the best book I ever read!"

"I wish," David repied with a whimsical smile, "that you were a publisher."

"Speaking of publishers, that's why I didn't bring the manuscript back. I sail in a week, and I want you to let me take it to a publisher I know in New York. He will give it a prompt reading."

"If it wouldn't bother you too much, I wish you would. You see, it would take so long for it to come back here and be sent out again each time it is rejected."

"Rejected!" scoffed Wilder. "You wait and see! Aren't you going to dedicate it?"

David hesitated, his eyes stealing dreamily out across the bay to the horizon line.

"I wonder," he said mediatively, "if the person to whom it is dedicated—every word of it—wouldn't know without the inscription."

"No," objected Fletcher, "you should have it appear out of compliment."

He smiled as he wrote on a piece of paper: "To T. L. P."

"The initials of your sweetheart?" quizzed Fletcher.

"No; when I was a little chap I used to spin yarns. These are the initials of one who was my most absorbed listener."

Wilder raised anchor and sailed back to the states. At the expiration of two months he wrote David that his book had been accepted. In time ten bound copies of his novel, his allotment from the publishers, brought him a thrill of indescribable pleasure. The next mail brought papers with glowing reviews and letters of commendation and congratulation. Next came a good-sized check, and the information that his book was a "best seller."

The night that this information was received he went up to the top of the hill that jutted over the harbor and listened to the song of the waves. Two years in this land of liquid light—a land of burning days and silent, sapphired nights, a land of palms and olives—two years of quiet, dreamy bliss, an idle and unsubstantial time! How evanescent it seemed, by the light of the days at home, when something had always pressed him to action.

"Two years of drifting," he thought. "It is time I, too, raised anchor and sailed home."

The next mail brought a letter that made his heart beat faster than it had yet been able to do in this exotic, lazy land. It was a recall from Barnabas.

"Dear Dave:

"Nothing but a lazy life in a foreign land would have drove a man like you to write a book. The Jedge and M'ri are pleased, but I know you are cut out for something different. I want you to come home in time to run for legislature again. There's goin' to be something doin'. It is time for another senator, and who do you suppose is plugging for it, and opening hogsheads of money? Wilksley. I want for you to come back and head him off. If you've got one speck of your old spirit, and you care anything about your state, you'll do it. I am still running politics for this county at the old stand. Your book has started folks to talking about you agen, so come home while the picking is good. You've dreamt long enough. It is time to get up. Don't write no more books till you git too old to work.

"Yours if you come,

B. B."

The letter brought to David's eyes something that no one in this balmy land had ever seen there. With the look of a fighter belted for battle he went to the telegraph office and cabled Barnabas, "Coming."

CHAPTER III

On his return to Lafferton David was met at the train by the Judge, M'ri, and Barnabas.

"Your trunks air going' out to the farm, Dave, ain't they?" asked Barnabas wistfully.

"Of course," replied David, with an emphasis that brought a look of pleasure to the old man.

"Your telegram took a great load offen my mind," he said, as they drove out to the farm. "Miss Rhody told me all along I need hev no fears fer you, that you weren't no dawdler."

"Good for Miss Rhody!" laughed David. "She shall have her reward. I brought her silk enough for two dresses at least."

"David," said M'ri suddenly at the dinner table, "do tell me for whose name those initials in the dedication to your book stand. Is it any one I know?"

"I hardly know the person myself," was the smiling and evasive reply.

"A woman, David?"

"She figured largely in my fairy stories."

"A nickname he had for Janey," she thought with a sigh.

"Uncle Barnabas," said David the next day, "before we settle down to things political tell me if you regret my South American experience."

"Now that you're back and gittin' into harness, I'll overlook anything. You'd earnt a breathing spell, and you look a hull lot older. Your book's kep' your name in the papers, tew, which helps."

"I will show you something that proves the book did more than that," said David, drawing his bank book from his pocket and passing it to the old man, who read it unbelievingly.

"Why, Dave, you're rich!" he exclaimed.

"No; not rich. I shall always have to work for my living. So tell me the situation."

This fully occupied the time it took to drive to town, for Cold Molasses, successor to Old Hundred, kept the pace his name idicated. The day was spent in meeting old friends, and then David settled down to business with his old-time energy. Once more he was nominated for the legislature and took up the work of campaigning for Stephen Hume, opponent to Wilksley. Hume was an ardent, honest, clean-handed politician without money, but he had for manager one Ethan Knowles, a cool-headed, tireless veteran of campaign battles, with David acting as assistant and speech maker.

David was elected, went to the capital, and was honored with the office of speaker by unanimous vote. He had his plans carefully drawn for the election of Hume, who came down on the regular train and established headquarters at one of the hotels, surrounded by a quiet and determined body of men.

Wilksley's supporters, a rollicking lot, had come by special train and were quartered at a club, dispensing champagne and greenbacks promiscuously and freely. There was also a third candidate, whose backers were noncommittal, giving no intimation as to where their strength would go in case their candidate did not come in as a dark horse.

When the night of the senatorial contest came the floor, galleries, and lobby of the House were crowded. The Judge, M'ri, and Joe were there, Janey remaining home with her father, who refused to join the party.

"Thar'll be bigger doin's fer me to see Dave officiate at," he prophesied.

The quietly humorous young man wielding the gavel found it difficult to maintain quiet in the midst of such excitement, but he finally evolved order from chaos.

Wilksley was the first candidate nominated, a gentleman from the fourteenth delivering a bombastic oration in pompous periods, accompanied by lofty gestures. He was followed by an understudy, who made an ineffective effort to support his predecessor.

"A ricochet shot," commented Joe. "Wait till Dave hits the bullseye."

The supporting representatives of the dark horse made short, forceful speeches. Then followed a brief intermission, while David called a substitute pro tem to the speaker's desk. He stepped to the platform to make the nominating speech for Hume, the speech for which every one was waiting. There was a hush of expectancy, and M'ri felt little shivers of excitement creeping down her spine as she looked up at David, dauntless, earnest, and compelling, as he towered above them all.

In its simplicity, its ring of truth, and its weight of conviction, his speech was a masterpiece.

"A young Patrick Henry!" murmured the Judge.

M'ri made no comment, for in that flight of a second that intervened between David's speech and the roar of tumultuous applause, she had heard a voice, a young exquisite voice, murmur with a little indrawn breath, "Oh, David!"

M'ri turned in surprise, and looked into the confused but smiling face of a lovely young girl, who said frankly and impulsively: 'I don't know who Mr. Hume may be, but I do hope he wins."

M'ri smiled in sympathy, trying to place the resemblance. Then her gaze wandered to the man beside the young girl.

"You are Carey Winthrop!" she exclaimed.

The man turned, and leaned forward.

"Mrs. Thorne, this is indeed a pleasure," he said, extending his hand.

Joe then swung his chair around into their vision.

"Oh, Joe!" cried the young girl ecstatically. "And where is Janey?"

The balloting was in progress, and there was opportunity for mutual recalling old times. Then suddenly the sibilant sounds dropped to silence as the result was announced. Wilksley had the most votes, the dark horse the least; Hume enjoyed a happy medium, with fifteen more to his count than forecast by the man behind the button, as Joe designated Knowles.

In the rush of action from the delegates, reporters, clerks, and messengers, the place resembled a beehive. Then came another ballot taking. Hume had gained ten votes from the Wilksley men and fifteen from the dark horse, but still lacked the requisite number.

From the little retreat where Hume's manager was ensconded, with his hand on the throttle, David emerged. He looked confident and determined.

The third ballot resulted in giving Hume the entire added strength of the dark horse, and enough votes to elect. A committee was thereupon appointed to bring the three candidates to the House. When they entered and were escorted to the platform they each made a speech, and then formed a reception line. David stood apart, talking to one of the members. He was beginning to feel the reaction from the long strain he had been under and wished to slip away from the crowd. Suddenly he heard some one say:

Mr. Speaker, may I congratulate you?"

CHAPTER IV

He turned quickly, his heart thrilling at the charm in the voice, low, yet resonant, and sweet with a lurking suggestion of sadness.

A girl, slender and delicately made, stood before him, a girl with an exquisite grace and a nameless charm—the something that lurks in the fragrance of the violet. Her eyes were not the quiet, solemn eyes of the little princess of his fairy tales, but the deep, fathomless eyes of a maiden.

A reminiscent smile stole over his face.

"The little princess!" he murmured, taking her hand.

The words brought a flush of color to her fair face.

"The prince is a politician now," she replied.

"The prince has to be a politician to fight for his kingdom. Have you been here all the evening?"

"Yes; father and I sat with your party. But you were altogether too absorbed to glance our way!"

"Are you visiting in the city? Will you be here long?"

"For to-night only. I've been West with father, and we only stopped off to see what a senatorial fight was like; also, to hear you speak. To-morrow we return East, and then mother and I shall go abroad. Father," calling to Mr. Winthrop, "I am renewing my acquaintance with Mr. Dunne."

"I wish to do the same," he said, extending his hand cordially. "I expect to be able to tell people some day that I used to fish in a country stream with the governor of this state when he was a boy.

After a few moments of general conversation they all left the statehouse together.

"Carey," said Mr. Winthrop, "I am going with the Judge to the club, so I will put you in David's hands. I believe you have no afraidments with him."

"That has come to be a household phrase with us," she laughed; "but you forget, father, that Mr. Dunne has official duties."

"If you only knew," David assured her earnestly, "how thankful I am for a release from them. My task is ended, and I don't wish to celebrate in the usual and political way."

There is a big military ball at the hotel," informed Joe. "Mrs. Thorne and I thought we would like to go and look on."

"A fine idea, Joe. Maybe you would like to go?" he said to Carey, trying to make his tone urgent.

She laughed at his dismayed expression.

"No; you may walk to the Bradens' with me. We couldn't get in at the hotels, and father met Major Braden on the street. He is instructor or something or the militia of this state, and has gone to the ball with his wife. They supposed that this contest would last far into the night, so they planned to be home before we were."

"We will get a carriage as soon as we are out of the grounds."

"Have you come to carriages?" she asked, laughingly. "You used to say if you couldn't ride horseback, or walk, you would stand still."

"And you agreed with me that carriages were only for the slow, the stupid, and the infirm," he recalled. "It's a glorious night. Would you rather walk, really?"

"Really."

At the entrance to the grounds they parted from the others and went up one of the many avenues radiating from the square.

The air was full of snowflakes, moving so softly and so slowly they scarcely seemed to fall. The electric lights of the city shone cheerfully through the white mist, and the sound of distant mirthmakers fell pleasantly on the ear.

"Snow is the only picture part of winter," said Carey. "Do you remember the story of the Snow Princess?"

"You must have a wonderful memory!" he exclaimed. "You were only six years old when I told you that story."

"I have a very vivid memory," she replied. "Sometimes it almost frightens me."

"Do you know," he said, "that I think people that have dreams and fancies do look backward farther than matter-of-fact people, who let things out of sight go out of mind?"

"You were full of dreams then, but I don't believe you are now. Of course, politicians have no time or inclination for dreams."

"No; they usually have a dread of dreams. Would you rather have found me still a dreamer?" he asked, looking down into her dark eyes, which drooped beneath the intensity of his gaze.

Then her delicate face, misty with sweetness, turned toward him again.

"No; dreams are for children and for old people, whose memories, like their eyes, are for things far off. This is your time to do things, not to dream them. And you have done things. I heard Major Braden telling father about you at dinner—your success in law, your getting some bill killed in the legislature, and your having been to South America. Father says you have had a wonderful career for a young man. I used to think when I was a little girl that when you wer a grown-up prince you would kill dragons and bring home golden fleeces."

He smiled with a sudden deep throb of pleasure. Her voice stirred him with a sense of magic.

"This is the Braden home," she said, stopping before a big house that seemed to be all pillars and porches. "You'll come in for a little while, won't you?"

"I'll come in, if I may, and help you to recall some more of Maplewood days."

A trim little maid opened the door and led the way into a long library where in the fireplace a pine backlog, criscrossed by sturdy forelogs of birch and maple, awaited the touch of a match. It was given, and the room was filled with a flaring light that made the soft lamplight seem pale and feeble.

"This is a genuine Brumble fire," he exclaimed, as they sat down before the ruddy glow. "It carries me back to farm life."

'How many phases of life you have seen," mused Carey. "Country, college, city, tropical, and now this political life. Which one have you really enjoyed the most?"

"My life in the Land of Dreams—that beautiful Isle of Everywhere," he replied.

Her eyes grew radiant with understanding.

"You are not so very much changed since your days of dreaming," she said smiling. "To be sure, you have lost your freckles and you don't kick at the ground when you walk, and—"

"And," he reminded, as she paused. "You are no longer twice my age."

"Did Janey tell you?"

"Yes; the last summer I was at Maplewood—the summer you were graduated. You say you don't dream any more, but it wasn't so very long ago that you did, else how could you have written that wonderful book?"

"Then you read it?" he asked eagerly.

"Of course I read it."

"All of it?"

"Could any one begin it and not finish it? I've read some parts of it many times."

"Did you," he asked slowly, holding her eyes in spite of her desire to lower them, "read the dedication?"

And by their subtle confession he knew that this was one of the parts she had read "many times."

"Yes," she replied, trying to speak lightly, but breathing quickly, "and I wondered who T. L. P. might be."

"And so you didn't know," in slow, disappointed tones, "that they stood for the name I gave you when I first met you—the name by which I always think of you? It was with your perfect understanding of my old fancies in mind that I wrote the book. And so I dedicated it to you, thinking if you read it you would know even without the inscription. Some one suggested—"

"It was Fletcher," she began.

"Oh, you know Wilder?"

"Yes, I've known him always. He has told me of your days in South America together and how he told you to dedicate it. And he wondered who T. L. P. might be."

"And you never guessed?"

Her face, bent over the firelight, looked small and white; her beautiful eyes were fixed and grave. Then suddenly she lifted them to his with the artlessness of a child.

"I did know," she confessed. "At least, I hoped— I claimed it as my book, anyway, but I thought your memory of those summers at the farm might not have been as keen as mine."

"It is keen," he replied. "I have always thought of you as a little princess who only lived in my dreams, but, hereafter, you are not only in my past dreams, but I hope, in my future."

"When we come back—"

"Will you be gone long?" he asked wistfully. "Is your father—"

"Father can't go, but he may join us."

After a moment's hesitation she continued, with a slight blush:

"Fletcher is going with us."

"Oh," he said, wondering at his tinge of disappointment.

"Carey," he said wistfully, as he was leaving, "don't you think when a man dedicates a book to a girl, and they both have a joint claim on a territory known as the Land of Dreams, that she might call him, as she did when they were boy and girl, by his first name?"

"Yes, David," she replied with a light little laugh.

The music of the soft "a" rang entrancingly in his ears as he walked back to the hotel.

(To be continued.)

OUR BOYS AND GIRLS

Suppose our boys and girls who write letters to The Missouri Farmer for this column just tell us what they are trying to do to make some money, or to help father and mother with their work, or what kind of games they play or something else they are doing.

I think the idea of Minnie to raise chickens to get some money is excellent and also of Thelma who raises ducks. Most any girl can make several dollars by raising a flock of ducks or chickens and she will get good experience and exercise in doing the work.

For the boys we know of nothing better than a pig or a pet lamb. Sometimes it will pay to grow some kind of crop like pop corn, or peanuts for sale. But the aim should be to try to produce something that will give you a few dollars you know you have earned.—The Editor.

Georgia Has a Pony to Ride

Dear Mr. Editor:

I am a little girl eleven years old and live on a farm in Henry County. We finished shearing our sheep today (May 15), and have about 100 pounds of wool, not so very much but enough to make a nice lot of warm stockings for several little boys and girls.

Mamma has 75 little chickens and 500 eggs setting besides a great many turkey eggs. Papa and I will set 150 R. I. R. eggs this week and I have 150 white Leghorn eggs to set, so you may guess we will have something to do. I have a pony to ride and her name is Daisy. When papa bought her for me she was very poor but I fed her good on bran and chops, corn, oats and hay and brushed her off and now she is smooth and fat and I ride her most everywhere. I have a red saddle.

Next winter I will not mind going a mile to school for Daisy will carry me over the snow and mud just like a bird and I think I owe her a lot of kindness for this service she gives me. I like to read the letters in the "Boys and Girls column. Georgia.

Thelma Raising Ducks

To the Boys and Girls Column:

I don't expect this letter will be printed as I have written before.

As I said before I live on the farm and for the last two or three years I have been raising ducks to sell. I sell my ducks just before Christmas each time for 45 and 50 cents apiece. Last year I made about four dollars, and fifty cents. I took the money and bought Christmas presents with it.

I am taking music lessons this summer and I like my teacher fine. I have three brothers and I am the only girl and the baby in the family. One of my brothers who attended school at Columbia, two years ago is married and has a little baby-boy his name is Otto Vincent Silvey. If I am welcome again I will send one of his pictures when he is a little older.

I hope there will be enough letters from the boys and girls to start a children's page. Thelma S.

Money From Pet Chickens

To the Editor:

I have been reading the story "David Dunne." I like it fine. I think David is the most interesting character. I like all the other characetrs of the story, there is a good lesson in the story. I am twelve years old. I live on a farm of one hundred and sixty acres. I am in the eighth grade. I have a father, a mother, a brother, and a sister. I have nineteen pet chickens. I don't know what I will do with the money I get for them. This is my first letter to a paper. I hope it will be printed in The Missouri Farmer. Minnie Woods.

From A Sunday-School Girl

Dear Editor:

I am a girl seventeen years old. I am very much interested in the story "David Dunne." I think David is the most interesting character, although I like all the story fine. I am always glad when the paper comes. I live on a farm of eighty-six acres. I go to Sunday-School every Sunday. I am also a Sunday-School teacher.

Bessie Bush.

Her First Letter

To Editor of Missouri Farmer:

I am very much interested in the story "David Dunne." I like all the characters in the story except Jud. I think David is the best character. I am always anxious for the next paper to come. This is the first letter of this kind that I have written.

Lula Dye.

Likes The Missouri Farmer

To the Editor:

I am a girl 9 years old. I am very fond of your paper. We take The Missouri Farmer, and all the family want to read it. I wish you could send it oftener. The character which interests me most is David. I shall not be sorry when your next paper comes.

Elsie Cromley.

From Southeast Missouri

To the Editor:

I am a girl fourteen (14) years old and I live on a farm southwest of East Prairie. I like "The Missouri Farmer" very much and I am very much interested in the story "David Dunne."

The character which interests me the most is David, although I like all the other characters except Jud

Lily Heath.

AN OFFER TO FARMER BOYS

After thinking over the matter for some time we have concluded to make the farmer boys who belong to our "Big Family" the following proposition: For $50.00 worth of subscriptions to The Missouri Farmer we will ship to every boy who procures them for us, a bred gilt, selected from one of the best pure bred Poland China, Duroc, Chester White, Hampshire or Berkshire herds in the state. There won't be any "contest" about it. Farmers receive The Missouri Farmer three years for one dollar—and 50 such subscriptions will win this fine bred gilt. That is all there is to it. All your neighbors will be glad to give you a dollar for three years' subscription to a paper like The Missouri Farmer. They will do it first, because the paper is more than worth the money and because it is fighting their battles. Secondly, they will be glad to help you win this splendid prize.

If you will take good care of the gilt and her litter it will start you in the pure bred hog business and if you will go in "halvers" with your Father you are sure to make some money. We are making this offer not only because we are trying to place The Missouri Farmer in every good farm home in the state but because we want to get our boy friends genuinely interested in the farm. In order to do this we want to help you earn some money. Now we can make this offer to only one farmer boy in each community—so there is no time to lose. You have all summer in which to work—and should you finally fail to get the required number of subscriptions, we will nevertheless pay you a substantial commission on all you do get. So you can't lose. Why not make this gilt and her litter the beginning of a fund which in a few years will pay your way through the Agricultural College or through some other good educational institution? The boys who take advantage of this fine offer will be among the "big farmers" of the future. William Hirth, Publisher,

THE MISSOURI FARMER, Columbia, Mo.

CO-OPERATIVE LIVESTOCK SHIPPING ASSOCIATIONS

(Continued from page 5.)

serve fund which is intended chiefly for use in reimbursing members for loss sustained on account of injury or death of animals in transit. The charge for the reserve fund is usually fixed at one cent a 100-pounds for cattle and two cents a 100-pounds for hogs.

How to Organize

The plan of organization is simple, as little or no capital is required. The plan recommended by the Minnesota Experiment Station is substantially this: "A few leaders naturally take the initiative in arousing interest in this subject in this community. An informal meeing is called to decide definitely whether to form an association. A temporary chairman and secretary should be elected. At least two committees should be appointed. First, a membership committee to solicit members, and an organization committee to draw up articles of incorporation and by-laws. A moderate membership fee should be charged to provide the small sum necessary for organization expenses; a fee of $1.00 should be ample in most cases and a good many associations charge less.

"The committee appointed to solicit membership should consist of active and influential farmers chosen from different parts of the district which the organization is to serve. The organization will naturally cover all the territory from which farmers ordinarily make shipments through a given town. In some cases, territory dependent upon two or more shipping points may advantageously be included."

Where a co-operative association is already in existence such as creameries or grain buying companies these can very well afford to carry on the shipping of livestock without any extra expense. The manager of the creamery or other association will usually have plenty of time to look after the shipping of stock and the expense will be kept down as well as the co-operative spirit be fostered and extended.

In all this work of farm betterment the central thought is co-operation. By co-operation we learn to help each other and to depend upon ourselves as a class rather than leaving our business to others who have no interest in us save the profit they get out of us.

DRY WEATHER CULTIVATION

The two important things in dry weather cultivation of corn are to prevent evaporation of the water in the soil adn to retain what may fall as rain.

To leave a slightly corrugated surface is best, since a flat surface of dust will get hotter than one with slight corrugations similar to the surface as it is left following a corrugated roller. Since on the flat surface the sun's rays strike more nearly perpendicular to the surface, hence evaporation by the wind and heat will be less than on a flat surface.

Again, if the surface of dust is left flat and a heavy rain should fall, this flat surface will "puddle" more quickly than the corrugated surface, hence the water will begin to run more quickly from the flat surface, while on the corrugated surface more rain gets into the soil, which is very desirable in a dry time.

Again, after the rain has ceased the flat surface will dry more rapidly, and crack open worse than will the corrugated surface.

In view of these facts, any tool such as a drag, mower, or corn planter wheel should have some harrow teeth so placed that they will leave the surface slightly rough. Where shovel tools are used, the plowing should not be deep nor very close to the corn roots, especially toward time for "laying by."

It would appear that corn roots finish their growth early, and do not grow much after the corn is large as can be plowed with a two-horse cultivator. Cutting of the roots when they have made their full growth does a damage that cannot be repaired.

Cultivation should be frequent enough to keep down weeds and to prevent the crusting and cracking of the surface. S. M. Jordan.

GOOD CREAM PAYS BEST

The American farmer who sells cream should insist that the creamery grade his cream. This will tend to cull out the poor quality of cream and make possible a better grade of butter. Give the creamery a good grade of cream and they can make a good grade of butter. Good butter sells for a high price, therefore top prices can be paid for the cream. Better cream prices stimulate the farmer in obtaining better dairy cattle and increases the desire for a more careful study of economical milk production.

The close grading of cream has become absolutely necessary. Within the last few years creamery butter of the United States has been meeting with greater competition from foreign butter. Butter from Siberia, Australia, Denmark, and South America has come to our shores by the ship-load and sold in our large markets alongside American made butter. It has poured into the United States on both the eastern and western coasts.

Imported butter does not reach our markets in as fresh condition as our own butter, consequently the majority of it sells as second grade. In many cases it leaves the point of production as a first class article, but is so long in transit that it deteriorates and arrives as second grade butter. Unfortunately the majority of American made butter is also second grade. This is not because it cannot reach the market at once, but because it is made from a poor quality cream. The American farmer is not producing as good quality of cream as his foreign brother.

First grade butter is still in big demand in this country and the producers of good butter are realizing a nice margin in price over the producers of second grade butter. Because of foreign competition with our second grade butter the difference in price between first grade and second grade is wide. Foreign competition has not materially increased the supply of first grades, while the supply of seconds has been increased tremendously.

Because of our poor markets for second grade butter the farmers in every community should compel their creamery to grade the cream, and should do all in their power to see that every farmer produces only first grade cream. Then and only then will that creamery be able to pay top prices for cream.—L. G. Rinkle, Missouri College of Agriculture.

CONE TRAP FOR FLIES

A fly trap is far more effective than fly paper, poison or fly killer for reducing the annual crop of house flies, according to specialists of the Bureau of Entomology in the U. S. Department of Agriculture. Many types have been advocated to apply to windows, garbage cans, and manure boxes. Exhaaustive tests on the part of the Department's specialists, however, have shown the cylindrical cone type will catch more flies than any other type yet devised. In a new Farmers' Bulletin, No. 734, by F. C. Bishopp, means of making this and various other types of traps and other methods of destroying flies are described. The bulletin describes how to make a trap of the cone type with only four second-hand barrel hoops, a barrel head, a few strips of lumber, and 45 cents worth of screening and tacks.

The two barrel hoops are bent into a circle and nailed together, the ends being trimmed to give a close fit. These form the bottom of the frame and the other two hoops, nailed together in a similar way, the top. The top of the trap is fitted with an ordinary barrel head with the beveled edge sawed off, causing the head to fit closely in the hoops to which it is securely nailed. A square is cut out of the center of the top to form a door, and the portions of the top are held together by inch strips. The door consists of a narrow frame covered with screening well fitted into the trap and held in place by buttons. When nailed together the trap is cylindrical in shape and the frame is covered with closely tacked screen wire on the outside of the hoops. Four laths (or light strips) are nailed to the hoops on the outside of the trap to act as supports between the hoops, and the ends are allowed to project one inch at the bottom to form legs. A cone is cut from the screen and sewed with fine wire or soldered where the edges meet. The top of the cone is then cut off to give an opening an inch in diameter. This is then inserted in the bottom of the trap and closely tacked to the hoop around the base.

COTTAGE CHEESE

Either skimmilk or buttermilk may be used for making cottage cheese. Skimmilk is used the most.

The sweet skimmilk is brought to a temperature of between 70° F. to 75° F. About one ounce (two tablespoonfuls) of good clean starter (sour milk or buttermilk) is added for every gallon of milk, and then stirred well. Then add rennet at the rate of one ounce of rennet to each 1,000 pounds of milk. The rennet should previously be diluted with cold water (½ ounce of rennet to one pint of water).

Set the milk away to curdle, cover it with a clean cloth to prevent dust from entering and also to aid in maintaining the desired temperature, 70° to 75° F. About from 12 to 24 hours will be required to properly curdle.

When the curd has become reasonably firm, it may be broken up by means of gentle stirring. Should the curd be too soft to separate from the whey, the temperature may be raised to about 85° F. to 90° F. Do not warm too much. This will make the curd hard and granular. The cheese should remain soft to be most palatable.

Then remove the cheese to a double cheese cloth, and hang it up to drain. About 6 to 8 hours time will be required for this.

When the loose whey has drained away, add and mix salt at the rate of from 1 to 1½ ounces to 5 pounds of curd. Some also add caroway seed to give flavor. Some like rich cottage cheese. In that case, cream is mixed with it. This results in a smoother, richer, and more palatable cottage cheese, but more expensive.

From 15 to 20 pounds of cottage cheese is obtained from 100 pounds of milk.

Buttermilk is also used for cottage cheese. In order to separate the curd from buttermilk, it is necessary to heat it to a temperature of about 120° F. for about two hours. This is necessary on account of the softness and fineness of the buttermilk curd. Otherwise, the process of manufacture is the same as when sour milk is used.

This cheese may be marketed in one pound paper containers made for this purpose, or it may be packed into glazed earthen jars. During the summer restaurants sell and serve considerable cottage cheese. Cottage cheese is used for sandwiches, it is eaten directly with cream, salt and pepper, and it is used for salads.

Cottage cheese may also be made in the same manner from naturally soured milk without any rennet. In that case, it is necessary to warm the milk to about 90° F. to separate the whey from the curd.—South Dakota College of Agriculture.

Fine Farm for Sale

One mile from corporate limits of Columbia, Mo., 90 acres. Practically all tillable; 50 acres in bluegrass; 10 acres in clover, balance in cats. Good 8-room house, with basement; good barn 36x50; well fenced; 3 wells, 2 good springs. On gravel road. No trade; easy terms. This is within a half hours walk of the University of Missouri and will afford buyer an opportunity to send his children to this great school. Address Clark Robinson, Columbia, Mo.

If you know of a bright farmer boy in your neighborhood, tell him about the free bred gilt offer which appears elsewhere in this issue.

OPPORTUNITY EXCURSIONS

Down in Oklahoma and Texas there's many a manless acre waiting the turn of the furrow to liberate it's wealth.

Land anywhere is never again likely to be as cheap as it is now—in Oklahoma and Texas it noticeablf increases in value year by year.

For Greatest Satisfaction Use
DOUBLE SERVICE Automobile Tires
Guaranteed 7,000 Miles Service
Absolutely Punctureproof

Double Service Tires are made double the thickness of the best standard make tires.

This 100% greater wearing surface naturally gives that much more mileage and service. The average of 12 miles of tough fabric and one inch surface tread rubber makes these tires *absolutely punctureproof*.

These tires excel all others for use in the country over rough and rugged roads as well as on hard pavements. They are as easy riding and resilient as any other pneumatic tire—the air space and pressure being the same.

They are the *most economical* and "care free" tires made and are used where tires must be depended on and tire troubles cannot be tolerated. Many *Double Service* style tires are in use in the U. S. government and European War service.

Our output is limited to a certain amount, but for a short time we offer the following reduced special prices as an Introductory Offer:

PRICES

	Tires	Tubes		Tires	Tubes
30x3 in.	$ 8.60	$2.30	36x4 in.	$17.45	$4.65
30x3½ in.	10.85	3.10	35x4½ in.	21.20	5.60
32x3½ in.	12.75	3.20	36x4½ in.	22.50	5.75
33x4 in.	15.75	4.20	37x4½ in.	23.60	6.20
34x4 in.	16.70	4.35	37x5 in.	26.30	6.60

All other sizes not included in above list also furnished. Non-skids at 10% additional.

Terms: Payment with order at above special prices, a 10% discount allowed on orders for two or more tires. All personal checks must be certified.

Try these tires now and be convinced of their very high qualities. Sold direct to the consumer only.

Descriptive folder upon request. Write for it.

THE TRACTION ENGINE PROBLEM

By A. A. Potter

Dean Division of Engineering and Professor of Steam and Gas Engineering, State Agricultural College, Manhattan, in address before the State Board of Agriculture.

The object of any industrial enterprise, whether this enterprise is farming or manufacturing, is to produce a good product in large quantities and at the lowest possible cost. The wonderful growth of the manufacturing enterprises of the United States is due mainly to the introduction of methods which resulted in large-scale production. Large-scale production is of comparatively modern development in manufacturing establishments and has been brought to its highest perfection in the iron industry, the automobile factories, the meat-packing plants and the electrical industries. The success of large-scale production is dependent upon the use of mechanical power and of mechanical devices.

The agricultural industry of the United States is not concerned as much with intensive farming as it is with extensive farming, which requires the application of modern manufacturing systems and large-scale production methods to the problems of the farmer.

In the earlier days when the wants of man were few, when women and slaves were willing to do all the hard work and land was cheap, the power problem of the farm was very simple. As civilization advanced and the people increased in numbers the demand for power other than human became urgent. The horse, mule or other animal was forced into service. Then a little later the development of farm machinery made it possible for one man to control the work of several horses. Desire on the part of farmers to raise large crops and to put under cultivation greater and greater areas of land created a demand for still larger power under the control of one man. With animal power one man can control at one time four horses; with mechanical power the number of horsepower under the control of one man becomes unlimited, if the ma controlling mechanical power is willing to learn the fundamental processes which govern the conversion of fuel into mechanical energy as well as the simple laws of mechanics which enable one to keep machines and mechanisms in adjustment and in perfect working order.

The demand for mechanical power is further augmented by the scarcity of farm labor and by the increased cost of draft animals suitable for farm work.

In the earlier "home-made" days of the traction-engine development, small stationary engines were mounted on various farm machines and an attempt was made to do farm work without regard to principles of engineering or of construction. Then followed the line of large traction engines which developed sixty to eighty horsepower on belt and thirty to forty horsepower on the drawbar. These traction engines were expensive, poorly designed, complicated and unsuited for practical farm conditions.

It is only within recent years that the largest and best engineering manufacturing companies began to realize that modern farming is, to a considerable extent, an engineering problem, which offers an excellent field and market for engineering ability and for machinery carefully designed and built.

About seventy-five manufacturers are building traction engines in the United States. The designs differ greatly. Some have engines with horizontal cylinders, others with vertical cylinders. In some cases the power of the engine is given to one wheel, in others to two, while still others pull with all four wheels. Several makes are of the so-called "creeping grip" types. The diversity of styles is very great, but, after all, a careful examination will reveal the fact that the best makes of traction engines are very similar. In fact, the whole traction-engine industry is undergoing a standardization process, weeding out freak designs and retaining only such types as are sound in accordance with the best mechanical-engineering practice. Before long the standard type of traction engine will be available, and, like the standard type of automobile, will give satisfaction in every detail.

Low first cost of any machine should not be made the most dominating feature. A high-grade traction engine must be the product of the best engineering talent, which means brains and money, and this must be included in the price of the machine.

The backing of a company whose financial standing is an assurance that the company will remain in business for many years is an important consideration. Expert service and repair parts may be needed at any time. A high-grade manufacturing company is usually very careful about maintaining its reputation and will see to it that it does "deliver the goods."

Before making up his mind to purchase a traction engine, the farmer must analyze very carefully himself, his farm, and the work of the traction engine.

In analyzing himself the farmer must decide as to whether he can plan his work so as to keep the traction engine busy. The average person spends too much time working and too little time in planning his work. Can the farmer lay out the work of his farm so that the traction engine can be used for belt work and for hauling as well as for field work? To make most on the investment of a traction engine the farmer must keep the traction engine busy.

Proper tillage is a very important factor in farming, if good crops and big crops are expected. The traction engine will probably never replace the horse, but will replace many horses, on large farms, and especially in connection with the very heavy farm work. The traction engine has advantages over the horse in that it is not affected by the heat, can be used for deep plowing, eliminates to a considerable extent the "hired man" troubles, as it is a concentrated form of farm power, can work continuously day and night, and can be used to advantage at all seasons of the year, if the farmer is a good manager and plans his work. Like horses, traction engines are liable to internal disorder on account of overwork. Some farmers overload their animals and use the same practice when dealing with traction engines. They get by with it for a time, but all at once, when least expected and most needed, the engine breaks down—and who is blamed? The engine and its manufacturer.

The traction-engine field work can include: Clearing the land; tearing out hedges; pulling up trees, stumps and stones; preparing seed bed and seeding, with the operations of plowing, disking, harrowing, listing, drilling, seeding, harvesting operations, such as mowing, hay loading, hay hoisting, and drawing binders and diggers.

The traction engine is suited for heavy belt work, such as hay baling, corn shelling, pumping water for irrigation and for other purposes, grinding feed, ensilage cutting, sawing wood, threshing, husking, hulling, shredding, filling silos, crushing rock, and elevating grain.

The traction engine can be used for hauling grain and other farm produce to the shipping-point or to the market; also for hauling fertilizer and other material to the farm.

In connection with road work, traction engines have been utilized for pulling graders, scrapers, road plows, drags and other road implements, as well as road materials.

A farmer who can find many uses for a traction engine and who can make use of this form of power the whole year round will find the traction engine a profitable investment.

Modern House Aids in Liking Country

The farm boy or girl likes to live in a good house. The call of the city is largely a call of the better house, the house better adapted to being made a home, say men in the United States Depatment of Agriculture.

It is not necessary to go to the city to get a modern home. A farm home can be built for three or four thousand dollars that would cost nearly twice as much in the city. A lighting and heating system can be installed as cheaply in the country and kept up at a much smaller expense than similar conveniences can be kept in the city home.

The amount of money necessary for taxes and for public improvement is almost negligible to the farm-home owner. To the owner of the city home, it is considerable.

The amount of money to be invested in the building of a farm home should not be determined by its relation to the balance of the plant in size nor the amount needed to provide a shelter. It should be the amount the owner may reasonably afford to spend without financially crippling himself too severely, says the Department of Agriculture. The average city home is bought as a social investment. The buyer looks to the comforts and conveniences that he can get in the new home that can not be supplied in a rented house. He does not think of how much he can sell the house for when he no longer wants it. He knows he can not sell it, oftentimes, for as much as he must pay for it in the first place.

The better farm house is not a panacea for all ills of dissatisfaction with farm life. There will be farm boys and farm girls who want to take up other professions than tilling the soil. The problem, continues the Department of Agriculture, is not to force them to stay on the farm, but to make conditions good enough there that they may make an intelligent choice.

By Old Jim Riley

I heerd of a farmer th' other day who mortgaged his work horses to buy an automobile while it takes all th' eggs and chickens his wife can rake and scrape to buy gasoline. He's a bigger fool than Charley Chaplin, only he don't get paid for it.

The Professor "Het Up"

The "Professor" wishes to say to his friends and enemies alike that he is all "broke out with the heat" and that as soon as he gets cooled off a bit he will be back into the game with the hottest lot of "Buckshot" that ever came down the line. Likewise the "Possum Holler" gang is so busy "fightin' flies and muskeeters" that the weighty matters of state must await a little cooler atmosphere. As he took a vicious swat at a green head which had temporarily forsaken his old gray mule, the Professor took this parting shot at "Old Jim Riley": he says that old Jim's hide is so tough that he couldn't break out with the heat if he wanted to.

NATIONAL AID FOR GOOD ROADS

Press dispatches from Washington announce that the good roads bill carrying aid to the amount of $85,000,000 has passed both houses of Congress and now awaits only the signature of the President to become a law. We have not been able to get a copy of the amended bill which has passed but hope to have a review of it in the next number of The Missouri Farmer.

Whatever the bill may provide farmers should not content themselves with thinking they have nothing to do with the question and wait for the Government and the State to find their own way to put the law into effect. That state and that community which is awake to its own interests and has its forces well organized and ready to do its part will reap more benefit from national aid than the ones who are indifferent about it. So let us suggest that our readers make themselves acquainted with the national aid bill and then get their members of th Legislature interested and by the time the next General Assembly meets v will be ready to accept the proffer of help and go to work to get out of the mud in Missouri.

If there is a boy in your family, why not urge him to win one of the fine bred gilts which are offered elsewhere in this issue? It will get him interested in the farm. Read it carefully and then tell him about it.

EXTRA OFFER!
3 Girls Dresses 99¢ POSTPAID

Here is a bargain indeed! Three girls' pretty Wash Dresses! One of tan linen, one of pink percale and gingham and one of plaid and checked percale, all for only 99c. Live Stock Notes

R. P. ROYCE, Fieldman

REPORT OF THE MISSOURI LIVE STOCK PRODUCERS' ASSOCIATION'S SPECIAL MEETING

The directors of the Missouri Livestock Producers Association held a special meeting at Kansas City, June 27th. This organization was formed last winter and has for its membership various breeders and feeders organizations of the state of Missouri. The directors are the presidents of these associations.

Ways and means for increasing the membership of the association were discussed. It was unanimously agreed that a man was needed who could devote all his time or at least a considerable portion of his time to the work of the association, combining the office of Secretary with that of field representative and a committee was appointed to work out a plan for securing such a man. This committee consists of President C. E. Yancey, Secretary E. A. Trowbridge, Dr. A. W. Nelson, and Dr. J. B. Unsell.

"If this association is to accomplish anything like the good for the livestock producers of this state that we believe it can, we must have someone to look after the large amount of detail work that will necessarily have to be done" said Dr. Unsell in urging the importance of securing the services of a good man. "In the first place the membership of the association must be built up until it includes the leading breeders and feeders of the state. This means much hard work. We should have a man who would be in a position to respond to the calls for a representative to attend the numerous livestock meetings held throughout the state. We are planning some aggressive work, and we need someone who will follow this work up and see that it is pushed as hard as possible. We might be able to get along with a part, only, of a good man's time for the present, but we cannot afford to depend upon the volunteer work of busy men, such as our officers and directors are."

Dr. Unsell was appointed a representative of the association to attend the meeting of the Missouri veterinarians to be held at Neosho, Aug. 1st and 2nd. The veterinarians have expressed their desire to meet representatives of the breeders at Neosho and have a heart to heart talk with them, and Dr. Unsell was instructed to correspond with the breeders and feeders and find out where they stand on questions affecting their relations with the veterinarians and be prepared to go "loaded" to Neosho.

Secretary Trowbridge was instructed to enroll the association as a member of the Missouri Federation of Agricultural Societies of which Walter W. Head of St. Joseph is Secretary.

The plan of this organization is in the immediate future to issue a directory containing names and addresses of members of it. This will be used to meet requests which come to members of the association and for those wanting to buy or sell live stock and other purposes which it may serve.

The organization plans to hold several meetings in different sections of the state at times when such meetings seem advisable. It also plans to be of any service it can in promoting the livestock industry of Missouri within the state.

American Royal Live Stock Show

The Eighteenth Annual American Royal Live Stock Show will be held in Convention Hall October 2 to 7, 1916, Kansas City, Mo. The four beef breeds, Hereford, Shorthorn, Angus and Galloway, will be represented—and the present prospects are for a much larger showing than in any previous year. The secretaries report that breeders generally are eager for the big show, and will have stock in fine condition to bring. A total of more than $12,000 will be offered in prize money in the breed classes, and there will be more prizes than usual in the range classes, contributed by the Kansas City Stock Yards Company. A calf class has been added in this division.

The arrangements for the show provide for about half again as much space as was available last year, the additional ground adjacent to the former barn room, being used for nurse cattle chiefly, and allowing for the use of the entire block across from Convention hall for the stabling of show cattle.

Special entertainment features will be provided, which will be staged in the big hall.

There will be three auctions, as follows: Wednesday, Galloway; Thursday, Shorthorn, and Friday, Hereford. There will be no auction of Angus cattle.

Following the custom of recent years, there will be no judging in the morning, that time being allowed for the visitors to take in the stock yards, and to see the city, after they have liesurely viewed the exhibits.

Southwestern Dairy Show

The Southwestern Dairy Show Association will hold its first annual Dairy Exhibition in Convention Hall, Kansas City, Missouri, September 18-23rd, inclusive.

The Association is preparing a strong program of lectures, demonstrations, and exhibits. There will be on exhibition six different breeds of dairy cattle to the number of 600 head. Guernseys, Jerseys, Ayrshires, Brown Swiss, Dutch Belted and Holsteins will be "At Home" to their friends for six full days. There will be something of interest for old and young, from early morn until late at night.

A feature of the show will be the evening parades of all the winning stock in the large arena of the hall. The best herds in the Middle West are entering as the premium list is attractive, between six and seven thousand dollars being offered in prizes.

Another feature attracting attention is the Market Milk Show. Dairymen all over the Mississippi Valley will enter exhibits, which consist of three quart bottles of market or of certified milk. No one is barred, so send in your sample and have its commercial standards determined. The samples will be judged as to appearance, flavor, fat, solids—not fat, acidity and bacterial count.

The State University Extension Service will have exhibits showing the value of various feed stuffs for milk production, the use of soiling crops; value of pure bred sire, the Babcock test and scales, silos and silage.

Kansas City should draw a big attendance and the manufacturers of dairy machinery and equipment realizing this, are planning on making extensive exhibits in the machinery section. The milking machine section will have some 10 or 12 different types on display and there will be as many different types of separators and engines of all types.

A SCRUB SIRE NEVER PAYS

Quality becomes more essential to profit in live stock farming each season. When labor, land, and feed were cheap it was possible to realize a profit on live stock of an inferior grade, but with the present high cost of these production factors and a constant discrimination on the market against the "scrub," it has become evident that the greatest profit can be expected only from live stock of good quality. It may be possible for the feeder or dealer to make a profit on inferior live stock if he is able to buy it sufficiently cheap and sell quickly, but usually someone has not realized the greatest possible profit when a "scrub" goes to market. If it is not the feeder, it is the man who produced the animal.

At the Missouri Agricultural Experiment Station lambs sired by a $30 mutton ram and out of Western ewes weighed 2.54 pounds more at three months of age than lambs out of the same kind of ewes by a "scrub" ram weighed at four months. The well-bred lambs were ready for market a month earlier, they ate only about one-half as much feed, and they sold for nearly $3 more per hundred than did the lambs by the inferior ram.

Just recently two Utah ranchmen are reported to have sold their cattle on the same market on the same day. Both used the same amount of national forest range per head and paid the same grazing fee. One had used good bulls to produce his cattle, the other had not. The good cattle brought $40 per head more than the poor cattle.

Whether the live stock is cattle, hogs, sheep, or horses, the good ones are appreciated when sold and consequently bring higher prices and normally yield greater return. The most practical means of improvement is through the use of good sires, for the male may become the parent of from 40 to 100 animals each year.—E. A. Trowbridge, Missouri Agricultural Experiment Sttation.

SELECTING DAIRY BULLS

Since the dawn of genuine interest in dairying the matter of how to judge the value of a bull has been one of the large questions presented for solution. Each breeder has met this problem sooner or later and each has solved it by one of three methods: the bull has been selected because of individual merit; because of his ancestry; or because of his get. In the past the first two—individuality and pedigree—have been the chief methods of selection. In fact, with young animals these are the only possible methods.

Individuality—In so far as type and the capacity to get high producing offspring are correlated, it is possible to select bulls by individuality. Most authorities agree that either we do not know this type as yet, or there is little positive correlation between the two.

Pedigree—Selection of pedigree is based upon the thought that high milk production or the power to beget high milk production is rather regularly transmitted from parent to offspring.

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.
BENNETT BROS. R. 5, LEE'S SUMMIT, MO.

Spring Boars by the Grand Champion
A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.
WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns
Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.
H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS
We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.
W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands
I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.
H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS
Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.
EDGAR DOOLEY, - Etterville, Mo.

DUROC JERSEYS

Durocs With Size and Bone
I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.
A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

BIG EARLY DUROC SPRING PIGS
Pigs with size, lots of bone and quality sired by our big prize-winning boars, Col. Wonder II., Merry Chief, and Rexall Col., and out of big prolific sows. None from litters of less than 11. Spring pigs are cheapest to buy, costs practically nothing to ship them, and they can be grown cheaply.
R. L. (BOB) HILL ADENHILL FARM, - - COLUMBIA, MO.

Guarantee and pedigree accompanies each sale. This herd has been exhibited at World's Fairs and State Fairs for years. You are sure to get prizewinning blood from us. Prices reasonable. Write us today. Address
S. D. & B. H. FROST, Kingston, Mo.

HAMPSHIRES

BROOKVIEW HAMPSHIRES
Herd headed by GEN. TIPTON and SIR BROOKVIEW, both grand champions. Spring boars and gilts of choice breeding and individuality. Prices reasonable.
ISOM J. MARTIN, - Kahoka, Mo.

RED POLLED

RED POLLED CATTLE
Herd established 16 Years
Young stock for sale. Young bulls sired by LOGAN 13500; Calves sired by KNOCKER 23791. Bred for milk and beef. Also offer spotted Poland China hogs and Rieds Yellow Dent seed corn.
M. L. SNYDER. - - POLO, MO.

ANGUS CATTLE

ANGUS CATTLE
Herd founded 1904
Young stock sired by Dean's Eric 139686. Also offer splendid herd bull for sale. Every one the right kind and priced to sell.
V. E. LAWRENCE, SALISBURY, MO.

Aberdeen-Angus
I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
J. D. Blackwell - Fayette, Mo.

This, as is known, is far from a dependable occurrence.

Frequently, always, in fact, where possible, a combination of the two methods mentioned is employed. That is, a bull is selected because he has the desired type and comes from a high producing family.

Even this combination of methods is far from adequate, as is evidenced by the numerous disappointments which have followed selections based upon it.

Performance—The advice to dairymen in later times has been to get a tested bull—one that has actually produced daughters of merit. This, of course, is the real test after all, for a bull is valuable in proportion to the average production of his daughters.

This method is not generally applicable, because the bulls must be tested in some herd. Another disadvantage is the time required to get an actual measure of the productivity of the female offspring of any one bull, but where at all possible a tested bull should be used. As between a young untried bull of ever such good individuality and breeding, and an older one which has proved his value as a sire of good producers, breed to the tried bull every time.—Dr. W. E. Carroll.

TAKE CARE OF YOUR COLTS

Horse and mule colts suffer more from heat and flies during July and August of their first year than at any other time, according to the experience of the Missouri Agricultural Experiment Station. During these two months many plump, well-developed, smooth-haired youngsters become thin, pot-bellied, listless and begin to show staring coats. In this condition they are likely to be weaned in September and perhaps before they have become thrifty again they are put on a scant spuply of dry winter feed. Such set backs cut profits seriously.

Colts from work mares should be kept in the barn or lots while their mothers are in the field and should not be turned in with their mothers if the mares are warm immediately on their return from the field at noon or in the evening. They should be kept separate until the mothers are thoroughly cooled.

The colts should be eating grain and a little grass or hay by the first of July and if they have not yet learned to eat grain, a clean mixture of equal parts of crushed oats, ground corn, and bran should be placed in a trough where they can get it at any time. The lots should have plenty of shade and if the colts are kept in the stable, the stalls should be partially darkened, taking care not to shut out the breeze or free circulation of air. If flies cause much trouble, hang up old burlap bags where the oclts can walk under them and scrape the flies off their backs and sides. Proper care may make a difference of from $10 to $40 in the value of the colt at weaning time and these inexpensive methods should be used to increase the owner's profits as well as to make the colt do better.—E. A. Trowbridge, Missouri College of Agriculture.

COLT SHOWS

Colt shows are proving a great aid in stimulating interest in the breeding of high-class horses. Next to community horse breeders' associations and State stallion license laws there is, perhaps, no other factor that will so materially assist in the improvement of the horses of the country. It is only in recent years that impetus has been given to this very important feature in connection with the rapidly growing movement for better horses.

At the present time colt shows are an annual event in many districts of a number of the States, chiefly where stallion license laws are in effect. As an illustration of the popularity of these shows and the keen interest manifested in them by the people of the farming communities, it is reported that in 1915 no less than 25 colt shows were held in the State of Minnesota alone. In some sections these shows are held in the spring, but in a majority of cases the fall of the year is selected. The latter season appears to be preferable for a number of reasons. At that time the heaviest part of the farm work is about over, and with more time to spare, farmers will take a greater interest in the event and the object for which it is held.

These exhibitions are invariably held independent of the county fair, although there is apparently no reason why a show of this kind could not be made an important and outstanding feature of the annual county event.

In some instances these shows were inaugurated with simply one class for grade draft foals and have gradually grown until the classification is almost as complete as that of the State fair. However, such a large classification is not possible in most localities, as the larger amount of money necessary can not be raised. The best plan, and the most beneficial one, perhaps, would be to hold an exhibition for weanlings and yearlings only. If the community or district has a fairly large number of purebred horses, separate classes could be provided for pure breds and grades.

The question of having classes for both light and heavy horses will depend upon whether sufficient attention is being given to the production of both classes.

In securing the necessary funds to finance such an exhibition as a colt show a number of different plans have been suggested. In Minnesota one show is financed by the stallion owners, each giving $25 in cash prizes, to be divided among the colts sired by his stallion. Another plan is to have the county horse breeders' association or the various farmers' clubs contribute sufficient money to finance the show, while still another scheme is for the local bank or banks to furnish the money for premiums and other expenses.

However, the most popular and common method is to go among the business men of the community and secure subscriptions in sufficient amount to pay all expenses of the show.

All premiums should be designated by neat, but inexpensive ribbons on which are printed the name of the show, the year, and the classes to which they belong.

While the premiums in the individual classes should consist of cash awards, it is suggested that the championship prize consist of a suitable trophy rather than money. This trophy need not necessarily be expensive. It should, however, be something lasting, to which the holder can point with pride. Any breeder would be glad to possess something of this kind, the true value of which is in what it represents.

The securing of competent men to act as judges is an important consideration. This problem probably can be solved comparatively easily by taking up the matter with the animal husbandry division of the State agricultural college or with the various breed associations. Either of these bodies probably will be willing to cooperate with the local committee and furnish efficient judges for the show.

When once established, it will be found that the annual colt show will do much to bring about an improvement in the quality of the horses raised in the community. These exhibitions, held preferably at the county seat, will afford possibly prospective buyers an opportunity to learn something of the class of horses being produced in the locality, and the community will thus be benefited by the fact that it will eventually have established itself as a market for horses that will readily sell at good prices.

There is every reason to believe that the practice of holding annnual colt shows will become more general. The fact that they have increased considerably in the past few years is evidence that they have not only proved popular but profitable as well.

The movement through the country today is not for more horses, but rather for better horses. Whatever the future demand may be, the man raising the better class of horses will receive the higher price.—Weekly News Letter.

VALUE OF A GOOD SIRE IN DOLLARS AND CENTS

A very practical and convincing demonstration of the value of a good sire over an inferior sire has recently been reported by the Illinois Experiment Station. A number of cows whose average annual production was 5,380 pounds of milk and 234 pounds of butter fat were bred to a bull termed "inferior" and the daughters from such matings were tested and it was found that they produced 1,050 pounds of milk and 18 pounds of butter fat less than their dams. The cows were then bred to a "fairly good sire" and the daughters showed a gain of 1,300 pounds of milk and 60 pounds of butter fat over their dams. When a "superior sire" was used the daughters showed a marked increase over their dams amounting to 2,545 pounds of milk and 110 pounds of butter fat.

Figuring the value of milk at $1.25 a hundred, the daughters of the "superior sire" produced $45.00 worth of milk more than the daughters of the "inferior sire." In view of these results, and they are by no means unusual, the progressive dairyman should exercise the greatest care in the selection of a herd bull. The production of a herd can be materially raised by the use of a bull backed up by heavy producing dams, and the man who allows a few dollars difference in price to influence him in the purchase of an inferior bull is indeed, "penny wise and pound foolish."

A FARMERS EXPERIENCE WITH THE SELF-FEEDER

The self-feeding practice of fattening hogs is, in the writer's opinion, a very profitable way to feed where it is desired to get the hogs on the market as early as possible. The first of February we started to feed fifty head of sixty pound shoats according to this system. It took about one week to get the hogs on a full feed so that it would be safe to turn them to the feeders, one of which contained corn and the other tankage. They were also given access to the following condition powder: 4 pounds of charcoal, 3 pounds each of, copperas, salsoda, glaubers salts, and common salt, and one pound of sulphur.

After a sixty-five day feed the hogs were sold at an average weight of 175 pounds. They made a net gain of 115 pounds in the sixty-five days or a daily gain of one and ten thirteenths pounds. The total gain for the whole herd being 5750 pounds. During this period they were fed 375 bu. of corn and one ton of tankage. Figuring corn at 75 cents and tankage at $50.00 the total cost of producing the 5750 pounds of pork would be $331.25 or a fraction over $5.75 per hundred pounds gain.

It is ordinarily recommended that corn and tankage be fed in the proportion of ten pounds of corn and one of tankage where the feeder does the mixing. In this instance the hogs mixed their own feed and the result was they ate 21,000 pounds of corn and 2,000 pounds of tankage which is a little less tankage than would have been given if the two had been mixed and fed as is the customary practice. However for the first thirty or forty days they ate a larger precentage of tankage than they did later in the feeding period. This may be accounted for to some extent from the fact that the hogs were running on a clover and timothy pasture and the clover had made some little growth by the middle of March.

E. R. Spence.

Remedies for Lice on Hogs

Of the remedies commonly used for lice on hogs, the Nebraska College of Agriculture says that crude oil is properly the cheapest and the most effective, as it kills not only the lice but the nits as well at one application. The most convenient method of applying is by means of a hog oiler, of which there are several good types. These have the advantage of being always ready and need little attention except keeping oil supplied. The best type of oiler is one that enables the pig to get the oil to all parts of the body. The oil can also be applied with a sprinkler, a spray pump, or a broom or brush. If there is any indication of skin disease, the part should be scrubbed with a broom or brush so as to get the oil well into the skin. Where crude oil is used, it will be noticed that the skin and hair are improved in appearance. Where any of the coal tar dips are used, at least two applications should be made at intervals of seven days. Where the floors of the pens or sheds are of dirt, a liberal application of oil will keep down the dust as well as aid in killing lice.

St. Joseph Feeder Show

F. C. Fletcher, secretary of the St. Joseph Stocker and Feeder show which will be held at the stock yards, Sept. 27 and 28, is working on the premium list of the show. About $2,000 will be paid out this year in cash premiums on exhibits of feeding cattle of the leading beef breeds. Practically the entire expense will be borne by the Live Stock Exchange and other stock yards interests. There is every reason to believe that the show this year will eclipse that held last year, both in the number of cattle entries and in the number of buyers for the auction sale which will be held the closing day when all of the good feeders will be disposed of.

Tried Shorthorn Bull

I offer for sale at reasonable price my herd bull, Imperial Knight 353519. Red, five years old. Splendid sire. Am keeping his daughters. Weight between 1800 and 2000 lbs. Good disposition.

NELSON COLE, - Brashear, Mo.

JERSEY CATTLE

JERSEY CATTLE

Bulls ready for service. They are sired by the Owl's Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

JERSEY BULL CALVES

I have three extra fine ones for sale. Sired by Stockwells Champion. He has won 29 first and Champion ribbons at the leading State Fairs. Calves are out of very high producing cows. For breeding, etc., writ.

J. B. SMITH Platte City, Mo.

SUNSET CORRECT TYPE JERSEYS

To keep our herd within 100 head we will offer at private sale fifty Jerseys, consisting of cows, bred and open heifers, young bulls, heifer and bull calves. Can fit out small herds for beginners. 125 head to select from. The famous Blue Belle-Golden Rosebays. Send for special circular before buying elsewhere. Bargains. Mention your wants.

THE ENNIS STOCK & DAIRY FARM, Horine, Mo. (Just south of St. Louis.)

HOLSTEIN CATTLE

Dutchland Sir Hengerveld Rag Apple 99771

A few choice bull valves out of heay producing dams sired by the above famous bull for sale.

BLACK AND WHITE FARM
Baden Station, Mo.

THIS BEAUTIFUL CAR FREE!

Don't You Want To Win This Car?

IN ORDER to increase its subscription list, **The Missouri Farmer** has concluded to give away this beautiful five passenger **Overland** automobile under conditions which place it within easy reach of any bright young farmer girl or young farmer in the state. Everybody almost wants to own an automobile and the wish is an entirely normal one. In the first place, the automobile wipes out distance. If an emergency of any kind arises, the automobile "goes there and back" in the length of time that it takes to hitch up and get started with a team which is frequently tired out from work in the fields.

The Pleasure of Owning a Splendid Car

BUT WHAT normal human being doesn't want to own a beautiful automobile because of the pleasure it gives and who is entitled to this pleasure more than those who live upon the farm? Just think of how gladly you will look forward to Sunday with this splendid car standing ready to glide away at the touch of a button! You can pile in the whole family and go to church on Sunday morning. Then, when dinner is over, you can take a 40 or 50 mile spin into some neighboring county and get back again by supper time. Think of the exhiliration out in the fresh air, the pleasure of seeing growing crops upon every hand and the visits you can pay to relatives and friends!—**and all this accompanied by a riding luxury not excelled by a Pullman Palace car!** Again, during week days when the days work is over you can pile in the "whole bunch" and take in a picture show in town. **Truly, is it any wonder that everybody wants to own an automobile?**

You Can Win It if You Try!

AND THIS beautiful car is within easy reach, as we said above, of any bright farmer girl or young farmer in Missouri. All that is required to win it is first, the **desire**—and then the willingness to do a few weeks **hustling!** Get a bunch of sample copies of **The Missouri Farmer** together with a subscription pad and then "hit the trail." We give three years subscription for one dollar and when you show your neighbors what a splendid paper **The Missouri Farmer** is—when you tell them that it is leading the fight for Farm Club organization throughout Missouri—**and that you want them to help you win this beautiful car!**—hardly a single one of them will turn you down. The renewal of old subscriptions will count the same as new—and should you fail to win the car we will nevertheless give you a **substantial commission on every subscription you send in—so in any case you will make a lot of money!**

Send Us Your Name Today

NOW WE WANT every farmer girl or young farmer who reads this advertisement and who would like to win this magnificent car to send us their name and address today. **Don't be afraid of not winning!** "Faint heart never won fair lady." Again, you don't know how **easy** our plan is for a real hustler. There may be some reason why it would be particularly easy **in your community!** We intend to help everybody who gets into this fight. We will tell you just how to conduct your campaign from start to finish. If there are a bunch of old subscribers in your neighborhood which need renewing we will send you their names. You will have little difficulty in getting **practically every one of them!** You owe it to yourself to find out all about our plan—**and your failure to write us may deprive you of this beautiful car!** If, after you understand our plan fully you do not care to go into the fight you will merely be out a postage stamp. **Isn't such an offer worth at least an investigation?**

THE PEOPLE WHO WIN

THE PEOPLE who win in this World are those who have faith in themselves and who are not afraid to hustle. Somebody who has this kind of will power and ambition is going to win this splendid five passenger OVERLAND. It might as well be you as somebody else. It is for you to say. It costs $695. Why not let THE MISSOURI FARMER buy it for you? And remember that in any event we will pay you handsomely for every subscription.

He Gets the "Hot End"

When the farmer goes to market to buy a new self binder, a suit of clothes or a pair of shoes the merchant tells him the price and usually that is final. If the farmer objects that the price is high, the merchant explains that the manufacturer has been compelled to advance the wholesale price because of the European War or because some other economic factor has increased the cost of the raw materials; that the Organized Labor which the manufacturer employs has compelled him to advance wages to meet the "high cost of living"—and that he, the merchant, of course, cannot afford to do business for nothing—that he must have some kind of a return on the capital invested in his business, and for clerk hire, rents, etc. Likewise, the banker or loan agent says, "I must have such and such a rate of interest on my money"—governed by the law of supply and demand in the money market at that particular time. Now I have no fault to find with the argument of the merchant or the banker, for it is sound. When the manufacturers' cost of production increases he must advance his price or face bankruptcy—and the merchant in turn must advance the price to the consumer. Likewise, the demand for money fixes the interest rate—and until the farmer exercises gumption enough to bring about the adoption of an Agricultural Credit System in his state, he has no right to grumble. Again, the farmer should be willing for the great manufacturing industries of the Nation to be wholesomely prosperous and to pay living wages to their millions of employees—for these employees consume the things which the farmer produces.

But how different is the situation when the tables are turned and when the farmer goes to market with the fruits of his years' sweat and toil? When he arrives at the Stock Yards with his hogs, cattle or sheep, the buyers for the Packers Combine say, "We will pay you such and such a price"—and that is all there is to it. Unlike the manufacturer of farm implements, clothes and shoes the farmer cannot say, "I fed these hogs and cattle on 75c corn and the price you offer me doesn't cover my production cost, saying nothing about a reasonable profit." The Packers are in control of the great Live Stock markets of the Country and there is no appeal from their ultimatum. They know that the farmer must accept what they offer—nor do they even stop to explain why today's market is 50c per hundred under that of yesterday or the day before. They hold the whip hand and that their methods may bring tears and anguish to thousands of farm homes or that they are striking a deadly palsy into the great fundamental industry of American Agriculture—these things are of no concern to the great Packer Kings who demand their "pound of flesh" with an abandon which knows no conscience. Likewise, when the farmer drives to market with a load of wheat or corn, he must accept the price which has been fixed by the grain gamblers. He cannot say, "We had a Nation-wide drouth this year which cut down the yield and I therefore must have more than I received last year when farmers produced a big crop." Again he is offered so much and perhaps with his interest due at the bank or the merchant crowding him for a long over-due store account he has no choice but to gulp down the bitter dregs as best he can.

Foreign wars and other factors which increase the cost of production for the manufacturer, merchant and Organized Labor compel the farmer to pay a higher price for the things they sell to him—but there the rule ends and when applied to his hogs, cattle, sheep, corn and wheat it becomes a dead letter. In other words, to use the language of the street, the farmer is the "goat" of our economic system and this he will continue to be until he and his neighbors organize and get in position to demand at least the production cost of the great staples of the American farm. In this situation you find a complete answer to "What's the matter with the farm?" And well may we exclaim, how long, Oh Lord, will the farmer continue to submit to this condition of affairs? How much longer will he drift with the current? Upon the answer to this question depends the future of American Agriculture.

FEDERAL AID FOR RURAL ROADS

The sum of $85,000,000 of Federal funds is made available for the construction of rural roads, by the passage of the Federal Aid Road Bill which became a law in July 11, 1916. Of this sum, $75,000,000 is to be expended for the construction of rural post roads under co-operative arrangements with the highway departments of the various States, and $10,000,000 is to be expended for roads and trails within or partly within the National forests. The Act limits the Federal Government's share in road work in co-operation with the States to 50 per cent of the estimated cost of construction. Federal aid may be extended to the construction of any rural post road, excluding all streets or roads in towns having a population of 2,500 or more except the portions of such streets or roads on which the houses are, on an average more than 200 feet apart.

Five million dollars is made available for expenditure during the fiscal year ending June 30, 1917, and thereafter the appropriation is increased at the rate of five millions a year until 1921, when the sum provided is twenty-five millions, making a total of seventy-five millions. In addition, an appropriation of one million dollars a year for ten years, a total of ten million dollars, is made available for the development of roads and trails wholly or partly within the National forests.

The class of roads to be built and the method of construction are to be mutually agreed upon by the Secretary of Agriculture and the State highway departments.

Apportionment of Funds Among States

The Act provides that after making necessary deductions for administering its provisions,—not to exceed 3 per cent of the appropriation for any one fiscal year,—the Secretary of Agriculture shall apportion the remainder of each year's appropriation in the following manner:

One-third in the ratio which the area of each State bears to the total area of all the States:

One-third in the ratio which the population of each State bears to the total population of all the States:

One-third in the ratio which the milage of rural delivery routes and star routes in each State bears to the total mileage of rural delivery routes and star routes in all the States.

Estimates of Funds Needed

Project statements setting forth the proposed construction of any rural post road or roads in a State are to be submitted by the State highway department to the Secretary of Agriculture, and upon approval by the Secretary all necessary surveys, plans, specifications and estimates must be furnished. The roads projected must be of a substantial character, and items covering engineering, inspection, and unforeseen contingencies are not to exceed ten per cent of the total estimated cost of the work.

Upon completion of the work as approved by the Secretary, the amount set aside for the project is to be paid to the proper State official. The Secretary of Agriculture is given authority in his discretion to make partial payments as the work progresses, but not in excess of the Federal Government's pro rata share of the labor and material which have been actually put into constructive work, nor in excess of $10,000 per mile, exclusive of the cost of bridges of more than 20 feet clear span. All construction work is subject to the inspection and approval of the Secretary of Agriculture.

States Charged with Maintenance

The various States securing aid under the provisions of the Act are chaged with the making of needed repairs and the preservation of a reasonably smooth surface, considering the type of the road, but are not obligated to make extraordinary repairs or undertake reconstruction. If, after due notice, a State fails to maintain a federally aided road properly, the Secretary is required to refuse further aid until the road has been properly repaired at State expense.

$10,000,000 for Roads and Trails in the National Forests

The sum of $10,000,000 is made available in yearly appropriations of $1,000,000 for the co-operative construction and maintenance of roads and trails within the National forests by the United States, States, Territories, or counties in which the forests lie. Expenditures for this purpose are not to exceed ten per cent of the value of the timber and forage resources available for income upon the National forests where the roads or trails are constructed. Beginning with the next fiscal year after an agreement is made between the Secretary of Agriculture and a State, Territory, or county for the co-operative construction of such roads, ten per cent of all revenues from such forest are to be applied toward reimbursing the U. S. Government for funds expended in road work until the whole amount advanced shall have been returned.

The objects sought through federal aid to roads in the National Forests are thus explained by the Secretary of Agriculture in his annual report for 1915 in which he recommends such legislation as well as federal aid to rural post roads:

"The real agricultural problem within and near the Forests is to make possible the successful occupancy and development of the lands that already have been opened to entry or actually patented. The mere private ownership of land does not insure successful use of it. In Oregon and Washington alone there are about 3,000,000 acres of logged-off land, much of it agricultural in character, now lying idle. In this condition speculative holding of the land for higher prices plays a large part. Another cause is the lack of transportation facilities. A settler may clear land and raise crops upon it, but he is helpless if he can not market them. There are great areas of fertile land unused today on this account. In many sections near the National Forests pioneer conditions still exist. The population is small and the task of road building is beyond the means of the residents. There is little or no demand for timber and the receipts from the Forests which go to he community are small. The fact that the public property is not subject to taxation makes such communities feel, and very justly, that the Forests are not contributing enough to local development."

BUMPER GRAIN CROPS
GOOD MARKETS — HIGH PRICES

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. **There is no war tax on land and no conscription.** Send for illustrated pamphlet and ask for reduced railway rates, information as to best location, etc. Address

Canadian Government Agent.

No passports are necessary to enter Canada

LYON'S PRACTICAL FARM PAPERS

As I write at 4:45 P. M., July 13, the rain is coming down in torrents, the first rain in twenty-two days. Our hay was later than in years owing to the cold, wet, June, but from July 3 to 8 inclusive, we put in twenty tons without a drop of rain on it, and with little or no damage from sunburn.

Just about half is medium red clover, more than half the rest clover and timothy, the balance being pure timothy, this being the last put in.

We cut of mornings from about 8:30 to 11:00 o'clock, raked after dinner and hauled to the barn at once, excepting in the case of some very heavy clover and a poor day for curing, this part being put into shocks of about 150 pounds on the afternoon of the day it was cut, and hauled in the next afternoon.

Our hay is all handled in the good old style way, with pitchforks, and we are just as careful about distributing and tramping it evenly in the mow, as if we were building stacks to stand rain. The mows are 13x13 feet and 18 feet deep, three of them side by side, the tops being filled from the tops of the loads, and the even distribution and packing of the hay w prevent uneven heating, too much in some spots and not enough in others.

Of course being put up green as it was, there is found to be some heat developed, but the finest clover and alfalfa hay I ever had, came from mows that got so hot I was almost afraid they would set the barn on fire.

Yesterday morning when I was gone to the station with the cream can, a neighbor came in to tell me that his clover hay had got hot and that he had dug an alley through it with forks, the very thing he should not have done as that hay will mold, and if he had let it alone it would not have done so.

When I had my first acre of alfalfa, one spring it kept raining all the time and I feared that I was going to lose the crop.

Remembering a talk with Professor Ten Eyck, in which he told me of curing alfalfa under very unfavorable conditions, one morning when the sun was shining but the earth still very wet, I cut that alfalfa, two boys following with forks and shaking it up.

This shaking was done twice between 9 A. M. and 2 P. M., when the alfalfa, still about as green as it ever was, was sledded into the barn and pitched into a 13x13 foot mow, evenly spread but not tramped at all.

It got hot and very hot, but I think that it made the finest hay I ever saw, and I have seen some alfalfa hay by thousands of tons.

Right across the valley, on grandfathers' old home farm, there lies in this soaking rain about five acres of mixed timothy-clover hay, cut yesterday morning, and not thought by the tenant on the farm to be cured enough to go up.

Last year the same tenant lost six acres of good hay in exactly the same manner, and it did not teach him any thing.

I may say that our pure timothy, and part of the mixed hay, will be baled and sold, as timothy hay is very scarce here and it is sure to bring a good price, enough at least to buy a ton of 15 per cent phosphoric acid fertilizer for each ton of hay, and that is more value than I can get out of timothy by feeding it.

With us, on our rolling lands, corn cultivation has been an easy matter this year, as the rains did not prevent us working it out well early, and it is early corn cultivation that counts, but on the flat lands a few miles north, and in the river bottoms south, a great deal of corn got very weedy, and the close work necessary to get the weeds out after the rains were over, has damaged the crop badly.

Wheat is a practical failure. I sowed eight acres and cut about 50 bushels, neighbor on the west twenty acres, cut 60 bushels, neighbor on the north, sixteen acres, cut about 50 bushels, neighbor on the east, twelve acres, cut about 60 bushels, and neighbor on the south, eighteen acres of the best wheat land near, will have perhaps 175 bushels.

Rye was good, and as it is selling about as high as wheat, much wheat land will be sown to rye. I do not like the rye crop on account of its being mean to handle, but it has several points in its favor, these being some of them; it may be sown earlier or later than wheat, it will produce more bushels per acre on thin soil, it can be cut earlier, or will stand late cutting better than wheat, it is not subject to fly damage, it requires less seed per acre, it does not need as much fertilizer, and it does not freeze out as badly as wheat does. C. D. Lyon.

Whitwash Mixture

For general use about the farm buildings to assist in destroying insects, the following recipe for whitewash is offered by the College of Agriculture: Slake 5 quarts of lime with hot water to about the consistency of cream. To this add 1 pint of zenoleum or some other coal tar product, and one quart of kerosene. Dilute with about its volume of water; apply with a brush or a pump. This solution when properly applied accomplishes three things: (1) Zenoleum acts as a disinfectant by killing disease germ (2) the kerosene aids in destroying mites; and (3) the lime whitens the house.

The Missouri Farmer

VOLUME VIII AUGUST 1, 1916 NUMBER 15

Saving the Small Grain Crops

BY W. L. NELSON

Reports show that a considerable per cent of the 1916 Missouri wheat crop is being stacked. This is due in part to the feeling that present prices are too low and that with a decreased yield prices should advance unless affected adversely by the European war.

Early plowing and thorough turning under of all stubble and volunteer wheat are important in the fight against the Hessian fly. It is not enough that wheat be seeded late; the stubble must be turned under early. This is the prime reason for stacking. The farmer with his wheat in the stack can time his threshing to suit his convenience. Only the farmer and the farmer's wife can appreciate just what this means. First of all, it simplifies the labor problem. Threshing from the stack saves the labor of eight or ten men, and even if as much help were required it would be easier to secure after the rush of shock threshing was over. Most threshing, at least in the corn belt states, means "swapping work," as in many communities it is practically impossible to hire help. When three or four machines are operating in the same neighborhood it can be seen how complicated the situation becomes. If by stacking, the farmer can, by giving a little more of his own time and that of his regularly employed help, dispense with several men at threshing time he has saved the housewife some of the work of cooking for threshers and also made it possible to get the help needed to "keep the separator singing" and the wagons going to market or granary. Wheat threshed from well-built stacks is better in quality. It grades higher, having good color and weight. The straw, too, is bright and fine.

Stacked Grain Should be Insured

One disadvantage in stacking is in danger from fire, especially from fire caused by lightning. For this reason a large number of stacks should not be grouped too close together. Where insurance can be carried in a farmers' mutual fire insurance company, it is a good plan to take out a short-time policy.

Opinions differ as to shape and suitable dimensions for stack or rick (the round stacking being generally in favor), but all good stackers are agreed that the foundation is of prime importance. But before foundation comes site. The location of the stackyard should be on well drained, yet level, ground and on that part of the farm where it will be most convenient to have the wheat stacked. The one exception to the latter consideration is where all the straw is to be baled. In this event the length and kind of haul to shed, barn or market should be considered.

In building the foundation, which may be of straw or timber, the object is to prevent the absorption of water. Some recommend a foundation of poles or scantling placed on logs so that the base of the stack will be eight or ten inches above ground to insure free circulation of air under the stack. The air prevents dampness. A common plan in Missouri and other states where rail fences once were plentiful is to use rails for a foundation. For an ordinary stack three 10-foot rails are placed on the ground about four and one-half feet apart and on top of these ten or twelve rails are placed crosswise. For a rick, the foundation consists of two such squares. Four stacks or ricks may be grouped for convenience. Leave space for separator between stacks, so that the pitchers in getting the bundles to the self-feeder will not have to pitch a great distance. Plan to do away with all unnecessary labor.

The way stacking is done in New South Wales. A fine job of stacking.

Methods of Stacking

In starting a stack or rick methods differ. One plan is to set up bundles for foundation just as for a shock in the field. The outside course is then started by placing butts so that they extend a little beyond the outer rail. Then follows the second course with the bundles so placed that they come to the band of the outside course. This plan is continued until the middle of the stack is reached. Speaking of the middle, as every good stacker well knows, the center should be kept full and well tramped so as to prevent the finished stack from taking water. It is desirable to have the outer edge of the stack settle more than the center so that the outside straws will pitch down and out. Where this is done, no rain can enter the stack as to do so the water would have to run upward. On this point Chris Smith, of Cooper County, who follows this plan, says, "Where the science in stacking comes in is always keeping the middle solid and full so the bundles will be sure to slope, yet not enough to cause a slide. In stack building I always 'carry,' or lay, two courses at a time and never 'knee' on the outside course, as I want to leave this loose so it will settle most. This is equivalent to tramping the center more. When I complete the outer and second courses, I take but one course at a time. I always 'knee' or walk on these courses and am careful to lap the bundles to the band."

Another rule for starting a stack is to begin at the outside, placing a row of sheaves completely around the pen, packed as closely as possible with the butts against the inner side of the pen. When one course is finished, begin a second by placing the butts of the sheaves about one-third the distance between the butts of the firs' layer and the twine, breaking the joints all the way around. Keep this up until the floor is entirely covered. When the pen is full go to the outside and lay a row on top of the timbers, projecting a few inches over. Keep the butts of the sheaves as nearly even as possible. Begin the next row as previously described, breaking joints and always working toward the middle of the stack. Each outer row should be projected over the one on which it is placed until a height of five or six feet is obtained. By this time, in a well-built stack, the diameter is probably three or four feet greater than at the base, or if a rick it is from three to five feet wider at the eaves than base. A full and solid center has a tendency to cause the stack to spring outward, and this should be taken into consideration. As the ends spring more than the sides, a good plan is to every now and then build an extra row of sheaves across the ends and around the corners. This keeps the ends as high as the sides when the rick settles and prevents it from being "stoop shouldered." The main object in the bulge of rick or stack is to cause all water that falls on the "roof" to fall clear of sides and foundation.

As the stack goes up it is a good plan to walk over it after each round, so as to see that it is level and that there are no "cuppy" places to catch water.

Now as to "drawing in," the common rule is to turn the slant side of the bundles up, or in other words, so that the long sides of the butts are at the bottom. Keep the cap bundles for the inside instead of placing them on the outside row where they would leave a hole. The last few tiers of the body would be kept extra full in the middle before beginning the roof, which should be so built as to have an angle of about 45 degrees when settled.

Some stackers, once the stack is fairly started, handle practically all the bundles with a fork. Where there is no danger from rain some stackers prefer, however, to allow a day's time for the stack to settle before putting on the last load.

How Some Farmers Do It

"For topping out a stack," says Mr. Smith, "I save a dozen or more cap bundles as it is much easier to finish with these than a round bundle. In the ridge bundles I put sticks three or four feet long so the wind cannot blow the top off."

The following method for stacking wheat is recommended by John Klingele of Audrian County, Missouri:

"A wheat stack ought to have a bottom of rails, or a layer of straw or damaged hay, as everybody knows. I merely mention it, as this gives us the exact start. Make your bottom three common steps broad for a rick, and not longer than six. For a round stack, rails 10 feet long make a good bottom, leaving the corners exposed. This may not seem important, but once you get used to it you get all stacks and ricks of a uniform height.

"If you make no other bottom, place four bundles at each corner, grain facing outward, three by three steps for a stack or three by five or six steps for a rick. (Round stacks are safer for a beginner.) Then make a shock in the center and continue around, ex-

Stacks built by John Klingele, a veteran Missouri stack builder.

posing not more than two bands on bottom, till you have your bottom laid. Be sure you get it as you want it, especially in a rick where you must have a straight line, for if you have any dents in it your rick will not stand well. Have the bottom right and start a little to the right of the lowest place, if there is any.

"Place the bundles alternately, but not right flat, one on another; they lay better. Get on them with your right knee, keep your outline straight. Keep this up for three or four rounds, putting as many bundles as may look well inside, but not too many. This makes your outside hard and solid. Now get on your stack with your fork. First walk over your stack on the outside. You must be able to walk with your left foot on the outside band. At least, the inside should be straightened out and walked down. It should appear to you lower than the outside if moderately walked down, does not need to be solid, just so it binds.

"After I have a stack this far I use a fork, till the last two or three dozen bundles, so I can only give it to you this way.

"Have the pitcher put the bundles on the center of the stack between you and him, and you will never have to take your left foot off the outside. This is important. In using a fork you will get so you can place the bundles from a distance and not get the outside solid enough in the bottom. Keep this up for four or five layers, place refuse bundles on the inside layers as you go around. Inside butts must not overlap too much. After every completed round walk all over your stack, see that it is level and stays that way. Never begin a layer in a low place. Start to the right of it and level up as you complete the round. It will hold better, as you have a counterweight on the outer side. Carry your stack up perpendicularly six feet or more in soft stuff. Have the outside solid and the center filled so it binds very well. Then commence building. Turn the slant side down and get on a second bundle first round and on the third layer as you get higher. All this time fill your center more by placing one bundle forward between the next two and putting another one next to you. You will soon get so you can bulge and bind anything that is not too short and dry. Bulge from four to six layers. If the stack develops soft places, prop, level up, fill center and draw to a head. You will not have to do this often, as you will soon learn how to do better. If you have no trouble with your stack, don't invite any. After bulging four to six layers, you will, by standing on the third bundles, be straight above your bottom outline and, even if the stack would stand, it is time to draw to a top, else it would get too high.

"Be sure your stack is level or even in outline. Fill in extra in center and don't leave any low places. I get a stack at this stage so that a little extra would make it turn a common rain. Now start to draw your stack to a top by putting the slant side of the bundles upward. This is generally the off side of the knot and has a better face. Don't put out too far at first drop. Push out a little if needed, it all goes at one move. Always cover half the stack as you go or at least three layers of bundles. Place both layers next outside shingle fashion. The stack will not seem so easy and the water must get on the outside of the bundles and can not run like in a valley.

"On a stack like this you never step in a hole. After you start to draw to a top, place your bundles straight, lay as above stated, stay on the third layer as the outside does not need to be so solid. It will get solid by settling and rain, the inside being solid and the bottom on outside solid, so as to make an even setting and be sheltered by the bulge. If you study this over you will see that it can not take water, and the reason for building it just this way.

"I have a medium long-handled fork, and by placing the fork prongs turned downward on the edge of outside bundles and standing on the third bundle toward center, holding fork in left hand, arm at full length down and outward, and the butt end of handle in right hand at right shoulder, I have an ever ready gauge that enables me to draw every stack or rick back, or to a top, as evenly as a roof, one like another, in height and shape. I am five feet ten inches high and left-handed, a right-handed man must go from right to left, if he wants to use a fork. If your first stacks don't have pitch enough, pull out one layer of bundles below bulge. Have your boys, fork in hand, get on the bulge and walk all around the stack. That will make the butts slant down."

Some well built stacks put up by Frank Heim, Barton County, Missouri.

SOME WHEAT ON EVERY FARM

By William D. McKee, farmer and institute lecturer, Polo, Missouri.

The yield of wheat in Missouri of a normal year is somewhere between 25 and 45 million bushels—60 millons maximum. The total would boom if some wheat were sown on every Missouri farm every year.

The quantity could be materially increased—not solely in increase in the acreage—not by those who are already growing this important cereal—but by farmers who are not growing wheat at all, by growing a small acreage, or as much as would fit into their crop rotation, in a wise and judicious way, on every Missouri farm.

It is true that much of Missouri soil is not adapted to the growing of wheat in the way and to the extent of much of the land in the favorite wheat growing districts—and in some ways I am proud it is not, for if it were, there would be almost an irresistible temptation, such as exist in those sections, to grow "wheat after wheat" to the great injury of the soil.

We cannot always figure on the immediate or direct returns of a crop like wheat in deciding to grow or not to grow it. When we plant an orchard we do not expect to gather fruit the next year, or the year after the next, but with patience, coupled with faithful industry, we await the coming of the reward. So it is, in a way, with our wheat growing.

If the sale of the grain alone was our only reward, wheat growing in Missouri would have a narrow and tottering fundation upon which to stand in most sections of the state.

The agricultural papers, the State Board of Agriculture, the Agricultural College, the Farmers' Institute lecturers, and the experiment stations, all, with one accord, are of the same mind and speak the same things when they recommend and insist that each and every farmer should plan and provide a sane, sound, and intelligent crop rotation. Now, it happens that Missouri soil conditions are such that the wheat crop helps very nicely to make it possible to provide this crop rotation. The best judges of the best farm practices in Missouri urge that the fertility of the soil be maintained. Barnyard manure stands at the head of the list, when it comes to accomplishing this task. Here is one place your wheat straw shines—it can be used for bedding—much bedding, much manure—more vegetable matter to be returned to the fields to help to keep up the humus content of the soil. Again, this being an age of silos and alfalfa in Missouri agriculture, the wheat straw can be utilized in a more profitable way in feeding live stock, than ever before. Hence, speaking in the parlance of the great packing houses and factories, this is a by-product, and constitutes an avenue of profit in wheat growing aside from the grain alone.

Again, there is not a better nurse crop for clover than the wheat plant. Clover can be sown in January or better still drill in the wheat after it has started to grow in the spring in the North part of the state and after the danger of late freezes in other parts of the state, thus securing a catch of this valuable crop and at the same time enjoying a return from the land.

At the time wheat is sown the bacteria in the soil are active and busily engaged in liberating plant food. This can be used by the wheat plant at once, while otherwise it might be carried by leaching, caused by heavy soaking fall rains, into the lower strata of the soil.

It will perform another, and perhaps the most important service of all, it will provide a cover crop—and its millions or rootlets will help to bind the soil particles together and prevent the soluble component parts of the soil from "washing into the wasting sea."

Go out upon your farms in broad daylight, as I have pleaded with the farmers all over this state, in the rolling portions especially, to do, and when you have counted and recorded the number of ravines and ditches that have been made by the cutting power of water falling on an unprotected soil since it was plowed—as a newground filled with stumps and roots, or, as a virgin prairie soil—and answer for yourself if this last mentioned reason why every man should make the wheat crop in Missouri a part and parcel of his crop rotation, is or is not well founded. I say it is—and so do you.

The wheat crop, if unwisely handled may multiply innumerable weeds and insect pests, but if wisely managed it can be used as an effective weapon to combat the noxious weeds and destructive insect pests.

It may be said that the wheat prices are not always satisfactory. Here, again, on account of the wide and almost unlimited domain in which the farmer operates, he is not compelled to put his wheat on a low and unremunerative market. He can feed it to well bred farm animals of all kinds, especially hogs, if the market proves very low. This I have done, time and time again, both to my own individual profit and to the good and betterment of my land.

The land must be prepared and the seed rightly planted, in wheat growing, the same as any other field crop. There are exceptional seasons when a disc and a drill may be all the implements necessary—but note, I say, this is the exception and not the rule—and I would rather rely upon the rule than the exception.

If it could be done—I say, if you can find the time, and the soil conditions are right, plow early—the earlier the better. The wheat plant is one that always requires a fine, firm seed bed—with plenty of emphasis on the qualifying adjective, "firm." By early plowing you give the furrow slice time and opportunity to settle and the proper relationship between the furrow slice and the subsoil to take place, which is of great importance in successful wheat growing. If you can plow good and early—then plow deep—8 inches if you want to, and have the horse power to so do. If you can't plow early, disc your ground—both ways will be the better. Then you may do more shallow plowing. You can with a disc and harrow and roller, compact a shallow furrow slice much better than a deep one plowed late.

Each neighborhood has discovered by long years of experience the variety and the quantity to sow per acre, so rules will not be offered along the lines of seed selection and quantities to sow. You can best choose the variety, based on local experiences. Use the wheat fan, and sow the heavy plump seeds and treat for the smuts, always.

Now, there is no better way to plant your wheat than with a drill, but do not neglect to sow broadcast, if you cannot procure a drill, for large yields of fine wheat have been grown by the old hand-slinging, broad-casting method. The drill is the only truly modern method, and pays best, but do not give up because you find drilling beyond your power. If you positively cannot secure a drill, sow broadcast as in pioneer days.

Just as soon as you have plowed, or better while you are plowing, disc and roll to fine, firm and pack your seed bed.

When the time comes, after all reasonable danger from Hessian fly troubles are past, then sow. The time of sowing will be controlled by the part of the state in which you are growing wheat. October 15th is considered always sure from the Hessian fly in North Missouri, in a normal season.

If you drill, and your soil is a strong clay soil, I suggest, not advise, but suggest, that you do not follow drill with a harrow or any smoothing implement, if the clods be small and not chunky.

These clods, have already been brought to the surface by disking and harrowing. Your litle grains of wheat are deposited in the fine, firm soil and will grow—the clods will hold the snow, and this snow will protect your wheat. Next spring the hard beating

rains will not then glaze the surface of your land, causing cracks to form allowing moisture to escape from these cracks—but, instead of reducing the yields of your crop, these same beating rains will melt or pulverize those clods, create a mulch and every time help and not injure the wheat plants.

BETTER ROADS IN NEAR FUTURE

The last ten years has been an era of road agitation and some progress in road work and the next ten years according to present prospects will be an era of great road construction. Congress has passed the good roads bill which appropriates $75,000,000 to be used to aid the states in road work within the next five years. For the fiscal year ending June 30, 1917 there will be available $5,000,000, and for the following four years there will be ten, fifteen, twenty and twenty-five millions respectively. The money is to be apportioned to the 48 states on the basis of area, population and mileage of rural delivery routes and star routes. Missouri will be fifth under this plan, the states of Texas, New York, Pennsylvania and Illinois in the order named will get more money than Missouri. The amount apportioned to this state for this year is $169,720.41.

The state must expend an equal amount and the money can be used only for construction and can not be used for repairs.

In the language of the bill "the Secretary of Agriculture is authorized to co-operate with the states, through their respective state highway departments, in the construction of rural post roads." Rural post roads are "construed to mean any public road over which the United States mails now are or may hereafter be transported, excluding every street and road in a place having a population, as shown by the last available census, of two thousand five hundred or more, except that portion of any such street or road along which the houses average more than two hundred feet apart."

The Act provides that not more than three per cent of the money may be used for administrative purposes. The plans for roads are to be submitted to the Secretary of Agriculture by the highway department and only projects approved by the Secretary can be ordered paid for out of this fund. The State must provide for the maintenance of such roads and if it fails to do so the Secretary shall refuse further appropriations.

Thus it will be seen that the kind of roads to be built and the general policy rests largely with the state highway department, but the Legislature may control this to a certain extent in any act it may pass accepting the Government appropriation. We think an important item would be to require any community where a road is to be built to pay at least one half the cost of construction.

A great opportunity faces the people of Missouri who want to get out of the mud. In the first place very much depends upon our state highway commission. If that department will plan a system of roads fair to all the people of the state and eliminate graft and political favoritism. Missouri can soon have a road system that every citizen will take pride in supporting. Why not require the people who live along any line of road to be improved to put up as many dollars as the State and Government puts up? Surely any community would be getting more than a fair deal if one-half the money for a good road is paid to them by the state and Federal Government. Under this arrangement we would have $678,881.64 available this year and double the amount next year and about five times that amount or nearly $3,500,000 for the fifth year. No doubt after five years if the work is well done the people of the state both town and country will realize the benefits from good roads to such an extent that a much greater sum can be secured to continue the improvement. The expenditure of this amount will have a good effect on the business of the state and particularly on any community where the road work is going on. Nearly all this expenditure will be for labor and material and very little of it will leave the community.

In this connection why not have the next Legislature of Missouri submit a proposition authorizing a bond issue of several million dollars to take up road improvement in a general way. A bond issue of $20,000,000 or $25,000,000 divided ito four or five series with one series available each year would give Missouri a great start in road building. This amount supplemented by the Federal funds and by the money put up by local commuities would build a great many miles of roads annually and being made available yearly there ought to be little danger of mismanagement.

The interest on these bonds can be paid by the money received from automobile licenses and a levy so small that we would scarcely notice it would retire the bonds in a few years.

Think about this proposition Mr. Farmer and if it appeals to you take the matter up with your member of the Legislature immediately after the election in November. What other public improvement can you suggest which will so nearly help every individual in the state as the building of better roads?

A TRIBUTE TO MISSOURI G-R-I-T —GRIT!

By Jewell Mayes

It is not catalogued in the mining reports, it is not indexed in the crop reviews, it is not listed in the factory bulletins—Missouri G-r-i-t Grit!

Without Grit, human life in Missouri is flat and without delight, lonely and stale—with Grit, ambition rules and life becomes the Dreamland Castle of Purpose.

It is common for speakers and writers to labor to seek to show the origin of the causes of the varied conditions in nature's kingdom, and to especially discourse on the forces leading directly to success in life—and we are a unit in our undimmed desire to find a short-cut across the twin-table-land of Fate and Hope!

Few are the worthy things in life that cost us nothing, and much of life with its position, honor and fame, is bought with a price—and that price is Missouri Grit and Get-up and Get!

Next to origin, comes the longing for unearned bliss. You may aspire to this or to that, yet what you desire should be reasonable. Whether you are hoping for a place which you think you deserve, or whether your ambition is yet to make ready for life by higher education, still the great question is: "What is it worth?"

Let us see what some things cost. For everything you dare to invest there is return of some kind. While we should ask no garland sought beyond the tide, yet we should venture out far enough to gather in a floating life-belt or lose a leg a la shark. Most things are worth more to us than they cost—"The noblest service comes from nameless hands and the best servant does his work unseen!"

Coming down to a "hoss and hoss" proposition, are we willingly demonstrating pride in shooting the only gun within our means, a target rifle, instead of lingering in the gloaming longing for a Schneider "75" millimetre rapid-firer? Are we mustering up enough personal Grit to brighten the little corner where we are while hankering and hungering for the spotlight of fame instead of hanging one's head in shame and indirection? Are we earning better "luck"?—are we? Are we industriously doing our "dead level best" and trusting to Providence to do the rest?

If we will dare to act unselfishly each day, as some one has said, "Out of the rough stones in the daily walks of life we may build a beautiful temple that will shield us from all harm and will invoke the Blessings of Almighty Himself". Providence seems to most cordially assist those people who help themselves.

The earliest principles of liberty in Europe; all successes in military combat; all the reforms in church, and in state; the first, and the latest sucesses in our own land, have been purchased with that wonderful coin—"Effort", milled out by Grit!

What is not worth risking if not worth having. An earnest endeavor is commendable, whether it be the purchase of national fame or whether it be the whole-souled effort of a hungry child laboring to earn money to buy an already needed supper for a sick mother. The great national opportunities are seldom—but the battle with poverty and hunger is fought daily by thousands in our own country. Great is the heroism in common life. Virtue merits respect, even in a beggar's garb. There are as many noble hearts in the breasts of neglected waifs as are to be found beneath the gold-laced coats of an equal number of military heroes.

How many men and women that have dared to die wihout the applause of men? Long is the list of those who dared to risk life and fortune. Wonderful is the glory due and yet untendered in the every-day battles of life. Many a mother struggling for food for her fatherless little ones merits the Carnegie medal a thousand times more than the excited soul that does a daring deed in the impulse of the moment and lives the life of a cringing coward ever afterward. Blessed are the heroes and heroines in these every-day battles of life and love. Harder than the African diamond is the Grit of the Missouri mother who faces the struggle of world undefended—heaven alone may cheer her rayless days, and only beyond the Uncharted Sea will the cost be known and justly acknowledged—Grit and Grace united accomplishes what the world never suspects possible in the human tragedy of sickness of soul through the sweetness of sacrifice!

Among three and a half millions of our people there are multitudes of daily deeds of daring nobler far in everyday life than have ever graced the books of chivalry and fame—and too high a tribute cannot be bestowed on Missouri Grit!

Several hundred Farm Clubs have been organized in response to the appeals made by THE FARMER and they have already saved their members a great deal of money. Why not organize a Farm Club in your school district?

Engineering the Telephone

THE great Bell System, with its telephone highways connecting the farthest points of the country, is primarily a brain creation.

The telephone engineer is the genius of communication. Like the general of an army, he plans, projects and directs his campaigns far ahead. He deals with the seemingly impossible — transforming ideas and ideals into concrete facts.

His problems may involve doubling the capacity of a city's underground telephone system, or the building of a transcontinental line, or a serious war-shortage of supplies needed in telephone work.

Whatever the difficulties, they must be overcome so that the progress of the telephone shall continue equal to the ever-growing needs of the people.

It is not enough to provide only for the present—the future must be anticipated and discounted.

In the Bell System, more than two thousand highly efficient engineers and scientists are constantly working on the complex problems of the telephone business.

As a result, the service keeps step with present requirements and the assurance is given to every subscriber that the Bell System is prepared for whatever the future develops.

THE STORY OF AN OLD FARM

By C. D. Lyon

(Editorial Note: We think 100 years continuous cultivation a pretty fair test of any system of farming and so when our regular contributor Mr. S. M. Jordan, after visiting the farm of C. D. Lyon in southern Ohio, about a year ago wrote The Missouri Farmer, "It was interesting to know that while his (Lyon's) farm has been in cultivation for over one-hundred years, there is no 'worn out land' on it. Yet the hills are so steep that I would not know how to go about it to farm them. That part of the country sure stands on edge. His system has and is producing gratifying results," we thought the story of how this farm has been maintained would make valuable reading for Missouri farmers. Mr. Lyon has promised to tell this story in three or four papers in The Missouri Farmer and if any of our readers are interested enough to discuss Mr. Lyon's methods as we progress or after he has finished we will be very glad to have them do so. If you have a question to ask to bring out anything not made clear to you do not hesitate to ask it.)

NUMBER II

When father came into possession of the farm in 1851, it consisted of 87 acres of land, and was practically divided into four fields, which may be described as; No. 1, north field, 16 acres, No. 2, point field, 13 acres, No. 3, west field, 14 acres, No. 4, south field, 14 acres; or 57 acres of cleared land, and 20 acres more or less of woodland.

It may be explained that the house, barn, orchard, garden and 4 acres of cleared new land, were on a 7 acre tract at the south end of the farm, this and a tract having been bought by father from a neighbor, the other 9 acres of the present 103, having been added since, 5 by father, 4 by myself.

The farm had been used since 1832 as a hay and pasture farm, timothy meadows cut as long as they produced hay enough to pay for cutting and the hay hauled to the main farm. After hay harvest the sheep and young cattle from the main farm were brought over and kept here until winter, and when a field in meadow "ran out," it was rented to some one for wheat at $3 per acre. The renter seeding it back to timothy.

Hence it may be seen, that for fully fifty years the farm had been skinned, and while it was all originally strong clay loam soil, in 1851 the loam had been pretty well worked out of a great deal of it, and the clay predominated.

The point field had suffered most, for as its name indicates, it is composed of five points or ridges sloping to the east, with four draws or ravines dividing it.

One of these draws was naturally too deep to cross with team, the other three had been allowed to wash out, in some places six feet deep, several bad gullies had been made where stock made paths in going to water, and while the field was originally one of the best, it was many years before it was all brought back.

The north and west fields were in better condition, as there is but little land in either of them subject to washing, yet the north field has a few acres of naturally second rate land in it, and this had run down until it would not produce good briars.

Some seventeen years ago, a relative was visiting us in August, and came out where I was mowing the weeds and briars on this thin land, which had begun to improve in fertility and he advised me to let it grow up to locust timber, yet during the first days of July this year, I cut two tons of clover hay per acre from this very land.

Father did some fruit growing for the first twenty years he owned the farm, this and the few acres of new land enabling him to keep his family, and it also permitted him to maintain a good part of the farm in grass, clover being always sown to follow small grain crops.

This brings us down to the early 70's, and about this time a systematic crop rotation began to be practiced, one crop of corn, a crop of small grain, one year in clover, but some timothy always sown with the clover, a year of timothy-clover, then corn again.

In 1876, we used our first commercial fertilizer on the four acres of tobacco crop, and in 1878, reasoning that if the fertilizer made an increase of 50 per cent in the tobacco crop it would enable us to grow better small grain, we began its use on wheat, 120 pounds per acre mixed with the wheat and drilled in.

Our first experience in this line was favorable; it not only gave us a much better wheat crop but the grass and clover was 20 to 50 per cent better than on unfertilized land.

It was in 1874, I think, that we began to go over all the uncultivated fields with mowing machines clipping not only the wheat stubble, and the young clover, but also the pasture fields, setting the mower bar low on the wheat stubble, and high on the pastures.

Very often the growth was so heavy in the rich spots of the fields, that when mowed it threatened to kill out the grass and clover, and I have hauled many a load of this weed and grass crop from the lower rich spots to the almost bare clay points, "Robbing Peter to pay Paul" we might say but always with satisfactory results.

It has never been our policy to sell hay, and we never did so unless it brought a high price, the same being true of the corn crop, both corn and hay being fed out upon the farm. If the barns and stacks had enough hay to promise rough feed for the coming year, we have often permitted good fields of mixed timothy-clover to go down on the land, of course mowing the crop down.

Indeed in the period of the most rapid increase of soil fertility on this old farm, or between 1890 and 1916, many a year we did not make any grass hay at all, depending upon the three acres of alfalfa 1903-1911, a few acres of clover hay in good clover hay seasons, and a few years no hay at all, corn stover being the entire forage crop.

In the next article of this series, I want to take up the subject of farm manuring as practiced by us for fifty years.

HOW TO HAVE BETTER ROADS

Thirty years ago my attention was called to the earth-road problem. Twenty years ago I began to drag the road. I bring you the fruit of those years of study, experiment and experience.

I came to the farm from the city, fresh from school with no practical farm knowledge. My mind was open and unbiased. It contained no prejudices or preferences. I was anxious to learn. With three miles of muddy road between my farm home and the station in Maitland, I had reason for my study and plenty of material convenient on which to practice. I began with an ax and a spade and worked the road in the good old way for a number of years.

Finally the split-log drag was discovered. The fame of the split-log drag has spread around the world. It is known and used in every civilized land; and also in places not so advanced, for President H. J. Waters found a beautifully dragged earth street in a village of tree dwellers in the Philippines. Therefore I need make no plea for it here.

To do the best work one must have the most perfect tools. A drag built according to the proper plan is strong but light. It has a substantial removable platform with narrow spaces between the boards. The chain is attached properly and the iron blade extends only half the length of the front slab.

Almost as important as the style of the drag is the condition of the soil. The proper moment for dragging comes at varying periods with varying soils. The road should be dragged after every rain or storm, but not too soon; nor should one wait too long a time. Drag when it is neither muddy nor dry; moist enough to mash, but dry enough not to stick. Don't wait too long, but if you find your drag clogging, wait a little longer next time.

When to Drag

Just a hint: In my experience I find that those draggings which are done when the road really does not need to be dragged are the most profitable. Drag after showers if you wish a glass-smooth roadway. By dragging after each of two consecutive showers one can produce a finish that will not be approached by even four or five consecutive draggings following a two days' storm. The excellence for driving and the delightful appearance of the shower-dragged road is not so profitable as is the power it gives the road to withstand the wet and travel that comes during and immediately following the next storm. Winter dragging, too, is of great value. Try it. Like shower-dragging, its value lies largely in the increased resistance given.

Different sections of roads usually require different treatment, and different effects are produced by shifting the snatch link on the draught chain and by changing one's position on the drag. By shifting the link well over to the ditch end and standing with one's weight on one foot right out at the ditch end of the front slab, one may turn a furrow almost like a plow. I mention only one foot; the other foot should rest as far back as one can reach, so it may be ready to catch the drag if the drag starts to tip over. Drive slowly and you will have time to stop it. When manipulated thus, a good drag, with plenty of power in front of it and sufficient weight on top of it, will roll out the dirt like an eight-horse road machine. Surely it can be done; but don't do it. Rather be satisfied to move a small amount of earth at each dragging, and thus build a solid road.

Keep the travel in the middle. Develop a crown slowly, and never put on at one time enough dirt to drive the travel to one side. Never break the hard, tough crust that covers every traveled wagon-way. The hard crust in the center of the wagon road is a most valuable good-road asset; and any man who breaks that crust into pieces or covers it with eight or eighteen inches of loose dirt commits a crime against the community, and the day is not far distant when he will be fined or thrown into jail.

The King drag is a pioneer in building dirt roads, as well as a maintainer of roads already built. Coupled with farm tools, it is the best and cheapest all-round road-working implement ever discovered. It is a beginner and a finisher. No other tool has been found that will leave a finer surface than the double-slab split-log drag. Go home and build one. No matter how bad your road may be, build a drag and try the formula I have here for you.

There are those who say the drag and a plow can not produce a worthwhile effect on an unimproved road. But there also are men who will not agree to that statement. There are men in my home township who will not agree to it, and in my home county are many more. Others of like mind may be found scattered over many states.

Listen to a neighbor of mine, C. T. Graves, the well-known Jersey judge and breeder, who says: "With a King drag and a plow a determined man can improve any piece of dirt road, no matter how long it has been neglected."

Next hear our probate judge, David Porter, of Mound City, who lives in a township adjoining mine: "We did more and better work with a King model drag than we did in twice the time with the road machine."

Still another from Holt county, A. A. Jeffries, of Forest City: "My three neighbors and I built a quarter of a mile of road with King drags and farm implements. In places a bank at one side was six feet high. It is astonishing how fast dirt can be moved over with drags and plows."

During an address in Rochester, Mo., a few days ago, I asked Judge C. E. Caldwell if with a drag and plow he could fill the middle of a road that is low in the center. He answered, "Sure." Then I asked others who could do so to raise their hands. Then I remarked, "We have a man at Washington who says the drag won't do any good on a neglected road." Instantly a man on a front seat ejaculated, "He must be crazy." This was N. H. Martin, who was a member of the committee in Rochester, and seemed to voice the opinion of the audience.

Formula for Road Building with a King Drag and a Plow

Build a King drag according to instructions. Hitch the team to the drag as directed, so that the drag will follow the team at an angle of about 45 degrees. Drive with one horse on each side of the wheel track to your neighbor's gate towards town, and come home over the other wheel track, smoothing the road and moving a small amount of earth toward the middle.

After the next rain or wet spell go again. Repeat this after each storm until the surface touched by the drag is smooth and slightly higher in the center than at the sides. The contour described may possibly be found after the fourth rain and dragging. It surely will exist after the sixth rain and dragging, provided the drag is properly built and skillfully used.

Now we are ready to widen the roadway and lift the center higher. The two objects can be reached by one operation. Plow a shallow furrow just outside the dragged portion of the road, turning the furrow onto the dragged portion. Spread this furrow over the road with the drag. When you have finished the roadway will be about two feet wider and the middle will be a little higher. After the next rain or storm plow again and drag again, adding two feet more to the width and building the road still a little higher in the center. Only plow one furrow between rains. When the road becomes wide enough quit plowing.

This plan of building has been in use on my own road for twenty years.

It will succeed any place if a plow is handy and the drag is right and the man determined. Probably some of my hearers will be skeptical, and it is quite possible that an individual here and there will say he has tried it and failed. I meet such men occasionally. Invariably when I question them they admit they did not follow the directions, but tried some sort of experiments of their own. Therefore, follow directions closely. Do not try any improvements or experiments until after a year has passed.

If any man will go out on the road with a drag and plow he can get the road in good condition. He can get a good surface and he can get good drainage. You do not build roads where there is no surface drainage. If you haven't got surface drainage you will have a pond there. If you will use the split-log drag you can put the water to the side of the road.

D. Ward King, Maitland, Mo.

WHEN THE WHEAT IS IN THE SHOCK

Are you a farmer, and did you ever feel the satisfaction that comes at this season when the small grain is safe in the shock? For weeks, perhaps, you watched every cloud and as the harvest time came nearer your uneasiness increased, lest wind or hail or continued rains cause the loss of the crop. The wheat crop, at best, can never be counted in advance. Especially is this true of winter wheat, which this season shows heavy losses from winter killing and Hessian fly.

It is true that the loss of wheat just when ready for harvest amounts to comparatively little in the total yield, but to the individual farmer it may mean much. In a few minutes hail may wipe out the crop, or rising water along streams subject to overflow may submerge thousands of acres. No wonder that the farmer discusses the weather and especially so at harvest time.

It's great to have the wheat in the shock and to feel that, at least, it is reasonably safe. But even then all speculation does not cease. Shall the wheat be threshed from the shock or shall it be stacked? If the latter, there comes the problem of securing a satisfactory stack builder—and stacking is, apparently, almost a lost art. Another question is, Shall we sell or hold? What do the government reports show and what do reliable buyers advise? What of the visible supply and what of the effect of war upon wheat prices?

Naturally, with a lowering of wheat prices in the face of a probable loss of several hundred million bushels in the 1916 crop of the United States as compared with the yield of last year, there is a prospect of profit by holding for higher prices. America, though, it must be remembered, represents only a part of the wheat territory of the world. Holding also means additional expense and risk. Lightning may cause losses. The shrink is considerable. If held in the stack, moisture may cause damage, while each year thousands of bushels go to the bad in the bins. Left in sacks for a long period the rental charges are considerable. The cost of sacks both to buyer and seller is an important item. A dealer in a small town in Missouri recently retired from the grain business. In looking over his books he was surprised to find that he had paid out more than $35,000 for sacks. Of course this charge fell, ultimately, upon the seller.

So it will be seen that the man who provides the raw material for light bread or hot buscuit has a business that requires thought and judgment as well as work. Furthermore, the wheat growing game is too often but little better than a gamble. The returns are frequently disappointing. Still, there is satisfaction when the "grains o' gold" are safe in the shock.

W. L. Nelson.

GOOD HORSES A STAPLE PRODUCT

I have visited farms where motive power costs absolutely nothing. Big quality, active horses are raised and used on these farms. They are broken to harness during the winter before they reach the age of three years, and the geldings are sent to market when they reach the age of five or six years to make room for younger horses. The increase in value from the time they are broken until they are sold will, under ordinary conditions, pay feed bills, making the services rendered cost practically nothing. Our own experience has been similar. In the fall of 1912 a bunch of grade colts, sired by fairly good pure-bred stallions, were purchased from near-by farmers. They were broken to harness in January, 1915, and have been working every day since that time. An offer of $200 each was received for these colts at the time they were broken to harness. This offer was at least $50 more than their total cost, even when the high prices of feeds during the year 1913-14 are taken into consideration. A few weeks ago we were offered $200 each for the poorest and $300 each for the best of the bunch. This increase in value has more than paid for the feed consumed since they were broken to harness one year ago.

In direct contrast with these experiences, the motive power on many farms is the most expensive item, but on such farms one usually finds carelessness, poor management, unsound, poorly-shaped, under-sized, inefficient horses for which there is practically no demand at any price.

Possibly some of the difference regarding the kind of horses that have been raised has been due to a general misunderstanding of the actual needs and demands for horses on the farm and in the city. Many horse raisers honestly believe that the need and demand for horses is almost a thing of the past, but, as a matter of fact, heavy horses have increased in value practically ten per cent during the past ten years, in spite of a widespread impression to the contrary. This assertion is proved by Chicago horse-market records, which show that all horses that would classify as drafters, including the good, bad and indifferent, averaged for each of the past ten years as follows:

1905	$186	1910	$198
1906	190	1911	203
1907	194	1912	210
1908	180	1913	213
1909	194	1914	208

Industrial depression due to the panic of 1907 resulted in a lower price for the year 1908, but this loss was soon regained. The effect of the war on general industrial conditions had somewhat the same effect on prices for the year 1914, but every indication points to higher prices in the near future. While good prices have been maintained for high-class horses, the fact must be emphasized that each year finds city buyers discriminating more severely agianst inferior horses. Quality in the horses we have been producing has not kept pace with the increased demand for quality upon the part of buyers and users, and we are now paying the penalty for this neglect in the form of an inefficient laborer and a decidedly weakened demand for the average kind we now have on hand.

At the present time three classes of horses are most in demand—wagon horses, chunks, and drafters, all of which are derived from draft blood. Wagon horses weigh from 1250 to 1550 pounds, are nice movers and well made, showing style, quality and finish to a marked degree. Chunks weigh from 1300 to 1600 pounds, and are, as the name implies, compactly built, averaging about two inches less in height than a wagon horse of equal weight. Style, quality and action are very desirable in this class of horses, while substance is an absolute necessity. Drafters weigh from 1600 pounds upwards—the bigger the better, providing they are well made, have plenty of style, substance, quality and finish, and are easy, snappy movers. Probably no horse is less in demand than the big horse without these qualities. Good horses of these three classes have been selling during the past year at prices ranging from $175 each for the lighter wagon horses to $350 each for the best drafters. However, it must be remembered that horse-market demands change with the seasons, and that there is about as much demand for heavy horses during the midwinter months as there is for straw hats at that season of the year. Heavy horses ordinarily command the best prices during the months of March, April and May. The city demand to which I have just referred is important, as it must take care of the surplus after the farm demand has been supplied, but we must give more attention to the farm demand, especially to that of individual farms and to the efficient type of farm horses, for seven out of every eight work horses are laboring on farms. It so happens that the most desirable farm horse is also the most desirable market horse; hence to make our horses a more staple product we must raise a better kind of farm horse and discard the idea that the horse that is not good enough for a market horse is good enough for a farm horse.—Dr. C. W. McCampbell, Secretary State Live Stock Registry Board, Manhattan.

CORN Harvester cuts and throws in pile on harvester or windrows. Man and horse cuts and shocks equal to a Corn Binder. Sold in every state. Price only $22.00 with fodder binder. Testimonials and catalog Free showing picture of Harvester.

Wants A Dog Law

Editor of The Missouri Farmer. Enclosed is one dollar for which please mark up my subscription. My banker first sent me The Missouri Farmer and now I find it is hard to get along without it. I have been reading your dog license law which I think would be the very thing we need (although I expect some of the hound dog fellows would howl pretty loud).

I would vote for it every time. I am very much interested in the farm advisor and wish we had one in Shelby County, still there are lots of men who think the farm advisor is a wrong thing, bu tif you would go by their farms you would see lots of things that the advisor could be a great help in. The Missouri Farmer is all right and getting better every month.

C. P. Cotton, Emden, Mo.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII August 1, 1916 No. 15

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

CO-OPERATION THAT COUNTS

Much has been said and written about the co-operation between town and country and a great deal of it has been ill advised because the authors did not recognize the fundamental fact that the success of co-operation depends on mutual interest. Where there is conflict of interest there has never been successful co-operation and we do not think there can well be.

There can be and there should be close and hearty co-operation between the people of the town and the people of the country in matters of mutual interest and benefit. But the man who would try to bring the urban and the rural citizen together on all matters alike is doomed to failure. Just as well that employers of labor and employees should be brought together in one organization. It would be just as sensible to try to unite the farmers with the labor organizations representing railroad employees on the ground that both farmers and railroad employees are to a great extent dependent upon the successful management and operation of the railroads.

We have in previous articles said that the only way for farmers to maintain their rights and to promote their interests is for them to maintain a strong organization of farmers and of farmers only. Unless this principle is accepted then we must accept the idea that there should be but one organization among all the various branches of trade, profession and industry and of course such an idea is absurd on the face of it.

Men connected with our state universities and the Federal department of agriculture have no doubt been influenced by the financial aid given different rural projects in their efforts to bring town and country together in an effective co-operative body. But their failure to get a single organization of this kind that is solving the hard practical questions of production, distribution or social betterment ought to convince them that they are working along impractical and impossible lines.

Where the town is organized for the town's betterment and the country is organized for the farmer's betterment there should be no trouble in bringing about co-operation between the two when the object is mutual. We have frequently said when discussing good roads that there must be two ends to a road and that one of them is in the town and the other is in the country. The progress in road building makes headway only about as fast as this idea spreads. It is the recognition of this idea that has given us national aid, state aid, the special 8-mile district in this state which puts the town into the road district, and the generally active interest of business men and commercial clubs in the work of road improvement.

The business man has a right to say to the farmer "I live at one end of the road you travel and I am as much interested in getting you to town as you are in getting to town, and it is my business to join with you in the work and expense of building better roads."

Recently some farmers in a progressive neighborhood in Boone County got interested in the formation of a district, known as the special benefit assessment district under our Missouri laws. There are some technicalities to be observed in the proper organization of such a district, and a preliminary survey is necessary and legal advice needed and this gives the people of the town of Columbia, the county seat their opportunity to co-operate in an effective way. The Columbia Commercial Club, one of the live organizations of the state has notified the farmers that the commercial club will pay out of its funds the preliminary expenses for attorney's fees, and surveyor's fees necessary to get the district organized.

This is the kind of co-operation that will count and that will not cause resentment among farmers because of intereference with matters which belong properly to themselves. Other commercial clubs will do well to adopt the same plan the Columbia club has originated.

CONSTRUCTION OR DESTRUCTION?

It does not matter in what line of endeavor it is we always find two classes of men, one who would build up, the other who would tear down. One man offers plans the other offers only objection or criticism. The thing that brought this thought so forcibly to our mind recently was the method used by many of the candidates for office before the primary election. Few of the candidates even for the high office of Governor had a constructive platform to stand on. Most of them seemed to think their special mission in this world was to point out the short comings of everybody who happened to get in the way of their own ambitions. This is a poor policy. It will never make the world better than it is. A man who deserves to win for any office should have a constructive plan and if it is right it is mighty apt to win him success. This is just as true of candidates of the different political parties as it is of those contesting before the primary. No party can hope to win, or at least should not desire to win because of the weakness of the opposition. That would be no honor. But the man who can win on merit even against a strong opponent has cause for gratification. Every voter however humble may help to bring about respectability in political campaigns by showing in some convincing way his displeasure of political mud slinging.

GOOD MEASURE PRESSED DOWN

The Great Teacher said "Give and it shall be given unto you; good measure, pressed down, and shaken together, and running over, shall men give unto your bosom. For with the same measure that ye mete withal it shall be measured to you again." What do our readers think about the way this advice is observed in the markets of the country. Would it not be a wise thing to have this wise saying of Christ printed in big black letters and posted on all our containers, measures and scales until we get into the habit of given full measure, "pressed down and shaken together, and running over." Farmers are not blameless in this matter for all over the country they have sold berries in boxes that were short measure, and other fruits in containers that did not hold what it was claimed. Many states are passing laws compelling full weight and full measure packages but we need to have these laws backed up with a wholesome public sentiment for their enforcement. A brick of butter is not a pound because it looks like a pound and if it weighs only fifteen ounces the one who buys it has been cheated out of one-sixteenth of its value. It matters not whether the deal is selling to the merchant or buying of the merchant, or between neighbars the only honest way of dealing is to "give good measure, pressed down, and shaken together."

MAKING THE BEST OF IT

The Central West including this state is now suffering severely from a protracted drouth and unless rain comes very soon the corn crop will be light. The damage is greater than it otherwise would have been had we not had too much rain early in the summer which prevented proper cultivation. It is now too late to plant emergency crops to take the place of grain but with a late growing season millet would have time to mature hay if sown early in August. This late sown millet if harvested before the seed ripens will make excellent feed for all kinds of stock fed on roughage. Dwarf essex rape may be sown any time now during August or early September and should furnish a lot of grazing for hogs, sheep or cattle during November or a least until freezing weather. It would not be advisable to sow the rape before the land can be put in good condition.

Rye or wheat seeded on good soil as early as the ground can be put in order will make a lot of grazing through the fall and winter months and we think in a season like this farmers can well afford to sow a large acreage of rye and wheat even though it is plowed up next spring. When sowing for pasturing we would sow not less than two bushels of seed per acre and it will not take very much pasturage when grain is high to pay for that amount of seed.

We have frequently called attention to the advantage of having a cover crop like wheat or rye on all cultivated land during the winter to save washing of the soil and loss of available plant food and this alone will often pay for the cost of seeding the land. If the land is to be put in corn next year a good growth of green stuff turned under next May will be a great benefit to the soil and help it to endure either too much rain or too much dry weather.

Such unfortunate weather conditions come upon us without warning but finding fault with the weather man will do no good. We must make the best of the situation by taking advantage of future opportunities.

LET US CONTINUE THE FIGHT

A few months ago when fat hogs and cattle were selling at a great sacrifice to those who had produced them, thousands of farmers had on their fighting clothes and were ready to do most anything to right matters. Now that prices are better we hear little about the need of co-operative effort to put the marketing of live stock on a fair basis. Just as sure as the seasons come and go the same conditions of marketing we suffered last fall will be repeated unless farmers prevent them by organized co-operative effort.

Last winter at the suggestion of THE MISSOURI FARMER some two

IT'S TIME TO GET BUSY

Soon the rush of harvest and threshing will be over and once more I plead that the farmers of every county in Missouri get together and plan a great County Farmers Mass Meeting sometime in the latter part of August or the fore part of September in order that we may make this the occasion of literally setting your county "on fire" with the Farm Club movement. Especially do I urge that the Farm Clubs which have already been organized take up this work to the end that a strong County Farmers Ass'n may be perfected in your county. This is no time to be idle or standing around like a lot of Doubting Thomases. Rome wasn't built in a day and so we have only started upon the great task which confronts us and upon the outcome of which depends the future of every farm home in the land. Because your Club hasn't thus far turned the World up side down is no reason why your members should grow feint hearted or lose interest.

THE MISSOURI FARMER is at work on matters which mean the saving of many thousands of dollars to the farmers of this state—but whether or not we will be able to carry out our plans depends entirely on the amount of co-operation we receive. In other words, we can't help the farmers of your county so long as they are unorganized. Already the Farm Club leaders in Lafayette County have planned a monster two days Farmer Picnic for September 14 and 15—and it is to be made the greatest farmers "Love Feast" that ever met in the history of that county and a powerful County Farmers Ass'n is to be formed. Several other counties are now planning similar meetings and their dates will soon be announced. To this end, I trust the farmers of many other counties will plan to follow suit at once. The first thing to do is to call a meeting of a few leading farmers from every township. Then write us for convenient dates—for the speakers from the State Board of Agriculture and the Agricultural College should be able to get from one meeting to another with as little expense and inconvenience as possible. As I have stated before, I will address as many of these county meetings as possible and will deal directly with the question of farmer organization while the other speakers will discuss other pertinent farm questions. If the matter is taken in hand in the right way it will result in the greatest farmer awakening in the history of your county. And either farmers must organize for mutual protection against the Combines which are robbing them or submit to Agricultural bondage. We have no other choice. It is no time to stand around in a haze of doubt. The hour for action has come—and why not let us here in Missouri "set the pace" for the farmers of every other state in the Union? Now I am talking to **you** my good friend and I want you to go to the telephone when you have finished reading this appeal and call up some of your neighbors and start the ball rolling.

Sincerely, William Hirth, Publisher,
THE MISSOURI FARMER, Columbia, Mo.

hundred or more farm clubs were organized and quite a saving was made to the members in both buying and selling. If for any reason any of these clubs have not been meeting during the crop rush they should not fail to start their meetings again now and be ready to protect themselves in every way possible.

Before our readers will have read this article a meeting will be held in Columbia for the purpose of completing the organization of a farm marketing association of Missouri. This meeting is the final outcome of a meeting called last January during Farmers' Week. We hope to be able to give our readers a tangible plan of organization in our next issue. We see no reason why such a plan should not now be put before the farmers of Missouri and then it is our hope to see it ratified with determination to win. The farmers have been trying to do too many things single handed A shovel plow can be pulled with one horse but the gang needs a draft team or a tractor. We must realize the necessity for team work in the process of farm organization.

The essential things as we see it after a proper organization is to have some one of ability and integrity to direct the organization and to find a practicable plan to finance the organization. Some one must be right on the job all the time and a force of helpers must be employed, postage and other expenses must be provided for and this will cost something but with the loyal co-operation of a hundred thousand farmers the individual cost will be too small to be felt and the benefit ought to be great.

Let us appeal to our readers to go ahead with the organization of school district farm clubs and when a final plan is agreed upon by the state organization your neighborhood will be ready to join and make the state work a success. Every dollar that is saved to the farmers in this way is kept out of the hands of those who would use it to keep farmers from using the power of organization and co-operation.

FARM LOANS AND SINGLE TAX

The farm loan act recently passed by Congress does the right thing in exempting the mortgages and the farm loan bonds from all Federal, State and Municipal taxes. This bill was passed by a very large vote and as a majority of the members of both political parties voted for it no charge can be made that it is a partisan measure.

There would be no sense in trying to give borrowers cheaper money and then tax the loans to make them dearer but that is what some of our demagogic politicians would have us do. The passing of the Federal Farm Loan Act is a complete answer to the objections raised against the Missouri Land Bank because the assests of the bank are exempt from taxes of any kind.

The more we study the Missouri plan in comparison with the Federal plan the more favorably are we impressed with the simplicity of the Missouri law. Anyway the Federal law only provides for loans on the first capitalization of $180,000,000 and as we have a greater farm debt than that in Missouri alone it is clear that we will have plenty of business for the Missouri Land Bank right along side of the Federal plan.

The bonds of the Federal Loan Board drawing 4 or 4½ per cent interest will be an attractive form of investment for those who have a little money they want to put in a safe place. The bonds are to be issued in denominations as low as $20 and not higher than $1000 and the individual who has only a few hundred dollars to loan will find them about the best place to put it. In this way the small investor will no doubt largely furnish the money for farm loans in the future.

BARNYARD GOSSIP

Many times we have called attention to the inadequacy of the farmers' income. Now comes the United States Department of Agriculture with carefully compiled figures which show that the average farmer, including large and small farms, receives a cash salary for his year's work of $360. If there is added to this his house rent garden, fruits, etc., that he gets and for which others must make a cash expenditure it is estimated the average farmer's labor income is about $600. The average policeman in the cities gets a salary of $1,052 and needs no capital to work with. The ordinary factory worker gets $610 a year while the clerks ad officers in factories average $1,188. The average Federal employee gets $948 and the minister, who, next to the farmer is at the foot of the list gets $663.

There are more than six million farmers in the United States as compared with approximately 200,000 salaried employees in the Federal service but when the latter can draw more than fifty per cent more pay for a much shorter day and less exposure it shows the value of organized effort. Most Federal employees get an annual vacation on full pay of three or four weeks while farmers must take a vacation at their own expense if they get any at all. Then employees of the Government as well as those of private corporations are furnished all the equipment they need to carry on their work but the farmer must supply himself or go without.

It appears that as soon as an individual gets on the public pay roll in most any capacity he thinks he has superior rights and that because of his position he is entitled to all the perquisites he can get his hands on. There has been an organized movement for a great many years to provide pensions for those engaged in the public service but the justice of any civil pension is hard to find. It is said our school teachers are underpaid and it may be when compared with other professions but it is not true when compared with the service rendered by the farmer and the salary he gets for it. In our higher institutions of learning there is a constant roar about salaries but not one in twenty of the men who are on the public payroll in these institutions getting from $1,000 to $5,000 a year could take an average farm and make a decent living on it.

But how is the farmer to get a better salary for his service? First, he must understand that he can not act independent of his fellows. There are so many things which affect the farmer's income that can be regulated only by law and by co-operative effort and by effective organization that the farmer who tries to act alone is helpless. We need just laws to prevent discrimination by the great corporations which have throttled competition but these laws can not be passed until there is a strong public sentiment aroused in favor of them. Suppose for instance just as one example that you have a small co-operative creamery in your community. It may be able to do a profitable business if it has fair competition with a small capital of $5,000 to $10,000. But what can you do when you must compete with a greedy corporation with $5,000,000, to $10,000,000 capital that will use any unfair means to crush your local plant. The only way for farmers to succeed under present conditions is, first, to demand and secure adequate laws that will permit and protect co-operative societies among the producing classes. Then these co-operative societies must be federated until all the people engaged in one industry in a state or better in the Nation are working under one organization. Then we will have capital enough and business enough to compete with any private corporation no matter how large it may be.

We are not prejudiced against private business large or small, but we are opposed to the plundering of the producers as they have been in the past by a body of business pirates who have grown rich by throttling honest and legitimate competition.

How do You Fill Your Silo?

CORN—always a wonderful crop—is more of a king each year. That is not to be wondered at since ensilage is proving so cheap and economical a feed. More and more we realize the extra profits in the all-year-'round use of green fodder.

In the same proportion **International** ensilage cutters have grown popular. Here are some **International** big points.

There's the famous special concave knife, with inward shear cut, cutting at outer edge first, hence the greatest volume is cut near the shaft with least power. The handy knife grinder that is always on the machine grinds one of the two sets of knives while the other is working. It's a water stone, leaving the temper in the knives. Perfect adjustment of knife blades to cutter bar can always be maintained, saving power and doing good work. Heavy channel steel frame, trussed, hot riveted, so that working parts can't get out of line. Self-feed keeps cutting always even; silage may be cut in various lengths. Blower pipe is adjustable to any angle; silage may be delivered to a silo of any height. Full equipment of safety devices.

These features make the **International** the best to buy. See the dealer who sells them. Write to us for the interesting booklet, "A Silo for Every Farm."

Housewives Attention!

The Philipsborn Co., of Chicago, offers three pretty girls wash dresses for the remarkably low price of 99c. One is made of tan linen, one of pink percale and gigham and one of plaid and checked percale. Sizes from 6 to 14 years and satisfaction absolutely guaranteed. Be sure to address them Dept. L, Philipsborn & Co., Chicago. They also make an exceeding low price on all other kind of women's furnishings and will send you a big catalog free of charge for the asking. This big concern has an advertisement in this issue which every farmer's wife should read carefully. It advertises a Jap Silk Blouse for 98c. See it on the second page. Be sure to mention The Missouri Farmer when you write.

Why not get together with your neighbors and plan a big farmers mass meeting which will set your county on fire for Farm Clubs?

Win Against the Hessian Fly

TO ESCAPE THE MAIN ATTACK OF THE FLY— sow your wheat late. The early brood is most destructive to young wheat and provides for future broods. Your own Experiment Station will tell you this.

THE BEST WHEAT YIELDS come from plants that enter the winter strong and vigorous. Your own experience will tell you this.

TO WIN AGAINST THE FLY, seed late, feed the crop with available fertilizers which will hasten growth to overcome the late start, and secure vigor with consequent resistance to later broods. Use 200 to 400 pounds per acre containing at least 2 per cent of ammonia. Acid phosphate alone does not give the necessary quick growth and resistance to the fly.

In Farmers' Bulletin No. 640, U. S. Department of Agriculture, fertilizers are recommended to give vigor to late sown crops and resistance to the Hessian Fly.

Write for our map showing best dates for sowing wheat in your locality; also our Bulletin, "WHEAT PRODUCTION," both mailed free.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER V

There was but one important measure to deal with in this session of the legislature, but David's penetration into a thorough understanding of each bill, and the patience and sagacity he displayed in settling all disputes, won the approbation of even doubtful and divided factions. He flashed a new fire of life into the ebbing enthusiasm of his followers, whom he had led to victory on the Griggs Bill. At the close of the session, early in May, he was presented with a set of embossed resolutions commending his fulfillment of his duties.

That same night, in his room at the hotel, as he was packing his belongings, he was waited upon by a delegation composed alike of horny-handed tillers of the soil and distinguished statesmen.

"We come, David," said the spokesman, who had been chairman of the county convention, "to say that you are our choice for the next governor of this state, and in saying this we know we are echoing the sentiment of the Republican party. In fact, we are looking to you as the only man who can bring that party to victory."

He said many more things, flattering and echoed by his followers. It made the blood tingle in David's veins to know that these men of plain, honest, country stock, like himself, believed in him and in his honor. In kaleidoscopic quickness there passed in review his life,—the days when he and his mother had struggled with a wretched poverty that the neighbors had only half suspected, the first turning point in his life, when he was taken unto the hearth and home of strong-hearted people, his years at college, the plodding days in pursuit of the law, his hotly waged fight in the legislature, and his short literary career, and he felt a surging of boyish pride at the knowledge that he was now approaching his goal.

The next morning David went to Lafferton in order to discuss the road to the ruling of the people.

"Whom would you suggest for manager of my campaign, Uncle Barnabas?" he asked.

"Knowles came to me and offered his services. Couldn't have a slicker man, Dave."

"None better in the state. I shouldn't have ventured to ask him."

Janey was home for the summer, and on the first evening of his return she and David sat together on the porch.

"Oh, Davey," she said with a little sob, "Jud has come home again, and they say he isn't just wild any more, but thoroughly bad."

The tears in her eyes and the tremor in her tone stirred all his old protective instinct for her.

"Poor Jud! I'll see if I can't awaken some ambition in him for a different life."

"You've been very patient, Davey, but do try again. Every one is down on him now but father and you and me. Aunt M'ri has let the Judge prejudice her; Joe hasn't a particle of patience with him, and he can't understand how I can have any, but you do, Davey. You understand everything."

They sat in silence, watching the stars pierce vividly through the blackness of the sky, and presently his thoughts strayed from Jud and from his fair young sister. In fancy he saw the queenly carriage of an imperious little head, the mystery lurking in a pair of purple eyes, and heard the cadence in an exquisite voice.

The next morning he began the fight, and there was an incessant cannonade from start to finish against the upstart boy nominee, who proved to be an adversary of unremitting activity, the tact and experience of Knowles making a fortified intrenchment for him. All of David's friends rallied strongly to his support. Hume came from Washington, Joe from the ranch, and Wilder from the East, his father having a branch concern in the state.

Through the long, hot summer the warfare waged, and by mid-autumn it seemed a neck and neck contest—a contest so susceptible that the merest breath might turn the tide at any moment. The week before the election found David still resolute, grim, and determined. Instead of being discouraged by adverse attacks he had gained new vigor from each downthrow. All forces rendezvoused at the largest city in the state for the final engagement.

Three days before election he received a note in a handwriting that had become familiar to him during the past year. With a rush of surprise and pleasure he noted the city postmark. The note was very brief, merely mentioning the hotel at which they were stopping and asking him to call if he could spare a few moments from his campaign work.

In an incredibly short time after the receipt of this note he was at the hotel, awaiting an answer to his card. He was shown to the sitting room of the suite, and Carey opened the door to admit him. This was not the little princess of his dreams, nor the charming young girl who had talked so ingenuously with him before the Braden fireside. This was a woman, stately yet gracious, vigorous yet exquisite.

"I am glad we came home in time to see you elected," she said. "It is a great honor, David, to be the governor of your state."

There was a shade of deference in her manner to him which he realized was due to the awe with which she regarded the dignity of his elective office. This amused while it appealed to him.

"We are on our way to California to spend the winter," she replied, in answer to his eager question, "and father proposed stopping here until after election."

"You come in and out of my life like a comet," he complained wistfully.

Mrs. Winthrop came in, smiling and charming as ever. She was very cordial to David, and interested in his campaign, but it seemed to him that she was a little too gracious, as if she wished to impress him with the fact that it was a concession to meet him on an equal social footing. For Mrs. Winthrop was inclined to be of the world, worldly.

"You have arrived at an auspicious time," he assured her. "To-night the Democrats will have the biggest parade ever scheduled for this city. Joe calls it the round-up."

"Oh, is Joe here?" asked Carey eagerly.

"Yes; and another friend of yours, Fletcher Wilder."

"I knew that he was here," she said, with an odd little smile.

"We had expected to see him in New York, and were surprised to learn he was out here," said Mrs. Winthrop.

"He came to help me in my campaign," informed David.

"Fletcher interested in politics! How strange!"

"His interest is purely personal. We were together in South America, you know."

"I am glad that you have a friend in him," said Mrs. Winthrop affably. "The parade will pass here, and Fletcher is coming up, of course. Why not come up, too, if you can spare the time?"

"This is not my night," laughed David. "It's purely and simply a Democratic night. I shall be pleased to come."

"Bring Joe, too," reminded Carey.

When Mr. Winthrop came in David had no doubt as to the welcome he received from the head of the family.

"A man's measure of a man," thought David, "is easily taken, and by natural laws, but oh, for an understanding of the scales by which women weigh! And yet it is they who hold the balance."

"Fletcher and David and Joe are coming tonight to watch the parade from here," said Carey.

"You shall all dine with us," said Mr. Winthrop.

"Thank you," replied David, "but—"

"Oh, but you must," insisted Mrs. Winthrop, who always warmly seconded any proffer of hospitality made by her husband. "Fletcher will dine with us, of course. We can have a little dinner served here in our rooms. Write a note to Mr. Forbes, Carey."

The marked difference in type of her three guests as they entered the sitting room that night struck Mrs. Winthrop forcibly. Joe, lean and brown, with laughing eyes, was the typical frontiersman; Fletcher, quiet and substantial looking, with his air of culture and ease and his modulated voice, was the type of a city man; David—"What a man he is!" she was forced to admit as he stood head uplifted in the white glare under the chandelier, the brilliant light shining upon his dark hair, and his eyes glowing like stars. His lithe figure, perfect in poise and balance, of virile strength that was toil-proof, wore the look of the outdoor life. His smile banished everything that was ordinary from his face and transmuted it into a glowing personality. His eyes, serious with that insight of the observer who knows what is going on without and within, were clear and steady.

The table was laid for six in the sitting room, the flowers and candles giving it a homelike look.

As Mrs. Winthrop listened to the conversation between her husband and David she was forced to admit that the young candidate for governor was a man of mark.

"I never knew a man without good birth to have such perfect breeding," she thought. "He really appears as well as Fletcher, and, well, of course, he has more temperament. If he could have been born on a different plane," thinking of her long line of Virginia ancestors.

She had ceded a great deal to her husband's and Carey's democracy, and reserved many an unfavorable criticism of their friends and their friends' ways with a tactfulness that had blinded their eyes to her true feelings. Yet David knew instinctively her standpoint; she partly suspected that he knew, and the knowledge did not disturb her; she intuitively gauged his pride, and welcomed it, for a suitor of the Fletcher Wilder station of life was more to her liking.

Carey led David away from her father's political discourse, and encouraged him to give reminiscences of old days. Joe told a few inimitable western stories, and before the cozy little meal was finished Mrs. Winthrop, though against her will, was feeling the compelling force of David's winning sweetness. The sound of a distant band hurried them from the table to the balcony.

"They've certainly got a fair showing of floating banners and transformations," said Joe.

As the procession came nearer the face of the hardy ranchman flushed crimson and his eyes flashed dangerously. He made a quick motion as if to obstruct David's vision, but the young candidate had already seen. He stood as if at bay, his face pale, his eyes riveted on those floating banners which bore in flaming letters the inscriptions:

"The father of David Dunne died in state prison!"

"His mother was a washerwoman!"

CHAPTER VI

The others were stricken into shocked silence which they were too stunned for the moment to break. It was Fletcher who recovered first, but then Fletcher was the only one present who did not know that he words had struck home.

"We mustn't wait another moment, David," he said emphatically, "to get out sweeping denials and—"

"We can't," said David wearily. "It is true."

"Oh," responded Fletcher lamely.

There was another silence. Something in David's voice and manner had made the silence still more constrained.

"I'll go down and smash their banners!" mutered Joe, who had not dared to look in David's direction.

Mr. Winthrop restrained him.

"The matter will take care of itself," he counseled.

It is mercifully granted that the intensity of present suffering is not realized. Only in looking back comes the pang, and the wonder at the seemingly passive endurance.

Again David's memory was bridging the past to unveil that vivid picture of the patient-eyed woman bending over the tub, and the pity for her was hurting him more than the cruel banner which was flaunting the fac before a jeering, applauding crowd.

Mrs. Winthrop gave him a covert glance. She had great pride in her lineage, and her well-laid plans for her daughter's future did not include David Dunne in their scope, but she was ever responsive to distress.

Before the look in his eyes every sensation save that of sympathy left her, and she went to him as she would have gone to a child of her own that had been hurt.

"David," she said tenderly, laying her hand on his arm, "any woman in the world might be glad to take in washing to bring up a boy to be such a man as you are!"

Deeply moved and surprised, he looked into her brimming eyes and met there the look he had sometimes seen in the eyes of his mother, of M'ri, and once in the eyes of Janey. Moved by an irresistible impulse, he stooped and kissed her.

The situation was relieved of its tenseness.

"I think, Joe," said David, speaking collectedly, "we had better go to headquarters. Knowles will be looking for me."

"Sure," assented Joe, eager to get into action.

"Carey," said David in a low voice, as he was leaving.

As she turned to him, an impetuous rush of new life leaped torrent-like in his heart. Her eyes met his slowly, and for a moment he felt a pleasure acute with the exquisiteness of pain. Such sensations are usually transient and in another moment he had himself well in hand.

"I want to say good night," he said quietly, "and—"

"Will you come here to-morrow at eleven?" she asked hurriedly. "There is something I want to say to you."

"I know that you are sorry for me."

"That isn't what I mean to say."

A wistful but imperious message was flashed to him from her eyes.

"I will come," he replied gravely.

When he reached headquarters he found the committee dismayed and distracted. Like Wilder, they counseled a sweeping denial, but David was firm.

"It is true," he reiterated.

"It will cost us the vote of a certain element," predicted the chairman, "and we haven't one to spare."

David listened to a series of similar sentiments until Knowles—a new Knowles—came in. The usual blank placidity of his face was rippled by radiant exultation.

"David," he announced, "before that parade started to-night I had made out another conservative estimate, and thought I could pull you through by a slight majority. Now, it's different. While you may lose some votes from the 'near-silk stocking' class, yet for every vote so lost hundreds will rally to you. That all men are created equal is still a truth held to be self-evident. The spark of the spirit that prompted the Declaration of Independence is always ready to be fanned to a flame, and the Democrats have furnished us the fans in their flying pennants."

David found no balm in this argument. All the wounds in his heart were aching, and he could not bring his thoughts to majorities. He passed a night of nerve-racking strain. The jeopardy of election did not concern him. That night at the dinner party he had realized that he had a formidable rival in Fletcher, who had a place firmly fixed in the Winthrop household. Still, against odds, he had determined to woo and win Carey.

He had thought to tell her of his father's imprisonment under softening influences. To have it flashed ruthlessly upon her in such a way, and at such a time, made him shrink from asking her to link her fate with his, and he decided to put her resolutely out of his life.

Unwillingly, he went to keep his appointment with her the next morning. He also dreaded an encounter with Mrs. Winthrop. He felt that the reaction from her moment of womanly pity would strand her still farther on the rocks of her worldliness. He was detained on his way to the hotel so that it was nearly twelve when he ar-

rived. It was a relief to find Carey alone. There was an appealing look in her eyes; but David felt that he could bear no expression of sympathy, and he trusted she would obey the subtle message flashed from his own.

With keen insight she read his unspoken appeal, but a high courage dwelt in the spirit of the little Puritan of colonial ancestry, and she summont its full strength.

"David," she asked, "did you think I was ignorant of your early life until I read those banners last night?"

"I thought," he said, flushing and taken by surprise, "that you might have long ago heard something, but to have it recalled in so sensational a way when you were entertaining me at dinner—"

"David, the first day I met you, when I was six years old, Mrs. Randall told us of your father. I didn't know just what a prison was, but I supposed it something very grand, and it widened the halo of romance that my childish eyes had cast about you. The morning after you had nominated Mr. Hume I saw your aunt at the hotel, and she told me, for she said some day I might hear it from strangers and not understand. When I saw those banners it was not so much sympathy for you that distressed me; I was thinking of your mother, and regretting that she could not be alive to hear you speak, and see what her bravery had done for you."

David had to summon all his control and his recollection of her Virginian ancestors to refrain from telling her what was in his heart. Mrs. Winthrop helped him by her entrance at this crucial point.

"Good morning, David," she said suavely. "Carey, Fletcher is waiting for you at the elevator. Your father stopped him. I told him you would be out directly."

"I had an engagement to drive with him," explained Carey. "I thought you would come earlier."

"I am due at a committee meeting," he said, in a courteous but aloof manner.

"We start in the morning, you know," she reminded him. "Won't you dine here with us to-night?"

"I am sorry," he refused. "It will be impossible."

"Arthur is going to a club luncheon," said Mrs. Winthrop, when Carey had gone into the adjoining room, "and I shall be alone unless you will take pity on my loneliness. I won't detain you a moment after luncheon."

"Thank you," he replied abstractedly.

She smiled at the reluctance in his eyes.

"David is going to stay to luncheon with me," she announced to Carey as she came into the sitting room.

David winced at the huge bunch of violets fastened to her muff. He remembered with a pang that Fletcher had left him that morning to go to a florist's. After she had gone Mrs. Winthrop turned suddenly toward him, as he was gazing wistfully at the closed door.

"David," she asked directly, "why did you refuse our invitation to dine to-night?"

"Why—you see—Mrs. Winthrop—with so many engagements—there is a factory meeting at five—"

"David, you are floundering! That is not like the frankly spoken boy we used to know at Maplewood. I kept you to luncheon to tell you some news that even Carey doesn't know yet. Mrs. Randall has written insisting that we spend a week at Maplewood before we go West. As we are in no special haste, I shall accept her hospitality."

David made no reply, and she continued:

"You are going home the day before election?"

"Yes, Mrs. Winthrop," he replied.

"We will go down with you, and I hope you will be neighborly while we are in the country."

The bewildered look in his eyes deepend, and then a heartrending solution of her graciousness came to him. Fletcher and Carey were doubtless engaged, and this fact made Mrs. Winthrop feel secure in extending hospitality to him.

"Thank you, Mrs. Winthrop," he said, a little bitterly. "You are very kind."

"David," she asked, giving him a searching look. "What is the matter? I thought you would be pleased at the thought of our spending a week among you all."

He made a quick, desparate decision.

"Mrs. Winthrop," he asked earnestly, "may I speak to you quite openly and honestly?"

"David Dunne, you couldn't speak any other way," she asserted, with a gay little laugh.

"I love Carey!"

CHAPTER VII

This information seemingly conveyed no startling intelligence.

"Well," replied Mrs. Winthrop, evidently awaiting a further statement.

"I haven't tried to win her love, nor have I told her that I love her, because I knew that in your plans for her future you had never included me. I know what you think about family, and I don't want to make ill return for the courtesy and kindness you and Mr. Winthrop have alweys shown me."

"David, you have one rare trait—gratitude. I did have plans for Carey—plans built on the basis of 'family': but I have learned from you that there are other things, like the trait I mentioned, for instance, that count more than lineage. Before we went abroad I knew Carey was interested in you, with the first flutter of a young girl's fancy, and I was secretly antagonistic to that feeling. But last night, David, I came to feel differently I envied your mother when I read those banners. If I had a son like you, I'd feel honored to take in washing or anything else for him."

At the look of ineffable sadness in his eyes her tears came.

"David," she said gently, after a pause, "if you can win Carey's love, I shall gladly give my consent."

He thanked her incoherently, and was seized with an uncontrollable longing to get away—to be alone with this great, unbelievable happiness. In realization of his mood, she left him under pretext of ordering the luncheon. On her return she found him exuberant, in a flow of spirits and pleasantry.

"Mrs. Winthrop," he said earnestly, as he was taking his departure, "I am not going to tell Carey just yet that I love her."

"As you wish, David. I shall not mention our conversation."

She smiled as the door closed upon him.

"Tell her! I wonder if he doesn't know that every time he looks at her, or speaks her name, he tells her. But I suppose he has some foolish mannish pride about waiting until he is governor."

When David, in a voice vibrant with new-found gladness, finished an eloquent address to a United Band of Workmen, he found Mr. Winthrop waiting for him.

"I was sent to bring you to the hotel to dine with us, David. My wife told me of your conversation."

Noting the look of apprehension in David's eyes, he continued:

"Every time a suitor for Carey has crossed our threshold I've turned cold at the thought of relinquishing my guardianship. With you it is different; I can only quote Carey's childish remark—'with David I would have no afraidments.'"

A touch upon his shoulder prevented David's reply. He turned to find Joe and Fletcher.

"Knowles has been looking for you everywhere. He wants you to come to headquarters at once."

"Is it important?" asked David hesitatingly.

"Important! Knowles! Say, David, have you forgotten that you are running for governor?"

Winthrop laughed appreciatively.

"Go back to Knowles, David, and come to us when you can. We have no iron-clad rules as to hours. Go with him Joe, to be sure he doesn't forget where he is going. Come with me Fletcher."

"It's too late to call now," remonstrated Joe, when David had finally made his escape from headquarters.

David muttered that time was made for slaves, and increased his pace. When they reached the hotel Joe refused to go to the Winthrop's apartment.

David found Carey alone in the sitting room.

"David," she asked, after one glance into his eyes, "what has changed you? Good news from Mr. Knowles?"

"No, Carey," he replied, his eyes growing luminous. "It was something your mother said to me this morning."

"Oh, I am glad. What was it she said?"

"She told me," he evaded, "that you were going to visit the Randalls."

"And that is what makes you look so—cheered?" she persisted.

"No, Carey. May I tell you at two o'clock in the afternoon, the day after election?"

She laughed delightedly.

"That sounds like our childhood days. You used to put notes in the old apple tree—do you remember?—asking Janey and me to meet you two hours before sundown at the end of the picket fence."

Further confidential conversation was prevented by the entrance of the others. Joe had been captured, and Mrs. Winthrop had ordered a supper served in the rooms.

"Carey," asked her mother softly when they were alone that night, "did David tell you what a cozy little luncheon we had?"

"He told me, mother, that you said something to him that made him very happy, but he would not tell me what it was."

Something in her mother's gaze made Carey lift her violets as a shield to her face.

"She knows!" thought Mrs. Winthrop. "But does she care?"

(To be concluded.)

OUR BOYS AND GIRLS

A Little Money Maker

Dear Editor:

You ask us to tell you how we make some money. Last year daddy gave me a little lamb whose mother had died and I fed it with milk out of a bottle. When it was about four months old I turned it in the pasture with the other lambs and it grew fine and this spring it sheared 6 pounds of wool. I got 35 cents a pound—$2.10 for the wool and I put that in the bank. Daddy says the sheep is now worth $8.00 I rode the horse when they were stacking hay and I got 50 cents a day for five days and I put that in the bank too. I had some other money I had earned so I now have $18.50 in my bank account and I want to buy a calf this fall and keep it until it is two years old and fatten it and sell it for $100. Do you think I can do it?

John, Sullivan County.

AN OFFER TO FARMER BOYS

After thinking over the matter for some time we have concluded to make the farmer boys who belong to our "Big Family" the following proposition: For $50.00 worth of subscriptions to The Missouri Farmer we will ship to every boy who procures them for us, a bred gilt, selected from one of the best pure bred Poland China, Duroc, Chester White, Hampshire or Berkshire herds in the state. There won't be any "contest" about it. Farmers receive The Missouri Farmer three years for one dollar—and 50 such subscriptions will win this fine bred gilt. That is all there is to it. All your neighbors will be glad to give you a dollar for three years' subscription to a paper like The Missouri Farmer. They will do it first, because the paper is more than worth the money and because it is fighting their battles. Secondly, they will be glad to help you win this splendid prize.

If you will take good care of the gilt and her litter it will start you in the pure bred hog business and if you will go in "halvers" with your Father you are sure to make some money. We are making this offer not only because we are trying to place The Missouri Farmer in every good farm home in the state but because we want to get our boy friends genuinely interested in the farm. In order to do this we want to help you earn some money. Now we can make this offer to only one farmer boy in each community—so there is no time to lose. You have all summer in which to work—and should you finally fail to get the required number of subscriptions, we will nevertheless pay you a substantial commission on all you do get. So you can't lose. Why not make this gilt and her litter the beginning of a fund which in a few years will pay your way through the Agricultural College or through some other good educational institution? The boys who take advantage of this fine offer will be among the "big farmers" of the future. William Hirth, Publisher,

THE MISSOURI FARMER, Columbia, Mo.

Flossie's First Letter

Dear Editor:

I am greatly interested in the story David Dunne. It is among the best stories I ever read. I like all the characters, especially David I certainly do enjoy reading the letters of this page. I am 13 years old. I live on a farm of 80 acres. I go to the Marion school, and will be in the 8th grade when school begins. This is my first letter to you and I hope to see it in print. Flossie Kincaid.

Likes David and Miss Rhody

To the Editor:

I am a girl twelve years old, and I am in the sixth grade. We have been taking The Missouri Farmer for several months and think it a fine paper. I am interested in the story "David Dunne." The character that I like best is David Dunne and Miss Rhody. I hope The Missouri Farmer will succeed in having a page for the girls and boys. Grace.

Wants to Become a Teacher

To the Editor:

I am a girl fourteen years old. I live on a farm east of Columbia. We have been taking The Missouri Farmer for six months, and think it a fine paper. I am very much interested in the story David Dunne, I like all the characters, but like David and Janie best. I finished country school last year and am going to High School. I am anxious to become a teacher I think it would be nice to have a page for the boys and girls in The Missouri Farmer.

Gertrude Wright.

Enjoys Reading The Missouri Farmer

Dear Editor: Mama and I read David Dunne, we think it is a nice story. I think David is the best of all. I am always glad when the paper comes. A friend sends us The Missouri Farmer and we enjoy reading it.

Mina Butler.

FEDERAL FARM LOANS

We recently gave an outline of the Federal Farm Loan Act which was before Congress and which became a law by the signature of the President on July 17. The object o this law is to enable farmers to borrow money on farm-mortgage security for long time and at a reasonable rate of interest.

There will be two systems by which borrowers may get loans, land banks and joint stock land banks. Both systems will be under the supervision of the Federal Farm Loan Board in the Treasury Department which is composed of the Secretary of the Treasury, ex-officio chairman, and four members appointed by the President. These members have already been appointed and we suppose the regional banks will be organized as soon as possible.

Twelve Federal Land Banks

The United States shall be divided into 12 farm loan districts, and a Federal land bank with a subscribed capital stock of not less than $750,000, each share $5, shall be established in each district. Each Federal land bank may establish branches in its district. Within thirty days after the capital stock is offered for sale it may be purchased at par by anyone. Thereafter, the stock remaining unsold shall be bought by the Secretary of the Treasury for the United States. It is provided, however, that the Government shall not receive any dividends on its stock. Ultimately, it is intended that all the stock in the banks shall be owned by the associations of borrowers, and provision therefore is made in the law for transferring the original stock at par to these associations.

National Farm Loan Associations

The Act provides for the creation of local national farm loan associations through which it is contemplated that the Federal land banks shall make their loans. In the event that a local loan association is not formed in any locality within a year, the Federal Farm Loan Board may authorize a Federal land bank to make loans on farm land through approved agents. Ten or more persons who own and cultivate farm land qualified as security for a mortgage loan under the Act, or who are about to own and cultivate such land, may form such an association, provided the aggregate of the loans desired by the membership is not less than $20,000. Each member must take stock in his association to an amount equivalent to 5 per cent of the amount he wishes to borrow. This stock the association holds in trust as security for the member's individual loan. The association, in turn, when applying for money from the bank, must subscribe for stock in the bank to an amount equivalent to 5 per cent of the sum it wants to obtain for its members. This stock is held in trust by the bank as security for the loans it makes through the association. If a prospective borrower has no money with which to pay for his association stock, he may borrow the price of that stock as a part of the loan on his farm land.

Under this plan, then, every borrower must be a stockholder in his local association, and every association a stockholder in its district bank. Each stockholder in an association is liable for the acts of that association up to twice the amount of his stock.

How Loans Are Obtained

A member of a national farm loan association, before obtaining a loan, must first fill out an application blank supplied to the loan association by the Federal Farm Loan Board. This application blank and other necessary papers will then be referred to a loan committee of the association which must appraise the property offered as security. Such application as is approved by the loan committee is then forwarded to the Federal land bank and must be investigated and reported on by a salaried appraiser of the bank before the loan is granted. This appraiser is required to investigate the solvency and character of the prospective borrower as well as the value of his land. When a loan is granted the amount is forwarded to the borrower through the loan association.

Conditions under which Loans may be Obtained from Federal Land Banks

The Act specifically defines the purposes for which loans may be obtained. These are:

"(a) To provide for the purchase of land for agricultural uses.

"(b) To provide for the purchase of equipment, fertilizers and live stock necessary for the proper and reasonable operation of the mortgaged farm; the term 'equipment' to be defined by the Federal Farm Loan Board.

"(c) To provide buildings and for the improvement of farm lands; the term 'improvement' to be defined by the Federal Farm Loan Board.

"(d) To liquidate indebtedness of the owner of the land mortgaged, existing at the time of the organization of the first national farm loan association established in or for the county in which the land mortgaged is situated, or indebtedness subsequently incurred for one of the purposes mentioned in this section."

Loans may be made only on first mortgages on farm land.

Only those who own and cultivate farm land or are about to own and cultivate such land are entitled to borrow.

No individual can borrow more than $10,000 or less than $100.

No loan may be made for more than 50 per cent of the value of the land mortgaged and 20 per cent of the value of the permanent insured improvements upon it.

The loan must run for not less than five and not more than forty years.

Every mortgage must provide for the repayment of the loan under an amortization plan by means of a fixed number of annual or semi-annual installments sufficient to meet all interest and pay off the debt by the end of the term of the loan. The installments required will be those published in amortization tables to be prepared by the Farm Loan Board.

The bank is given power to protect itself in case of default by recalling the loan in whole or in part or taking other necessary action.

The Interest Rate Paid by the Borrower

No Federal land bank is permitted to charge more than 6 per cent per annum on its farm mortgage loans, and in no case shall the interest charged on farm mortgages exceed by more than one per cent the rate paid on the last issue of bonds.

For example, if the bank pays only 4 per cent on an issue of bonds, it can not charge more than 5 per cent for the next farm loan it makes.

Out of this margin of not to exceed 1 per cent, together with such amounts as it can earn on its paid-in cash capital, the bank must set aside certain reserves and meet all its expenses. Any balance or net profits can be distributed as dividends to the loan associations or other stockholders. The loan associations, from their bank dividends, after setting aside the required reserves and meeting expenses, can declare association dividends to their members. In this way the profits, if any, will be distributed among the borrowers and will, to that extent, reduce the amount of interest actually paid by them.

Amortization Plan of Repaying Loans

The borrowers may get his loan for not less than 5 nor longer than 40 years and must pay the interest and a small payment on the principal every year. A loan for $1,000 made at 5 per cent for 20 years would cost the borrower an annual payment of $80.24 or a total of $1,604.89 to finally extinguish the debt and pay the interest. The man who borrows $1,000 for 20 years at 5 per cent under the ordinary plan would pay besides any commissions $50 a year and would owe the debt at the end of 20 years thus it would require $2,000 to pay the debt. The difference $355.11 is the saving he would make or rather the premium he would get for the small annual payment he makes.

On the amount of capital authorized at the beginning the banks may loan $180,000,000 but by increasing the capital stock more bonds may be sold and the amount of loans increased. The bonds will be issued in denominations of $20, $50, $100, $500 and $1,000 which will make them attractive to any one who has a small amount of money to loan. These bonds will be exempt from taxation of any kind.

THE FARMER'S INCOME

A comparison of the farmer's income with that of other classes of workers is difficult because the farming business has not been entirely reduced to a money basis.

The average farm family has earnings, including house rent and the value of food and fuel supplied by the farm, about equal to those of the average industrial family, but the farmer has the advantage of a much lower cost of living and has, in addition to his earnings, the interest on the money he has invested in his farm business.

The wages of the average farmer are about $600, composed of about $200 in cash and about $400 supplied by the farm. The average wage earner in a factory earns about $460, and the average salaried employee about $1,200. Thus the farmer's wages are higher than those of industrial wage workers but lower than those of salaried employees in industry.

In view of the lower cost of living on the farm and the fact that two-thirds of the farmers have interest in addition to wages, it appears that farmers, as a class, are better off than the majority of persons engaged in other pursuits.

Nature of Farm Business

The business of the farm is so complex and so different in many particulars from that of other enterprises that it is a difficult task to measure the income earned by farmers in terms comparable to incomes of persons in other pursuits. The farmer lives at his place of business and pays no cash rent for the use of his house, while his fields and groves are nearly as much a part of his residence as the rooms in the farm dwelling. The farmer derives two-thirds of his food and fuel from the farm and pays no cash for them. When a value is placed on these items it is a wholesale farm value, which is much less than the price paid for the same articles by the city dweller, who has to pay in addition a series of transportation charges, commissions, and profits of middlemen. Furthermore, the products supplied by the farm are generally superior in quality to those obtained at groceries by the average city dweller. It is impossible, however, to place a correct money valuation on this difference.

The farm owner's capital is his farm. This includes not only his real-estate investment but also his entire working capital. The farm generally represents all of his savings and the inherited savings of his ancestors. The income derived from the farm is composed, from his point of view, of four different elements—the cash earnings of the farm family during the year under consideration, the living supplied by the farm, the annual return on the accumulated savings of his forbears.

In comparing the farmer with the city man who draws a weekly wage for his labor and spends it in providing the necessities of life for his family, the outstanding difficulty involved is the fact that the farm business has as yet not been reduced altogether to a money basis. The city man sells his labor for money and buys all he consumes at the cost of money. He invests whatever savings he may have or whatever capital he may have inherited in enterprises that often have no connection whatever with his own activities. In other words, the city man's life has been entirely reduced to a commercial basis, his income and outgo may be measured in terms of the medium of exchange, while the farm is still to a large extent a self-sufficient unit producing values not all of which have been reduced to exchange prices and an income that contains elements measurable only by the amount of satisfaction derived by the owner.

Earnings of Farm Family

It is estimated on the basis of the census figures that the total value of crops produced in 1909 by the 6,362,000 farmers in the United States and not fed to live stock amounted to about $3,250,000,000. The value of the live-stock products of the farms was $1,125,000,000, and the value of animals sold and animals slaughtered on farms, $1,833,000,000. The total gross income derived by farmers from all these sources was about $6,208,000,000, or $976 per farm. In this item are included such portions of the farm products consumed at the home farms as the census enumerator was able to estimate, but the total falls short of the full amount of the farmer's income by the omission of the milk and cream consumed on the home farm and of a large proportion of the vegetables, fruit, and poultry. Furthermore, the figure includes no allowance for the fuel and use of the house. The aggregate of these additional items has been estimated at $1,654,000,000, or $260 per farm, making a total gross income of $1,236 per farm. Out of this gross income the average farmer pays $512 in farm expenses, including labor, fertilizers, feed, animals purchased, etc., and the cost of repairs and depreciation charges, leaving a net earning of $724 available for family expenses, payments on mortgage, and savings. After deducting interest on the investment at 5 per cent ($322), there is left $402, the income produced by the labor of the farm family.—E. A. Goldenweiser, U. S. Department of Agriculture.

THE PACKER PLAYS SAFE

During the last two weeks the Packer's Combine pounded down the price of Beef Cattle approximately $1.50 per hundred. Simultaneously they announced with a flare of trumpets that they had reduced the wholesale price of dressed beef 2 cents per lb. to the retail butchers of the Country. In other words, the reduction in the wholesale price of meat was the pretext upon which they pounded the live stock producer.

Now lets see how this works out: A reduction of $1.50 per hundred to the cattle shipper meant a loss of $15.00 on every 1000 lb. steer. A 1000 lb. steer will dress out approximately 550 lbs.—and a reduction of 2 cents per lb. in the wholesale price means $11.00. So the Packers have $4.00 more in profits on every 1000 lb. steer today than they had before they pouded the price to the producer or reduced it to the consumer. In other words, the Packers never make a move that doesn't put more money into their till—and once more I ask, how much longer will the farmers of this Country stand for this kind of a deal?

Wanted Stock or Dairy Farm

I want to lease a fully stocked farm or dairy big enough for my own force. I have four farm raised boys and we are up-to-date and mean business. Prefer share basis and possession at once. Can furnish best of references. If you have a good stock farm or dairy and are looking for somebody who will sincerely try to make money for you and for himself, write to W. C. J., care of The Missouri Farmer, Columbia, Mo.

Farm Manager Wanted

I want a high class man capable of managing a fine 320 acre farm and will pay good money to the right man. Must have a good head on him, be willing to buckle down to hard work and know how to handle all kinds of farm machinery and how to feed live stock. This is an unusual opportunity for a young married farmer. A steady and intelligent young German preferred. No "clod hopper" can fill the bill. Write to H. J., care of The Missouri Farmer, Columbia, Mo.

Farmer organization is the only hope for deliverance from the intolerable manipulated markets which exist at this time. How much longer are you and your eighbors going to stand for it?

THE COMMON GOOD

There is a principle involved, in this, that relates to character building. Until a sufficient number of men and women are unselfishly inspired to protect our civilization and promote a better one, without reference to compensation, other than a living that by habit they are accustomed to, if such compensation is needed, governments will continue to dissolve and evil thrive. A desire to promote the Common Good must permeate the multitude, before we can stay the devastating forces in evil character that are destroying us.

Too many are trying to pluck the Common Good. The commonly accepted idea is that the Common Good —our civilization—will take care of itself. That it will stand being neglected and being imposed upon. The question is too often asked, "What is there in it for me?" And to pluck the Common Good, to graft on it and to get out of it for oneself as much as possible, giving as little as possible in return, is the practice of too many.

We are in an era where too few appreciate, That man serves himself best by promoting the Common Good.

When a sufficient number exist, each trying to benefit self by neglecting or imposing on the Common Good, there will come an end to free government and to civilization. They will tear out the pillars from under the Temple of Civilization and it will all come down on our heads—as in Mexico and in twelve other nations where it is now a pile of ruins.

On one occasion, a road overseer going to his field to work took with him a plank to replace a broken plank in a culvert that he would cross in the road. He put the new plank in the culvert and worked in his field all day for himself, then charged and received pay for a day's work on the road. This illustrates how the Common Good, that should be of first and prime considration, is plucked. I have known the officers of a railroad, when the employees of the government were weighing the mail in transit to establish the yearly average on which to fix the railway company's compensation, to load the mails with everything they could get their hands on that was mailable.

This same disposition, practiced generally, signals the falling in of the Temple on our heads.

Washington gave eight years of his life to the Common Good, as Commander-in-Chief of the American army and refused any compensation for it. Many others did the same. Where are their prototypes today? Now they not only want pay for their services, but a pension for life thereafter, till the country is bled by taxation for hundreds of millions of dollars to pay pensions to able-bodied men, who in their old age are as healthy as you and I. We have one instance of a United States Senator who is doing this. I do not mean to include in this, those who have served their country and are needy—who deserve to be pensioned—but to the tens of thousands who are drawing pensions unjustly, the number unprecedented in the history of nations.

A new era, however, and fortunately, is beginning by men who are now coming to the front, promoting their personal happiness by giving of their time and money to promote the general welfare.

In Jasper County, Missouri, they have road district commissioners to handle and manage the road fund and road work, who charge nothing for their services—men who have an earnest desire to see the Common Good benefited in this respect—and Jasper County under their management has more good roads, probably than any other county in the United States. This movement is spreading in Missouri, now has legal recognition, and in each instance means more roads and better roads—men who are able to do so are emulating the immortal example of Washington.

There is a proper time and place for accepting pay for services performed for the Common Good. The one who needs it for his maintenance, if he earns it, should receive. Those who are able to help promote the Common Good without pay, should find pleasure, happiness and contentment in so doing.

All should do something. The poor man, who can not do more, who gives a day's work helping to make a good road, is doing his part. He who does not find pleasure in making a better world here on earth, is not fitted by character for a paradise in another world. All character may be measured by one's desire or disinclination to promote the Common Good. A desire in one to promote a better civilization is the key that will unlock the door in the Temple in which is stored the treasures of character. Such a person will be unselfish, with mind devoid of false pride and prejudices.

Wm. H. Harvey.

By Old Jim Riley

All I am tryin' to do is to hold onto my old pa'm leaf fan until that rain which old Doc Hicks has promised to send around the first of August gits here. If Doc goes back on me this time, th' only other thing left I know of is th' ice house.

ARE YOUR CHICKS DOING WELL?

If, for no apparent reason, there is a lack of thrift among your young chicks, perhaps the cause is lice, or worms in the intestines. Examine the chicks about the head for head lice. Lice are more likely to be present on hen-raised chicks. If lice are found grease the heads of the chicks with lard which is free from salt. Do not use lard and sulphur. Apply the lard with the finger, rubbing the head, neck, under the wings, and around the vent. The brooding hen should also be treated. One of the best methods of exterminating lice on the mature fowl is to rub a piece of blue ointment, the size of a pea, into the skin just beneath the vent, and also under each wing. Do not daub it on, but rub it well into the skin, as blue ointment is very poisonous and will kill the hen if she gets some of it into her mouth.

If no lice are found, carefully examine the intestines of a dead chick for intestinal parasites, such as tapeworms or round worms. If worms of any kind are found, the chicks should be treated and removed to fresh ground where there are no worms in the soil. As long as the chicks remain on the old runs the danger of contamination is always present.

To treat for intestinal parasites feed should be withheld for twelve hours, and one of the following remedies given:

Powdered areca nut 30 to 45 grains for an adult bird.
Powdered areca nut 15 grains for immature chicks.

This can be mixed in a wet mash and fed so that each gets an equal amount. It can be fed to older birds in capsules which can be forced down the gullet.

Turpentine, 1 to 3 teaspoonfuls, depending upon the age of the bird, is also effective. It can be made less severe by mixing with an equal amount of cottonseed oil, but if ineffective, should be used full strength. The best method of giving turpentine is by forcing it through a small flexible catheter that has been oiled and is passed through the throat into the crop.

Good results have been reported also with the use of tobacco dust, using 5 to 10 grains to a bird. This can also be fed in a wet mash.

The droppings containing the worms should be burned or buried deep to prevent the chickens from picking them up.—H. L. Kempster.

BUY YOUR SILO NOW

The Dickey Silo

is salt-glazed and vitrified, like a jug or your milk crock. Four walls, three dead air spaces. Thirty years of knowing how is worked into each and every block. We give you written guarantee to protect you.

The Dickey Silo is the kind you want on your farm; because it will last forever. No paint—no plaster needed to make it tight; the glaze and vitrification (glass like) takes care of that.

Buy It Now! Pay Later

Save yourself against loss of crops by having Silo ready to use if drouth and hot winds come.

We Can Ship at Once

We can send you an experienced mason to erect the Silo.

Send for our book telling why the Dickey Silo—Salt-Glazed—Vitrified—is better than all other kinds. Read what the man says who owns one. Compare the Dickey Glazed Silo with all others. If you do, you will buy the Dickey.

Let us know about what size silo you want, and we will quote you prices. Complete instructions with blue prints—everything you need to begin building at once.

Dickey Clay Mfg. Co.
204 Silo Dept. Kansas City, Mo.

A DOLLAR AND A HALF A HEN

There is profit in keeping a good poultry flock. This was shown by a flock of White Leghorn pullets at the University of Missouri. From 50 to 60 birds were housed in an open front poultry house with a yard 100 feet square which was sowed to wheat in the fall. This furnished green food in the late fall and early spring and was not charged against their feed bill.

In a year's time the fowls consumed 2,693 pounds of grain and 962 pounds of mash. The total cost of the feed was $66.27. In estimating this cost the following prices per 100 pounds were used; wheat $1.66; corn, $1.60; bran, $1.20; corn-meal, $1.75; shorts, $1.40; and beef scraps, $3.25. These prices are higher than the feed would bring if sold by the farmer, but at that the flock returned a good profit. They produced a total of 8,057 eggs at a food cost of 10½ cents a dozen. At the prevailing prices the eggs sold for $157.17, thus giving a total profit of $90.90. The results per month were as follows:

Month	Eggs	Per cent production per month	Eggs in dozens	Price per dozen	Value
Nov.	337	4.1	28.1	.30	$ 8.42
Dec.	215	2.6	18	.35	6.30
Jan.	300	3.7	25	.40	10.00
Feb.	552	6.85	46	.30	13.80
Mar.	993	12.3	82.7	.25	20.69
Apr.	1124	13.9	95.3	.20	19.07
May	1005	12.44	83.7	.20	16.75
June	921	11.81	76.7	.20	15.35
July	1059	13.1	88.2	.20	17.65
Aug.	880	10.9	73.2	.20	14.65
Sept.	478	5.9	40	.25	9.95
Oct.	193	2.4	15.2	.30	4.57
Total	8057	100%	671.4	Av.23.4	$157.17

At an average price of 23.4 cents a dozen the hens returned a profit of a dollar and a half apiece above the cost of feed. Even at an average price of 20 cents a dozen the hens doubled the value of the feed.

They were fed as a scratch food a mixture of two parts cracked corn and one part wheat. The mash consisted of equal parts of bran, shorts, corn-meal, and beef scrap. Grit, oyster shell, and water were kept before the birds all the time.—H. L. Kempster, Missouri College of Agriculture.

Suburban Home for Sale

A nice home consisting of 17 acres in the suburbs of Columbia, Mo.—5 room house, good outbuildings, young orchard, good shade and water. Located within half mile of city. This is a fine chance for those who desire to educate children in the University of Missouri. Write for further particulars and price to The Missouri Farmer, Columbia, Mo.

Stop Crop De-struction

Solve the drainage problem. Write for free book and letters from hundreds of farmers telling what they do with the Martin.

The Martin O.D.&G.Co.
Farm Ditcher and Road Grader
cuts ditches, throws up terraces, levels bumps, fills gullies, makes levees, builds roads. All-steel, adjustable and reversible for wide and narrow cutting. 10 days' trial. Money back guarantee.
Owensboro Ditcher and Grader Co., Inc., Box 311, Owensboro, Ky.
Branch: Traders Building, Kansas City, Mo.

Overhauling Typewriters Rebuilding

To the typewriter owners who are located in the smaller towns in the state of Missouri, and who do not have the advantages of the city in having a typewriter Mechanical Department near at hand, this advertisement is to advise you that our agents cover the entire state and do repairing, overhauling and rebuilding in your own town without the necessity of boxing your machine and shipping it in. All work done under a guarantee of satisfaction or no charge. Kindly write for further information.

American Typewriter Rebuilding Co.
Kansas City, Missouri.

Learn Telegraphy

80 miles north of St. Joseph, Mo.

If you believe in the fight which THE FARMER is making for the organization of Farm Clubs, why not write to us for a suitable Constitution and By-Laws and then get your neighbors together and get down to business? Why not join hands with the splendid work which thousands of farmers are doing in other parts of the state?

Live Stock Notes

R. P. ROYCE, Fieldman

Adenhill Farm Durocs

In regard to the Durocs now in offer by R. L. Hill, Columbia, Mo., this well known breeder has the following to say:

Just at this time we have several good yearling gilts, and a number of good fall gilts, all bred for fall litters, and these are doing nicely, running on rape and alfalfa, and getting a good lot of feed. They are well grown, in good breeding condition, and are going to make big sows at maturity, for they are sired by big boars and out of big prolific sows. Sows and gilts bred for fall farrow are going to be scarce, and we only have a few to offer and we are pricing them very reasonable. Will be glad to have inquiries for these, as we are anxious to see them go into good hands.

Our spring pigs are growing rapidly, and we are now offering about twenty-five good spring boars, sired by such boars as Col. Wonder II., our big 2nd prize boar at the Mo. State Fair, 1913, sired by the grand champion that year, and a litter mate to the 1914 grand champion sow. We have some boars by Golden Tat, one of the good big sons of the reserve grand champion Tatarrax Again, and also a few good boars sired by Missouri Valley Chief. These boars are priced reasonably, according to their age, and they will make big boars at maturity, with lots of stretch, plenty of bone, and quality to spare.. At this season of the year these spring boars can be purchased cheaper than at any other time, the best pigs are offered for sale, they can be shipped for less money now than at any other time.

We guarantee satisfaction on these boars and the bred gilts and if the purchaser is not pleased with what we ship him he does not have to accept the hog.

Splendid Shorthorn Bull Value

Elsewhere in this issue appears the advertisement of Nelson Cole, Brashear, Mo., in which he offers for sale his Shorthorn herd bull, Imperial Knight 353519. This bull was calved March 19, 1911, he is by Flower Knight 264126 out of Orange Crest 2nd by Lavender Viceroy. This bull is well bred, of excellent type, and will weigh around 1800 pounds in just breeding condition. He has given good account of himself in the Cole herd and is being offered for sale because Mr. Cole plans to keep a number of his daughters. Here is a good chance for some one to buy a well bred bull worth the money.

Shropshire Bucks

Hugh Whiteford, the well known Hereford breeder of Guilford, Mo., offers our readers some excellent values in pure bred and high grade Shropshire bucks. The four year old registered buck is one of the best in the state and is highly recommended by Mr. Whiteford. The grade yearling bucks are all out of choice ewes and are of the type most sought after by discriminating sheep men. Our readers can always depend on getting a square deal from Mr. Whiteford and will find his stock to be just as represented, or better.

Missouri Hampshire Breeders to Stage Free Sale August 8th

On August 8 the Missouri Hampshire Breeder's Association will hold the first free sale ever held in the history of the breed. The sale will be held at St. Joseph, Mo.

This sale is the first of a series planned and backed by the Hampshire Record Association, for the purpose of bringing this popular breed before the public in a strong way.

The leading Missouri breeders have agreed to furnish one hundred head of exceptionally high class boars and sows. Fifty per cent of the selling price goes to the breeder, ten per cent goes to the Missouri Association, and forty per cent will be used as premium money at the National Swine Show at Omaha and other important fairs and shows. All advertising, auction fees, and other sale expenses, are donated free. The management of the sale has exercised great care in getting together a superior consignment and prospective purchasers are assured of having a very unusual lot to bid on. When it is stated that the foremost breeders of this state are consigning top animals, an idea is given as to the quality of the offering, for, be it remembered that Missouri has some of the greatest sires the breed has ever produced.

Our readers are urged to keep the date, August 8th, in mind, and to arrange to attend this very unusual sale. Any further information may be obtained by writing Col. Thos. E. Deem, Cameron, Mo.

TANKAGE, CORN, AND WHEAT FOR HOGS ON PASTURE

In experiments recently conducted at the Missouri Agricultural Experiment Station and published in Bulletin 136 it was found that more rapid gains were made by hogs fed tankage in addition to wheat or corn or both than if the tankage was omitted. Whether the gains were more economical depended on the quality of the tankage and the price it was necessary to pay for it. If part or all of the grain ration was wheat the gains were both more rapid and more economical than if corn was the only grain fed.

For the 120-day feeding period the wheat-fed hogs made an average daily gain of one pound and a quarter a head a day as compared with one pound for the corn-fed hogs. It required 582 pounds of corn for every 100 pounds gained but only 483 pounds of wheat. Apparently the more exclusively the ration was made up of wheat the more efficient it was, for a mixture of equal parts of wheat and corn proved more efficient than corn alone both for low cost of gains and for rate of gain but the mixture was less efficient than wheat alone.

Tankage added to the feed increased the rate of gain and reduced the amount of grain required to produce a hundred pounds of gain. This increase in gain was much more pronounced, however, during the first 78 days of the 120-day feed than during the last 42 days. Results indicate that it would be profitable to feed tankage to fattening hogs for the entire feeding period when corn was used but only for the first 78-day period when wheat was fed. While the addition of tankage to the wheat ration increased the rate of gain during the last 42 days of the 120-day feeding period, this increase was hardly enough to warrant the increase made in the price of the ration due to the addition of the tankage.

TEMPERATURE IN THE SILO

Every one who has used a silo has observed that at times the silage becomes hot. This is generally noticed on the surface during mild weather as when the silage is being fed in rather small quantities. Many have supposed that the entire mass of silage becomes very hot and that a certain amount of heat is necessary to preserve it. Agents of various types of silos have also taken advantage of the lack of general information on this subject to make claims for or against certain types of silo on the ground that the temperature of the silage is influenced by the particular construction.

The Missouri Experiment Station decided two years ago to get the facts. Electric thermometers were placed in silos to take the temperatures. A bulb was placed in the silo during filling at any point where it was desirable to take the temperature. This bulb had wires leading to the outside of the silo so the temperature could be taken with an electrical device at any time. Temperature readings were taken near the center of the silage mass and at the wall at frequent itervals during two seasons in from 8 to 10 silos including stave, iron, tile, Gurler and concrete.

It was found that the temperature in the depth of the silage is never high as is so often thought. After filling, the temperature rises from 5 to 10 degrees the first few days and then slowly declines during the fall and winter until it reaches the lowest point, about 40 degrees, in March. In good silage the temperature seldom goes more than a few degrees if any above 100 F. and may not go above 90. The only high temperatures found are at the surface when the air comes in contact with silage. Furthermore a temperature much above 100 means loss of silage as some of the material is being actually burned to make the heat. Mould will raise the temperature some. Corn put in the silo in a mature condition develops more heat than that put in green. No relation was found between the material used in the construction of the silo and the temperature of the silage. Practically no difference in the freezing of the silage on the wall was observed with the different kinds of silos.

No one in the climate of Missouri at least, need hesitate to choose whichever type of construction he prefers on account of any fear regarding the temperature or freezing of the silage. —C. H. Eckles, Missouri Agricultural Experiment Station.

Appointment of Committee on Live Stock Sanitary Affairs

The Secretary of Agriculture has appointed the following named members of the Bureau of Animal Industry as an advisory committee on Live Stock Sanitary Affairs: Dr. A. D. Melvin, Chief of the Bureau of Animal Industry, chairman; Mr. Geo. M. Rommel, Chief, Animal Husbandry Division, Bureau of Animal Industry; Mr. B. H. Rawl, Chief, Dairy Division, Bureau of Animal Industry; Dr. R. A. Ramsey, Chief, Field Inspection Division, Bureau of Animal Industry; Dr. R. W. Hickman, Chief, Quarantine Division, Bureau of Animal Industry.

The committee will act in an advisory capacity on all live stock sanitary questions and will consider such matters as may be referred to it by the chairman or the secretary. Also on its own initiative it will consider related questions, suggest means for the control and eradication of animal diseases, and recommend such measures as seem best suited for live stock sanitary control work and for the gneeral welfare of the animal industry.—U. S. Dept. of Agr.

POLAND CHINAS

Smooth Columbus
THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.
BENNETT BROS. R. 5. LEE'S SUMMIT, MO

Spring Boars by the Grand Champion
A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.
WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns
Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.
H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS
We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.
W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands
I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.
H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS
Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.
EDGAR DOOLEY, - Etterville, Mo.

DUROC JERSEYS

Durocs With Size and Bone
I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.
A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

Adenhill Duroc Boar and Gilt Bargains
I can supply readers of this paper with choice yearling gilts bred for fall farrow. Also extra good spring boars. My Durocs are noted for size and quality. Satisfaction guaranteed. Inquiries gladly answered.
R. L. (BOB) HILL, ADENHILL FARM, - - COLUMBIA, MO.

BREED DAYS AT SOUTHWESTERN DAIRY SHOW

The Southwestern Dairy Show Association have designated Monday, September 18th as Brown Swiss Day; Tuesday, September 19th, Ayrshire Day; Wednesday, September 20th, Guernsey Day; Thursday Septemoer 21st, Jersey Day; Friday, September 22nd, as Holstein Day, at their first annual exhibition of dairy stock, dairy products and dairy machinery and equipment, to be held in Convention Hall, Kansas City, Missouri, September 18th to 23rd, inclusive.

On these particular days the local and state breeders' association will hold their meetings. The Southwest Jersey Cattle Breeders Association, Mid-west Guernsey Breeders' Association, State Holstein Breeders Association, are planning special programs for their respective days.

Special breed trophies have been donated by the Holstein-Freisian Association, American Jersey Cattle Club, Ayrshire Breeders Association, Southwest Jersey Cattle Breeders' Associaton, State Holstein Breeders Association, the J. R. Mercer Jewelry Company of Kansas City and J. G. Watson of Kansas City.

Special mention is made of trophies presented by the American Jersey Cattle Club. These trophies are replicas of the famous Warwick Vase. The design is famous and the cups are valued at $100.00 each. The trophies are presented for the grand champion Jersey bull and grand champion Jersey cow, at the Southwestern Dairy Show.

NEW SHIPPING RATES FOR PURE BRED LIVESTOCK

The Interstate Commerce Commission handed down a decision July 20, establishing new shipping rates and regulations governing the transportation of pure bred livestock. The decision was the direct result of a complaint made by the National Society of Record Associations, representing 100,000 pure bred livestock breeders, against practically all the railroads of the country.

Minimum weights were fixed for the computation of freight rates on cattle, sheep and swine, and it was orde that the liability of carriers should be on the following basis:

Horse or mule, $150; colt, ox or bull, $75; cow, $50; calf, $20; hog, $15; sheep or goat, $5.

In the case of shippers desiring to declare higher values, the commission held railroads are justified in charging an additional 2 per cent on the rate for each 50 per cent or fraction above the standard value.

Higher charges for crated stock than for uncrated and rules requiring shippers to furnish attendants were found unreasonable and ordered discontinued.

CARE OF HORSES IN HOT WEATHER

The Boston Work-Horse Relief Association has prepared the following rules for the care of horses during hot weather. If every horse owner would put into practice these simp rules, he would get more efficient service from his horses.

Load lightly, and drive slowly.

Stop in the shade if possible.

Water your horse as often as possible. So long as a horse is working, water in small quantities will not hurt him. But let him drink only a few swallows if he is going to stand still. Do not fail to water him at night after he has eaten his hay.

When he comes in after work, sponge off the harnes marks and sweat, his eyes, his nose and mouth, and the dock. Wash his feet but not his legs.

If the thermometer is 75 degrees or higher, wipe him all over with a damp sponge. Use vinegar water if possible. Do not turn the hose on him.

Saturday night, give a bran mash, lukewarm; and add a tablespoonful of saltpetre.

Do not use a horse-hat, unless it is a canopy-top hat. The ordinary bell-shaped hat does more harm than good.

A sponge on top of the head, or even a cloth, is good if kept wet. If dry it is worse than nothing.

If the horse is overcome by heat, get him into the shade, remove harness and bridle, wash out his mouth, sponge him all over, shower his legs, and give him two ounces of aromatic spirits of ammonia, or two ounces of sweet spirits of nitre, in a pint of water; or give him a pint of coffee warm. Cool his head at once, using cold water, or if necessary, chopped ice, wrapped in a cloth.

If the horse is off his feed, try him with two quarts of oats mixed with bran, and a little water; and add a little salt or sugar. Or give him oatmeal gruel or barley water to drink.

Watch your horse. If he stops sweating suddenly, or if he breathes short and quick, or if his ears droop, or if he stands with his legs braced sideways, he is in danger of a heat or sun stroke and needs attention at once.

If it is so hot that the horse swe in the stable at night, tie him outside, with bedding under him. Unless he cools off during the night, he cannot well stand the next day's heat.

STAY WITH ONE BREED

It is surprising to observe how many stock farmers have been inclined, after having bred grade cattle for a considerable number of years, usually of Shorthorn blood, to use upon thes females a cross of some other breed. The writer has known a number instances of herds having been graded up in Shorthorn blood for a period of ten to twenty-five years and then all of these years' efforts abandoned by the introduction of a sire of another breed. In some cases, the first cross on such a foundation appears entir satisfactory, but the later crosses are less reliable and in a large percentage of cases, prove a disappointment.

It takes years to grade up a herd, and when this is done by the continuous use of registered sires of any breed the results show a steady improvement, assuming the sires used to be of a higher standard than the foundation females. After a few such crosses are made, the herd becomes for all practical purposes as useful as a full blood herd; but when a cross of another breed is introduced, further improvement becomes uncertain. It opposes an established law of heredity and that breeder is doomed to disappointment who runs counter to this law.

It is unfortunate that this practice has been more or less frequent. Yet, experience teaches that the breeder of grade herds who expects to make progress has only one practical course open and that the use of sires of one breed and of meritorious ancestry and individuality. Remarkable results have been obtained in the British Isles where many high grade herds of Shorthorns are maintained both for dairy and beef purposes that compare favorably in individual excellence with the standard of the registered herds. This has been accomplished by the careful and continuous selection of Shorthorn sires and the gradual elimination of the undesirable blood.

Frank D. Tomson.

$50,000 SUBSCRIBED TO INAUGURATE NATIONAL ADVERTISING OF DAIRY PRODUCTS

A fund of $50,000 has been subscribed by men prominent in the dairy industry for the preliminary work of the big national advertising campaign to increase the production and consumption of milk, butter, buttermilk, cheese, and ice cream.

Advertisements are in preparation and will shortly appear in the Saturday Evening Post and other national magazines, in such newspapers as the New York Times, Chicago Tribune, Philadelphia North American, St. Louis Globe-Democrat, Boston Post, Cleveland Plain Dealer, Detroit Free Press, and others.

It is proposed to raise a total fund of at least $750,000 to cover a complete campaign of 3 years and to expend in advertising, general publicity, and organization work approximately $20,000 a month for 36 months.

The godfathers of this extensive, powerful, and beneficial project are enthusiastic in their belief that this step means the full realization of the object of the National Dairy Council, now counting 280,000 members, "to advance the cause of dairying in America by promoting the dairy cow and all interests dependent upon her, through co-operative and united effort."

All now depends upon the support given the execution of this plan by the individual members of the industry. And the broad-guaged underwriters to the preliminary fund are confident that their enterprise and liberality in financing the opening campaign will electrify producer, manufacturer, distributor, and consumer alike and that the big fund of $750,000 will be promptly subscribed.

It is believed that the wonderful results obtained through co-operation in the orange and raisin industries, in the lumber and cement industries and others will be equaled and surpassed; that the American cow and all dependent upon her will, at last, come into her own, and that the dairy industry will quickly be placed in the very front rank of modernized, closely organized and highly efficient institutions.

The cow, the milk producer, the buttermaker, the cheesemaker, the ice cream manufacturer, the distributor will now have a sponsor armed to the teeth to combat inimical interests, stop misrepresentation, spread information and education, and heighten the standard, the prestige, and profit of the industry at large.

And the great American people and public will be benefited in its health and its pocketbook.

Over and beyond all that, the success of the campaign must solve the Nation's most troubling agricultural problem—the fertility of its soil, and ward off the impending danger of its loss of standing among the nations of the world as the standard bearer of agriculture.

Battles are won not by wishbone, but by backbone—with men, money and machinery, and the dairy industry is to be congratulated upon the acquisition of a fighting machine to thwart its foes and secure its rightful place in the sun. What is your contribution to the war chest?

W. E. Skinner, Secretary.

Lambs in the Cornfield

We wean our lambs about the first of July or even earlier at the Missouri Agricultural Experiment Station, but do not turn them into the cornfield until late in August or early in September when the forage has passed the "watery and washy" stage.

It is better to turn the lambs into the cornfield only an hour or so in the evening the first time and a little longer each day for three or four days, after which they can be left in the cornfield without further danger from the new feed.

Lambs will make more profitable gains in a cornfield in which cow-peas have been sown.—H. Hackedorn, Missouri College of Agricluture.

Know Your Cows

Don't be satisfied if the average milk yield from your herd is fairly good. Many cows board at the expense of the high-producing members of the herd. Success on the dairy farm depends on weeding out all these star boarders and keeping only the cows that more than pay their way.

The only way to be sure which cows really do pay is by keeping careful record of the amount of milk given by each cow in the herd, and the amount of butter fat her milk contains as shown by the Babcock test. The test should be made fairly frequently but the milk given and the feed used should be recorded every day. Circular 57 which is distributed free by the Missouri Agricultural Experiment Station shows how easy it is to keep the necessary records.—L. W. Wing, Jr., Missouri College of Agriculture.

Status of Horse Industry

Up to May 1 since the war in Europe began the United States has exported 593,136 horses, valued at more than $130,000,000, and 158,154 mules, valued at more than $32,000,000. Foreign nations are buying more heavily than ever before. In addition to that the United States government on June 26 opened bids for more than 60,000 mules and horses for its army.

Tried Shorthorn Bull

I offer for sale at reasonable price my herd bull, Imperial Knight 353519. Red, five years old. Splendid sire. Am keeping his daughters. Weight between 1800 and 2000 lbs. Good disposition.

NELSON COLE, - Brashear, Mo.

JERSEY CATTLE

JERSEY CATTLE

Bulls ready for service, They are sired by the Owl's Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

JERSEY BULL CALVES

I have three extra fine ones for sale. Sired by Stockwells Champion. He has won 29 first and Champion ribbons at the leading State Fairs. Calves are out of very high producing cows. For breeding, etc., writ.

J. B. SMITH Platte City, Mo.

SUNSET CORRECT TYPE JERSEYS

To keep our herd within 100 head we will offer at private sale fifty Jerseys, consisting of cows, bred and open heifers, young bulls, heifer and bull calves. Can fit out small herds for beginners. 125 head to select from. The famous Blue Belle-Golden Rosebays. Send for special circular before buying elsewhere. Bargains. Mention your wants.

THE ENNIS STOCK & DAIRY FARM, Horine, Mo. (Just south of St. Louis.)

FARMER BOYS ATTENTION!

Here is Great News for You

A Bank Account of Your Own!

HERE IS A GREAT AND SPLENDID OPPORTUNITY!

SEVERAL WEEKS ago we announced that we would present a fine bred gilt to every farmer boy who sends us $50.00 worth of subscriptions to THE MISSOURI FARMER between the time the announcement was made and November 1st —and we have never made an offer which has aroused more interest and dozens of bright farmer boys are already at work, while fresh inquiries are coming in on every mail. This offer is open to any farmer boy in the state and all you have to do is to get 50 farmers in your neighborhood to give you a dollar each for three years subscription to THE MISSOURI FARMER when we will ship you a bred gilt selected from among the best pure bred herds in the state. You can select either a Duroc, Poland China, Berkshire, Chester White or Hampshire gilt—whichever breed you like best and between now and November 1st I want

ONE THOUSAND MISSOURI FARMER BOYS

to **make good** on this great offer. If you take good care of the gilt and her litter of pigs they will start you in the pure bred hog business and enable you to make a lot of money. You can go "halvers" with your Father in the profits—or maybe he will let you keep them all and soon you will have a nice bank account which will enable you to pay your way through College later on or build up a "nest egg" with which to buy a farm of your own some day. Now I am mighty serious about this proposition. The farmer boys of today will be the farmers of tomorrow. Upon their shoulders will rest the responsibility of citizenship—and therefore the sooner you have definite aims in life the better for yourself and for the great Country of which you are a part and which has a right to expect you **to become a real man and play a man's part in the World's work.** That's why I want you pitch in and win one of these fine gilts—for it will give you a greater interest in your Father's farm **and teach you how to become a business man in your own right.** Now just think how fine it would be to have a bank account **of your own** so that when you want to buy something which will add to your happiness you will not have to ask someone else for the money!

Get Busy at Once:

Now think this proposition over carefully. Talk it over with your Father—then if he is willing for you to win one of these fine pure bred gilts—which I am sure he will be—write me at once for a bunch of samplecopies and subscription receipts—**and then pull off your coat, grit your teeth, and go in to win!** No doubt you can sit down right now and think of 25 farmers who will be glad to give you a dollar for three years subscription to a fine paper like THE MISSOURI FARMER—and with a good stiff fight during the next three months you can easily round up the balance. Go to every one of your neighbors and show them a sample copy of the paper. Tell them that it is the **best farm paper in Missouri!**—that its Managing Editor is Geo. B. Ellis who for years was Secretary of the Missouri State Board of Agriculture and who understands Missouri farm problems and conditions better than any man living—that it is their **home farm paper** and that they ought to read it in preference to farm papers published outside the state which do not understand Missouri farm conditions first hand—**and then tell them that you want them to help you win one of these fine gilts—and seven out of ten will do so gladly because everybody is anxious to help a boy who is a hustler!** Don't forget this last point, for it is the truth. That is where we got the splendid adage that the "Lord helps those who help themselves." Now make up your mind right away and write me **before some other boy gets your territory!** The boy who writes first gets the first chance in his neighborhood—**so fill out the blank below and mail it today!**

To Our Subscribers:

If there is a boy in your family please call his attention to this splendid offer. If there is not, then I will take it as a great personal favor if you will bring this to the attention of some bright farmer boy in your neighborhood. It is a chance to do good.

DON'T GET DOWN HEARTED

Once more we have been compelled to go through a drouth which has withered up thousands of corn fields and turned the rich pastures of a few weeks ago brown and barren—and what this means to the farmers of Missouri is nowhere better understood than in the office of THE MISSOURI FARMER from which we have watched with sinking heart the drouths of 1911, 1913, 1914, and the floods of 1915. In fact, except for the big corn crop of 1912, there has not been a single normal, bountiful year during the last six—and yet, discouraging as these things are, none of us can afford to get down hearted—for, after all, the most of us have much to be thankful for if the good Lord has permitted ourselves and our loved ones to remain in good health. And this last point is a mighty important one during these intensely hot summer days when everybody should be on guard against typhoid fever and other ailments which are deadly, once they find lodgment in the human system. To this end, be sure that your water supply is pure and unpolluted—that no filth of any kind from any source can get into the cistern. In fact, while I am no physician, I think I would boil every ounce of water before it passed the lips of a single individual in the household—for herein lies safety and one cannot be too careful. And then, make war on the deadly fly. Destroy its breeding places in the barns and elsewhere. Keep the farm home premises absolutely clean. Prevent the flies from touching a single morsel of food—and to this end, the house must be well screened and the fly swatter brought into frequent play. Giving this kind of advice is a little out of my line—and I am doing it only for lack of someone who can deal with the subject more ably and because, so long as good health is granted to you and yours, the effect of drouths and other disappointments is, after all, only of passing consequence.

For one thing, let us be thankful that our Country is at peace—that, unlike the great and splendid nations of Europe, there is no roar of battle which reverberates through the hills and valleys by day and by night to bring sorrow and anguish to tens of thousands of homes from whence brave men have gone forth to return nevermore. After all, with the meadow full of hay stacks, is not our fate vastly more fortunate than that of these people across the seas—even though our corn fields show the effect of a summers pitiless sun?

On the contrary, let us hitch up our belts a notch or two and start to planning a big County Farmers Mass Meeting along the line of the appeal which appears elsewhere in this issue from the Farmers Marketing Committee and which every farmer in Missouri should read with profound thought. These frequent short crops only go to show that we cannot combat drouths, floods, the "Packers Combine" and the grain gamblers all at one and the same time. Either one of these influences is bad enough—but when they "double up" on us they overwhelm us. Now while we cannot control rain and sunshine, we can get together and by means of powerful farmer organizations compel a "square deal" in the market place—and this is the overshadowing issue which confronts every farmer in the land today. Again, if the farmers of your county will get in line on this organization program it means that you will be able to buy whatever feed you may need next winter at the prices which other farmers receive for it. So, also, the proposal to sell our surplus apples direct to Western farmers is a great step in the right direction. In other words, here is a constructive, practical program which will save thousands of dollars to the farmers of every county in the state if they will only "wake up" and get together.

The business of farming is the greatest business in the World—and once farmers are in position to demand a fair price for what they produce—when the parasites are no longer in position to rob both producer and consumer—then crop failures will be robbed of their terror because with the margin which now goes to a gang of great industrial vampires equitably divided between producer and consumer, the farmer will reap a reward which is in keeping with the natural law of supply and demand—and thus, while he will not make nearly so much during the lean years as during the fat ones, he will nevertheless be able to pull through without going backward.

"HOLDING UP" THE FARMER

By WILLIAM HIRTH

During the recent wheat harvest in Kansas, Nebraska and other Western States, the public press contained numerous dispatches dealing with the lawlessness of the I. W. W.—a labor organization of which the public has heard considerable in recent years. Droves of I. W. W. followers sought to compel every harvest hand to join their order and thus not only exact an exorbitant daily wage from the farmer but also to cut down the usual number of hours of work which farm hands have cheerfully rendered from time out of mind. When young farmers and college students who had, in many instances, left their homes in distant states in order that they might earn a little extra money in the Western harvest fields refused to do their bidding, they were beaten, kicked off moving trains and otherwise maltreated. In many towns the local police were utterly powerless against these lawless aggregations and the inhabitants lived in a state of terror day and night.

As a result, hundreds of decent, law abiding harvest hands who were perfectly willing to render an honest days work for an honest days pay, returned to their homes rather than incur the risk of bodily injury—and many farmers suffered tremendous loss because they were unable to get the necessary help in their wheat fields when they needed it. And thus, at last, the "reign of terror" with which every great American city and industrial center has been forced to contend from time to time in years gone by has finally reached the quiet and law abiding precincts of the farm, and the farmer has received a sudden and rude introduction to the "real article" in the modern way of "protecting the dignity of labor." It is not the intention of this article to place all the labor organizations of the Country in the same class with the I. W. W.—and yet, is there any essential difference in the methods which are employed in the average labor controversy? Do not nine out of every ten labor disputes finally rely upon the policy that "might makes right?" Is not terrorism and resort to force almost the invariable accompaniment of every labor strike?

If a farm hand is willing to work 10 hours per day for $2.50 in the harvest field, has any labor organization the right to beat and maim him because he refuses to demand twice as much for a less number of hours? Is this not a matter which should be left entirely to him and the farmer who employs him?

Surely the recent experience of these Western farmers should cause farmers throughout the Country to have a keener appreciation of the dilemna in which the Railroads find themselves at this hour with reference to the demands of the Railway trainmen who are asking for an 8 hour day and time and a half for overtime—a concession which would increase the operating cost of American railroads to the extent of $100,000,000 per year and which, in the end, would have to come out of the pockets of the farmer and the general public in the form of increased freight and passenger rates.

Back of this "rule or ruin" demand stand the four great Brotherhoods of Railway Trainmen comprising the conductors, engineers, firemen and brakemen of every railroad in the United States who are, relatively speaking, already the best paid workmen in the Country. The average yearly wages paid to railway engineers at the present time is $2067, conductors $1850, firemen $1203 and brakemen $1095—and as a matter of comparison it is pertinent to ask, how many farmers are there the Country over who can point to an assured annual income of this much? And mind you, unlike the average farmer, these men do not have thousands of dollars invested in land and farm equipment nor are they compelled to contend against crop failures, etc. Their money is as certain as the rising and setting of the sun regardless of whether the balance of the people are prosperous or depressed.

Under the present rules a conductor, engineer, fireman or brakeman receives a full days pay for whatever service he renders during a given day—whether that service constitutes five hours or ten hours work. Hence, at the recent conference between the Railway Managers and the Brotherhood chiefs in New York, the Managers for the carriers asked the tentative question whether, if the demands were granted, the trainmen would consent to do 8 hours work for 8 hours pay—to which the labor chiefs demurred on the ground that they could only discuss the concrete issue before them. That they would ever grant this eminently fair concession no one conversant with the situation believes for one moment. In other words, it is a case of holding all the unfair advantage which they now possess—and, under the threat of tieing up every railroad in the Country, grabbing as much more as they can. Is there anything fair about this? If the farmers of the United States were already paying their farm hands as much for 5 hours work as for 10 hours, would they not hotly resent being forced to pay at the rate of time and a half for the occasional hours of overtime?

The trainmen understand perfectly well that the railroads cannot establish an arbitrary 8 hour day—because, even if all the railroad divisions were rebuilt and relocated, unforseen delays due to weather and a hundred other causes make it impossible to operate a railroad train like a factory which begins and quits with the blowing of the whistle. Hence, the 8 hour day is merely a specious pretext by which these already highly paid employees expect, under the threat of a Nation-wide railroad strike, to extort an additional $100,000,000 per annum out of the railroads.

When the railroad executives proposed to submit the controversy to arbitration at the hands of the Inter-State Commerce Commission which cannot protect the public against an increase in rates unless it also has the power to protect the carriers against an unfair increase in the cost of operation, the Brotherhood Chiefs flatly refused. Then the proposal was made to arbitrate under the Newlands Act which was created for this specific purpose—and again the Brotherhood chiefs demurred and replied in substance that their demands were "just" and that there was therefore nothing to arbitrate.

As a result, the Railroads of the Country are fighting with their backs to the wall. If they stand for the "hold up," they will later on be compelled to shift the extra burden of $100,000,000 per year onto the shoulders of the people in the form of increased freight and passenger rates—a process to which there is no end and a responsibility which they have no right to assume except upon the authority of some power or tribunal which represents and has a right to speak for the American public. If, on the other hand they refuse to "deliver" and hold out for the great American principle of arbitration, they incur the risk of a strike which in point of disaster would be without precendent in the history of the Nation—which would send food prices souring in every village and city in the land and drive many communities

(Continued on page 10)

A Great Increase in Railroad Wages Means Higher Freight Rates and a Burden on Agricultural Prosperity

Do you think the railroads ought to increase the wages of their highly paid train employes $100,000,000 a year?

No great increase in railroad wages can be made without directly touching your pocketbook. Out of every dollar you pay the railroads 44 cents goes to the employes.

Compare the wages of these men (who have refused to arbritrate their demands for higher wages, and are threatning to tie up the country's commerce to enforce them) with those of other American workers—with yours.

On all the railroads in 1915 three-quarters of the train employes earned these wages:

	Passenger		Freight		Yard	
	Range	Average	Range	Average	Range	Average
Engineers - -	$1641 3983	$2067	$1455 3505	$1892	$1005 2445	$1526
Conductors - -	1543 3004	$1850	1353 2932	$1719	1055 2045	$1310
Firemen - - -	943 2078	$1203	648 2059	$1117	406 1633	$924
Brakemen - -	854 1736	$1095	755 1961	$1013	753 1821	$1076

You have a direct interest in these wages because the money to pay them comes out of your pocket.

Low freight rates have given American farmers command of the markets of the world.

With **two-thirds of the cost of operating railroads the wages paid labor,** any great increase in labor cost inevitably means higher freight rates.

A $100,000,000 increase in railroad wages is equal to a five per cent. increase on all freight rates.

The railroads have urged that the justice of these demands be determined by the Interstate Commerce Commission (the body that **fixes the rates you pay the carriers),** or by a national arbitration board. The employes' representatives have refused this offer and have taken a vote on a **national strike.**

This problem is your problem. The railroad managers, as trustees for the public, have no right to place this burden on the cost of transportation to you without **a clear mandate from a public tribunal.**

The Missouri Farmer

VOLUME VIII AUGUST 15, 1916 NUMBER 16

An Appeal to the Farmers of Missouri

By the Farmers Marketing Committee

"In response to the demand of the Farmers Market Conference which was participated in by representative farmers from all over the state in Columbia last January, we, the Executive Committee of the said Conference make the following appeal to the farmers of Missouri:

We believe that the farmers of this Nation are confronted by the gravest crisis in the history of American Agriculture at this hour and that the time has come when we must organize and stand together as never before if we would save ourselves and our children in the years to come from conditions little better than that of Agricultural bondage.

Farmers Must Pay the Price

On the one hand, the manufacturers of all kinds of merchandise compel the farmer to pay a price for their wares equal to the production cost together with a substantial profit while upon the other hand when the farmer goes to market with his hogs, cattle, sheep, corn or wheat he is compelled to accept a price fixed by the Packers Combine and the dealers in grain futures who are in absolute control of the livestock and grain markets of the Nation and from whose manipulation under existing conditions there is no escape. In other words, the farmer is compelled to buy in a market governed by the law of supply and demand and to sell in a market in which an arbitrary price is placed upon the fruits of his year's sweat and toil—a price which utterly ignores the cost of production and in which condition of affairs is found the answer to the tremendous increase in farm mortgages recorded by the last Federal Census, the increase in land tenancy and the reason why thousands of boys and girls are being driven from the farm to the already overcrowded cities.

Manufacturers Prosper but What of Farmers?

The great manufacturing industries of the Nation find themselves in the midst of unprecedented prosperity at this time and New York rather than London promises to become the future financial center of the World. Every laboring man who is willing to work finds ready employment and through the power of Organized Labor sets a generous price upon his srevices—and although the American farmer furnished $1,600,000,000 worth of exports during the fiscal year of 1914 and 1915 as against $900,000,000 on behalf of our allied manufacturing industries, he is not permitted to share in the prosperity which abounds on every hand but, on the contrary, he was compelled to contend against one of the worst live stock markets in the history of the American farm last winter. Within the last 30 days, the Packers have again arbitrarily reduced the price of beef cattle $1.50 per cwt.—and this condition of affairs, which has existed for the last 25 years, is becoming more and more intolerable. That last winters prices for live stock were the result of deliberate manipulation is exemplified by the fact that, although our meat exports in 1915 were $100,000,000 greater than in 1914, the prices for cattle and hogs were much lower and entailed a loss of untold millions of dollars upon farmers throughout the Country.

Must Organize Now

That the hour has come when we must organize for our mutual wellbeing, and thus place ourselves in position where, like the manufacturer, the merchant, the banker and Organized Labor we can protect ourselves and demand what it costs to produce the great staples of the American farm together with a reasonable profit—upon this depends the future of every farm home in the land and the future of our children who will have to contend against these unbearable conditions when we shall have passed from the scene of action. Upon every hand it is admitted that the farmer could be the mightiest force in the land if he would co-operate and stand shoulder to shoulder with his neighbor—and at last we have reached a time when self preservation offers no other alternative—when organization, co-operation and real farm leadership are the only forces which can rescue our farm homes from the blight which rests upon them at this time, which can provide the pleasures for our loved ones to which they are justly entitled and preserve to the Nation a profitable American Agriculture which is the true source of its wellbeing and permanent prosperity.

County Mass Meetings

To this end, we hereby earnestly appeal to the farmers of every county in Missouri to begin immediate plans for the holding of a two days County Farmers Mass Meeting as soon as the necessary arrangements can be perfected and upon this occasion the undersigned Committee will actively assist in the organization of a strong County Farmers Ass'n through which the foundation of a Farm Club in as nearly as possible every School District in your county may be actively taken in hand. The College of Agriculture and the State Board of Agriculture will doubtless co-operate as far as possible by furnishing a number of able speakers upon Agricultural subjects while other men familiar with this great new movement will deal directly with the question of Farm Organization—and thus this occasion should be made the greatest two days farmers "Love Feast" and coming together of farmers that has ever assembled in the history of your county. Therefore, our good brother, when you have finished reading this appeal, call up your neighbors and direct their attention to it; then see that 15 or 20 of the leading farmers of your township are called together for a conference and notify the editor of the newspaper in which this article appears whether you are willing to get behind a big County Farmers Mass Meeting. As soon as he receives a report from a majority of the townships in your county a meeting of leading farmers from the various townships should be arranged and at this time definite plans can be made. No dates for the County Mass Meeting should be named however until you have advised with W. H. Thomson, Columbia, Mo., Secretary of the undersigned Committee—as the dates for the different county meetings will have to be so arranged as to enable the various speakers to reach from one meeting to another with the least expense and inconvenience. No meetings should be planned earlier than the latter part of August and from that time on it is our purpose to hold from three to five county meetings every week until the coming of winter weather.

A State Association to be Formed

As soon as 25 or 30 counties have been organized in this manner, a powerful Missouri Farmers Ass'n will be formed and thus for the first time in the history of our great commonwealth the farmers of Missouri will be in position to take in hand the grave questions which confront them at this time and upon the solution of which depends our happiness in the years to come. That the farmers of your county cannot afford to be indifferent toward this appeal will be plainly manifest when we tell you that arrangements have already been made to furnish wholesale prices on car load shipments of corn, bran, ship stuff, oats, coal, salt and fertilizers to the members of every Farm Club in the state and that at this time the farmers of the Central Western States are being canvassed for car load orders of apples at prices which will save thousands of dollars to the farmers of this state as well as enable these western farmers to buy more cheaply than after the apples have passed through the hands of various jobbers and commission firms.

Already the drouth which is largely prevalent throughout the state means that many farmers will be compelled to buy corn and hay—and it is our purpose to see to it that the farmers of every county who actively aid in this great movement be placed in position where they can buy this feed direct from farmers who live in the more favored communities and thus purchase it at the lowest possible cost. We will not be able to do this however unless you and your neighbors take immediate steps to form a County Farmers Ass'n as above outlined.

In conclusion, the members of the undersigned Committee are plain Missouri farmers like those to whom this appeal is addressed and at our own expense we have been willing to leave our homes and travel hundreds of miles in order that we might contribute our mite toward this great new movement upon which depends the paying off of the mortgages which hang like a dark cloud over thousands of Missouri farm homes at this hour. That you will not turn a deaf ear to our plea—that you will get together with your neighbors at once and plan a great County Mass Meeting which shall literally set your county on fire with the spirit of farmer organization

HOW DO YOU LIKE IT?

Some days ago, THE MISSOURI FARMER received a request from a Farm Club in the Western part of the state for 300 bushels of potatoes. We at once got in touch with the growers at Orrick, Mo., and found that the average grade of potatoes were being delivered in two bushel sacks in the car on the railroad tracks at 50c per bushel, or the choice grade at 60c. Upon inquiry in the local market here in Columbia we found that the average grade of potatoes were selling at $1.25 per bushel —or at a profit of over 100%. This is a sample of how our present marketing system "ham strings" both the producer and consumer. It is only another little side light on "What's the Matter with the Farm?" and the "high cost of living."

Last fall, the daughter of a farmer near McBaine, Mo., put this slip of paper in the top of a barrel of apples: "We sold this barrel of apples for 75c. Whoever buys them will please write and tell us what they paid"—and then she signed her name and address. In about two months she received a letter from a family living down in Tennessee, saying, "We have just bought your barrel of apples and paid $5.00 for it." And so it goes. And so it will continue to go until farmers exercise the ordinary common sense to organize and shorten the route from producer to cosnumer—thus realizing what their stuff is worth and also rescuing people who live in town from the "hold-ups" of the present system. In the meantime, why doesn't the average merchant get busy and help out? Why should he sit around sucking his thumb and permit a lot of jobbers and unnecessary commission concerns to get an unnecessary "rake off?"

William Hirth, Publisher,
THE MISSOURI FARMER.

and co-operation—that you will help us to write here in Missouri a new Declaration of Independence on behalf of American Agriculture and a "square deal" for the fruits of the farmers sweat and toil—this is our concluding wish and we trust every farmer in the state may take it profoundly to heart.

Anderson Craig, Chairman, Maryville, Mo.
W. H. Thomson, Secretary, Columbia, Mo.
W. A. Ferguson, Houstonia, Mo.
T. B. Ingwersen, Bowling Green, Mo.
Floyd Tuggle, Gallatin, Mo.
E. H. Bullock, Edina, Mo.
H. H. Weaver, Rush Tower, Mo.

That our readers may take this appeal to heart and act upon it without delay is the ardent hope of THE MISSOURI FARMER which has fought harder for farmer organization than any other farm paper in the Corn Belt. As we have stated in previous issues, two-day farmers picnics have already been arranged for in Lafayette and several other counties while similar arrangements are now in progress in Chariton County. There is, however, no time to lose because it will require at least a month or six weeks to prepare for a great County-wide Farmers Mass Meeting—for it means that a strong committee of farmers must be organized in each township to guarantee a big attendance. Again, the sooner your county gets in line the sooner you will be able to obtain four or five able speakers—and it will require that many for a two days program.

Organize for Immediate Advantage

Now what the Market Committee recommends in the above program is not only an organization of farmers sufficiently powerful to deal with the Combines which are crushing the life out of the farm—but a dollars and cents program of which farmers can take immediate advantage in the form of wholesale prices on car load shipments of many commodities which bear an unjust tribute at this time. Because of the drouth, thousands of farmers will have to buy corn and other feed—and here is a chance, if the farmers of your county will get enthusiastically behind this movement, to buy these commodities at the lowest possible cost. Again, if rain comes in time to save the fruit crop, the selling of apples in car-load lots direct to western farmers will mean a much better price than could possibly be obtained in the local markets.

So it means money to the farmers of your county to wake up and give an immediate and hearty response to this appeal. Call up a few of your good farmer neighbors and talk matters over. Then help to arouse the adjoining townships. When you are ready to act, put a notice in your weekly newspapers and ask the farmers from every section of the County to unite with you. In the meantime, as soon as you and your neighbors are ready to act, write to Sec'y Thomson of the Market Committee, Columbia, Mo., and tell him that your "hat is in the ring." This will enable him to put you in touch with other farmers in your county who have written him to the same effect. There is no time to lose. This is a fight for our farm homes—for the right to honest prices for farm products and a chance to save money on corn, hay, bran, ship stuff, fertilizers, salt and coal—and an opportunity to get what your surplus apples are worth this fall. Unless you and your neighbors get together at once, nothing will be done. Clearly, the matter is up to every farmer who reads this appeal.

THE STORY OF AN OLD FARM

Editorial Note.—If any reader has not read the previous articles in this series by Mr. Lyon he had better hunt them up and read them now to get the full benefit of what he has to say on keeping up the fertility for one hundred years. "It is interesting to note" says Sam Jordan" that while Lyon's farm has been in cultivation for over one hundred years there is no worn out land on it. Yet the hills are so steep that I would not know how to go about it to farm them. His system has and is producing gratifying results."

NUMBER III.

It was my fathers practice to box stall all the farm stock, use an abundance of bedding, and haul the manure to the fields once a year, always applying it to the plowed land just before planting.

This practice was kept up until a very few years ago, or until the keeping of four to six dairy cows, as well as a horse or two more than we kept fifty years ago, made the box stall system too large a proposition for our stable room.

We have wasted hundreds of loads of manure on this farm by applying it too freely, as in years gone by, it was nothing unusual to use twenty good two horse loads of stall manure per acre on tobacco, or ten loads per acre on corn land, while we get as good, or better, results now, by using half or less of that amount.

I do not think, that in the fifty-five or more years that I can look back over, that we ever allowed half a dozen loads of manure to lay out, exposed to the rains, for as much as ten days.

The idea has always been, to run as much rough material, straw, corn fodder and the like, through the stables, as was possible, increasing the bulk of manure to make humus, as well as to absorb the urine, and to keep the stock clean.

Once, perhaps thirty years ago, we undertook to compact the manure with a lot of moldy straw, with the result that the whole mass overheated, and we seriously damaged perhaps twenty loads of good manure.

Manure was always spread directly from the wagon, never thrown out in piles, and we always aimed to harrow or cultivate it into the soil as soon as possible after hauling it.

Under our present system, and the use of the manure spreader, we clean the stables as often as it is convenient to do so, or as they need it, applying the manure to the land that is to come under plow next, but allowing as much as possible to accumulate from the middle of March to May for use on top of plowed land.

If I could have the farm munare put on the land just when I think it will do the most good, not only to the land but to the coming crop, I would have it done a week or ten days before planting and have it thoroughly cultivated into the soil.

For the coming crop, I think I can get more good out of ten loads used in this manner, than out of fifteen used in any other way, and as for the benefit to the soil, considering the greater area covered, I think that it will be just as much.

In this series of articles, I want to give as much history of the land as is possible, and it is not too late to say, that the use of farm made manure, in earnest, began with the coming of people from foreign lands, in our case with the Germans, and father has often told me, that their first real manure campaign was made sometime about 1847, being organized by a German who was working for them as a hired man.

In writing, as well as in institute lecturing, I often favor the permanent pasture, and for over thirty years have kept one, but still this feature in farm practice has a disadvantage, in that this tract of land gets an undue share of the droppings of the farm stock.

Of course this pasture needs reseeding in a long term of years, and ours, having laid in blue grass and white clover for twelve years, will be broken in 1917, a crop grown, and the land reseeded.

Coming back to the manure question proper, we stack our straw close to the barns, having small lots for the young stock to run in, use the straw heavily in bedding in the stables and let the young stock work the rest down.

On clay lands, we get more good out of the straw stack manure than from that made in the stalls, this being especially noted where the soil has been washed away. In such cases we apply the wet half rotten straw before plowing and turn it under, the favorable results being less marked in the corn crop following, than in the wheat, and the grass and clover seeding.

Now as to turning under green crops for manure, our experience has been limited, yet it has always been favorable to the practice. In 1865, and in 1877, and again in 1900, we turned under heavy crops of green clover in early May, planting the land to corn and tobacco with the most favorable results.

Again, in 1884, I turned under a heavy crop of rag weed in late July, seeding the field to wheat, with a resultant crop of 44½ bushels per acre.

If I had to begin with a badly exhausted soil, I would not resitate to make the first steps toward its upbuilding, by sowing cowpeas to turn under to furnish humus to the soil.

As I have indicated elsewhere, we have found commercial fertilizers invaluable in crop growing, they enabling us to get better stands of grass and clover on the thinner parts of the farm, this one benefit from them being enough to justify their use, even if they did not repay their cost from tree to ten times, on all crops they were used under.

Even with our land built up to its present good state of fertility, the use of any standard fertilizer on wheat, at the rate of 100—150 pounds per acre will be repaid in the better grass stand alone, to say nothing of the extra amount of wheat.

In corn, fertilizers not only repel insects, but they favor an early development of a good root system to the plants, enabling them to better withstand adverse weather conditions.

In my next article I wish to take up our system of breaking land and cultivation of crops, and if any reader has any comment or any questions, they may be sent to me direct, or to the Editor of THE MISSOURI FARMER.

C. D. Lyon.

"WHY ARE FARM MORTGAGES INCREASING?"

Farm mortgages are increasing because the farmer takes the other fellow's price for everything he produces on the farm, while the other fellow sets the price on everything that the farmer has to buy. The farmer feeds 85 cent corn to his cattle, hogs, sheep and other live stock and puts in fourteen hours per day caring for them, but when he is ready to sell, Mr. Packer sets the prices that he wants the farmer to get for said stock. Frequently, if he can get as much as 50 cents per bushel for the corn which he has fed and little consideration for his time, he is fortunate.

This same farmer goes out to buy. Upon anything from a calico dress to a threshing machine, the merchant or manufacturer tells him that the cost of labor and material has increased to such an extent that Mr. Farmer will be compelled to pay an advanced price for what he needs. In other words men who FILL the Bread BASKETS of the world, men (whom, if they should go on a strike would soon cause increased want in our cities or nations to starve) continue to work humbly and steadily at their tasks, allowing the other fellow to dictate the price of everything that he either produces or has to buy.

We live in a day of ORGANIZATION—a day of great business. Men following the most humble trades today are organized but here is this great agricultural class, which, up to this time, has not realized the proper hold within its grasp nor the influence it could wield in the State and in the Nation if it would but organize—get together.

If, to the duties of our State Board of Agriculture we might add a department—A Farmers' Selling Organization—the return to the farmers of this state would be incalculable. He in turn would put it into better roads, better schools, better churches and distribute it across the counters of our banks and stores.

In advocating a great organization of this character we are working a hardship upon no one but endeavoring to lift a great burden from the producers—a burden which is becoming almost unbearable.

James A. Houchin,
Jefferson City.

FIGHT DROUTH IN THE ORCHARD

The Department of Horticulture of the University of Missouri finds in investigation work carried on during recent drouth years that proper orchard management can largely off-set the effects of drouth in our apple orchards. Everybody recognizes in a general way that a well managed orchard will stand drouth better than a neglected one. The reasons why this is true are not fully understood by most orchardists. If they were fully understood and appreciated, a larger number of orchardists would make a greater effort to bring their apples to full size and maturity.

Dead and dying limbs should be pruned out close to the tree and the wounds painted. Many people suppose that once a limb on a tree is dead that it dries out and does no essential harm. As a matter of fact a dead or dying limb evaporates large quantities of moisture from the tree. Cutting off a dead limb and painting the wound save a large quantity of moisture for the remaining living limbs, leaves and fruit.

Canker wounds or sun-scald areas where the growing limb beneath the bark has died ought to be scraped clean up to a layer of healthy growing tissue and the wound painted. Cleaning and painting these wounds will destroy many insects which are sheltered behind the shelly bark of the wound, which feed on the growing layer and prevent it from healing over the wound, and the painting will save loss of water from the dead and spongy wood.

Water sprouts and surplus limbs not needed by the tree ought to be pruned out now. All wounds more than ½

inch in diameter made in pruning should be painted with common paint to save evaporation from the wound. This is particularly desirable during the present year, on account of the exceedingly moist cool spring the trees made rank growth and a very large leaf surface. This most abundant growth occurred during the month of May. Now that drouth has occurred suddenly the trees have a larger leaf surface than can adequately be supplied with water. Reducing this evaporating surface, pruning out surplus growth, leaves just that much larger water supply for the fruit, leaves and limbs which remain.

Investigations during recent years at the Experiment Station show that this point is of special importance. It has been found that in a dry time the fruit is the first part of the tree to suffer from lack of water. This is because when water supply is inadequate the leaves have the power of drawing out of the adjacent fruits. The sap in the leaves is more concentrated than that in green fruit so the sap of the leaves draws water from the apples. This point can be tested by cutting off two branches from an apple tree, each containing a similar number of fruit and leaves. Hang them up in a dry place, pick all the apples off one of the limbs. The leaves on the branch having no apples to supply water will turn brown, dry and brittle within 24 hours. The leaves on the branch containing apples will keep green for days until the water is drawn from the apples and the latter are dried and shriveled. In a similar way cucumber or melon vines, containing large watery fruits, have their leaves remain green until the cucumber or melon is entirely shriveled, while a similar vine containing no fruit will have the leaves begin to wilt as soon as the vine is cut off.—J. C. Whitten, Missouri Agricultural Experiment Station.

THE SIRE AND THE STOCK MARKET

In the market for any kind of manuactured goods uniformity is demanded. The man who went to an implement dealer for a corn grinder like the one that did so well for his neighbor would object strongly if told that no other machine like it had ever been made but that there was one in the market that day that weighed about as much and looked very much like it. He would want a machine that would give exactly the same results. Of course, this is not quite possible in case of corn and cattle but we can come much nearer uniformity than we do.

We have well-defined breeds within which uniformity and standardization are established facts. They do not provide quite the uiformity of the manufacturing world but come near enough to it for all practical purposes. Part of the market trouble is that carloads of stock do not come on the market, each made up of uniform animals of some one of these breeds. The breeder has too often used a scrub sire whose offspring lack uniformity or was uniformly inferior. In many more cases he has bought feeders rather indiscriminately from the owner of scrub sires and pure-bred sires of various breeds.

The use of the pure-bred sire is part of the remedy. If the rest of the herd is very inferior, it will take a number of years of "grading up" to bring the best results but there will be marked improvement every generation if breeding is wisely done. As good pure-bred sires of the same breed are used on a farm year after year, that farm will send better stock and more uniform stock to market and the shipper will be in a better position to demand high prices. In this grading up, the sire is often said to be half the herd. As a matter of fact, he is more than half because the good pure-bred animal is so much more prepotent or able to impress his own good characteristics upon his offspring than the grade animal upon which he is crossed.

The man who cannot afford a pure-bred sire of his own can often co-operate with one or more of his neighbors in securing one, and whether he owns co-operatively or not, he should combine with as many others as possible at the same shipping point in securing similar good sires of the same breed in order to secure uniformity in mixed shipments, or in lots bought from various men in the vicinity to be fed by one of them.

The live stock industry of the middle west is undergoing a building process in both quality and numbers but it has only begun the improvement which must come in the near future if this section is to fulfill the demands of the markets, maintain its position in the live stock industry, and demand profitable prices. This section has some of the best flocks and herds to be found anywhere but the general average is far too low. This average must be raised and we may fairly expect a corresponding rise in price.

S. T. Simpson,
Missouri College of Agriculture.

HOW TO GET THE MOST OUT OF FARMERS' INSTITUTES

How to make most effective the work of farmers' institute lectures and other agricultural extension field men is a problem difficult of solution. Apparently the question is one that is more and more claiming the attention of officials whose duty it is to direct this important work. Results, good as they have been, are not altogether satisfactory to those in charge.

Frequently, lecturers paid by the state or national governments travel considerable distances to hold meetings where large crowds are expected, but where only a few of the faithful are in attendance. Why? How is the work to be popularized? And, what is of vastly more importance, how are more of the practical truths as taught to be put into practice?

So many things enter into the success or failure of a farmers' institute or similar meeting that it is difficult to enumerate even the most important. The qualifications of the speaker are perhaps of first consideration—and first of all this speaker must be one who "rings true" and who deals in facts. The average farmer will not stand for "four flushing" and is capable of detecting a fakir or grandstander almost at sight. The farmer's long and intimate association with nature has apparently made it possible for him to distinguish the genuine from the counterfeit. It is the wise institute worker who bears this fact in mind.

Then, the speaker must possess a broad sympathy and a personality that is reasonably pleasing, and must be able to present his subject in a popular and easily understood manner. In other words, he must be able to hold his audience. This does not mean that he must be an orator and a painter of rose-hued pictures. Far from it. Much less does it mean that he must be able to qualify as a capital story teller. What it does mean, though, is that from his store-house of information, the result of study and research, or from his actual experiences he is able so to present his subject that his hearers will not fail to follow. Naturally, this means talk that is clear-cut and convincing and easily followed because so simple and easily understood. Only the amateur uses the big word where the little one in more common usage will do.

The subject, too, has much to do with the success or failure of the lecture. It is not enough that it be well presented; it must be timely. We all listen to talk in which we are interested, and we are interested in different subjects at different seasons. Right now, for instance, the average farm audience would be very much more interested in a discussion of the methods of selecting seed corn than in a talk that had to do with testing and planting it. "Ice for the Farm Home" or "The Selection of a Farm, Either for Rent of Purchase," will soon be of interest, the latter because many farm leases date from March 1. "Varieties of Winter Wheat" or Fighting the Hessian Fly" would be timely subjects. Just now "Silage and Silos" are of interest. There is need too, of discussions looking to substitutes for corn as a feed. Next winter or spring will be the time to discuss treatment of oats for smut.

Subject selection, then, is important and may help increase both interest and attendance. In this connection it should be said that the subject fit the community as well as be suited to the season. It would not everywhere be profitable to talk dairying, or truck farming.

How to get the people out is always a problem. Undoubtedly, advertising will help. Every farm meeting held costs money and the per capita cost for the people reached decreases just as the attendance increases. Sometimes, we suspect, farmers fail to attend the institute because they are not in sympathy with the local leader, who may be personally unpopular. This fact, however, should deter no one from attending. Maybe this leader, who, after all, is really doing his best, would be glad to relinguish his duties if anyone would assume them. Or it may be that the leader has no capacity for leadership, is really selfish, and has not the good of the community at heart. If so, it is the duty of that community to chose another leader rather than suffer loss because of lack of proper leadership.

W. L. Nelson.

BUY YOUR SILO NOW

The Dickey Silo

is salt-glazed and vitrified, like a jug or your milk crock. Four walls, three dead air spaces. Thirty years of knowing how is worked into each and every block. We give you written guarantee to protect you.

The Dickey Silo is the kind you want on your farm; because it will last forever. No paint—no plaster needed to make it tight; the glaze and vitrification (glass like) taken care of that.

Buy It Now! Pay Later

Save yourself against loss of crops by having Silo ready to use if drouth and hot winds come.

We Can Ship at Once

We can send you an experienced mason to erect the Silo.

Send for our book telling why the Dickey Silo—Salt-Glazed—Vitrified—is better than all other kinds. Read what the man says who owns one. Compare the Dickey Glazed Silo with all others. If you do, you will buy the Dickey.

Let us know about what size silo you want, and we will quote you prices. Complete instructions with blue prints — everything you need to begin building at once.

Dickey Clay Mfg. Co.
204 Silo Dept. Kansas City, Mo.

NOW IS THE TIME!!
UNTIL SEPTEMBER FIRST
PRESENT LOW PRICES CONTINUE

MY BIG BOOK FREE
Ask for it today. A postal gets it. Your copy is ready. 250 pages illustrating and describing the great Galloway line of manure spreaders, cream separators, gasoline engines, farm tractors, vehicles, farm and household necessities. Just drop me a postal.

On and after that date spreader prices must advance. Malleable castings cost more, steel costs more, all materials entering into construction of Galloway Manure Spreaders have advanced and we are forced to raise the prices September 1st when new material contracts begin.

That's why I say if you need a spreader in the next three months, six months, twelve months or longer, you should buy now. The saving is worth making! Remember at the end of twelve months if a Galloway Spreader has not paid for itself, provided you have hauled out a hundred loads of manure or more, and has not proven everything I say for it, I AGREE TO TAKE IT BACK, pay freight both ways and return your money, no matter on which of my six selling plans you buy. Could I make this offer if the Galloway SPREADER DID NOT back up everything I said for it--if I were not sure that my spreader would please--would pay for itself on your farm? My new steel beater and wide spreading V-rake pulverizes and tears the manure to shreads--WORTH $15 EXTRA ON ANY SPREADER--costs you nothing on the Galloway. My invincible patented roller feed--an exclusive feature on the Galloway--makes it superior to all others, the secret of its light draft--A FEATURE WORTH $25 ALONE ON ANY SPREADER--costs you nothing extra on the Galloway. These and other features fully explained and illustrated in the second edition of my big free catalog. DON'T BUY A SPREADER of any make or kind until you have tried a Genuine Galloway AT OUR RISK.

THE WM. GALLOWAY CO., 599 Galloway Sta., Waterloo, Iowa

26 years' prestige. Students now on 52 railroads. Over 300 students each year. Earn from $60.00 to $150.00 per month. Station work taught. Wabash R. R. wire. Car fare paid. Write for catalog.
CHILLICOTHE TELEGRAPHY COLLEGE
293 Irving Ave., Chillicothe, Mo.

WHY DO YOU NOT GROW MORE ALFALFA?

Alfalfa is Arabic in origin and it means the best fodder. I think a more appropriate name could not have been suggested for this most valuable plant. Just take a trip out into the country these hot August days and along the dusty roads you will see fields of brown prairie and scorched vegetation everywhere. But when you happen to pass a field of alfalfa what a change! The refreshing green is pleasing and restful to the brown-tired eyes for alfalfa will hold its green even during the most severe drouth. The deep growing roots enables it to do this and make it one of the most profitable crops as well as the "best fodder" and helps to put the balance on the right side of the ledger for any progressive and fortunate owner who has had the good foresight to put his faith in alfalfa.

I think alfalfa is grown in almost every county in every state in this great country of ours. The old saying that "alfalfa will not grow here" is all bosh. I have heard that so long I might be a believer myself if it were not for the real fact that I see alfalfa growing successfully all around me. Alfalfa will not only grow but will acually do well on most of our Missouri soils if conditions are made right—that is all you have to do to insure success—make the conditions right.

Alfalfa prefers a lose, sandy or gravelly soil but will grow and do very well on most any kind of soil but it is necessary to make the right conditions in that soil before you can hope for success. You must supply your soil with what the alfalfa plant lives on, nitrogen, phosphorus, potash and lime. If these are not in the soil then you must put them there. The field for Alfalfa must be well drained and if not naturally so then it must be tiled. Land that never grew alfalfa before should be inoculated. The commercial cultures will give good results in inoculation when properly handled but I think soil from an old alfalfa field showing plety of nodules on the roots is the safer plan. In most sections this inoculated soil can be obtained without very much trouble or expense.

For my section (Lawrence County) spring sowing is not to be recommended for it very seldom gives good results. Conditions are generally, by far, better for fall seeding and it seldom fails if rightly managed. Cultivation is absolutely necessary for the surface of our soil will pack and crust and the surface becomes so solid that alfalfa will not do well unless this is broken up by cultivation. Then the blue grass, white clover and other undesirable mixtures will get started and crowd out and eventually destroy the alfalfa if they are not cultivated out.

A cultivated surface has numerous advatages but I think they are so well understood that it is not worth while to enumerate them here. It is claimed by some that cultivation is injurious. Well, once in a while a plant is cut off by cultivation so as to be killed, particularly when a sharp disk is used but I have found it better to lose a few plants than to let it go without cultivation and lose it all.

I was born and raised in a county where alfalfa grows exceedingly well and I have been growing it here for 20 years, I have exhibited it at the big fairs and have brought home the blue ribbons so I do not think you can say this is all hearsay with me. I am not a native of Missourian but I have been here long enough to "show you" that alfalfa can be successfully raised on our soil.

Simon Baumgartner,
Lawrence County.

THE VALUE OF MANURE AS COMPARED WITH CHEMICAL FERTILIZERS

By C. H. THORNE, Director, Ohio Experiment Station.

The complete fertilizer used on Plot 11 in the Ohio Experiment Station's 5-year rotation at Wooster has carried 76 pounds of nitrogen in nitrate of soda, 20 pounds of phosphorus in acid posphate and 108 pounds of potassium in muriate of potash for each 5-year period. The cost of this application has been computed at $23.50, or at 19 cents per pound for the nitrogen, 13 cents for the phosphorus and 6 cents for the potassium. The 20-year average value of the increase produced by this fertilizer, as shown in Circular 144, has been $39.28, corn being valued at 40 cents per bushel, oats at 30 cents, wheat at 80 cents, stover at $3 per ton, straw at $2 and hay at $8. On these valuations for fertilizers and produce, $1 expended in fertilizers has produced $1.67 in increase of crop.

Plot 17 in the same experiment has received 38 pounds of nitrogen, 30 pounds of phosphorus and 108 pounds of potassium, costing $17.60 for each rotation, and has produced increase to the value of $35.23, or $2 in increase for each dollar expended in fertilizers.

Plot 18 in this experiment has received 16 tons of barnyard manure, 8 tons each on corn and wheat, taken from the open barnyard in the spring and in August, and being plowed under for corn and spread on the surface after plowing for wheat.

The manures used in the Station's special manure tests were anaylyzed for 5 years by J. W. Ames and his assistants, and were found to contain on the average the following elements per ton:

	Nitrogen	Phosphorus	Potassium
Yard manure, lbs.	9.0	2.0	6.0
Stall manure, lbs.	13.3	2.3	10.0

If we assume that about 20 percent of the nitrogen in the stall manure had escaped before it was plowed under, as seems probable from late investigations, and use the same valuations employed for the chemical elements in nitrate of soda, acid phosphate and muriate of potash, the nitrogen, phosphorus and potassium in a ton of yard manure would cost $2.33 and in a ton of stall manure, $2.85, if purchased in these carriers. The cost of the chemicals carried in the 16 tons of yard manure used on Plot 18 would therefore be $37.28. The value of the increase on this plot has been $40.40 for each 5-year period, or nearly $1.09 for what would have cost $1 if purchased in chemical fertilizers.

Plot 20 in this test has carried only half as much manure as that given to Plot 18, and has produced increase to the value of $24.54, or nearly $1.32 for each dollar in chemical values.

In the special manure test, which has been running since 1897, the 16-year average value of produce for 8 tons of untreated yard manure has been $20.80, while from 8 tons of stall manure it has been $26.24, or approximately $1.12 for one dollar in chemicals in yard manure and $1.15 in stall manure.

Where the manure has been treated with acid phosphate in this test, the value of the produce, after deducting the cost of the acid phosphate, has been $33.77 for 8 tons of yard manure and $39.12 for 8 tons of stall manure, or $1.81 for each dollar in chemicals in the yard manure, and $1.71 in the stall manure. In this calculation, however, no credit is given to the acid phosphate beyond the returning of its cost, whereas all our experiments show that acid phosphate is sure to return much more than its cost when properly used.

Apparently there has been no great difference in the effectiveness of the chemical elements in the two manures, the greater total effect of the ton of stall manure over the ton of yard manure being chiefly due to the larger total quantity of elements contained in the stall manure.

The lesson to be drawn from these results is that the man who is purchasing fertilizers cannot afford to pay quite as much for the pound of nitrogen, phosphorus or potassium spread on his fields in barnyard manure, as he would pay for the pound of the same elements in nitrate of soda, acid phosphate and muriate of potash also laid on is fields; or, to put it in another form, open-yard manure of good quality should not cost him more than about $2 a ton, and manure fresh from the stable not more than $2.50 a ton, spread on his fields, as compared with nitrate of soda at $60 a ton, 16 percent acid phosphate at $18 and muriate of potash at $50 properly compounded and spread on the field.

On the other hand, the man who can produce and spread on his farm annually 100 tons of manure from well-fed animals may safely assume that that manure properly cared for, used in systematic rotation of crops and supplemented with acid phosphate, bonemeal or raw phosphate rock, may be expected to produce, as an average for a long term of years, as large an increase of crops as he would obtain from an annual expenditure of $200 to $250 in chemical fertilizers.

JORDAN'S SENSE AND NONSENSE

The public good is your good unless you are wrong.

* * *

Wasn't that a big overflow on August first, of "Salt River?"

* * *

How would we manage it if we were set back in all things just thirty years?

* * *

I went to one place on my vacation, and the first thing offered me was a bath.

* * *

Anyway its a good time to be alive even if the boys do have to give Mexico a "lickin'."

* * *

I have had a really fine time the last two weeks even though I got lots of chiggers on my vacation.

* * *

I went fishing one day. The fish did not bite so well as did the mosquitoes, and I got stung on my return by a bumblebee.

* * *

My brain has been on a strike ever since dog-days, and just refuses to move. That's the reason there's no sense to this nonsense.

* * *

If a fellow makes you a present of a new kind of soap, don't take offense. Take the soap, it may be for your good.

* * *

The "Swat the Fly" fight has surely brought results. It does not seem in most places that there is one fly now for every thousand we saw a few years ago. Let the good work go on.

Will L. Jr., was telling about his little friend E. A. Jr. and he was asked if they ever had any fights, Will L. Jr. said "yes, sometimes." The next question was, "Well, who whips?" to which Will L. Jr. made answer, "Our mammas."

* * *

Mexico don't know how it would civilize them to be whipped. If the fellows down there just knew how we wanted to civilize them, they would no doubt say, "Come on fellers and lick ———out of us, we need it."

* * *

After I had made up my mind as to the date of starting home after my vacation the folks tried to get me to change my mind and stay longer, but the weather was too hot to make the effort. One mean man told me he thought my mind was so small that a change would be easy.

* * *

Did you read about that Mrs. Castle who went into half mourning because of the death of her houn-dog? The paper said she was prostrated. If it had only been known in Columbia there are from four to six dirty curs, that work the corner of Hitt St. and University Ave. by chasing teams, autos, bicycles, etc., from sunrise to sunset, to the annoyance of neighbors, and danger of those with teams and riders of motor and bicycles. So far as many are concerned, Mrs. Castle could have all these houn dogs, and save her the cost of "gloom rags." There are also a lot of lonesome cats in this town that she could have by catching them. If she could not love old man Castle good and proper she might run onto a loving and affectionate alligator. A dear woman just must love something.

* * *

"What to do" is a question often asked when a farmer's club is organized. Too many things are often undertaken, but just one thing might be mentioned, and that is "Let us put an end to gambling in grain." The farmers' vote can "make or break" and Congressmen will listen if farmers' clubs wake up. If this one thing could be done all efforts would be worth while, and I do not see that the gamblers would be really hurt, as they could gamble on the "direction of the wind" and the betting would be just as good, and the results just as sure, and the betting would be fairer since no set of men could control it and that would be true sport. Their fun then would in no way damage the farmer. If all the farmers would unite for only the one thing "Stop Grain Gambling" it would be stopped in short order.

RATIONS AND ROTATIONS

Rations and "rotations" have come to be big words in farm life. For a good many years we have been discussing "balanced rations" for live stock, and now we are talking balanced rations for men and women and boys and girls. This is the human hour and because it is we are not limiting to food alone our discussion of balanced rations for human beings. There comes the problem of the "balanced ration" of work and play, and even a balanced ration of riches. The farmer is as never before giving thought to the matter of spending money. He is trying to arrive at true values. Along with the added "eighty" and the necessary farm equipment he is considering the things which will insure to him and to his more of the "durable satisfactions of life."

The idea of rotations as the word

is commonly used, is old. Xenophon speaks of a two-year rotation of wheat and fallow, while the alternate culture of grains and legumes is mentioned by Cato and Virgil. Here in America as our soil becomes depleted by constant cropping we realize more and more the importance of correct rotations. In arriving at what constitutes the best rotation we would perhaps have in mind the maintenance of soil fertility, economy of labor, ample provision for live stock, and general cost of production in proportion to the profits accruing. But these are facts generally familiar to every good farmer.

There are other "rotations," some of them not so good. We have had too much "rotation" with reference to renters and to country preachers and teachers. The one-year farm lease system is wrong. It is an injustice to the soil and to the man who works it. Followed up, it means, with rare exceptions, that both will be poorer. Just so does too much rotation in the schoolroom mean a poor school. All else being equal, the best teacher is the one who best understands his pupils, who knows the environment in which the child lives, and who is in fullest sympathy with those whom he serves. Why not, then, a "teacherage"—a home for the teacher—for some of our good country schools?

And if the country school suffers because of too much "rotation" what shall we say of the rural church? Surely there is need of a parsonage and of a resident pastor. It will be a fine thing also if this pastor can feel that his parish is his home and that he can have a part in a community upbuilding that makes for permanency. His zeal in the saving of men's souls will be none the less if perchance he is also interested in the farms of the neighborhood and in the saving of the soil. In the pulpit at least, there may be too much "rotation" in religion. A reasonable degree of permanency it would seem, ought to make more profitable a pastorate.

So one way to promote a better country life is to see to it that the rations and rotations are right.

W. L. Nelson, Columbia, Mo.

COST OF GROWING BEEF CATTLE IN THE CORN BELT STATES

That cattle in most cases add to the income in the corn belt is indicated by the results of a recent investigation conducted by the U. S. Department of Agriculture as part of a comprehensive study of the meat situation in which its specialists have been engaged for some time. The direct profit from the raising of calves in this section, the averages seem to establish, is usually small, but the investigators point out that there are other factors which make the practice more advantageous than would appear at first sight.

Among these advantages are the fact that live stock on the farm provide a home market and a means of utilization of farm roughage, some of which might be wasted if not fed, and the use of pastures which could not be employed profitably in any other way. Live stock also afford a ready home market for certain other crops, which at times would have to be hauled considerable distances to be sold. Finally, the presence of live stock on the farm gives productive employment throughout the year to labor which at certain seasons might otherwise be idle. Live stock also gives some interest on capital invested on equipment which would produce nothing if not utilized at all seasons. The fertilizing value of manure also must be considered. When these factors are taken into consideration, even though there appears to be little or no profit as shown by cost figures, it is believed that in most instances the farm income is greater because of cattle having been kept on the farm. The keeping of live stock, therefore, is to be recommended on farms having large quantities of cheap roughage available or having land which can be best utilized as pasture.

Summary of Results

The figures of costs cited by the investigators are purely averages based on actual farms and herds investigated. The investigators obtained in 1914 and 1915, 596 records from farms in Indiana, Illinois, Minnesota, Iowa, Missouri, South Dakota, Nebraska and Kansas. These records dealt with 14,634 cows, 621 bulls and 12,591 calves produced from them, of which 2,023 were classed as baby beef.

Classification of Records

These were arranged in six groups based on six distinct practices followed by the farmers of this region. These are:

(1) Beef—Farms where all the cows are kept strictly for beef (except baby beef), in which there is no sale of milk and butter.

(2) Baby beef—Farms devoted to the production of high-grade calves fattened and sold at from 12 to 18 months of age.

(3) Dual purpose—Farms on which all the cows are milked and the calves weaned at birth and raised on skim milk.

(4) Mixed—Farms where the best cows are milked, their calves being weaned at birth, while calves from other cows run with their dams. This is a combination of beef and dual purpose.

(5) Partially Milked — Farms on which calves are not weaned but on which a part of the milk is drawn from the cow, the calf taking the remainder.

(6) Double nursing — Farms where some of the cows are milked and their calves given to other cows.

Summary of Results

The following summaries are based on these six classifications and are given as averages from the records of the farms and live stock actually reported. The conclusions are averages for the entire section studied and the reader must bear in mind that there are wide divergences in cost in the several States. For this reason the report, after considering the general problem, deals in great detail with the range of costs in the several States and the averages for the several sections. The following are the more important facts cited in the summary:

In discussing the different costs the investigators point out that the difference between the net cost and the gross cost for the different groups is partly due to credit for manure and largely to credit for milk products from the cows that were milked. The high cost of maintenance of bulls where baby-beef calves are produced is largely due to the fact that breeding bulls of high quality are necessary. The bull charge is determined largely by the number of calves produced per bull. While the cow charge for raising a calf was lowest in the dual-purpose group, the addition of the cost of feed and labor for the skim-milk calves makes the cost of the calf somewhat greater than in the double-nursing group. Winter feeding costs indicate that there is comparatively little difference in the cost of keeping calves in the five groups other than the baby-beef after weaning time. The "credits" for baby-beef calves, amounting to $7.53, include an allowance for manure and pork. Beef calves, though the most valuable as yearlings, cost so much more than the others that, according to averages, they were the least profitable. The cost of production exceeded inventory value by $15. All calves, except those of the baby-beef group, were inventoried just before being turned on pasture at a time when the cost of the calf is greatest as compared with its value. It is believed that if the records had included data on the calves until the following November that the difference betwe- the cost and value would have been much less. The calves in the dual-purpose group, although the poorest in quality, seem to rank second in point of profit.

The cost of production was lowest for calves in the double-nursing group, and as these animals are relatively of good quality they showed the greatest profit. Although there were but 22 farms in this group, the results seem, to the investigators, significant.

SUMMARY TABLE SHOWING FOR THE SIX GROUPS THE VARIOUS FACTORS THAT MAKE UP THE COST OF PRODUCING A YEARLING (a)

ITEM	Beef	Baby Beef (a)	Dual Purpose	Mixed	Partially Milked	Double Nursing
Numbe of farms	230	66	110	102	65	22
Average number of cows per farm	31.50	34.56	12.75	23.47	14.29	17.32
Cost of maintaining the breeding herd:						
Gross cost of maintaining a cow	$35.12	$36.77	$55.14	$43.95	$42.75	$46.50
Credits other than calf	4.79	5.39	49.07	24.72	21.43	33.26
Net cost of maintaining a cow	30.33	31.88	6.07	19.23	21.32	13.24
Net cost of maintaining a bull	42.27	53.26	37.51	46.79	34.14	40.53
Calf crop:						
Percentage of cows raising calves to weaning time	48.90	90.7	83.90	87.50	90.10	92.10
Number of calves per bull	20.90	25.30	10.70	18.50	12.60	15.00
Cost of raising a calf to weaning time:						
Cow charge	35.47	34.50	7.34	22.29	23.71	14.53
Bull charge	2.26	2.29	4.02	2.91	3.35	3.02
Feed	.01	.00	9.35	4.48	.02	.26
Feed	.00	.00	2.56	1.11	.00	.01
Total cost at weaning time	$37.74	$36.79	$23.27	$30.79	$27.08	$17.82
Cost of raising a yearling:						
Number of farms	190	67	99	96	57	22
Average number of calves per farm	24.43	30.20	10.57	18.46	11.16	14.23
Cost at weaning time	(*)38.20	(*)37.01	(*)23.64	(*)30.61	(*)26.39	17.82
Winter-feed cost	12.32	35.02	9.93	12.01	12.21	10.24
Other charges	4.62	6.02	4.92	4.72	4.66	3.86
Gross cost	55.14	78.05	38.49	47.34	43.26	31.92
Credits	1.60	7.53	1.89	1.48	1.54	1.67
Net cost	53.54	70.52	36.60	45.86	41.72	30.25

(a) The statement for baby-beef group gives figures on the calves until they are marketed at approximately 15 months of age.

(*) The change in the number of farms on which the tabulation of cost of producing yearlings is based causes the figures on cost of calf at weaning time to change in this part of the table.

The figures in bold face type call attention to the fact that the baby-beef animal is carried somewhat beyond the yearling stage.

Fills Highest Silo

AN **International** ensilage cutter, Type A, filled a Pennsylvania silo 110 feet high and 27 feet in diameter, said to be the highest silo in the world. This machine has tremendous capacity. It pours a stream of ensilage into the silo at the rate of 16 to 25 tons an hour, cutting as fine or as coarse as may be desired. This is our largest cutter. Type B cuts 12 to 16 tons; Type E, 10 to 12 tons; and type F, 3 to 6 tons per hour. On all models knives and blower are attached to the flywheel, the simplest arrangement and the one that uses the least power. The knives can be adjusted to absolute accuracy, and, once set, are held firmly in place. Their clean shear cut begins at the outer edge, throwing most of the work close to the center, where the power is greatest. No power is wasted.

International ensilage cutters are safe. All working parts are carefully housed. The lever that starts, stops, and reverses the machine is so placed that a man cannot reach his hand as far forward as the knives without stopping the machine.

The power cost is low. The machine will fill any silo. The operators are carefully protected from injury. Here are three good reasons for seeing the machine at the local dealer's place of business, or writing to us for full information.

SWAT THE HESSIAN FLY

Pointers from the Missouri College of Agriculture

Plow early.

Bury the fly.

Destroy all volunteer wheat.

Sow on or soon after fly-free date.

Use oats or rye as fall pasure. The fly can't eat oats and it cares little for rye.

Deep plowing of wheat stubble buries the fly and a good harrowing makes it harder for him to escape.

Starve the fly till about the middle of October then sow and you'll have no Hessian fly next year if all your neighbors do the same. If one of them sows early or lets volunteer wheat stand, his fly crop will probably get your wheat next year.—T. J. Talbert.

Sheep Die from Maggots

Much injury from maggots on sheep is reported this season. In ordinary years these maggots bother only the lambs, especially following docking and castration, when sores are exposed. The maggots develop in the clotted filth in the wool and work well over the hind quarters if not checked. If undisturbed they become so bad that serious injury and death frequently result. Under favorable conditions the maggots develop in twenty-four hours.

The Nebraska College of Agriculture says hat each sheep should be carefully examined, and enough lysol or some other strong dip of practically full strength at the first application should be poured on the maggots. Apply as many times as is necessary to be effective. Then examine frequently, and when the maggots are all killed apply a healing salve so that the skin will keep soft and the wool will grow again.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII August 15, 1916 No. 16

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the potoffice at Columbia, Missouri, as second-class mail matter.

WHAT ABOUT A SILO?

Several thousand silos have now been in use in Missouri for a period of one year to many years and so far as we have been able to ascertain practically all of them have given satisfaction. There have been a few failures where the silos were not properly built; some have failed because they did not know how to fill them and now and then a man has built a silo who did not have enough live stock to make it pay but all of these make only the exception to the rule that a well built silo is about the best investment a farmer can make.

The conditions this year seem to be favorable for making the silo pay. Much of the corn has been cut short so much by drouth that there will be little profit from it unless it is put into the silo. THE MISSOURI FARMER has published frequent statements from farmers who put their corn in the silo in the drouth years of 1911 and 1913 and many of them state that a poor crop siloed is worth about as much as a good crop when the grain only is saved.

After a drouth the chances are that there will be a great deal of fall rain at least this seems to have been the rule in the past, and the immature, sunburned fodder that is put into the shock is easily spoiled by the rain. In such seasons if a part of the fodder can be fed in the early fall and winter and the silage saved for late winter and spring and in that way prevent the heavy loss that occurs where the fodder stands in the shock all winter.

The man who owns his farm can well afford to look to the permanency of the structure when contemplating building. So far as the keeping of the silage is concrened it has been found that in this climate the cheaper forms of silo will do as well as the more expensive ones provided they are made "air tight" but the cheaper forms are more easily twisted out of shape or blown down by the wind and must be rebuilt after only a few years use.

The more permanent silos, particulary those built of hollow tile or cement will last indefinitely, are seldom ever injured by lightning or wind storms and when once built the owner need have no further worry about a place to save his corn crop.

A smaller acreage of corn grown along with more alfalfa, clover, soy beans and other legumes and the raising of more sheep and cattle in Missouri will mean a greater conservation of soil fertility as well as more permanency and more profit to those farmers who follow this system.

When the corn is cut early and put in the silo it leaves the field in good shape for seeding to rye or wheat and there should be very much more of this done than is now the practice. Farmers generally have come to a full realization of the value of these crops for fall and winter pasture and also for the great benefit to the soil which is afforded by a winter cover crop. With favorable weather through fall and winter a field of early sown rye or wheat will save a great many bushels of corn and the succulence of the pasture is just what is needed to go along with the dry feeds. In an open winter calves and other young stock can be very largely wintered on a rye or wheat pasture supplemented with a light feed of hay and they seem to grow off much better the next spring when turned on the grass than dry-fed stock.

These drouths come most too frequently but that is a matter we can not control but we can change our methods of cropping so as to prevent and overcome the damage usually wrought by a drouth to the ordinary corn growing farmer.

HOW TO GET A FARM LOAN

A farmer from Nodaway County writes that he desires to get a farm loan under the Federal plan for rural credits and asks how he shall proceed?

In answer let us say that no one can tell now just how long it will take to organize the Federal land banks. At this time the Federal farm loan board has been organized and the first step will be to divide the United States into twelve districts and a Federal land bank will be organized in each district. Branch banks may be organized on the approval of the Federal board. As soon as the twelve districts are formed a city will be designated in each district for the location of the bank and a temporary board of directors of five members will be appointed by the farm loan board and this board will proceed to organize the bank. The minimum capital of the bank is to be $750,000 and if the stock is not taken by private individuals the Secretary of the U. S. Treasury is authorized to subscribe for the stock.

The bank will not loan directly to you but if you want a loan you must organize in your community what the law names, a national farm loan association. This farm loan association must consist of ten or more natural persons who are the owners, or about to become owners of farm land. Each member must be an applicant for a loan of not less than $100 nor more than $10,000 and the aggregate of all the loans must be not less than $20,000. If then your association by its members wants a loan of $20,000 after your association is formed you must first subscribe for stock in the Federal land bank of 5 per cent of the loan asked for, in this case $1000 of stock must be subscribed for. The details of this organization, blanks, etc., will doubtless be furnished by the Federal land bank as soon it is organized.

No one except a borrower can become a member of one of these farm loan associations and each member must subscribe for stock to the amount of five per cent of his desired loan. If our inquirer should apply for a loan of $5000 he must first subscribe for $250 worth of stock in the farm loan association and this must be paid in cash when the loan is granted.

After the association is organized new members are taken in only on two-thirds vote of the directors but he must subscribe for the necessary shares of stock to equal 5 per cent of the loan desired.

It will probably be several months before a bank is organized in Missouri but the farmers of any community who desire to take out loans under this plan would do well to get together and form a farm loan association and be ready when the bank is organized.

ALFALFA INSURANCE

Two tons of hay to the acre, a crop of seed worth $15 or $20 and still a chance for another cutting of hay is not a bad return for an acre of good upland in a drouth year like the present season has been. In our June 1 number we gave an account of a Boone County piece of upland which had produced one ton of cured hay to the acre on May 15. The second cutting was ready for harvest June 25 and now on this date, August 14 there is a fair seed crop just beginning to ripen. This crop was grown on just good average upland soil which had been treated with barn-yard manure. After this seed crop is saved there will be time for considerable pasturage or another light cutting of hay. We think this yield of two tons or more of alfalfa hay and a seed crop that now looks good for at least two or three bushels per acre will give the owner a better return than most farmers will get from any other crop.

For the man who contemplates seeding alfalfa this year there is no time to lose because it takes some time to get a good seed bed. The soil should be plowed deep, thoroughly fined and compacted to the bottom of the furrow and the seeding should be preferably done in August or early part of September. The young plants must have time to make a good start to give the necessary winter protection. It is not the purpose of this article to give details of seeding or cultivation but we would have our readers know the great value of alfalfa as an insurance against drouth as well as its value as a soil building crop. Better try at least a few acres of alfalfa this year if you are not already growing it on your farm.

SHALL MISSOURI FARMERS ORGANIZE?

We want to urge every reader of THE MISSOURI FARMER to turn to page 3 of this issue and read the "appeal" made by the committee of farmers who were appointed under the authority of the Farmers' Conference held during Farmers' Week in Columbia last January. Then after reading that "appeal" if you think there is room for improvement in the marketing of what you produce and in buying some of the things you need to buy, we want to appeal to you to take the matter up with your neighbors and see if you can not organize a farmers club in your school district or township and when several townships are organized a county association should be formed with a view of soon completing the organization of a state association.

The detailed plans for the organization are yet to be worked out but when the farmers of several hundred districts are organized, delegates can be selected and entrusted with the working out of the plan.

A number of farm clubs were organized last winter at the suggestion of THE MISSOURI FARMER and a number of them saved enough in buying binding twine to make a good working fund for the club for some time. Clubs reported a saving of from $50 to $200 on this one item alone. We want to warn our farmer friends of the dangers of failure when farmers seek to enter the retail business as the experience of the past with the Grange and Farmers' Alliance has shown but in the buying of heavy articles which may be handled without waste there is no reason why farmers should not buy in car lots and make a considerable saving. On account of the drouth considerable feed will have to be bought this year and if farmers can make a saving of $2 or $3 a ton on alfalfa or on mill feed, or five or ten cents a bushel on corn, is not that worth while? In buying coal and fertilizers a saving can be made by buying direct in car lots that would amount to $200,000 or $300,000 a year. Do you not think that is worth while?

Aside from the business reasons for organizing farm clubs there are many social and educational advantages to be gained. Better schools, better churches, good roads and a better environment all round for the enjoyment of life will come with a complete organization of farmers.

SHALL WE SOW WHEAT?

The above question has been asked us a number of times within the last few weeks and we think it represents a very general feeling among farmers of Missouri and surrounding states. Only yesterday a man who has had extensive work among the farmers of Missouri for the last two years came to us and said, "You ought to be urging your readers to sow all the wheat they can this fall. It looks to me like the price is going to be very high and I think farmers ought to get ready to sow a big acreage of wheat this fall." It takes more knowledge than the writer claims to have to forecast with any certainty the prices on any crop a year ahead but we do know that the United States will produce very much below an average crop of wheat this year. Canada will also produce a decreased crop and it now looks like there will be very little surplus over and above what we will need at home including a reasonable carry over. The world's wheat prices do not depend all together on the crop of this country but as we produce about one-fourth of the total, a shortage of more than one-third in this country should make some difference in prices. Industrial conditions can make a very material difference in the amount of wheat consumed and with the great European war likely to close by another year no one can forecast just what effect that will have on our industries. But with all these uncertainties it is a safe guess that wheat will maintain a fair price level for the year at least.

We would not sow wheat unless we could sow it on well prepared land. We think much of the failure of last year's crop was because most of the wheat was sown late and sown on land that had been recently plowed with a rank growth of weeds turned down which did not have time to decay. This always makes a poor seed bed. Weeds plowed down green will

soon decay and furnish food for the growing wheat, but mature weeds plowed under in September furnish little available material for the wheat besides it leaves the land in the very worst possible condition for the winter. This was one of the principal causes of the winter killing of the wheat last year.

The farmer who is planning to sow wheat this year should lose no time in getting the ground plowed and worked into a good seed bed for experience has demonstrated that wheat must have a good, fine and compact seed bed in nine years out of ten to produce a profitable crop.

The Hessian fly makes it necessary to sow wheat later in the season than we used to think best and to overcome the late sowing it is best to sow more seed per acre and to use plenty of fertilizer. The late seeding will not tiller so well and hence the need of more seed, and the late plants require the fertilizer to push them along in the spring and to hasten the ripening and get the crop out of danger from rust, chinch bugs and other pests.

There is no money in growing a half crop of wheat and to grow a full crop requires a good soil, well prepared seed bed, reasonably good season and two of these are entirely under the farmer's control.

BARNYARD GOSSIP

To introudce the subject I want to write about this week by way of explanation let me say that Butler is the county seat of one of the largest counties in the state, Bates which is situated about 60 miles south of Kansas City. Hudson is the name of a farm community some 16 miles from Butler. Now this from the Butler Times:

"Among the most pleasing numbers of the 1916 Chautauqua was the Hudson Township Orchestra Monday afternoon. The orchestra is composed of some of the best musicians in this part of the country. Their leader is James Kupke, a finished musician, who received his musical education in Europe. The other members of the orchestra are: Violins, Burl Browning, Claude Stephenson and Ernest Browning; Cornet, Bruce Pheasant; Trombone, Ellis Smith; Drums, Dee Brown; Horn, Lewis Deweese; Piano, Mrs. Ben Baskerville. The orchestra is the outgrowth of the Hudson Home Improvement Club and their playing was better than many of the professional organizations traveling over the country charging larger prices to hear them play. It is to be hoped that they may be induced to play a return engagement in Butler at some future time."

Then here is another item about this country district, from Appleton City Journal, that will help the reader get an idea of what a neighborhood can do to put itself on the map:

The Girls' Agricultural Club of Hudson held their annual picinic at the home of their leader, Mrs. Cora A. Chapin. After partaking of the elegant dinner out under the trees, they went to the house and had a program consisting of readings, piano solos, duets and songs. They had two guests from Oklahoma, who were visiting cousins here. They had a great time practicing drinking out of a Cuban Water Jug and playing various games that girls enjoy.

One of these girls has four achievement buttons. These buttons are sent out by the extension department of the Missouri State University, College of Agriculture for work done and reports made.

Recently these girls made a poultry survey of Hudson school district. At the time of year when the most chickens are found on the farm there are 10,000 chickens, both old and young, in the Hudson school district.

Have you caught the idea, dear reader? I happen to know about the work in this country community for it was my home for nearly 25 years. A few years ago every thing seemed dead, so to speak. The little old school house was poorly suited to the needs of the district. The Sunday-school had only a struggling existence for the summer months. There were practically no social activities for young or old and on Sundays or evenings the boys would seek the town four miles away for their entertainment. There seemed to be no community spirit yet it was a fairly good community, made up mostly of farmers, who owned their land and individually were good citizens. One day a few years ago, it dawned on some of these good people that there was something lacking to make life what it ought to be in that school district.

In short a get-together-meeting was held—a Farm Home Improvement Club was organized and the above are only incidents of what has been accomplished. A modern school house has been erected,—a fine piana the property of the club is in the school house for use on all occasions when needed. An annual Harvest Home fair and picnic is held and premiums amounting to $150 to $200 are awarded for home products and activities—mostly going to the young people. This was purely an educational and social movement but it has paid and paid well in many ways.

There is not a school district in the state that can not do what this one has done. Is it worth while? Do you want your boys and girls directed toward the better things of this life and do you want to enjoy some of these good things yourself or are you satisfied to just let things drift with the current? If you do not find some place for your young people to spend their time in useful, interesting and healthful work they will find a place and a way that may bring you and them to sorrow. These are some of the reasons why THE MISSOURI FARMER would like to see a good farm improvement club in every district in the state.

AS I LOOK AT IT

Better "dig" than "soar."

A mud hole in the road is worse than the hole in a doughnut.

Organization on the part of the farmer is the best kind of preparedness.

A good way to keep the boy on the farm is to make it to his interest to stay there.

Not every politician who "has an axe to grind" is willing to turn the grindstone.

Wool is now selling for practically twice what it did five years ago, but dog hair shows no advance in price.

The best Missouri songs are those for which the accompaniments are played on corn planters and self binders.

Well may Missouri bluegrass make the people of other states turn green with envy. "Knee deep in June"—in Missouri.

You and your farm are a part of your community. What are you doing to help the community? Are you a lifter or a leaner?

So you "haven't time" to help the wife and daughter with a few flowers? Too busy making money with which to buy the things they want? Well, now, isn't it just barely possible that a few flowers would bring to the entire family more of pleasure than would be possible from the purchase of any article that could be bought with the money earned in the hour or two devoted to the flowers? Figure it out.

Apple growers who last season sold 350,000 barrels of apples recently met in St. Louis and organized the National Commercial Apple Growers' Association. The purposes of the association are to create greater publicity, larger apple consumption, to collect statistics on crop conditions and market reports, to investigate and perfect systems of cold-storing apples, to obtain a uniform distribution and supply to produce an average scale of prices, and to obtain economy of distribution More and more are the workers in every field of agriculture coming to appreciate the value of organization. "Going it alone" means loss and often destruction.

"Yes sir-ee, we always plant root crops in the dark of the moon and other crops in the light of the moon, and we always have good crops." The statement we believed to be true, for the speaker, an excellent farmer, was just as careful to put his seed in a good seedbed, as "in the moon."

Another tells of how he always plants a certain crop on St. Patrick's Day—March 17, and aother on Good Friday. "And I never have a failure," said he. Now this farmer, like the first, is a believer in preparedness—soil preparedness. The preparation of his potato patch practically approaches perfection. Naturally, then, he has potatoes when anybody does.

Faith in the moon, in signs or in certain days is all right for such farmers. It is hurtful, though, to the farmer who fails first to look to the fields, who neglects to provide a good seedbed and to plant good seed.

W. L. Nelson.

THE MISSOURI FARMER has made arrangements with several Fertilizer manufacturers to supply fertilizers at the wholesale-price in car load shipments to Farm Clubs and also to those of our readers who succeed in making up a neighborhood order. This will affect quite a saving and those interested should therefore get in immediate touch with us.

Prepare! For old man winter is coming!

IDEAL Boilers are easier to run than a stove and the heat can be regulated to suit the weather—mild for chilly days or warmer to defeat the blizzard

Make up your mind to have this greatest of farm comforts and equipment right away. Don't put it off another day before finding out all about it and making arrangements for putting it in your house. Not necessary to have running water or a basement. The IDEAL Boiler can be placed in a side room or in a "lean-to;" even a well boarded up summer kitchen will answer the purpose.

AMERICAN RADIATORS & IDEAL BOILERS

But above all things, *have IDEAL - AMERICAN heat this winter.* A properly heated home is more important than automobiles or farm machinery.

Keep dampness and chill—(those half brothers of sickness) out of your house entirely. Give your family and yourself genuine comfort, pleasant health-giving warmth. IDEAL heating is the most successful and most profitable investment you can make—yielding big returns in comfortable living, health and happiness for the whole family.

Hot water supply for home and stock

Our little Hot Water Supply Boilers are fine for the home that has running water—domestic hot water always on tap for the use of the family or can be piped out to the water trough for tepid drinking water for the stock in winter.

Fuel: IDEAL Boilers will burn most anything—hard or soft coal, lignite, screenings, wood, and they produce the full heat to distribute to the AMERICAN Radiators placed to warm all parts of the house.

A No. 4-19-W IDEAL Boiler and 270 ft. of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Ideal heating best for farm house

Turn old Winter out and keep him out! Money spent in IDEAL-AMERICAN heating comes back in good living, health, happiness, savings in fuel and the big increased value that your property gets by this, the most important equipment of the farm home. Bankers and real estate men will almost invariably lend money for installing IDEAL-AMERICAN heating for they know that the security is sound and never less in value.

Write today for "Ideal Heating" and get this big book of information free. Investigate now before the winter rush and while prices are so attractive!

Sold by all dealers. No exclusive agents.

David Dunne

A Romance of the Middle West

By BELLE KANARIS MANIATES

CHAPTER VIII

At two o'clock on the day after David Dunne had been elected governor by an overwhelming majority, he reined up at the open gate at the end of the maple drive. His heart beat faster at the sight of the regal little figure awaiting him. Her coat, furs, and hat were all of white.

He helped her into the carriage and seated himself beside her.

"Have you been waiting long, and are you dressed quite warmly?" he asked anxiously.

"Yes, indeed; I thought you might keep me waiting at the gate, so I put on my furs."

The drive went on through the grounds to a sloping pasture, where it became a rough roadway. The day was perfect. The sharp edges of November were tempered by a bright sun, and the crisp air was possessed of a profound quiet. When the pastoral stretches ended in the woods, David stopped suddenly.

"It must have been just about here," he said, reminiscently, as he hitched the horse to a tree and held out his hand to Carey. They walked on into the depths of the woods until they came to a fallen tree..

"Let us sit here," he suggested.

She obeyed in silence.

An early frost had snatched the glory from the trees, whose few brown and sere leaves hung disconsolately on the branches. High above them was an occasional skirmishing line of wild ducks. The deep stillness was broken only by the scattering of nuts the scurrying squirrels were harvesting, by the cry of startled wood birds, or by the wistful note of a solitary, distant quail.

"Do you remember that other—that first day we came here?" he asked.

She glanced up at him quickly.

"Is this really the place where we came and you told me stories?"

"You were only six years old," he reminded her. "It doesn't seem possible that you should remember."

"It was the first time I had ever been in any kind of woods," she explained, "and it was the first time I had ever played with a grown-up boy For a long time aterward, when I teased mother for a story, she would tell me of "The Day Carey Met David."

"And do you remember nothing more about that day?"

"Oh, yes; you made us some little chairs out of red sticks, and you drew me here in a cart."

"Can't you remember when you first laid eyes on me?"

"No—yes, I remember. You drove a funy old horse, and I saw you coming when I was waiting at the gate."

"Yes, you were at the gate," he echoed, with a caressing note in his voice. "You were dressed in white, as you are to-day, and that was my first glimpse of the little princess And because she was the only one I had ever known, I thought of her for years as a princess of my imagination who had no real existence."

"But afterwards," she asked wistfully, "you didn't think of me as an imaginary person, did you?"

"Yes; you were hardly a realit until—"

"Until the convention?" she asked disappointedly.

"No; before that. It was in South America, when I began to write my book, that you came to life and being in my thoughts. The tropical land the brilliant sunshine, the purple nights, the white stars, the orchids, the balconies looking down upon fountained courts, all invoked you. You answered, and crept into my book, and while we—you and I—were writing it, it came to me suddenly and overwhelmingly that the little princess was a living, breathing person, a woman who mayhap would read my book some day and feel that it belonged to her. It was so truly hers that I did not think it necessary to write the dedication page. And she did read the book and she did know—didn't she?"

He looked down into her face, which had grown paler but infinitely more lovely.

"David, I didn't dare know. I wanted to think it was so."

"Carey," his voice came deep and strong, his eyes beseeching, "we were prince and princess in that enchanted land of childish dreams. Will you make the dream a reality?"

"When, David," she asked him, "did you know that you loved, not the little princess, but me, Carey?"

"You make the right distinction in asking me when I knew I loved you. I loved you always, but I didn't know that I loved you, or how much I loved you, until that night we sat before the fire at the Bradens'."

"And, David, tell me what mother said that day after the parade?"

"She told me I had her consent to ask you—this!"

"And why, David, did you wait until to-day?"

"The knowledge that you were coming back here to Maplewood brought the wish to make a reality of another dream—to meet you at the place where I first saw you—to bring you here, where you clung to me for the protection that is henceforth always yours. And now, Carey, it is my turn to ask you a question. When did you first love me?"

"That first day I met you—here in the woods. My dream and my prince were always realities to me."

CHAPTER IX

The governor was indulging in the unwonted luxury of solitude in his private sanctum of the executive offices. The long line of politicians, office seekers, committees, and reporters had passed, and he was supposed to have departed also, but after his exit he had made a detour and returned to his private office.

Then he sat down to face the knottiest problem that had as yet confronted him in connection with his official duties. An important act of the legislature awaited his signature or veto. Various pressing matters called for immediate action, but they were mere trifles compared to the issue pending upon an article he had read in a bi-weekly paper from one of the country districts. The article stated that a petition was being circulated to present to the governor, praying the pardon and release of Jud Brumble. Then had begun the great conflict in the mind of David Dunne, the "governor who could do no wrong." It was not a conflict between right and wrong that was being waged, for Jud had been one to the prison born.

David reviewed the series of offenses Jud had perpetrated, puishment for which had ever been evaded or shifted to accomplices. He recalled the solemn promise the offender had made him long ago when, through David's efforts, he had been acquitted—a promise swiftly broken and followed by more daring transgressions, which had culminated in one enormous crime. He had been given the full penalty—fifteen years—a sentence in which a long-suffering community had rejoiced.

Jud had made himself useful at times to a certain gang of ward heelers and petty politicians, who were the instigators of this petition, which they knew better than to present themselves. Had they done so, David's course would have been plain and easy; but the petition was to be conveyed directly and personally to the governor, so the article read, by the prisoner's father, Barnabas Brumble.

By this method of precedure the petitioners showed their cunning as well as their knowledge of David Dunne. They knew that his sense of gratitude was as strong as his sense of accurate justice, and that to Barnabas he attributed his first start in life; that he had, in fact, literally blazed the political trail that had led him from a country lawyer to the governorship of his state.

There were other ties, other reasons, of which these signers knew not that moved David to heed a petition for release should it be presented.

Again he seemed to see his mother's imploring eyes and to hear her impressive voice. Again he felt around his neck the comforting, chubby arms of the criminal's little sister. Her youthful guilelessness and her inherent goodness had never recognized evil in her wayward brother, and she would look confidently to "Davey" for service, as she had done in the old days of country schools and meadow lanes.

On the other hand, he, David Dunne, had taken a solemn oath to do his duty, and his duty to the people, in the name of justice, was clear. He owed it to them to show no leniency to Jud Brumble.

So he hovered between base ingratitude to the man who had made him, and who had never before asked a favor, and non-fulfillment of duty to his people. It was a wage of head and heart. There had never been moral compromises in his code. There had ever been a right and a wrong—plain roads, with no middle course or diverging paths, but now in his extremity he sought some means of evading the direct issue. He looked for the convenient loophole of technicality—an irregularity in the trial—but his legal knowledge forbade this consideration after again going over the testimony and evidence of the trial. The attorney for the defense had been compelled to admit that his client had had a square deal. If only the petition might be brought in the usual way, and presented to the pardon board, it would not be allowed to reach the governor, as there was nothing in the case to warrant consideration, but that was evidently not to be the procedure. Barnabas would come to him and ask for Jud's release, assuming naturally that his request would be willingly granted.

If he pardoned Jud, all the popularity of the young governor would not screen him from the public censure. One common sentiment of outrage had been awakened by the crime, and the criminal had been universally repudiated, but it was not from public censure or public criticism that this young man with the strong under jaw shrank, but from the knowledge that he would be betraying a trust. Gratitude and duty pointed in different directions this time.

With throbbing brain and racked nerves he made his evening call upon Carey, who had come to be a clearing house for his troubles and who was visiting the Bradens. She looked at him tonight with her eyes full of the adoration a young girl gives to a man who has forged his way to fame.

He responded to her greeting abstractedly, and then said abruptly:

"Carey, I am troubled to-night!"

"I knew it before you came, David. I read the evening papers."

"What!" he exclaimed in despair. "It's true, then! I have not seen the papers to-night."

She brought him the two evening papers of opposite politics. In glowing headlines the Democratic paper told in exaggerated form the story of his early life, his humble home, his days of struggle, his start in politics, and his success, due to the father of the hardened criminal. Would the governor do his duty and see that law and order were maintained, or would he sacrifice the people to his personal obligations? David smiled grimly as he reflected that either course would be equally censured by this same paper.

He took up the other journal, the organ of his party, which stated the facts very much as the other paper had done, and added that Barnabas Brumble was en route to the capital city for the purpose of asking a pardon for his son. The editor, in another column, briefly and firmly expressed his faith in the belief that David Dunne would be stanch in his views of what was right and for the public welfare.

There was one consolation; neither paper had profaned by public mention the love of his boyhood days.

"What shall I do! What should I do!" he asked himself in desperation.

"I know what you will do," said Carey, quickly reading the unspoken words.

"What?"

"You will do, as you always do—what you believe to be right. David, tell me the story of those days."

So from the background of his recollections he brought forward vividly a picture of his early life, a story she had heard only from others. He told her, too, of his boyish fancy for Janey.

There was silence when he had finished. Carey looked into the flickering light of the open fire with steady, musing eyes. It did not hurt her in the least that he had had a love of long ago. It made him but the more interesting, and appealed to her as a pretty and fitting romance in his life.

"It seems so hard, either way, David," she said looking up at him in a sympathetic way. "To follow the dictates of duty is so cold and cruel a way, yet if you follow the dictates of your heart your conscience will accuse you. But you will, when you have to act, David, do what you believe to be right, and abide by the consequences. Either way, dear, is going to bring you unhappiness."

"Which do you believe the right way, Carey?" he asked, looking searchingly into her mystic eyes.

"David," she replied helplessly, "I don't know! The more I think about it, the more complicated the decision seems."

They discussed the matter at length, and he went home comforted by the thought that there was one who understood him, and who would abide in faith by whatever decision he made.

The next day, at the breakfast table, on the street, in his office, in the curious, questioning faces of all he encountered, he read the inquiry he was constantly asking himself and to which he had no answer ready. When he finally reached his office he summoned his private secreary.

"Major, don't let in any more people than is absolutely necessary to-day. I will see no reporters. You can tell them that no petition or request for the pardon of Jud Brumble has been received, if they ask, and oh, Major!"

The secretary turned expectantly.

"If Barnabas Brumble comes, of course he is to be admitted at once."

Later in the morning the messenger to the governor stood at the window of the business office, idly looking out.

"Dollars to doughnuts," he exclaimed suddenly and confidently, "that this is Barnabas Brumble coming up the front walk!"

The secretary hastened to the window. A grizzled old man in butternut-colored, tightly buttoned overcoat and carrying a telescope bag, was ascending the steps.

"I don't know why yo uthink so," said the secretary resentfully to the boy. "Barnabas Brumble isn't the only farmer in the world. Sometimes," he added, pursuing a train of thought beyond the boy's knowledge, "it seems as if no one but farmers came into this capitol nowadays."

A few moments later one of the guards ushered into the executive office the old man carrying the telescope. The secretary caught the infection of the boy's belief.

"What can I do or you?" he asked courteously.

"I want to see the guvner," replied the old man in a curt tone.

"Your name?" asked the secretary.

"Barnabas Brumble," was the terse response.

He had not read the newspapers for a week past, and so he could hardly know the importance attached to his name in the ears of those assembled. The click of the typewriters ceased, the executive clerk looked quickly up from his papers, the messenger assumed a triumphant pose, and the janitor peered curiously in from an outer room.

"Come this way, Mr. Brumble," said the secretary deferentially, as he passed to the end of the room and knocked at a closed door.

David Dunne knew, when he heard the knock, to whom he would open the door, and he was glad the strain of suspense was ended. But when he looked into the familiar face a host of old memories crowded in upon his recollection, and obliterated the significance of the call.

"Uncle Barnabas!" he said, extending a cordial hand to the visitor, while his stern, strong face softened under his slow, sweet smile. Then he turned to his secretary.

"Admit no one else, Major."

David took the telescope from his guest and set it on the table, wondering if it contained the "documents in evidence."

"Take off your coat, Uncle Barnabas. They keep it pretty warm in here!"

"I callate they do—in more ways than one," chuckled Barnabas, removing his coat. "I hed to start purty early this mornin', when it was coolike. Wal, Dave, times has changed! To think of little Dave Dunne bein' guvner! I never seemed to take it in till I come up them front steps."

The governor laughed.

"Sometimes I don't seem to take it in myself, but you ought to, Uncle Barnabas. You put me here!"

As he spoke he unlocked a little cabinet and produced a bottle and a couple of glasses.

"Wal, I do declar, ef you don't hev things as handy as a pocket in a shirt! Good stuff, Dave! More warmin' than my old coat, I reckon, but say, Dave, what do you s'pose I hev got in that air telescope?"

David winced. In olden times the old man ever came straight to the point, as he was doing now.

"Why, what is it, Uncle Barnabas?"

"Open it!" directed the old man laconically.

With the feeling that he was opening his coffin, David unstrapped th telescope and lifted the cover. A little exclamation of pleasure escaped him. The telescope held big red apples, and it held nothing more. David quickly bit into one.

"I know from just which particular tree these come," he said, "from that humped, old one in the corner of the orchard nearest the house."

"Yes," allowed Barnabas, "that's jest the one—the one under which you and her allers set and purtended you were studyin' your lessons."

David's eyes grew luminous in reminiscence.

"I haven't forgotten the tree—or her—or the old days, Uncle Barnabas."

"I knowed you hadn't, Dave!"

Again David's heart sank at the confidence in the tone which betokened the faith reposed, but he would give the old man a good time anyway before he took his destiny by the throat.

"Wouldn't you like to go through the capitol?" he asked.

"I be goin'. The feller that brung me up here sed he'd show me through."

"I'll show you through," said David decisively, and together they went through the places of interest in the building, the governor as proud as a newly domiciled man showing off his possessions. At last they came to the room where in glass cases reposed the old, unfurled battle flags. The old man stopped before one case and looked long and reverently within.

"Which was your regiment, Uncle Barnabas?"

"Forty-seventh Infantry. I kerried that air flag at the Battle of the Wilderness."

David called to a guard and obtained a key to the case. Opening it, he bade the old man take out the fla

With trembling hands Barnabas took out the flag he had followed when his country went to war. He gazed at it in silence, and then restored it carefully to its place. As they walked away, he brushed his coat sleeve hastily across his dimmed eyes.

David consulted his watch.

"It's luncheon time, Uncle Barnabas. We'll go over to my hotel. The executive mansion is undergoing repairs."

"I want more'n a lunch, Dave! I ain't et nuthin' sence four o'clock this mornin'."

"I'll see that you get enough to eat," laughed David.

In the lobby of the hotel a reporter came quickly up to them.

"How are you, governor?" he asked, with his eyes fastened falcon-like on Barnabas.

David returned the salutation and presented his companion.

"Mr. Brumble from Lafferton?" asked the reporter with an insinuating emphasis on the name of the town.

"Yes," replied the old man in surprise. "I don't seem to reckleck seein' you before."

"I never met you, but I have heard of you. May I ask what your business in the city is, Mr. Brumble?"

The old man gave him a keen glance from beneath his shaggy brows.

"Wal, I don't know as thar's any law agin your askin! I came to see the guvner."

David, with a laugh of pure delight at the discomfiture of the reporter, led the way to the dining room.

"You're as foxy as ever, Uncle Barnabas. You routed that newspaper man in good shape."

"So that's what he was! I didn't know but he was one of them three-card-monty sharks. Wal, I s'pose it's his trade to ask questions."

Barnabas' loquacity always ceas entirely at meal times, so his silence throughout the luncheon was not surprising to David.

"Wal, Dave," he said as he finished "ef this is your lunch I'd hate to hev to eat what you'd call dinner. I never et so much before at one settin'!"

"We'll go over to the club now and have a smoke," suggested David. "Then you can go back to my office with me and see what I have to undergo every afternoon."

At the club they met several of David's friends—not politicians—who met Barnabas with courtesy and composure. When they returned to David's private office Barnabas was ensconced comfortably in an armchair while David listened with patience to the long line of importuners, each receiving due consideration. The last interview was not especially interesting and Barnabas' attention was diverted. His eyes fell on a newspaper which he picked up carelessly. It was the issue of the night before, and his own name was conspicuous in big type. He read the article through and returned the paper to its place without being observed by David, whose back was turned to him.

"Wal, Dave," he said, when the last of the line had left the room, "I used ter think I'd ruther do enything than be a skule teacher, but I swan ef you don't hev it wuss yet!"

David made no response. The excitement of his boyish pleasure in showing Uncle Barnabas about had died away as he listened to the troubles and demands of his callers, and now the recollection of the old man's errand confronted him in full force.

Barnabas looked at him keenly.

"Dave," he said slowly, "it ain't no snap you hev got! I never knowed till to-day jest what it meant to you. I'm proud of you, Dave! I wish—I wish you hed been my son!"

The governor arose impetuously and crossed the room.

"I would have been, Uncle Barnabas, if she had ot cared for Joe!"

"I know it, Dave, but you hev a sweet little gal who will make you happy."

The governor's face lighted in a look of exquisite happiness.

"I have, Uncle Barnabas. We wil' go to see her this evening."

"I'd like to see her, sartain. Hain't seen her sence the night you was elected. And, Dave," with a sheepish grin, "I'm a-goin' to git spliced myself."

"What? No! May I guess, Uncle Barnabas—Miss Rhody?"

"Dave, you air a knowin' one. Yes, it's her! Whenever we set down to our full table I got to thinkin' of that poor little woman a-settin' down alone, and I've never yet knowed a woman livin' alone to feed right. They allers eat bean soup or prunes, and call it a meal."

"I am more glad than I can tell you Uncle Barnabas, and I shall insist on giving the bride away. But what will Penny think about some one steppi in?"

"Wal, Dave, I'll allow I wuz skeered to tell Penny, and it tuk a hull lot of bracin' to do it, and what do you suppose she sed? She sez, "I've bin wantin' tew quit these six years, and now, thank the Lord, I've got the chance.'"

"Why, what in the world did she want to leave for?"

"I guess you'll be surprised when I tell you. To marry Larimy Sasser!"

"Uncle Larimy! She'll scour him out of house and home," laughed David.

"We'll hev both weddin's to the same time. Joe and Janey are a-comin', and we'll hev a grand time. I hain't much on the write, Dave, and I've allers meant to see you here in this great place. Some of the boys sez to me: 'Mebby Dave's got stuck on himself and his job by this time, and you'll hev to send in yer keerd by a nigger fust afore you kin see him.' but I sez, 'No! Not David Dunne! He ain't that kind and never will be.' So when I go back I kin tell them how you showed me all over the place, and tuk me to eat at a hotel and to the air stylish place where I wuz treat like a king by yer friends. I've never found you wantin', Dave, and I never expect to!"

"Uncle Barnabas," began David, "I—"

His voice suddenly failed him.

"See here, Dave! I didn't know nuthin' about that," pointing to the newspaper, "until a few minutes ago I sed tew hum that I wuz a-comin' to see how Dave run things, and ef ther disreptible associates of Jud's air a-gittin' up some fool paper, I don't know it! Ef they do send it in, don't you dare sign it! Why, I wouldn't hev that boy outen prison fer nuthin'. He's different from what he used to be, Dave. He got so low he would hev to reach up ter touch bottom. He's ez low ez they git, and he's dangerous. I didn't know an easy minute fer the last two years afore he wuz sent up, so keep him behind them bars fer fear he'll dew somethin' wuss when he gits out. Don't you dare sign no petition Dave!"

Tears of relief sprang into the strong eyes of the governor.

"Why, Dave," said the old man in shocked tones, "you didn't go fer to think fer a minute I'd ask you to let him out cause he wuz my son? Even ef I hed a wanted him out, and Lord knows I don't, I'd not ask you to do somethin' wrong, no more'n I'd bring dishonor to that old flag I held this mornin'!"

David grasped his hand.

"Uncle Barnabas!"

His voice broke with emotion. Then he murmured: "We'll go to see her, now."

As they passed out into the corridor a reporter hastened up to them.

"Governor," he asked, withimpudent directness, "are you going to pardon Jud Brumble?"

Before David could reply, Barnabas stepped forward:

"Young feller, thar hain't no pardon ben asked fer Jud Brumble, and what's more, thar hain' a-goin' to be none asked—not by me. I come down here to pay by respecks to the guvner, and to bring him a few apples, and you kin say so ef you wanter!"

When Carey came into the library where her two callers awaited her, one glance into the divine light of David's deepening, glowing eyes told her what she wanted to know.

With a soft little cry she went to Barnabas, who was holding out his hand in welcome. Impulsively her lips were pressed against his withered cheek, and he took her in his arms as he might have taken Janey.

"Why, Carey!" he said delightedly, "Dave's little gal!"

THE END.

OUR BOYS AND GIRLS

Some of our boys and girls have been doing well in the way of making a little money and we hope others will write and tell what they have done.

Remember you can choose your own subject to write about. If you have had no experience in money making may be you can write a story about a fishing party, a birth day party, or about some interesting thing that has happened in your neighborhood. If your school is better than those around it may be you could tell us why it is better. There are a lot of things boys and girls know and if they would get in the habit of writing stories it would improve their writing, their thinking and expression which are all very important. Do not try to imitate some one else but try to write in your own way.

If we think it worth while after a little more interest is manifested we may offer prizes for the best letters.

The Editor.

How Marie Made $45.50

To the Editor:

I like to hear how other boys and girls are trying to make some money for it may help me in my efforts to do the same thing. When I was ten years old an old uncle gave me a dollar and said that if I would use it so as to make more money that when I was fifteen years old he would then give me as much more as I had made out of the dollar and for my own work.

Mother advised me to buy a setting of Rhode Island Red eggs to start with and from that start I raised 10 chickens. Three were culls, I sold for market and I sold 3 others for one dollar each, leaving me $4.50 in money. I have paid for the food eaten except what they picked up and when I w fifteen years old last April I had $35.50 to my credit and a pen of 10 nice chickens valued at $10.00.

Uncle Ben said that was fine and he gave me $50 to go with my $35.50 which makes my account now $85.50 and the pen of chickens.

Now I would like for some one to tell how to invest the money to get the most out of it. I will keep on with the chickens but I can not keep very many because mother raises chickens.

Marie Hanley.

Ruby Raises Chickens to Buy Christmas Presents

To the Editor:

I live on a farm in Vernon County, in Southwest Missouri. We take THE MISSOURI FARMER and I am reading the splendid story "David Dunne." I like all the characters except Jud, but, of course David is the hero. I was very much disappointed because Janey did not marry David instead of Joe. David you know loved Jany so much and wanted to marry her.

I am twelve years old and the youngest and only girl of the family. I have two brothers, one of whom is twenty and the other is sixteen. I have twenty chickens all my own. I will sell them this fall but do not know just what I will do with the mor but I think I will buy Christmas presents with part of it.

I am always anxious for the next paper to come. Ruby Gist.

How Eva Bought a Cow

To the Editor:

I am a little girl eleven years old, and live on a farm of 160 acres, in Moniteau County. I am very fond of good stock on a farm. My father has a saddle mare, which I enjoy riding very much.

I have a cow and calf of my own, and will tell you how I came by them. When I was very small friends gave me nickles and dimes, these I saved until I had fifty cents, I first bought a pair of bantans, raised ten and sold them for $1.50. With this money I bought a pig, fed it well for a few months and sold it for fourteen dollars. I have bought and sold pigs and calves since until I now own a fine short-horn cow and calf.

Eva Henry.

Make the Boy a Business Farmer

Give him the benefit of the special course in Farm Accounting at Gem City Business College Quincy, Ill. Est. 1870 America's Greatest Commercial College. Then he will help you make the farm pay better. Complete business and stenography courses also. Civil service preparatory, private secretaryship—commercial teaching courses. D. L. MUSSELMAN, Pres. Lock Box 59 Quincy, Ill.

Here's Tuition Money

ATTEND ON CREDIT, pay us when in position. 26 years of prestige. 1,400 students from 30 states. 26 Instructors. 4 big buildings. 160 typewriters. 3 College Banks. College Band. Athletic Park. Big Campus. Car fare paid. Write for free catalog. CHILLICOTHE BUSINESS COLLEGE 1350 Monroe St., Chillicothe, Mo.

A Ransomerian Training Will Make You INDEPENDENT

and fit you to hold any high-salaried position in business. If you are tied to a small-pay job, I can make you FREE, able to earn a bigger salary anywhere you go and I'll help you pay your way while learning. Write me today. C. W. Ransom, Pres. RANSOMERIAN BUSINESS SCHOOL, 1335d Grand Ave., Kansas City, Mo.

Free Tuition Send us this adv. for a $10 certificate and free catalog. Moberly Commercial College, Moberly, Mo.

Build Your WORN OUT SOIL SWEET CLOVER

The great crop for soil fertility and animal feed. Exceptionally rich in nitrogen and humus. Higher protein content than alfalfa. Sow in spring, summer or winter. Write for prices. Bokhara Seed Co., Box F, Falmouth, Ky.

In answering advertisements, please mention THE MISSOURI FARMER.

"HOLDING UP" THE FARMER

By WILLIAM HIRTH

(Continued from page 2)

to the point of starvation—which would cause the shutting down of thousands of manufacturing enterprises big and little—which would make it impossible for the farmer to get to market with his grain and live stock and otherwise utterly demoralize the commerce and industry of the Country as never before.

In view of what recently took place in the Western harvest fields and this threatened calamity which looms up more ominously every hour, should not the American farmer to whom Congress will listen as to no other force in the land, take a hand before it is too late? Should not every farmer sit down at once and write to his Congressman and the Senators from his state and demand in no uncertain terms that Congress meet the issue fairly and squarely—that it send an ultimatum to both the Railroads and the Railway Brotherhoods that there shall be no strike and that this dispute shall be arbitrated by the Inter-State Commerce Commission which is the highest tribunal on transportation matters in the Nation and which must have the power to keep down unnecessary increases in the cost of railroad operation if it is to retain the power to keep down unnecessary increases in railroad rates?

We leave the matter to our readers. That a tremendously grave crisis confronts the Nation there is not the slightest question—and a personal appeal from tens of thousands of citizens direct to Congress is the only power which can avert the impending calamity.

LYON'S PRACTICAL FARM PAPERS

By the time I see a printed copy of this I will be sixty years old, and not having been at all well since March, I really feel that old.

I recall some events of 1859, one the making of sorghum syrup by my father, who was a pioneer in that work here, and of "Granddaddy" Crabb, the local veterinary, who sat on the woodpile and showed me his watch, an old "bullseye," and the only one in the neighborhood, also that Granddaddy got "tight" one day, eating dried peaches that came out of a whiskey barrel.

There were two buggies in the school district and one piano; father was "squire," and in addition to the dozen law books of his office had perhaps twenty-five other books, a large library for the time.

The custom of furnishing whiskey in harvest had just passed away, although a few farmers still set out the bottle at dinner time, and it was some years later, when the custom of a drink all around at barn raisings, went out.

We had a Ketchum one-wheel mower, the only one in the township, but in 1860 father bought a two-wheeled machine, a Wm. Anson 1 hood, and a man four miles north a Buckeye, the first improved mowers in the county.

Every town had several saloons in it, and there was also a saloon at every important cross roads, all well patronized as the records of peace warrants and assaults and batteries, in fathers old criminal docket show.

The farming outfit of a 100 acre farmer here in 1865, consisted of a breaking plow, a nineteen tooth A harrow, small turning plow, one double shovel and a single shovel plow, wagon, sled, two or three hoes, and a mattock, neither more or less, all costing about $150.

Perhaps I had better include grain craddle, scythe and a pitchfork or two, and in an entire neighborhood there were always two or three spades and shovels, a crowbar or two, and as many sledge hammers, these always for loan to those who did not have them.

Up to 1875 most of the grain was cut with cradles, and from the time I was 17 I was a first class cradler, but I never could make a full hand at binding.

Combined mowers and croppers sold at $200 up to 1874 when the Grange movement brought them down to about $125, and while we had tried out an unsuccessful combined mower and self rake in 1873, we bought a mower and cropper in 1875.

In 1877, I cut 130 acres of grass and grain for neighbors, charging $1 for grass, $1.25 for grain, and this money put me through six months at college. Up to 1870, no live hogs were shipped to market, the plan being to dress them, and deliver to the packing houses, one of which was in each river town. Pipley, Ohio, eight miles east of us, had several packing houses, and while the town was of only 2000 inhabitants, from 1850-1868, it packed as many hogs per year as Cincinnati does now.

Until 1861 all the wheat of the country was made into flour, principally by water mills, the flour loaded on flat boats and floated south, but the war put a stop to that, and the five big water mills on the creek a mile west of me, all in a space of five miles, have been dismantled for years. Previous to 1836 wheat was tramped out with horses or flailed out and cleaned with a fanning mill.

In 1836 a man bought a machine called a "ground hog" thresher from Pennsylvania, which threshed, but did not clean the grain; in 1846 a rude cleaning thresher was made at Pipley; in 1876 a first class separating machine came into the country, all these being operated by horse power, and in 1886 the first machine with tracto, engine, was operated here.

We are two miles from the Ohio river, and forty or fifty years ago there was a magnificent fleet of steamboats on that river, three or four great side-wheel boats each way stopped at our landing every day in the year, besides more than that many smaller craft, these boats all loaded with freight and passengers, and bound for all poits between Cincinnati and Pittsburg.

Now a double track railroad along the river has sent the big boats to the "bone yard," and three or four dinkey little stern wheelers are all that are left. C. D. Lyon.

THE MISSOURI FARMER has made arrangements with several Fertilizer manufacturers to supply fertilizers at the wholesale-price in car load shipments to Farm Clubs and also to those of our readers who succeed in making up a neighborhood order. This will affect quite a saving and those interested should therefore get in immediate touch with us.

Open The State Fair to the Boys and Girls

There is no work that our Home Makers Conference or any club in the state can do that is more worth while than that of helping our boys and girls. As the time for our State Fair draws near and great plans for its success are being consumated our thoughts go out to our young people in whom we are so much interested and who should have the benefit of this great educational institution.

With this thought in mind I am asking every club in the state to take an interest in the effort to have our fair board make Monday of Fair Week. Children's Day and admit every child fifteen years of age and under free of charge.

Our fair is a state institution for the benefit and education of the people but there are many children who are deprived of its privileges because of the expense attached. We have seen boys standing outside the gates looking longingly across upon the scene of attraction but were denied admittance because they lacked the required entrance fee and yet as they stood there they saw men of wealth and influence with their families pass in without money and without price.

In this day of automobiles people come long distances with their families and doubtless more would come if their children could enter free.

We ask that every club become interested at once and write to the President or Secretary of the fair making this request thereby helping our boys and girls to this educational treat.—Mrs. Harry Sneed, President Missouri Home Makers Conference.

We Second the Motion

We heartily approve of Mrs. Sneed's suggestion to open the State Fair one day free to all the children of the state who can come. Of course the benefit will be largely to the children of Pettis County but it will do the fair no harm and will do the children some good.

The State Fair is a great educational institution and a day or two for any boy or girl spent at the fair if under proper guidance will be worth a month's time in school.

Yes, cut out the free passes, every one of them and admit the boys and girls free.

THE FLOWERS OF MISSOURI

By Miss Laura Arnots, R. F. D. 2, Polo, Ray County, Missouri.

Spake full well, in language quaint and olden,
One who dwelleth by the castled Rhine,
When he called the flowers, so blue and golden
Stars, that in earth's firmanent do shine.

Flowers "toil not, neither do they spin", yet all down through the ages they have been influencing mankind just by what they are and not by what they do.

In the creation of this good old world, God in His great love, wisdom and kindness to the human family, gave us the lovely, gorgeous, splendid flowers for our pleasure, joy and gladness for the human heart yearns for the beautiful in all ranks of life.

"Flowers, music, and poetry", the ancients said, "form a trinity of which flowers is the elder brother and individually or togeter they are the universe manifesting itself to the better nature of man by appealing directly to the heart."

Flowers, or dream-smiles as the poet called them, have an indisputable influence upon human kind. The graciousness and loveliness they radiate has ever made for sweetness and light, for right living and wholesome thinking, for cleanliness and order.

Flowers, fresh and pure as just from the hand of God, are a tonic and inspiration. They delight and refresh the weary, care-worn traveler on the road of life, not only in being pleasing to the eye, but unconsciously calling the anxious down-trodden, discouraged heart away from care, worry and trouble.

And how the heart of the invalid is gladdened by the sight of flowers, and beautiful floral tokens from friends!

Flowers have a very refining, ennobling influence and minister to the finer instincts and best attributes of higher civilization.

With a flower garden attached to it, the merest shelter from wind and weather—a rude hut it may be—becomes a home.

We are glad in our hearts that more rural homes in Missouri are recognizing the beautiful and fascinating side of country life. While those living in the narrow confines of the city spend their money that they may enjoy nature's delicate gifts, should not those living in the country revel in her lavishness!

Much pleasure and supreme joy are derived from flower gardening. Most mothers and daughters of the farm home have a passionate love for flowers, and it is to be hoped that they may be given the necessary assistance and encouragement in their endeavors to beautify the home surroundings, where all members of the family alike can enjoy and admire the loveliness and beauty.

Beauty counts much toward making life seem worth while. It makes glad the heart while we are striving and toiling for the material things of life necessary for our existence.

The cultivation of the aesthetic taste and a love for the artistic side of life uplifts us from the pure worldly and sordid, and kindles a high and holy reverence for the beautiful adornment provided by nature for our enjoyment and inspiration to better and nobler things than mere existence for a few fleeting years.

Missouri has numerous and varied kinds of flowers. Here in the middle of the continent, half way between the rugged pines of the North and the orange blossoms of the South, with no extremes of climate, it is favorably situated many months of the year for a large procession of different kinds of flowers. We can't have the fragrant magnolia and sweet jasmine blossoms of the sunny Southlands, neither can our roses be so ever-blooming, mammoth, and magnificent as on the Pacific slope, but we can successfully grow enormous varieties of elegant floral plants rich in blossom and fragrance. In the early spring, scarcely before the blue birds and robins have arrived, and the trees have put forth many leaves, we have the beautiful, brilliant and gorgeous blooms of the crocus, tulip, hyacinth, daffodils, narcissus, Easter lily, then as the season advances come the flowering shrubs of many varieties among the more common and beautiful are the sweet purple and white lilacs, flowering, almond and snow-balls. Then closely follows bleeding heart, the flags in varieties of blue, yellow and white, and the aristocratic white, pink and red peonies.

In the springtime wild flowers grow in profusion along te roadside and in the meadow and woodlands—the yellow dandalions blossom. Sweet William, wild honeysuckle and Jack-in-the-pulpit, thousands of modest blue violets, and along the streams in the moist earth grow dutchman's breeches and lovely little ferns and mosses.

In the early summer comes the rose, loved by all the world, with its sweet breath of perfume like incense from an altar. The lovely rose from earliest time has figured in poetry and song. Among the many varieties of beautiful and elegant roses are the climbing and garden roses, the Dorothy Perkins, American Beauty, crimson and pink ramblers. The white and purple clematis, the fragrant honeysuckle and various other pretty vines now beautifully adorn the dooryards and arbors and porches with their masses of brilliant colors.

Now we have reached the season of wonderful luxuriance—so many flowering plants are blossoming in midsummer in Missouri—the lawns and gardens are in glorious splendor with many-hued pansies, pinks, poppies, phlox, sweet peas, verbenas, nasturtiums, feverfew, candytuft and some of the old-fashioned blossoms our grandmothers loved—the glorious hol-

lyhock, zinnias, marigold, and larkspurs. Then follows the gladiolus, dahlia, canna, golden glow, snap dragon, asters, chrysanthemums, and cosmos. We have the geraniums and various potted house plants with us all the time.

Oftentimes we notice a "sea of loveliness" along the counry roadsides in our Missouri State. We glory in the wild rose made famous in story and song. We love and admire the wild daisies and purple asters, the beautiful blue bells, black-eyed Susans, the yellow golden sunflower, the pink thistle blossoms, the white elders, and the silk weed blossoms are pretty and a haunt for the beautiful plumed mammoth butterflies. Yes, the golden rod, everywhere present in Missouri, is near and dear to us. We native Missourians love the golden rod. It is wonderfully beautiful, tall, slender, carrying its golden plumes, and stands as if conscious of its beauty.

There is much beauty for admiration in the blue alfalfa blossoms, the white red and sweet clover which sends out its sweet fragrance.

While we recognize and value the material worth, the great pink heads of the clover are flowers to me. I ever am reminded of James Whitcomb Riley's "Knee Deep in June" when I get out in a red clover field in full bloom. And Mr. Riley tenderly says in his sweet little clover poem,

"And so I love clover, it seems like a part
Of the sacredest sorrows and joys of my heart,
And wherever it blossoms, oh, there let me bow
And thank the good God as I'm thanking Him now,
And I pray to Him still for the strength when I die
To go out in the clover and tell it goodbye
And lovingly nestle my face in its bloom
While my soul steps away on a breath of perfume."

So let us ever preach the gospel of flowers. They grow for the rich and poor, for the city and rural homes. They give to us uplifting thoughts, and a taste for the beautiful. They inspire us to higher, holier, cleaner and purer living by awakening the spiritual part of humanity.

Oh, Missouri, our grand old imperial State, our homeland, how beautiful, how gorgeous, how divinely lovely are thy blossoms of all hues of the rainbow and all the combinations of the colors of those seven tints. We all love them supremely. How the universal heart of mankind blesses flowers! We gladly use them on occasions of greatest rejoicing and deepest sorrow. They are wreathed around the marriage altar, the cradle and the tomb. Longfellow beautifully says:

"In all places then and in all seasons,
Flowers expend their light and soul-like wings;
Teaching us by most persuasive reasons,
How akin they are to human things.

"And with childlike, credulous affection
We behold their tender buds expand;
Emblems of our own great resurrection,
Emblems of the bright and better land."

BUCKSHOT BY THE PROFESSOR

All I've got to say to the rival candates is to "go to it." I hate peace anyway.

* * *

They say that fiddlers are thick in Hades—but they'r not a marker to the "also rans" that sailed up Salt River this time.

* * *

The man who don't cuss in the kind of weather we'v been having for the last six weeks is entitled to an annual pass to Paradise.

* * *

Yes, I am back once more. But I haven't got energy enough to raise a fuss. I've worn it all away moppin' sweat and fightin' flies.

Old Chas. A. Dana once said that there are three kinds of lies. Ordinary lies, d—— lies and statistics. We will hear a pile of all three varieties from now until Nov.

* * *

After all, I'd rather be swatting flies here in the U. S. A. and cussing the weatherman than to be dodging bullets as big as a washtub over in France and Belgium.

* * *

The "After Thought" man asks me to say that he will be with you again soon—that he wants to wait until everybody gets cooled off and in a real humor to read once more.

* * *

There never was weather hot enough to suppress that "Jim" Riley person. In fact, nothing can suppress him. He's so anxious to see that old red and purple nose of his in the paper that he turns up in every issue—and he thinks he's so funny.

* * *

Things have come to a great pass in this country when a lot of railroad trainmen can demand a one hundred million dollar increase in salaries per year and then refuse to submit their demands to just and honorable arbitration. The day isn't far off when this policy of "might makes right" is going to cause trouble—and very serious trouble at that.

* * *

Don't miss reading "Sam" Jordan's "Sense and Nonsense"—for there's a pile of mighty good sense in it. Old "Sam" is just about as useful a citizen as we have in this great state. If the Publisher gave us a little more Jordan and a little less "Jim" Riley, it would suit me a whole lot better—but some Publishers have about as little taste as they have money.

* * *

They say that Agriculture is the greatest business in the World and that the farmer is the greatest fellow in the World—but did it ever occur to you that we haven't sent a farmer to Congress from Missouri during the last 25 years? Why if a great big farmer with four times the brains of a little cross-roads lawyer was to announce himself for governor, the politicians would have heart failure. And yet if we farmers were to stand together we could name every state officer and every congressman outside of the cities of St. Louis and Kansas City. Isn't it time we gave this matter a little thought.

By Old "Jim" Riley

There seems to have been a slight misunderstandin' between "Dock" Hicks and old Jupiter Pluvius. "Dock" said old Jupe was goin' to cut loose an' rain on things to beat th' band along about th' second of August—but th' only thing that's bin moist around in my neck of th' woods is Bevo—and that costs 15c a bottle—and it aint got no "kick" in it at that.

GEO. A. COOK

2012 Main Street, Kansas City, Mo.

Home Made Grape Juice

All containers should be sterilized in boiling water before use. To 2½ pounds grapes, without stems, add 1 pint water and cook until soft. Drain through a jelly bag and add 1 pound of sugar to this juice, then bring it to boiling and boil for five minutes and bottle at once, hot. Be certain to fill the bottles within an inch or two of the stopper. This juice should keep an indefinite length of time and may be diluted to suit taste when serving. A small piece of lemon added to each glass may improve the taste.

Grape juice may be made by the so-called cold process by adding 1 gallon of sugar to each gallon of juice. See that the bottles are perfectly clean, and well sealed when filled, as in the previous method.

Prepared by either of these methods, the juice should contain no alcohol.—Chas. K. Francis, Okla. Agr. Ex. Sta.

Intestinal Worms in Poultry

Intestinal worms from infested poultry may be plainly seen in the droppings. For treatment, prevent the spread by removing all droppings in reach of the birds. Spray with a disinfectant.

Lime the infested yards, and plow. Place the poultry on fresh ground. For individual treatment, give each bird one teaspoonful of turpentine and one ablespoonful of Epsom salts. For 100 birds, dissolve 5 pounds of Epsom salts in warm water and mix in a wet mash.—College of Agriculture.

Water Chickens Often

It is surprising how much water a chicken will drink, particularly in hot weather. At this time fresh water is necessary to the rapidly growing chick and good producing hen. Water chicks in shallow dishes in the shade at least three times a day, preferably after each feed. A chicken wants a drink the last thing at night and the first thing in the morning, and it will not drink stale water.

August Sweet Clover Seeding

If sweet clover is to be seeded in the fall, it should be doen early in August. The early fall seeding will permit sufficient growth to prevent winterkilling, according to Extension Bulletin No. 22 of the Nebraska Experiment Station. In general, the same preparation of the seed bed should be given for sweet clover as for alfalfa. The rate of seeding is 20 to 25 pounds of the hulled seed per acre, and at least 5 pounds more of the unhulled seed should be used. The seed may be sown broadcast and covered with a smoothing harrow set rather slanting or else with a grain drill with grass seed attachment. In either case the seed should not be covered more than about three-fourths of an inch deep.

Fertilizers for Wheat

Wheat yields at the Ohio Experiment Station at Wooster during 22 years have been increased eight bushels by the use of 320 pounds of acid phosphate in the five-year rotation. The addition of potash has caused an annual net increase worth 45 cents an acre, but this would be a loss this year because of prices caused by the European war. Applications of nitrogen in commercial form have increased yields, but the cost in nearly all cases has decreased the net returns. Hence soil fertility experts at the Experiment Station suggest that farmers buy only acid phosphate and steamed bonemeal for their wheat crops, and rely upon manure and clover to supply nitrogen and potash.

Enlarging College Building

Workmen have started adding a fourth floor to the Main Building of the Chillicothe Business College which when completed will house the Telegraphy Department. It is expected to have the work completed in time for the Fall Opening, Sept. 5th. With this end in view, as many workmen are being engaged as possible and everything is being done to prevent delays. The new quarters of the Telegraphy Department will be more than double the present quarters and will give the college capacity for 500 telegraphy students annually. It was the intention of the college to get along with its present quarters, at least for the approaching year, but the big mails which the college is receiving assures a much greater enrollment than the past year and caused the school authorities to contract for the extensive addition at this time.

Live Stock Notes

R. P. ROYCE, Fieldman

AMERICAN ROYAL LIVE STOCK SHOW

The prospects for exhibits and visitors for the American Royal Live Stock Show, Kansas City, October 2 to 7, are so good that already the arrangements have had to be expanded. Some of the breeding stock will be stabled in Convention Hall. The temporary quarters on vacant property across Thirteenth street from the hall, will be built of lumber instead of canvas as had been originally planned, and the tabernacle used by Billy Sunday during his revival services will be used. There will be additional ground on which tents will be erected for nurse cattle.

C. A. Davis, who will be remembered by exhibitors and many visitors for his official part in many previous Royals, has been appointed assistant secretary. W. H. Weeks, secretary, has opened Royal offices at 539 Live Stock Exchange, Kansas City, Mo., with Mr. Davis in charge.

Inquiries about the Royal have been coming for several weeks, from all parts of the United States. One of the oldest breeders of purebred cattle who has moved to the state of Washington wrote recently, saying that he wanted to bring an exhibit, and that other breeders of Washington would visit the Royal this year. Similar letters have come from numerous other distant states, and it is certain that a wider district than ever before will be represented, in the exhibits and by the visitors.

GREAT SHOW OF SADDLE HORSES FOR STATE FAIR

In the present year, September 23rd to 26th, at Sedalia, there will be gathered together 25 or more of the greatest saddle horses in America. The Directors of the Missouri State Fair have hung up Twenty-five Hundred Dollars ($2,500) in cash to be divided between the winners of the Senior Saddle Stake, and Five Hundred Dollars ($500) to winning entries in the Junior Saddle Stake. This three thousand dollars has caused the stakes to fill quickly by the entry of America's greatest saddle horses. Missouri, Kentucky, Illinois and Colorado will be represented by some of the greatest saddle horses ever produced upon American soil. Time was when a great horse was mentioned our thoughts naturally fell upon Kentucky as its place of nativity, but today Missouri can lay claim to the breeding and training of some of the finest on earth. This feature of the great State Fair should be sufficient in itself to bring every lover of a fine horse to Sedalia fair week.

FEEDS FOR HOGS

Probably no state in the United States has so large an area of bluegrass pasture as Missouri. Certain advantages in this state have led many men who farm, and particularly those controlling large bodies of land, to follow grazing on permanent pastures. When the price of land was low and the value of grain less than at present, bluegrass farming was more profitable than rotative farming. A change of conditions makes more skillful handling of grass lands necessary.

Investigations carried on at the Missouri Experiment Station for five years, comparing bluegrass with ten other rotations, including the best forage crops known for Missouri, show that the average return per acre which can be accredited to bluegrass forage for fattening ogs is $22.50 per acre, estimating pork at 6 cents a pound, and corn fed at 60 cents a bushel. A rotation of rape, clover, and corn yielded an annual income of $22.42 per acre. A succession of corn in which cowpeas were planted at the last cultivation gave an annual income per acre of $19.48.

The figures indicate that it is not necessary for men who farm to plow up all the land devoted to bluegrass pastures in order to make it pay a good income even on the basis of high land values now prevailing.—F. B. Mumford, Missouri College of Agriculture.

A HOG HOUSE FOR MISSOURI

On some farms a permanent hog house is desirable, and the Missouri College of Agriculture has prepared a plan for a 24x50 ft. house to fit such conditions. This house makes it possible to do the most work in the least time and permits the production of two litters a year and the marketing of pigs at the most profitable time. It consists of seven 8x7 ft. pens on one side and four pens of the same size on the other side, as well as a feed storage and mixing room. An eight-foot alley running through the center of the house allows room enough to drive a wagon through to aid in cleaning the house. The doors are so arranged that they may be swung open as single doors and the upper half of each is so constructed that it will swing open, admitting light and air while the lower half is closed.

The arrangement of the pens provides for an outside lot for each pen, if this is desired. A concrete feed trough is recommended, but lumber may be used if desired. Woven wire partitions are desirable as they let light and air into the pen, thus drying out the bed litter. The sows are also able to see each other and the attendant, when he approaches and are not so likely to become frightened and kill the young pigs as a result of the sudden appearance of the attendant.

A moderately rough concrete floor is best, as it will help prevent the sows from slipping. On the other hand the surface should not be too rough, as too much moisture would be absorbed. A board overlay and plenty of bedding should be provided for each pen, so as to prevent the cold concrete from absorbing too much heat from the body. A concrete floor is not considered objectionable when plenty of bedding is used.

Another type of floor which is now coming into use is made of hollow tile the same as those commonly used in other farm buildings. The tile are laid flat on the ground on a good level, firm foundation, and a good bed of gravel beneath the tile is desirable. The tile may or may not be covered with concrete. Concrete floors are easier to clean. This type of floor is not so cold as the ordinary concrete floor.

A window, hinged at the bottom so that there will be no direct draft on the sow and her pigs, is provided for each pen. The house has a semi-monitor roof which furnishes more window space. These upper windows are hinged at the center and aid in ventilating the house. They may be closed or opened from below by a rope and a few pulleys.

A tank which makes it easy to dip the hogs frequently if necessary is set in the middle of the alley. When not in use, it is kept covered with planks. This makes a convenient location for the dip but it can be easily constructed on the outside if so desired. Plans for building a concrete tank will be sent free to farmers of Missouri who ask for them.

M. A. R. Kelley,
Missouri College of Agriculture.

BETTER LIVE STOCK—MORE PROFIT

"Use pure-bred sires" is the slogan used by workers at the Missouri College of Agriculture as a partial reply to stockmens' questions as to how they can make profits on increasingly expensive land, labor, and feed. These three factors will remain high and the quality of the live stock and efficiency of the methods used must be correspondingly improved if the live stock industry is to survive.

The slogan of the pure-bred sire is being sounded by Dean F. B. Mumford and others of the Agricultural Experiment Station and College in the field and feed lot, from the chautauqua platform and on farm to farm trips through various counties.

For use in these campaigns a "red headed" poster bulletin has been printed. That head says in red type, "Use Pure-Bred Sires" and underneath this head are brief statements of the careful tests of the Experiment Station and the common experience of Missouri farmers which agree absolutely on this point. The station got much bigger profits by using a fair pure-bred mutton ram such as any farm sheep-raiser could afford instead of a scrub ram. They were used on western ewes which were equally good so far as the best judges could tell. From such a ewe the fairly good pure-bred mutton ram got a good lamb which weighed 60 pounds and sold for $7.35 when three months old, but the scrub ram got from a similar ewe a poor lamb which weighed 56 pounds and sold for $4.50 when four months old. Fletcher Smart of Harrisonville, Missouri, used a good pure-bred boar on some average sows and got sixty good pigs which reached an average weight of 270 pounds and topped the Kansas City market at eight months.

The Pure-Bred Sire Means—
1. Uniformity.
2. Individual superiority.
3. Early maturity.
4. More marketable stock.
5. More money for your feed.
6. Credit to the owner.
7. Bigger profits.

The Scrub Sire Means—
1. Lack of uiformity.
2. Mongrels and misfits.
3. Late maturity.
4. Poor market demand.
5. Less money for your feed.
6. Discredit to the owner.
7. Loss and dissatisfaction.

These are some of the facts indicated by the poster which explains why a survey of the live stock producers shows that those who are producing the good stock are the ones who stay in business when so many others are dropping out.

From the breeding standpoint the important steps are (1) the use of tried pure-bred sires, (2) proper feeding of breeding animals, (3) careful culling of barren and poor-breeding females, and (4) replacing culls with the best females in each season's produce.

Since it costs little or no more to produce an 8-cent steer than it does to produce a 5-cent steer, the profits to be derived from producing live

THE BOAR THAT PUT MISSOURI ON THE MAP. HEADS OUR HERD

SMOOTH COLUMBUS BLOOD has held the record in Missouri for two years—it will do it again next year. Fall pigs, either sex, by this great boar, now offered for sale.
BENNETT BROS. R. 5, LEE'S SUMMIT, MO.

Spring Boars by the Grand Champion
A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.
WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns
Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.
H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS
We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.
W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands
I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.
H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS
Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.
EDGAR DOOLEY, - Etterville, Mo.

DUROC JERSEYS

Durocs With Size and Bone
I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.
A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

Adenhill Duroc Boar and Gilt Bargains
I can supply readers of this paper with choice yearling gilts bred for fall farrow. Also extra good spring boars. My Durocs are noted for size and quality. Satisfaction guaranteed. Inquiries gladly answered.
R. L. (BOB) HILL, ADENHILL FARM, - - COLUMBIA, MO.

RED POLLED CATTLE
Herd established 16 Years
Young stock for sale. Young bulls sired by LOGAN 13500; Calves sired by KNOCKER 23791. Bred for milk and beef. Also offer spotted Poland China hogs and Rieds Yellow Dent seed corn.
M. L. SNYDER. - - POLO, MO.

ANGUS CATTLE

ANGUS CATTLE
Herd founded 1904
Young stock sired by Dean's Eric 139686. Also offer splendid herd bull for sale. Every one the right kind and priced to sell.
V. E. LAWRENCE, SALISBURY, MO.

Aberdeen-Angus
I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
J. D. Blackwell - Fayette, Mo.

stock on corn belt farms is limited by the quality of the animals. Good sires must be secured and the herd must be carefully culled.

Last but not least, the marketing problem must be carefully handled. Co-operation with neighbors is often essential if purchases and sales are to be made to the best advantage. For this purpose breeders' and feeders' associations are desirable in many cases.

S. T. Simpson,
Missouri College of Agriculture.

WIRE CUTS AND OTHER WOUNDS

First aid is most important.

Quick healing leaves smaller scars.

Don't use dust or lime to stop bleeding.

Bleeding that can be stopped with powders will soon stop itself anyhow.

Frequent washing irritates wounds, prevents prompt healing, and may cause proud flesh.

Small concealed stab wounds such as those from nails are the most likely to cause death. Find them and keep them clean and well disinfected.

Swab out deep cuts with pure tincture of iodin as soon as it can be secured and they will take care of themselves then if the normal pus discharge is removed.

A long continued discharge from a wound indicates an abcess pocket, a bone injury, or the presence of a snag or something else that should not be in the wound. Call a veterinarian.

As soon as bleeding has been stopped, wash the wound with a pint of warm water to which two teaspoonfuls of creolin, lysol, carbolic acid, or some similar disinfectant has been added.

A wound should be healed in about three weeks. If it is doing well the swelling will gradually go down, and the discharge will be odorless, thin, and bloody at first, and thicker and whiter later.

Antitoxin will prevent lock jaw after nail or other puncture wounds. If not so prevented, very few of the lock jaw cases ever recover. The hard crust lime forms over the surface of a wound favors lock jaw by shutting out the air.

Bleeding from a leg can always be stopped by tying a small rope loosely about the wound, then twisting it wi a stick or small rod. Tighten till bleeding stops. Apply bandages and remove the cord if possible. If bandages cannot be applied, prevent serious bleeding by pressing the fingers against the cut blood vessels until a veterinarian can be called.—L. S. Backus, Missouri College of Agriculture.

SILOS SAVE SUMMER SUCCULENCE

In order that the farm stock may do their best, either in the production of milk as in the case of dairy cows, or in putting on flesh in the case of fattening cattle or sheep, it is necessary that succulent feed be furnished as a part of the ration. No ration is complete, unless, in addition to supplying the right amount and proportion of digestible nutrients, it also includes some feed which, in its composition, approximates that of green grass. This fact has long been recognized by intelligent feeders everywhere.

The silo furnishes the best means for storig the natural juices of green plants for fall and winter use. Not only is ensilage fully the equal of grass as feed for stock to supply succulence, but it also is the cheapest form of succulent feed that can be grown under average conditions in the north and central west.

Corn is the standard crop for silage purposes and where this crop can be fairly well matured it is undoubtedly best for the purpose. Other crops higher in protein, such as soy beans and second crop clover, are frequently put in the silo with corn as a mixture, thus saving the succulence in those crops and increasing the feeding value of the ensilage as well. In certain sections where corn does not matu well, peas and oats are often grown for ensilage with good success.

A large dairy farmer known to the wr'ter has filled his concrete silo with such a mixture for three successive seasons with very satisfactory results. Pea vines from the canning factories can also be utilized for the purpose of making silage.

In 1913 clover was successfully ensiled at the Rusk County demonstration station, the Spooner branch station and the Ashland branch station. At the Rusk County station, corn and clover were first put in together in the silo, then when the corn ran out the silo was filled to the top with clover. Considerable water was used in packing the second crop of clover which was quite ripe at the time it was put in. The ensilage proved to be very satisfactory as the miexd corn and clover. The results at the Ashland and Spooner stations also corroborated the results at Conrath. At Ashland rye and clover was ensiled and also millet. The rye and clover made fair ensilage but much water had to be used on account of the hollow stems in the rye. Timothy and clover made very good ensilage and proved one of the best combinations since the timothy approaches corn in composition and the stems are not very hollow. The millet silage was not satisfactory at Ashland—probably because it was very immature at the time it was put in the silo. Oats and peas at Superior yielded nine tons per acre and the cost of production was about one-half that of corn. All these grasses and legume crops for the silo should be cut in the same manner as corn, and plenty of water used so as to make the ensilage pack well.

The up-to-date progressive live stock raiser of necessity must make use of the silo in which to preserve the natural juices of our best forage plants for use after pasturage is no longer available.—E. J. Delwiche, Agricultural Experiment Station, Wisconsin.

DEVELOPING DRAFT FILLIES

In the "Percheron Review" J. L. Edmonds of the Illinois experiment station, says the importance of good feeding, commonly referred to as the "corn-crib cross," is well understood by successful producers of draft mares. Such feeding, coupled with abundant exercise, results in desirable thriftiness, which is not found in the underfed or overfed. The part which good pastures play in development is quite generally appreciated. The judicious feeding of some grain, however, along with pasture, and the use of green corn during the dry spells common to late summer, are not practiced to as great an extent as would be profitable.

During seasons when pasture is not available, good growth may be secured on timothy or prairie hay, provided enough oats and bran are fed with them. On the other hand, good quality legume hays, such as alfalfa and red clover, may be used to advantage. When such roughage is fed, less grain, and grain in which the nutrients cost less, may be fed; a part of the grain ration may well be corn. Furthermore, consideration of this latter type of ration and results obtained from feeding seem to show that there is little need of feeding purchased protein concentrates, because the rations abundantly supply the muscle and bone-building elements needed for growth. Again, by relying, to a considerable extent at least, upon such feeds, we are making use of the crops which are most desirable to grow on corn-belt farms. In this conection, a brief consideration of the growth made by Percheron fillies now being fed at the Illinois experiment station may prove of some interest.

A lot of ten weanling fillies wa started on feed late in the fall of 1914. Four of these fillies were produced by the college mares, six were purchased from Illinois breeders, two from A. L. Robinson & Sons, three from George Frerichs & Sons and one from G. W. Weyrich. These fillies are registered in the Percheron Society of America.

The fillies were fed well-cured alfalfa hay, corn one-half, oats one-half, proportioned by weight. The corn and oats were ground during the first winter and afterward were fed whole: the corn, however, was shelled, in order to insure the fillies having equal opportunity for getting their share. At no time were they fed more than would prevent their polishing the mangers clean. During pasture season they ran on eight acres of good blue grass, and in addition they were fed approximately half grain ration. On this fare the fillies have made a good growth of frame and have carried enough condition for thrift. For shelter, the lot had a shed space forty feet by sixteen feet, open on one side This shelter was not sought except at feeding time and during storms.

The average weight of the fillies at the beginning of the trial was 823 pounds; the average weight on the day they were one year of age was 1,112 pounds; the average weight of the lot on March 14, 1916, was 1,445 pounds. They were at no time fat, but are well grown in bone and muscle. At that time most of the fillies were not yet two years of age, there being two March foals, one June and one July, and the balance April and May foals.

UNSOUNDNESS IN STALLIONS

Reports received from 13 of the states having laws regulating the public service of stallions show the following percentage of unsoundness in stallions out of 2,640 reported cases:

	Per cent
Sidebone	35
Laryngeal hemiplegia (roaring)	12
Bone spavin	11
Defective or curby hocks	7
Periodic ophthalmia	6
Cataract	4
Spavin (not classified)	3
Bog spavin	6
Ringbone	*
Stringhalt	3

The remaining nine per cent consisted of such defects as chorea, general unsoundness, faulty conformation, and scattering imperfections.

These figures do not represent individual stallions, but indicate the number of cases of unsoundness. For instance, a single stallion may be affected with two or more physical defects and others with but one. A report from all the states having stallion license laws could not be secured, as in several no record is kept, but the figures given may be accepted as reasonably offering an index to the most common physical defects among public-service stallions.

In some of these states certain diseases and unsoundnesses disqualify a stallion for service, while in others the stallion may stand, but the condition of soundness must be noted on the license certificate, a copy of which is required to be posted at the place where the stallion is being stood for service.—U. S. Dept. of Agr.

PRICES FOR WOOL

Unusually high prices prevail for wool. The average price paid to producers of the United States for unwashed wool in the past month was 28.7 cents per pound, which compares with 23.7 cents, 18.4 cents, 15.6 cents, 18.7 cents, 15.5 cents, and 19.5 cents, respectively, in June of the past six years. These estimates are based upon reports of crop correspondents of the Bureau of Crop Estimates.

The average weight of wool per fleece this year is about 6.92 pounds, which at 28.7 cents a pound is worth to producers $1.99, or practically $2 per fleece. The number of fleeces shorn in recent years has been between thirty-six and thirty-seven million yearly.

The weight of wool per fleece this year, 6.92 pounds, is the heaviest ever recorded in the United States. Last year the average was 6.84 pounds, and the average of the past ten years is 6.74 pounds.

It is interesting to observe how the production of wool per sheep has been steadily increasing in the past 70 years. The average weight per fleece reported by the census of 1910 was 6.84 pounds, and by each of the preceding censuses from 1900 to 1840, respectively, the average weights were 6.66 pounds, 5.57 pounds, 4.80 pounds, 3.52 pounds, 2.68 pounds, 2.42 pounds, and 1.85 pounds. Similar improvement in wool production per sheep is observed in the wool statistics of Australia.—U. S. Dept. of Agr.

SHROPSHIRE RAMS

One two-year old and five yearlings. Priced to sell and sold on approval. Description and prices sent upon application. Address,

J. M. GEORGE.
R. F. D. No. 3 Fayette, Missouri

Tried Shorthorn Bull

I offer for sale at reasonable price my herd bull, Imperial Knight 353519. Red, five years old. Splendid sire. Am keeping his daughters. Weight between 1800 and 2000 lbs. Good disposition.

NELSON COLE, - Brashear, Mo.

JERSEY CATTLE

JERSEY CATTLE

Bulls ready for service. They are sired by the Owl's Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

JERSEY BULL CALVES

I have three extra fine ones for sale. Sired by Stockwells Champion. He has won 29 first and Champion ribbons at the leading State Fairs. Calves are out of very high producing cows. For breeding, etc., writ.

J. B. SMITH Platte City, Mo.

SUNSET CORRECT TYPE JERSEYS

To keep our herd within 100 head we will offer at private sale fifty Jerseys, consisting of cows, bred and open heifers, young bulls, heifer and bull calves. Can fit out small herds for beginners. 125 head to select from. The famous Blue Belle-Golden Rosebays. Send for special circular before buying elsewhere. Bargains. Mention your wants.

THE ENNIS STOCK & DAIRY FARM, Horine, Mo. (Just south of St. Louis.)

HOLSTEIN CATTLE

Dutchland Sir Hengerveld Rag Apple 99771

A few choice bull valves out of heay producing dams sired by the above famous bull for sale.

BLACK AND WHITE FARM
Baden Station, Mo.
Tel. Colfax 1812 R. R. 30

IN MISSOURI

Eight Bulls, 2 to 8 months, $100 to $175 each. Always have a few good cows and bred heifers for sale. Nothing but registered Holsteins.

S. W. COOKE & SON, MAYSVILLE, MO.

HOLSTEINS

Young bulls and heifers from A. R. O. cows. Sired by Sir Korndye Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.

M. E. MOORE & CO., Cameron, Mo.

Shropshire Bucks

For Sale—Registered Shropshire buck, four years old, a great individual. Also grade yearling bucks out of choice ewes, priced right.

HUGH WHITEFORD,
GUILFORD, - - - MISSOURI

Reg. Shropshire rams, yr's and twos. Square built, rugged hardy bucks with weight, bone and heavy fleece. Quick shipping facilities & priced cheap. 412 head. Above Kansas City.

HOWARD CHANDLER, Chariton, Iowa.

RAMS Registered Shropshires—yrls. and twos. Bred for weight and wool. That's what you raise lambs for. The best go first. Come to the farm or write C. W. Chandler, Kellerton, Iowa 80 miles north of St. Joseph, Mo.

FARMER BOYS ATTENTION!

Here is Great News for You

A Bank Account of Your Own!

HERE IS A GREAT AND SPLENDID OPPORTUNITY!

SEVERAL WEEKS ago we announced that we would present a fine bred gilt to every farmer boy who sends us $50.00 worth of subscriptions to THE MISSOURI FARMER between the time the announcement was made and November 1st —and we have never made an offer which has aroused more interest and dozens of bright farmer boys are already at work, while fresh inquiries are coming in on every mail. This offer is open to any farmer boy in the state and all you have to do is to get 50 farmers in your neighborhood to give you a dollar each for three years subscription to THE MISSOURI FARMER when we will ship you a bred gilt selected from among the best pure bred herds in the state. You can select either a Duroc, Poland China, Berkshire, Chester White or Hampshire gilt—whichever breed you like best and between now and November 1st I want

ONE THOUSAND MISSOURI FARMER BOYS

to **make good** on this great offer. If you take good care of the gilt and her litter of pigs they will start you in the pure bred hog business and enable you to make a lot of money. You can go "halvers" with your Father in the profits—or maybe he will let you keep them all and soon you will have a nice bank account which will enable you to pay your way through College later on or build up a "nest egg" with which to buy a farm of your own some day. Now I am mighty serious about this proposition. The farmer boys of today will be the farmers of tomorrow. Upon their shoulders will rest the responsibility of citizenship—and therefore the sooner you have definite aims in life the better for yourself and for the great Country of which you are a part and which has a right to expect you **to become a real man and play a man's part in the World's work.** That's why I want you pitch in and win one of these fine gilts—for it will give you a greater interest in your Father's farm **and teach you how to become a business man in your own right.** Now just think how fine it would be to have a bank account **of your own** so that when you want to buy something which will add to your happiness you will not have to ask someone else for the money!

Get Busy at Once: Now think this proposition over carefully. Talk it over with your Father—then if he is willing for you to win one of these fine pure bred gilts—which I am sure he will be—write me at once for a bunch of samplecopies and subscription receipts—**and then pull off your coat, grit your teeth, and go in to win!** No doubt you can sit down right now and think of 25 farmers who will be glad to give you a dollar for three years subscription to a fine paper like THE MISSOURI FARMER—and with a good stiff fight during the next three months you can easily round up the balance. Go to every one of your neighbors and show them a sample copy of the paper. Tell them that it is the **best farm paper in Missouri!**—that its Managing Editor is Geo. B. Ellis who for years was Secretary of the Missouri State Board of Agriculture and who understands Missouri farm problems and conditions better than any man living—that it is their **home farm paper** and that they ought to read it in preference to farm papers published outside the state which do not understand Missouri farm conditions first hand—**and then tell them that you want them to help you win one of these fine gilts—and seven out of ten will do so gladly because everybody is anxious to help a boy who is a hustler!** Don't forget this last point, for it is the truth. That is where we got the splendid adage that the "Lord helps those who help themselves." Now make up your mind right away and write me **before some other boy gets your territory!** The boy who writes first gets the first chance in his neighborhood—**so fill out the blank below and mail it today!**

To Our Subscribers: If there is a boy in your family please call his attention to this splendid offer. If there is not, then I will take it as a great personal favor if you will bring this to the attention of some bright farmer boy in your neighborhood. It is a chance to do good.

The Kind That Win!

LIBRARY
College of Agriculture
University of Illinois

At the head of the greatest bank in New York City—which means that it is the greatest individual banking institution in the World—stands a man who fought his way up from the obscurity of an humble farmer boy to his present eminence which, financially speaking, is second to that of no other man in the United States. His history is only another one of those romances for which our land is famous—which has given us a race of Titans who began at the bottom of the ladder—who cared naught for hardship or opposition—who have proven time and again that the birth right of the "golden spoon" is a handicap rather than an advantage and whose herculean accomplishments, daring and keen foresight have made us the most envied people in all the World.

Seated behind a desk to which few men gain access, this big financier directs the destinies of a number of gigantic institutions aside from his great banking house and deals in sums which run into billions of dollars during the course of the average year—and in addition to all this, there is perhaps nowhere a more careful student of National and World events than this man who mingles a broad and philanthropic citizenship with the hard and harsh rules of the dollar world.

But it is of his philosophy rather than of the man himself that I wish to write in this article—and I trust that every boy or young man who chances to read these lines will ponder them well. The other day a magazine writer went to him and said: "I understand there are a number of men in your institution who receive a salary of $25,000 per year and I wish you would therefore tell me how you make your selections—what qualifications must a man have before you are willing to pay him that kind of a salary?" In substance the big banker replied as follows: "A man of that kind must know the work for which he is chosen thoroughly. In other words, he must be splendidly capable. He must be morally clean. His word must be as good as his bond and of course he must be scrupulously honest." And now listen! "I am not looking for "smart," "sharp" or "cute" men, for we don't want that kind in this institution—and more than one applicant has ruined his chances for employment by telling me how cleverly he had turned some deal in the past. We want cler-eyed, clean, capable men who are good to their families—and when you find a big man of this kind he is certain to generously earn any salary we pay him."

The point in this story which I want to drive home is that when this man who heads the greatest financial institution in the land gets ready to hire a man for some responsible position, he looks, not for brilliancy or cleverness but for just plain, clean, capable, every day, sterling manhood. And how vitally important it is for every young man to hug this great truth to his heart! Often some young man in a community gets the reputation for being "brilliant" and his fond parents and friends prophesy great things for him in the years to come. By and by the young fellow becomes impressed with the idea that he is a sort of superior human being. He begins to strut and pose and considers the ordinary things of life beneath his dignity. But as a rule he never "lands"—and down deep in his heart he thinks it is because he "isn't appreciated." Then there is the young fellow who prides himself on being smooth and clever—in outwitting the other fellow by some act of sharp practice—and he also is finally left stranded amid the debris of human failures when it is forever too late for him to retrace his steps or change his methods. In the meantime, the boy to whom nobody has paid any particular attention—who is neither brilliant nor clever but who quietly builds physical and moral strength for the future—who woesn't waste time looking for a royal path to success—who comes again with a smile when fate has knocked him down—who loves work for its own sake—who fights hard and plays a square game—he is the kind the big banker is looking for.

—By the Author of After-Thoughts.

LYON'S PRACTICAL FARM PAPERS

Since the morning of August 4th up to August 11th, I have set 600 strawberry runner plants, Beder Wood and Dunlap and in looking over them today, August 17, I do not think I lost two plants.

In setting strawberries, I break every rule laid down by writers on the subject, setting any kind of plants and any time the ground is not frozen, and I seldom lose a plant, that is, if I dig and set it myself.

I regard the cultivation of strawberry plants, of a great deal more importance than the time of setting, and I would cultivate my little patch twice a week during the entire season if I could do so.

Since the rains have come, I never saw as great an improvement in the condition of crops in so short a time, and corn and tobacco that seemed entirely ruined will make a full crop.

The real early corn was past help, but we had none of that kind, and as for our tobacco, I think I could show our friend Sam Jordan a better crop than our fine one he saw last year, and this year we could not show him any weedy corn.

Last year we suffered some damage from soil washing, not a great deal but more than we like to see, this year, with four acres of our steepest land in tobacco, no loss at all as we had no dashing rains until the crops had filled the soil with roots.

There is a heavy August pig crop here, and no losses reported so far, neither is there any hog disease, although some is reported thirty or forty miles north.

The chautauqua and the primary election are over. The first was not as fully attended as usual, and the same is true of the other, it costing taxpayers an even dollar a vote to see who would get the offices, in other words, 2650 votes were cast, at a cost of $2585, in one county 27,560 votes, cost $30,308.

It is said that lots of whiskey and some money was used, and while of course the officials will not prosecute "because it might hurt the parties," I find that other forces are on the trail, and it does look as if somebody might get punished this time.

THE MISSOURI FARMER is not a political paper, nor am I a politician or political writer, so I may say that the events of the past ten years here so disgusted me, that were it not for trying to get half decent men into local offices, I am not sure that I would ever attend an election again.

The trend is toward more offices to fill and in this respect our state (Ohio), is cursed more than any other, the offices being created to furnish jobs, not for men who are qualified to fill them, but for men who have assisted to elect the higher officials.

In 1905 I left the political party I had voted with since 1877, simply because of this tendency in it to make more offices, and hang me, if the party I changed to, did not "out Herod Herod."

It simply made itself odious in this respect, and in 1914 my old party got back in power, (without my help) under promise to abolish a whole lot of offices, a promise which of course was not kept, for it was not intended to be kept.

It costs $6,000 per year to hire five men to supervise our country schools, and the schools are no better than before we had the supervisors, and a nice young man, with practically no training, gets $2,000 a year for road supervising and our roads are in worse shape than ever before.

People do not stick to party lines here as they used to do, and that is one good sign, but still the men who get into power manipulate affairs to suit themselves. We pay our officials entirely too much salary, for excepting surveyor and judge of the courts, no office in the county requires any more technical training than is given in a country school, and the best Probate Judge our county ever had, was a blacksmith who had taught two terms of school.

The weather is still rainy and hot with everything, even weeds, making up for lost time in July. The Sudan-rape-cowpea patch of an acre, is making the hogs grow very fast, but the rape part was not fully a success, owing to the cabbage aphis.

I notice that this bunch of hogs eat the Sudan and the rape before they eat the cowpeas, but last year the result was just opposite, as the cowpeas were eaten to the roots before the rape was touched.

The second brood of tent caterpillars has made its appearance, and today I took more than 100 small tents from forty young apple trees. Nearly all these tents were small, not involving more than four or five leaves, and I find it easier, and cheaper, to pick them off and stamp on them, than to spray the trees with arsenites.

Fearing that I may mislead someone in planting strawberries, let me say, that unless there is lots of rain it is not safe for the novice to set plants later than September 10, and ten days earlier is better. For commercial planting, April and early May is the only time to plant, but as I indicated before, for home use, one can, by using a little extra care, set almost any time.

C. D. Lyon.

Co-operative shipping associations will do nearly eighteen million dollars worth of business this year. They save farmers from $20 to $50 a car on the stock shipped and get a price according to what the animal is really worth.

HIRING MONEY ON THE FARM

How to hire money on the farm, and make the hiring profitable, is a problem which has been coming up as regular as the sun. So much has been said and written upon the subject that the main points have often been obscured in a mass of words.

No doubt that some such legislation as that embodied in the proposed rural credits measures is in line with agricultural progress; but if you were to go to any successful farmer today you could get from him the solution of the problem without a moment's hesitation. He would tell you on the instant that how to hire money is automatically solved by knowing how to make it pay. There is not a banker in any community who does not welcome the opportunity to "farm out" capital "on shares," to use a farm phrase, and at a just rate to the farmer who uses it. But the honest banker, who is entrusted with the investment of surplus capital in the community must first know that the man who is going to work it on shares knows how to make it pay. Learning how to hire money and make it pay is therefore the farmer's problem, and if he expects to obtain money upon a sound basis, he must learn the lesson before he starts to town to see his banker.

An illustration of how to hire money and make it pay is found in the case of a farmer living near Ballinger, Texas. He went to a local banker and requested a loan to buy a certain number of cattle. He thought he had figured out just how he could take that amount of capital and make it pay. The banker listened to his plans and declined to make the loan.

"But" said the banker, "here is what I will do. I'll let you have the money to build a concrete silo, and with the money you save on your feed bill, after paying me back, you can buy more cattle. In that way you'll have the cattle you want, and a permanent investment in your silo, which will go on making money for you every year in the saving it will make in your feeding costs."

The farmer accepted the banker's suggestion, built the silo and his problems worked out just as the banker had prophesied. Today that farmer has two silos. He found in that particular case how to hire money and make it "earn its own rations" in the form of principal and interest for the banker and a profit for himself.

There is perhaps no more interesting development on the farm today than the silo. Undoubtedly it is one of the most profitable investments the farmer can make. It requires no financial wizardry to see that if you have on the farm a permanent structure in which you can store corn and other silage crops in their succulent, green state, you have provided one form of insurance against the hot dry months of summer and the cold of winter when natural pasturage fails or is unavailable.

It requires no great wizard in finance to see that such an investment will soon repay its cost in maintaing maximum power in preparing cattle for market, whether the weather be wet or dry. Not only are these advantages apparent but a silo is especially valuable in preventing the loss of soft corn and in increasing the usefulness of drought-hurt crops.

These silo facts have been coclusively established in many counties throughout the United States. In Marion County, Missouri, for instance, I. F. Gillmor, County Agent for the Missouri College of Agriculture and the Marion County Farm Bureau, made a careful silo survey of his county. He found 200 silos, of which 118 are wood stave, 29 solid concrete, 27 flooring stave, 6 vitrified tile, 6 concrete stave, 4 pit, 2 brick, 2 concrete block, 1 modified Gurler and 1 stone.

The stone silo was the first of the lot built. It was erected in 1893 and is still in good condition. But aside from this one, the more permanent silos were largely built in 1914. Prior to that time, the less durable materials, had been used, but during 1914 more than one-third of the silos constructed were of material other than wood, 21 being solid concrete, 6 cement stave, 5 tile, 2 concrete block, 1 brick, and 4 pit. Of the 94 silos built in 1914, prior to August 1, all were of solid concrete and 75 per cent of all the silo owners interviewed stated that if they were building again, their choice would be solid concrete. The silo has proved itself a success under Marion County conditions and the builders have decided that permanence is now the important consideration, and they have planned accordingly.

Building permanent concrete silos is therefore one of the sure ways in which farmers may profitably solve the problem of how to hire money and make it pay.

RYE FOR FALL PASTURE

After six weeks of severe drought and intense heat, blue grass and most other pastures are so dry that they will furnish no pasturage until late in the fall even with the aid of the usual late summer and early fall rains. The man who has much livestock on hand will find it necessary to provide temporary fall and winter pasture. For this purpose there is no better crop than rye, according to C. B. Hutchison of the Missouri Agricultural Experiment Station.

Rye may be seeded any time during September or October and is not attacked by the Hessian fly so it will not endanger fall wheat. It may be sown just as early as the seed bed can be put into proper condition on stubble land or after corn has been cut for silage or fodder.

A bushel and a half is enough for early sowing but two bushels should be used later, or a mixture of 30 or 40 pounds of rye and 15 or 20 pounds of vetch will give good results if sown late in August or early in September.

Small fields of such cover crops furnish a great deal of pasture at little expense and leave the soil in better condition than if they had not been grown. The vetch is a legume which adds nitrogen and the fine roots of rye protect the soil against washing which is more serious between growing seasons than most people realize. Next spring the rye may be turned under as a green manuring crop before corn planting time.

VOLUME VIII SEPTEMBER 1, 1916 NUMBER 17

A Taste of Real Competition

By William Hirth, Publisher

How has the price of cattle and hogs suited you during the last several weeks? Cattle selling as high as $10.75 and hogs at $11.30 sounds pretty good, doesn't it? You think the Packers have a heart after all—that maybe they are not as bad as we thought they were along in the latter days of 1915 when they had hammered the bottom out of the hog and cattle market? Or, maybe you think they have been "seeing things" because of the threatend investigation in Washington? Well, if you have been thinking any of these things with reference to the present market you have got another guess coming. But just the same, there never was a time when every farmer should sit up and take notice as much as now because the present situation is a mighty interesting one.

In the first place, get it out of your head that the Packers have had a change of heart or that they are playing the role of a "Lady Bountiful." They are the same old gang they were back in November and December of last year and have the same fondness for buying the farmers hogs and cattle at their own price. Nor have they gotten scared at the Borland resolution which, for some mysterious reason, is quietly sleeping in the Committee in Washington and which, for "lack of a quorum" has thus far not seen the light of day. On the contrary, the Packers started in to "smash the market" several weeks ago and did actually pound down the price of cattle $1.50 per hundred—and had the drouth continued we wouldn't have seen cattle selling at $10.75 as they did at Kansas City some days ago. But when the rains came the run which had set in from Kansas, Oklahoma and many other sections suddenly stopped and scores of Cattlemen turned up at the different yards anxious for feeders—and so anxious were they to get back into the feeding game this fall that they fought the Packers, big and little, for everything except the finished stuff and as a result, feeders have sold for as high as 9c per lb. at the Kansas City Stock Yards within the last couple of weeks. Hence, we have witnessed the unusual spectacle of cattle feeders fighting the Packers for every car load of cattle which did not come into the yards in a finished condition.

The Independent Packers

But this is merely an incident of a very interesting story. When the Packers made their great raid on the market back in November of last year, they had their safes full of meat contracts running into the tens of millions of dollars for the Allies in Europe. About this time, a group of Canadian Packers as well as a similar group of small Packers in the United States, sat up and began to take serious notice. They had been left "out in the cold" on the foreign meat contracts, but once they had time to carefully look the situation over, they concluded to "buy a stack of chips" and "sit in the game." They went to the agents of the Allies and said, "Why not inject a little competition into this situation? Why not give us a chance at some of your contracts?" To make a long story short, the agents of the Allies listened and the small Packers came away with a substantial bunch of orders—and no sooner had the negotiations been concluded, when the aforesaid Canadian Packers turned up at the Union Stock Yards in Chicago with "blood in their eyes"—and those of our readers who remember the sharp upturn of the market back in last January and February and who didn't understand it at the time can here find the answer. Most of us said it was because the big Packers had the lions share of the winters supply of hogs and cattle in cold storage and that therefore they could afford to throw out a little "sop" in the form of increased prices. But the real reason was the advent of these Canadian "invaders" who commenced to give the "Big Five" a "run for their money" and who have kept it up merrily ever since.

A Real Fight

Had the drouth continued and had the markets become glutted, the Packers would undoubtedly have pounded the market to pieces during the last few weeks—for then the over supply would have rendered the performance more easily possible. In confirmation of this fact, I recently talked to a friend who perhaps has as intimate an insight into conditions "behind the scenes" as any man in the Corn Belt. He is feeding about 1000 hogs at the present time and was formerly in the employ of one of the big Packers. Naurally he has been keenly concerned about the market. Like all other thinking feeders, he was expecting the "bottom to drop out" and was about to load his hogs and ship them. About this time—or a day or two before the drouth was broken—he ran into a representative of one of the Canadian Packers at the Union Stock Yards in Chicago and frankly asked him his opinion of conditions and the man from Canada answered substantially as follows: "Unless this drouth continues and literally overwhelms the markets, I look for stiff hog and cattle prices for soemtime to come and for this reason: The Canadian Packing companies as well as many small packing companies in the Unied States have substantial war orders for foreign meat and in order to fill our contracts we've got to have the hogs and cattle. The big Packers have a lot of orders also—so it means a fight to a finish." As a result of this conversation, the friend referred to above held onto his hogs in order to finish them before he ships them to market.

The longest end of the foreign orders outside of those held by the big Packers have been captured by the Canadian contingent—and so substantial are these contracts that they have sub-let many of them to the smaller American Packers. No doubt they said to the English agents, "As loyal subjects of His Majesty, we think we are entitled to first consideration at your hands—and that this argument as well as the prices which they offered commanded attention is manifested by the first real fight which has taken place in our live stock markets for many a day.

What it Means

Had the Canadian Packers not been caught "asleep at the switch" a year ago, the Packers would not have had things their own way last fall and winter—and to these influences is due absolutely the splendid prices which have prevailed in recent weeks—supplemented by the sharp bidding for feeders to which I referred in the first part of this article. Of course this latter factor was only temporary and no doubt its influence is already spent. But the Canadian people and our own small Packers are after finished cattle just as they are after the available supply of hogs. These things show what farmers would have received for their live stock last winter had the market been honest—and likewise they show the tremendous importance of destroying for all time the monopoly which the "Big Five" exercise over the markets at this time. The great European war has introduced an unusual phase into the situation and the reason why the little Packers have suddenly become an important factor in the market is undoubtedly due to the fact that they have offered to fill foreign orders at a lower price than that exacted by the "Big Five." When the war comes to an end the latter will no doubt be able to dominate the situation as completely as before—but the history of the few months should show live stock producers what real competition in the live stock markets would mean and that the time has come when the farmers of the entire Nation should arise as one man and smash this monopoly completely and permanetly. Only in this way will we be able to emancipate ourselves from a system of thievery which has robbed the live stock producers of the Country out of untold millions of dollars in recent years.

ARE YOU SATISFIED?

Aside from the fact that you realize as a farmer that you are not getting a "square deal" in the Market Place for the things produced by your sweat and toil—that you are compelled to pay for the things you buy what is demanded of you while when you get ready to sell you are compelled to humbly accept what the "other fellow" offers—aside from this intolerable condition of affairs which is driving the smiles from the faces of thousands of hard working farmers throughout the land, don't you feel that tomehow or in some way we ought to put more interest and more sunshine into farm life in general?

That, like the manufacturer and the others who are organized we should place ourselves in position to demand what our products are really worth instead of being compelled to accept what the buyers are pleased to offer—this is a condition which ordinary intelligence and self respect should persuade us to bring about without further "drifting with the current." We have the power. We need but to assert it. We have always had it—but we have proceeded on the theory of "everybody for himself and the Devil take the hindmost."

But aside from this overwhelming duty of the hour, don't you believe that a fine Farm Club at the little district school house would be a splendid institution in many ways? If you could get together with your neighbors to "talk things over" a couple of times every month, wouldn't it add a new zest to life? We are living in a remarkable period crowded full with some of the greatest problems that have ever confronted mankind. Are you contributing your full share toward their solution? Are you living the fullness of a real man's life? Do not your brain and heart and soul need an occasional stimulus other than that of the fields and feed lots? Could you not, in fact, go back to them with greater zeal and joy after a splendid discussion with your friends and neighbors the evening before? And then there are your wife and children and the wives and children of your neighbors. Do they not need a little community entertainment which you can share with them once in a while? Do they not need a little relief from the dull monotony which makes yesterday, today and tomorrow the same—forever and always the same? Could we not—if we really tried—put vastly more enjoyment into farm life? Are you satisfied with life on the farm as you are living it today? Doesn't it need a little more joy and heart and soul? William Hirth.

Saving Money to Farmers

We have just issued a new Farm Club Program which means the saving of a lot of money to the farmers of any community on the buying of coal, bran, shorts, cotton-seed meal, fertilizers, salt, corn, hay and potatoes. We will also try to help you find a market for your surplus apples. If you are interested write at once to

THE MISSOURI FARMER when we will be glad to send you suitable Constiution and By-Laws and other necessary information for organizing Farm Clubs. Please inclose stamp for reply. On coal alone we can save farmers as much as one dollar per ton in many communities. Write at once. There is no time to lose.

MISSOURI FIRE INSURANCE CO-OPERATION

By Jewell Mayes, Secretary of the Missouri State Board of Agriculture.

You so often have heard and continue to hear it said that "Missouri farmers won't work together" that one is delighted to call the turn on that old gag which never was wholly true, yet in too many instances it has been partly true!

The Missouri farmer has a strong disposition to want to be "shown"—and isn't he right in going slow unless he feels certainly safe? The Missourian is conservative to a reasonable degree, but he is willing to go anywhere that warrants more than a fifty-fifty chance for legitimate profit or satisfactory saving!

The "county mutual farmers' fire insurance company" plan is the finest example of co-operation among farmers in Missouri.

Each and every county in Missouri should have county mutual fire protection well organized. Our farmers' institute lecturers will do right in preaching the gospel of fuller co-operation among farmers for fire protection. The Missouri farmer has proven his ability to handle his own farm fire insurance—and handle it better than the great insurance organizations of Big Business!

It is two stories, how the county fire mutuals organized as a protest against the unreasonable rates of the old-line stock companies of the east and the wild-cat western created for "milking" purposes, verily the one undesirable form of "dairying". The first county mutual recorded as organized on a permanent basis was the "Maries County Lois Aid Association", still in existence. It began its organization in the midst of the opening days of the Civil War, in 1861. The second was organized in Lafayette County immediately following the war, in 1867—and it had a name typical of the times, "Freedom Benevolent Association".

There are an even 100 County Mutual Insurance Companies in the State of Missouri. It is conservative to conclude that they protect the hearthstones of nearly one-fourth million country homes, whose inhabitants sleep in the serene satisfaction that they have the most perfect of fire insurance and yet at the lowest price!

If 200,000 of the 277,000 farm homes and barns are carrying their own fire insurance on a co-operative basis on about one-fourth of the old-line cost—organized officered and managed by farmers—is that not answer enough against the charge that "Missouri farmers can't co-operate"?

Let it be said to the credit of Missouri that the Legislatures have been loyal and faithful to this form of co-operation among farmers, and the laws now on the statute books are liberal, reasonable and just, whereas in certain states the legislation has been unfavorable to this type of county mutuals organized not for profit.

In the after the war period the county mutuals fought a long and finally successful battle to prove their worth to the rural communities. For example, William H. Fitch of Ray County (now State President) is said to have carried the records of the Ray County company one year in his coat and that his wife made a second pocket on the inside of the left side of his coat—one pocket was "New Business" while the other was "Settled Business". However, he kept the records rightly and well, and won!

The Mutuals had a further struggle to overcome prejudice and to prove their stability. The average citizen had to be shown that they themselves were able to furnish their own protection at cost, thereby eliminating agent's commission, high salaries and dividends.

One of the favorite excuses against the Mutual Fire Insurance Company has been that nobody could know in advance just what it would cost. The lowness of cost was what always bored the old-line agents.

Risks carried by "Farmers Mutuals" of Missouri and the average cost of $1,000.00 insurance for 1909 to 1914 were as follows:

1909	$117,237,371	.....	$2.02 per $1,000
1910	131,551,943	.....	2.44 per 1,000
1911	146,563,825	.....	2.32 per 1,000
1912	157,163,426	.....	2.35 per 1,000
1913	173,095,529	.....	2.56 per 1,000
1914	185,772,086	.....	2.32 per 1,000

$150,897,363.00, $2.33½ General average per year. To add 50 cents per $1,000.00 for operating expenses would make the total cost $2.83½ per $1,000.00, or a total cost of $427,794.12 to the patrons of the Mutual Fire Insurance Companies of Missouri, while the same amount of insurance in the Old Line Companies at the usual rate of $1.00 per $100.00, would have cost $1,508,973.63 per year.

The Mutuals of Missouri saved their patrons an average of $1,081,179.00 per year for the six years or $6,487,077.00—more than six millions in six years—or enough to build about 1,500 miles of rural rock road and have a nice balance left over!

In 1909 there were eighteen Mutuals carrying insurance amounting to over $2,000,000.00, and three Mutuals carrying insurance amounting to over $4,000,000.00 each.

In 1914 there were thirty-seven Mutuals with risks to the amount of over $2,000,000.00 each, and ten Mutuals with over $4,000,000.00 insurance in force.

The report of the 1915 Association showed insurance in force to the amount of $185,772,086.00 and a cash balance of $111,254.02.

The growth and success of the Farmers Mutuals of Missouri is attributed by State Secretary Will Russell to the following:

(1).—Simplicity of all the details, in connection with the management of the business.

(2).—By furnishing the kind and class of insurance needed and that at actual cost.

(3).—By knowing the patron and also the property.

(4).—By prompt and equitable adjustment of all claims, ever mindful of the modern Golden Rule, "Giving your neighbor the same square deal that you would expect of him."

The millions of dollars saved the patrons of the Missouri County Mutual Insurance Companies have contributed a wonderful share toward the development of the rural communities of this commonwealth.

The golden age for the Mutuals of Missouri has just begun to dawn—to become acquainted with the Farmers Mutuals is to become an enthusiastic patron!

The time and place for the 1916 convention of the State Association of County Mutuals is Nevada, November 15-16.

Sheep for Profit

William Merritt Golding, Maryville, Mo. Breeder of Pure-Bred Percherons, Short-Horns, Mammoth Poland-Chinas, and Shropshires.

The "Golden Fleece" will put the best of clothing on a poor man's back. Never has there been so much interest manifested in sheep as at the present time. Everybody is talking sheep. Those who have none are going to buy some, while those who have sheep are going to buy more. And why not when every farm can support from ten to forty ewes, according to size of farm, on what would otherwise be wasted. For the number to fit your farm you would have the wool and lamb or mutton crop, all for profit. These are soaring and the outlook is that they will continue high for years to come.

The decimation of flocks all over the world is due to varied causes. In the United States drouth and consumption of mutton have alarmingly reduced our flocks to a minimum. The great war in Europe has practically annihilated the sheep industry there. Australia, the greatest sheep land in the world, has only about two-thirds as many sheep now as there were twenty-five years ago. South America, only, seems to be little more than holding her own. So, the statement that high prices will prevail for a number of years yet to come is well founded.

How pleasant as well as profitable it is to gather corn in a field into which the spring lambs have been turned and they have been fattened on the grass and weeds and corn blades below the ears! This useless vegetation has been converted by the lambs into fertilizer and trampled into the ground to enrich the soil for your next year's crop.

This method of harvesting is putting money into your pocket and infusing new life into your land by no other means so easily and quickly done.

It requires at least 30 bu. of corn to make a 300 pound hog. (And, by the way, hogs require the cream of the soil.) At 10c per pound the hog would bring $30 on the market. Thirty bushels of corn at 70 cents per bu. would be worth $21. The feeder would, therefore, receive $9 profit.

Now 30 bu. of corn will supply at least ten breeding ewes with sufficient grain to produce their ten lambs which will weigh at least 75 pounds by mid summer, or an aggregate of 750 pounds.

Selling at 10 cents per pound would mean $75 for their owner. Interest and taxes on the amount invested in their dams would probably amount to about $8 which added to the value of the corn, $21, leaves the sheep owner $46 for his profit on the amount of corn required for fattening one hog. The wool "crop" from the ten ewes will bring more than enough to pay for the shepherd's service and the additional roughage consumed by them during the winter.

If you have any worn out land seed it to alfalfa and clover. Divide the latter into pastures for your sheep to graze upon and feed them alfalfa in winter and you will soon have fertile land and many dollars. The "Golden Fleece" will put the best of clothing on a poor man's back. Go to the fairs this fall: Buy at least five first class ewes, the better the quality the more they make for you, and start now. In purchasing foundation stock always consider quality and not price. However, may it be said that no class of live stock responds so readily to improvement in quality of offspring as do ewes when mated to a pure bred male. Lambs sired by a registered ram and from the scrubbiest sort of dams are fairly respectable. Give your sheep the little care and attention they require and you will not regret your venture.

PLANNING A SHEEP BARN

It is impossible to suggest any very definite sheep barn plans without knowing under just what conditions the barn is to be built but Professor H. Hackedorn of the Missouri College of Agriculture makes some general suggestions. He says "In planning barns or sheds for a breeding flock of sheep, a space of 10 or 12 square feet per ewe will give sufficient room. The essentials of shelter for sheep are (1) dry floor, (2) good roof, (3) an abundance of fresh air, (4) avoid drafts, (5) avoid narrow doors and passages so ewes heavy with lamb will not be injured, and (6) provide sufficient feeding-trough space so all the sheep can eat at the same time.

"We find that a shed 25 or 30 feet wide and as long as necessary to house the flock gives good results at the Missouri Agricultural Experiment Station. It should open on the south and may be built with a feed trough and feed alley along the north side. Economy of rack space may be secured by the use of movable racks so arranged as to make as many lots as are needed in the shed. These partition racks can be moved out of the way whenever a wagon is driven in to be loaded with

Sheep are good gleaners and improve pastures by keeping down the weeds. No other class of farm animals promise better profits right now than sheep.

manure. The shed should be high enough to afford plenty of loft room. As we feed baled hay, a loft five feet high at the eaves gives us room enough to store a winter's supply for the flock, but if loose hay is put in and fed oorrespondingly, more loft room must be provided."

DOES COUNTRY LIFE INDUCE INSANITY

The statement has been made, often by college professors and others who should be better informed, that insanity is more common in the country than in the city. Those who make these statements may go so far as to point out the causes that lead to this alleged condition. The usual argument advanced is that owing to the "great isolation and consequent loneliness," of farm life, together with much of drudgery and but little of pleasure, the minds of many country dwellers, and especially of country women, finally become unbalanced.

It is true that in the country there is not that intimate contact between peoples such as is seen in the cities. While the farmer and the members of his family lead rather quiet lives as compared with urban dwellers, it is not to be inferred that these lives are one of loneliness. Always in the country there is much that quickens interest and holds attention. There is no sameness in the seasons. The out of doors is constantly changing. Gardens, orchards, fields and pastures are full of interest for those who love growing things. The live stock, poultry and pets afford real companionship. In all this there is not the stifling sameness of the city.

It is easy to understand why the city dweller, used to the clang, clutter and confusion, the haste and hurrah of the crowd, frequently sees in the country only a stillness and solemnity which appalls. It is easy, too, to understand how, with nerve strain and high tension, how, accustomed to these things, he comes to look upon them as life. Nor is it difficult to understand why the dweller in the country —the modern country, with daily R. F. D. service, the rural telephone and other "city conveniences"—as he, unaccustomed to the city, has his sleep during his visit there broken by the noise and confusion, wonders why everybody there "just doesn't go crazy." Perhaps the answer is that all of us are more or less creatures of circumstances and are largely influenced by environment.

Certainly it would seem that the high tension of the city, the stress and strain, would be more conducive to insanity than the quiet of the country, where, in the main, the dwellers see less of excitement and lead more normal lives. Doubtless there are, here and there, instances where country women in sparsely settled, pioneer communities, have, because of loneliness and isolation, lost their reason. Even where neighbors are few and far apart, where there is no rural telephone and no daily mail delivery, those who love nature and who are interested in her every mood, are seldom subject to great worry merely because they fail to see other human beings as often as they might wish. The truth is that there is no greater loneliness than comes to the stranger, the timid and the misfit in a great city. "A sea of faces," none of which the stranger recognizes, may bring to him heart-hunger and loneliness such as cannot be caused by great stretches of prairie or towering mountains, with not a human being in sight.

Is, then, the statement that country rather than city conditions are conducive to insanity true? Is insanity more common in the country? The answer is, no. A very thorough investigation made when the last census was taken shows that of 60,769 insane admitted to hospitals, 36,654 came from urban communities while only 20,442 came from rural communities, no reports as to origin were available on 3,673 cases. In other words, for each 100,000 population in urban communities there were 86 insane, while for each 100,000 population in rural communities there were but 41.4 per cent. For cities comprising all incorporated places having more than 250,000 inhabitants, the ratio was more than twice as high, being 86 per hundred thousand. In cities of 500,000 and over, for each 100,000 population there were 102.8 cases of insanity; cities of 100,000 to 500,000, 89.9; 50,000 to 100,000, 77.2; 25,000 to 50,000, 86.5; 10,000 to 25,000, 75.6; 2,500 to 10,000, 70.2.

In all the investigation made on this subject, with but one exception, and that in the densely populated New England states, the ratio is invariably lower in rural communities than it is in any of the four classes of cities.

It should be a pleasure to country people to know the facts in this case. A certain class of "uplift" reformers have so long talked of rural isolation, and have so frequently declared that country life is conducive to insanity, that in many quarters the statement has gone unchallenged.

W. L. Nelson.

SOME SENSE—SOME NONSENSE

By Sam Jordan

A most promising crop now on many farms—Weeds.

If your town, or your community, or your home is unclean whose fault is it?

Pure air, bright sunshine and clean dirt, are nature's greatest tonics, but dirty dirt is a bad one.

Weeds, manure piles, old tin cans, filthy closet vaults, are all disease breeders. Swat all of them.

By the way, I wonder if any one now has left any of those big white pills that some folks bought at a dollar a piece to take to keep from being killed by the poison gas in the tail of "Halley's Comet"?

Talk is now ripe again about a new consitution for Missouri. I have heard of this same for many years and it seems to come from all parties, and I have never seen in print a word against it. What seems funny to me is, why we don't go to it and get one. Whose job is it any way? Can we get it by praying for it? Or i sit by some hokus-pokus-presto-change method?

Will it be "sacred" when we get it? If we all wanted to do some thing that was for the good of us all but "unconstitutional" would we dare do it? Maybe we do not have a new constitution for fear the people may come more nearly getting their rights, or such rights as may not be to the interest of the "boys"?

I see so much about "goats" and "rabbits" in Kansas City. I guess they just allow them to run around loose. They seem to be owned mostly by a party named Shannon, and another by the name of Pendergast. I see there is most always a fight going on, but I do not see how it could be much of a fight for a goat smells so bad, and a rabbit can run so fast, and is such a coward besides, that I do not see how a fight could be pulled on. Then again if the houn dogs are as numerous in Kaysee as they are in our town goats and rabbits would not last very long unless they were fenced in. But maybe the kind that can live in Kaysee would not be fit for a dog to eat, in which case when they make too much bother they could be shot.

It always seemed funny to me just why the name of a railway station is placed so high up. It is comfort for a person traveling to learn the names of the town he passes through. Usually when one is on the side next the station he can read the name without having to stand on his head, but from the opposite side he cannot. Maybe it is for the purpose of letting the engine men know what station he is running into. Express companies put their signs low, knowing the people "do not look up," but the station may not be for any accommodation of those who travel. Of course stations are "called," but, oh my! If one knew how to spell the name of the station backward without looking in the book, he could perhaps make out what the "caller" called. It sounds to a stranger about as much like one thing as another.

Since I wrote that item about there being fewer flies than formerly there was at least one town I had not visited up to that time. They seem to be using tangle foot and traps, but the hotel dining room almost swarmed with the dirty pests. The wife of the landlord seemed to be just a wall flower or something or other, as she was always dressed up well and was "good to look upon" but I would have respected her a lot more had she been in the dining room with her swatter, or even throwing "biscuits" at the flies on our bald heads.

The flies seemed to spend most of the day in the filth of the street, the horse stables, and water closets, except at meal time, most of them seemed to have come to the dinning room.

Traveling men are at the mercy of such dirty hotels, since they are often compelled to put up at them.

I have often wondered why such conditions are allowed to exist and can only conclude that it is laziness, ignorance, or just plain filthiness. I think it is largely due to ignorance.

You know it takes a long time for all of us to learn even a little.

If you and your neighbors are going to have to buy corn next winter you should organize a school district Farm Club at once, as THE MISSOURI FARMER expects to make arrangements with the Farmers Elevators in Nebraska, Iowa and Northern Illinois to sell direct to Missouri Farm Clubs —thus saving for them the margins which usually go to the Commission men and feed dealers..

BLIND MILTON DICTATING TO HIS DAUGHTER
From the original by Munkacsy, in New York Public Library

The Vision of the Blind

"Thousands at his bidding speed,
And post o'er land and ocean without rest;
They also serve who only stand and wait."

Was the spirit of prophecy upon John Milton when, more than two hundred and fifty years ago, he dictated those words to his daughter?

Did the "blind poet" have a vision of the millions of telephone messages speeding instantly over hundreds and thousands of miles of wire spanning the continent?

"They also serve who only stand and wait." The Bell Telephone is your servant even while it "only stands and waits." The whole system is always prepared and ready for your instant command.

Every wire and switchboard and telephone instrument is kept alive and responsive by an army of telephone workers.

Each one has his special part to do and, because he does it faithfully, countless messages speed throughout the length and breadth of the land, at every minute of the day and night.

HOT WEATHER IN THE HOG LOT

The past few weeks of dry, hot weather and the air heavy with dust, have been working a hardship on the herd. The man who has been properly looking after his hogs has undoubtedly been repaid many times, but the fellow who has neglected his herd now finds them in poor condition to enjoy the cooler weather. Some men are content with letting the hogs make the best of it themselves, but the real hog man is he whose conscience bothers him if he hasn't attended to everything connected with the comfort and well being of his hogs.

Should Have Clean Water

The first and one of the most important items considered by the hog man in hot weather is water for his hogs. An old, dirty, mucky hole full of slimy water is not a bit to his liking and you won't find his hogs there at all. If he hasn't a good clean pond to which his hogs have access, he is in most cases, provided with an artificial wallow, usually made of concrete. These concrete wallows are proving very successful and meeting with favor by the hog men generally. They can be made any convenient size and depth with the proper slope on the bottom, and arrangements for draining and cleaning. The men with whom I have talked who are using concrete wallows change the water often, practically once or twice a week, and always keep some disinfectant in the water. A hog loves a good wallow and will always do better when there is a bath at all times. I have one water tank which started leaking recently during the warm weather and in the course of a few hours the hogs in that dry lot had rooted out a big hole and made themselves comfortable, and it has been almost impossible to keep the hole filled up since then. Shade is very essential and this is needed most where there is water. Good shade is absolutely necessary on any farm. If the concrete wallow cannot be placed in the shade, a sun protection should be made over it.

While the hog will get lots of enjoyment out of a good bath or wallow, no other class of animals appreciates clean, cool water to drink any more than do hogs, and no other class of live stock will respond any better to having access to good drinking water. Keeping not only hogs, but all classes of live stock, well supplied with good water is one of the essentials of profitable live stock production. Fortunate is the man who has a good deep well as a water supply. Few men are thoughtless enough to permit their hogs to have access to ponds or creeks into which infection could come from other herds, and many men never really understand why it is necessary to keep hogs away from such holes until after they have contracted some disease.

A hog will make a wallow or muss of his drinking fountain after he drinks if he can get his body into the place. It is therefore necessary to see that the opening in the water tank is just large enough to permit the hog to get only enough of his head through to drink comfortably. There are a number of patent automatic appliances on the market which can easily be attached to water pipes and tanks which are meeting with success and all of them have small spaces for the hog's head. These appliances are handy too, for they can be moved from place to place. We have several different kinds on the farm and find constant use for all of them. A 365-foot well supplies us with 16 gallons of water per minute and we use plenty of it. A 100-foot hose permits us to keep the dust settled around the feeding quarters and to give the hogs a good washing before shipment.

Feed A Balaced Ration

During the hot days it doesn't take much feed for the aged hogs, especially if they are running on good pasture, but their feed should be balanced and not constipating. The old hogs are subject to constipation as well as the young, and all of them should be watched closely. The breeding hogs should not get too much corn when the weather is so hot. A cool, well-mixed slop is much better, cooling the system and aiding digestion. Where the pasture is green, the water good, the feed balanced and the hogs taking plenty of exercise, there is not much danger of constipation. It is good policy, however, to give the hogs a laxative occasionally to cool out the system and keep their bowels conditioned. If it is possible to do so, a good plan is to keep some of the many good condition powders before the hogs all the time, letting them eat it as their appetites call for it, but where this is not possible, a not too frequent dose in the slop helps out wonderfully. Where ear corn is fed, the cobs will give best returns by raking them up once a week and burning them for charcoal, sprinkling salt water on the coals to make them appetizing. The hogs will clean up this charcoal and it is an excellent conditioner. After the feeding floors are cleaned up lime should be sprinkled freely and if it is dusty, dip should be used where the feeding is done. Avoid dust around the feeding and sleeping quarters. I often give the hogs soft coal, but very little at a time, for it is said that too much soft coal will cause piles.

Keep Free From Lice and Worms

It is hard to keep hogs free from lice and worms during any season, and it is an endless job to keep them away, but an easy one for the man who watches his herd closely and never permits either the lice or the worms to get a foothold. The hogs should be sprayed regularly or provided with rubbing posts to keep them free of lice. One good plan in spraying them is to get a bunch of hogs in a box stall, well bedded and sprinkle them with dip from a sprinkling can. Being packed in the stall closely they will rub it on all sides, and the dip which falls on the bedding will reach under their bellies and flanks and they usually get a pretty good dipping of it. It is not advisable to get a bunch of pregnant sows or gilts crowded up in this manner to sprinkle them. A better plan, where the hogs are gentle and will stand long enough to be sprayed, is to sprinkle them where they are fed and while they are eating. This not only gets the lice on the hogs, but the dip that runs off acts as a disinfectant on the feeding quarters, and it is decidedly good policy to keep the feeding floors clean and sanitary. A little dip in the wallows keeps lice away, but in the winter time they must be sprayed and watched carefully.

The powders and conditioners spoken of before will help keep worms away, but they frequently slip in, especially if a close watch is not kept on the hogs. If there is a bad case of worms in the herd the old hog man has his particular remedy, while others use worm powders, or santonin, which is high in price right now.

When hogs are covered with lice and infested with worms, usually their bowels are out of condition and the system is run down, and in this condition they are more susceptible to contracting disease than at any other time, and while many hogs die of cholera, a great lot of it is due to the neglect of the man who owns the hogs by not keeping them in the proper condition. A few hours spent in the hog lots every day will do more to open a man's eyes as to what hogs require for best results than anything could suggest. Plenty of thought and common sense is necessary and this will pay big when winter comes if the hogs have summered well. Bob Hill.

APPLY LIME IN THE FALL OR SPRING

The results of ten-year experiments on about twenty-five fields scattered through Missouri show an average return of $5.80 from applying about a ton of ground limestone once in a corn, oats, wheat, clover rotation. The largest return was secured in clover, second on corn, and lowest of all on wheat. These tests seem to show that about $3 a ton is about the highest price that a man can usually afford to pay for ground limestone for this purpose. Of course, on a sour soil where lime is absolutely necessary and makes the difference between a clover failure and a good stand, the lime has a still higher money value.

About 1200 pounds of lump lime or 1500 pounds of water-slaked lime furnish the equivalent of 2000 pounds of ground limestone for this purpose, but the ground limestone is usually so much more economical to use. It should be applied at the rate of about two tons per acre under the average conditions of these tests but, of course, this depends very largely on the sourness of the land. Samples of the soil and of the limestone to be used should be sent to an agricultural experiment station which is usually willing to examine the samples and make recommendations based on them. The Department of Soils at Columbia, Missouri, keeps on hand a list of companies which deal in ground limestone in the state and a list of the firms which have limestone grinders and distributors for sale. These lists are mailed on application to anyone interested.

Lime is not really a fertilizer although it is sometimes called an indirect fertilizer, that is, a material which indirectly helps the crop even though it is not a plant food as are manure and good commercial fertilizers. It should usually be applied either in the spring before corn or in the fall to land that has been plowed for wheat. The preparation of the seed bed then works it into the soil. It is sometimes plowed under but it is usually better to mix it with the surface soil. It should not be used as top dressing on wheat or other rotated crops although sometimes so used on grass.

Where limestone is readily available it is often cheaper to grind it on the farm than to buy elsewhere. It is easy to secure a small grinder on the market which will do very good work and tests show that they may be used very economically, but they are used such a small part of the time that it is usually desirable for a number of farms to combine for the purchase of one, if the experiment station tests of the lime rock which they have available shows that it is of proper quality to make grinding profitable.

The Missouri soils which need lime worst are the level rolling prairies in the northeast and southwest parts of the state, but the badly worn timber soils in other parts are very likely to need it. The soils which need the lime the least are the well-drained bottom lands, brown loams, hill soils along the Missouri river, the better prairies of northeast Missouri, and the better limestone soils of south Missouri. The experiment station work already done seems to indicate that more than half the soils of this state are more or less in need of lime.—M. F. Miller Missouri Agricultural Experiment Station.

AS I LOOK AT IT

A mixture of booze and gasoline in an auto is more dangerous than gasoline in the coal oil can.

The sympathy of the city girl who feared that the farmer might freeze to death while harvesting winter wheat was altogether misplaced.

You may kill flies by the bushel or barrel but until you get rid of the breeding places such slaughter will avail little or nothing. As of flies as of many other evils—get rid of the source.

The great lack of country life is real rural leadership. Until farming communities develop their own leaders, stand by them and support them, many of the most important agricultural movements must fail.

The crossing of the Atlantic ocean by a German merchant sub-sea liner, loaded with 1,000 tons of dyestuffs and other merchandise, was a most impressive feat. It may be, though, that it was not more important than the shipment of the first car-load of Mississippi-made butter to northern markets.

We don't object to a fellow chewing tobacco. Honestly, though, it doesn't look well to see the juice running out of the corners of his mouth like cider from a mill when a big double hopper of Winesap apples is being squeezed down with all the energy that a 200-pound man can exert at the end of the lever.

It is not easy for a community to get rid of the Hessian fly. In the first place, it is not always possible to get all the farmers of the neighborhood to work together. Yet this is just what must be done—and in the right way—if the fly is to be put out of business. In this, as in many other matters, co-operate and win; go it alone and lose.

Unscrupulous real estate firms and land agents, who, through their lying literature misrepresent conditions and promise the impossible, are doing more than any other force to bring about the failure of the back-to-the-land movement. The man who fails to get value received in his initial purchase, is in poor position to prosper. There are splendid opportunities for investment in Missouri farm lands, but here, as everywhere, it is important that the purchaser investigate and that he know what he is doing. In San Francisco, a few days ago, a star witness for the government told of land frauds in which nearly $1,000,000 had been collected from men and women in all parts of the United States. W. L. Nelson.

Live Stock Breeders Offer Prizes

The prominent live stock breeders of the state have considered the short course in Agriculture of the University of Missouri of such importance that they have offered thirty-one gold medals valued at $510 which have been awarded to the best judges of horses, cattle, sheep, and hogs in the annual short course live stock judging contests.

THE STORY OF AN OLD FARM

Editorial Note.—If any reader has not read the previous articles in this series by Mr. Lyon he had better hunt them up and read them now to get the full benfit of what he has to say on keeping up the fertility for one hundred years. "It is interesting to note" says Sam Jordan" that while Lyon's farm has been in cultivation for over one hundred years there is no worn out land on it. Yet the hills are so steep that I would not know how to go about it to farm them. His system has and is producing gratifying results."

NUMBER IV.

I have never been able to find one who could fix the date of the general introduction of plows of the all metal share and mouldboard type, but it was sometime between 1825 and 1835, prior to this all breaking being done with the "bull plow," iron share and wooden mouldboard, or with a strong single shovel plow, such as is still in general use in the Southern states.

Even the first improved plows, as I recall some made about 1840 and in use thirty years afterward, did very poor work, rather pushing the soil aside, instead of turning it over.

The gullied lands of the South, owe much of their barren character to this system of poor plowing, and, beyond doubt, the same thing was a strong factor in making washed land here. This may be noted yet on steep hillsides, where for thirty or forty years all breaking has been done with swivel plows, that have never been made to do as good work as others do.

Taken as a rule, our people here were never extra deep plowmen, eight inches being the maximum depth anywhere, six much nearer the average. What is called deep breaking, with most of the work done at perhaps five inches, and I have, in observing closely, noticed the fact that those who broke rolling lands the deepest, have suffered the greatest loss by washing.

Dr. Contra, one man who owned all rolling land and was a four inch deep plowman, lost perhaps less top soil than any other man I know.

In dealing with lands that were gullied we have found it a good plan to plow and scrape the gullies so nearly full as to enable us to cross them with horses in cultivating, scatter a small amount of manure in them, and sow strips of broom corn four to eight feet wide across them where the greatest flow of water is to be expected, at intervals of fifty feet.

While I have never made a thorough test of Sudan grass for this purpose, a single trial, and its habits of growth, incline me to the belief that it might be better than broom corn.

It is a rule to never break lands of a steep character twice in succession, but to seed them to small grain, wheat or rye, following the plow crop, and to be liberal in the use of timothy and clover seed.

Going back a little, we have never been able to make the cowpea fit just right into our system of farming, but in four or five cases I have made them do wonders in soil building, by planting them on badly worn patches, such as scraped in gullies and allowing them to go down where they grew.

It has been our policy to always run our furrows with the contour of the land as far as is possible, and in marking or planting decidedly rolling land, we do not hesitate to put in "point rows," whenever we see that we are getting the long rows to run so as to carry the water too much down hill.

About the only rule we ever had in regard to the cultivation of crops on hillside land, is the one so often quoted as applying to crops on any land:

"Shallow, Level, Frequent."

One deeply furrowed or hilled row along a hillside, will allow water to accumulate, "gather a head," as the old water mill men used to say, and when this water starts down hill, it forms the basis for a washout that will carry away a great deal of soil.

On our longest hillside, and we have it in corn and tobacco this year, we run guard furrows diagonally down the slope in the worst places, something like the terrace plan practiced in the South, a practice that gives good results excepting in case of the heaviest rains, which amount almost to cloudbursts, and when one of these comes, the guard, or water furrow, does more harm than good.

This year, with some very heavy rains, these furrows have been of untold benefit to the land.

In my next, and final article of this series, I want to treat of the results of the management of the farm since 1876, as about that time I became the manager, and since that time the farm has been virtualy under my full care.

If any one wishes to ask any questions, my address may be found at the close of this paper and I will answer through THE MISSOURI FARMER.

C. D. Lyon,
Rt. 1, Georgetown, O.

MAKING FARM HOMES COMFORTABLE

This is an age when comfort not only means ease and longer life but greater efficiency in the daily tasks with which the struggle of life constantly confronts us. There are many serious problems which face the farmer of today. There is the never ending battle in the fields and feed lots which means that the farmer must use his head as well as his hands. Then there is the question of a "square deal" in the market place which means that farmers must organize and thus place themselves in position to realize a legitimate return upon their years sweat and toil—but close upon the heels of these great questions follows the problem of making our farm homes more comfortable and pleasant, not only for the "old folks" but for the splendid country boys and girls who are fast growing to young manhood and womanhood and who demand that life shall mean something more than mere drudgery and endless toil.

That thousands of our brightest boys and girls have flocked to the big cities by the thousands in years gone by is due in no small degree to the fact that life on the farm has been too harsh and hard—and not until we make our farm homes more enjoyable and comfortable will this drift to the already overcrowded cities with their pitfalls of vice and crime be arrested. Nor should this appeal be made on behalf of the young folks alone—for all of us have but one life to live and it is an evidence of intelligence and refinement when we insist that there shall be as much wholesome enjoyment in our daily existence as our means permit.

Among the modern improvements which is lacking in many farm homes is a farm home furnace—and it would be impossible to suggest a convenience which is so many times worth what it costs from every viewpoint. At small expense a basement can be dug under thousands of farm homes. Most of the excavating can be done by the farmer himself—and with the assistance of a man who knows something of masonry, a basement large enough not only to accommodate a furnace but which will also offer ample storage facilities for fruits and vegetables can easily be provided—and for the latter purpose it is worth several times what it costs while the furnace itself means an added comfort and luxury which no farmers family would do without, once they have experienced its enjoyment through the long dreary months of a single winter. The old time heating stove is about the greatest nuisance conceivable. It is dirty and a constant menace to fire—while many a man has lost big chunks of his religion getting up in the early hours of the morning when the thermometer hovered around zero, trying to get the "blamed thing to burn." Furthermore, the uneven temperature produced by the old heating stove has caused thousands of cases of pneumonia, "grip" and other diseases—and altogether is a menace which should not be tolerated in a modern farm home. A furnace produces an even heat day and night and needs attention only a few times per day. It is clean and there is no danger of fire—and it will last for years and repay its cost many times. Elsewhere in this issue appears the advertisement of the American Radiator Co.—a splendid, high class concerns in which our friends can place every confidence and we suggest that those of our readers who are interested drop them a line and ask for literature giving the price of modern home furnaces. To say the least the information will be interesting and well worth your consideration. A postal card will bring it to you.

MY 1917 MODELS NOW READY!

NO OTHER SPREADER COMPARES WITH IT

COSTS ONLY $87.50

JUST READ THESE 1917 IMPROVEMENTS!

They mean that every Galloway Spreader is **built stronger and better than before.** The beater bolts are 1-16 in. larger with lock nuts. Beater bar bolts increased in size and strength. Beater teeth longer and stronger than ever which means they now tear the toughest manure finer than ever and spread it easier. Heavier bolts hold the beater bars in the beater head. Rear shaft increased in strength—higher carbon steel used. Additional bolts strengthen (beyond actual necessity) the beater bracket. Larger drive sprockets, which mean **lighter draft than ever.** The fifth wheel castings are larger and increased in strength—spreader box **steadier in turning.** Rear conveyor shaft now made of No. 40 carbon steel. All steel tongue. All metal parts thoroughly coated with asphaltum weather-proof paint. Spreader box better finished and painted.

Galloway WIDE SPREADING V-RAKE on every machine WORTH $15 on any spreader, COSTS YOU NOTHING EXTRA. INVINCIBLE, IRRESISTIBLE, PATENTED ROLLER FEED--an EXCLUSIVE GALLOWAY FEATURE, makes it SUPERIOR to all other feeds on all other machines--the SECRET OF OUR LIGHT DRAFT. The mechanical principle is the same as MOVING A HOUSE ON ROLLERS. THIS FEATURE ALONE WORTH $25 on any spreader, EXCLUSIVE AGAIN on the Galloway, costs you NOTHING EXTRA. PATENTED AUTOMATIC STOP, uniform clean out push board, WORTH $10 EXTRA on any spreader, EXCLUSIVE on the Galloway, costs you NOTHING EXTRA. These are a few of the features you will find on the Galloway, which are PROTECTED BY GALLOWAY PATENTS. Don't buy a spreader of any make or kind until you have tried a genuine GALLOWAY 1917 MODEL, No. 5, No. 1A or No. 8 at our risk, without obligating yourself in any way. Thirty days' field trial and returnable to us within one year if not perfectly satisfactory. Remember, we manufacture this spreader in our own factories and sell it direct from factory to farm. Do not confuse the Galloway spreader with lower priced machines made to sell for a price, which are all cheap, worthless imitations. Over 60,000 Galloway Spreaders in use. These and other features make the Galloway Spreader more invincible than ever in actual field work. No big, cumbersome, four-horse team or three-horse team needed to handle a Galloway. Two average horses can spread with the Galloway anywhere.

Complete particulars and details of this 1917 model spreader now ready.

A Postal Gets These Two Books---Write Today

Which tell the whole story. No. 1 is my 250-page four-color catalog. No. 2 is my 100-page fall supplement to the big spring book. **YOUR** copies of these books are now ready to mail. **Ask for yours today.** Remember a postal gets them. **They will save you from $100 to $200** on your fall purchases because they are crammed full of standard quality merchandise priced at **one small factory profit. Gasoline engines, farm tractors, farm implements** of all kinds, household goods, clothing, sewing machines, furniture, kitchen utensils, **automobile accessories, sporting goods,** shotguns, ammunition of standard high quality makes and grades, all priced to you at **one small profit** based on **great volume.** Ask for these books **now!**

Box 593 WM. GALLOWAY, Pres., THE WM. GALLOWAY CO., WATERLOO, IOWA

TURN UNDER SECOND CROP CLOVER

A ton of clover contains an amount of nitrogen equal to that in four tons of average barnyard manure. At fertilizer prices this nitrogen is worth between seven and eight dollars. A man can cut the first crop of clover for hay and by turning under the second crop, which usually weighs about a ton, he can add this nitrogen directly to the soil. Since on the average soil the nitrogen in that part of the clover plant above the ground comes entirely from the air, this nitrogen is pure gain to the land. Of course, most farmers prefer to cut the second crop for seed but with the increasing need of soils for nitrogen, it is a grave question whether, in the long run, this is a good practice. In addition to the nitrogen supplied by turning under this second crop, the seed added to the ground goes a long way toward insuring a good clover stand.

The organic matter contained in a ton of clover hay equals that in about three and one-half tons of ordinary barnyard manure. Organic matter is needed badly by most upland soils in Missouri. The gain to the soil in both organic matter and nitrogen when this second crop is turned under is at once apparent. This is one of the things which should be considered by the man who is interested in building up or maintaining his soil. Economically maintaining soil fertility is the most important problem of the average Missouri landowner.—M. F. Miller Missouri Agricultural Experiment Station.

Mineral Mixtures for Sows

A shallow trough containing a mixture of charcoal, sulphur, air-slacked lime and common salt assists in keeping sows in good condition. This mixture can be made by mixing one bushel of charcoal with two pounds of powdered sulphur, five pounds air-slaked lime and five pounds of salt. Wood and coal ashes dumped into the hog yard are beneficial and will help to serve the same purpose as the mineral mixture above.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

William Hirth, - - - Publisher
Geo. B. Ellis, - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

THE POWER OF ORGANIZATION

The most convincing argument that we could offer in favor of farmers organizing to protect their interests could not begin to equal the demonstration of the power of organization the country has witnessed within the past few days in the deliberate holding up of Congress of the United States by the four railroad brotherhoods. These organizations representing only one-fifth of the number employed by the railroads, by their threats to paralyze every industry of the United States have dictated their own terms to the President and to Congress with the threat that if their demands are not granted they will stop the wheels of commerce in this great country of 100,000,000 people over night.

There are about 2,000,000 men engaged in the railroad work of the country and only 400,000 in the four brotherhoods which have threatened to strike but in the absence of some compulsory plan of arbitration this one-fifth can deliberately throw the other four-fifths out of employment and cause them and their families untold suffering. The members of these four organizations together with their families make up less than 2 per cent of the total population of this country and yet without any regard for the rights, inconvenience, suffering or financial loss of the 98 per cent this small minority can by the issuing of a strike order produce chaos for the time being and probably arson, bloodshed and murder with it.

We have urged farmers to organize in order to be able to get justice for themselves but we have never had in mind the domination of every other interest by this organization. The farmers certainly have a very vital interest in the question of any general railroad strike. If this strike is carried out as now ordered it means that every feeder who has a bunch of cattle or hogs ready for the market must hold them till the strike is settled. The man who has planned to bring in feeders must wait the pleasure of the strikers. Already at this date four days before the strike order is to go into effect buyers of poultry, eggs, fruits and other farm produce have discontinued buying. These are only very small items in the demoralization which would result from a general strike but they are enough to show the imperative necessity for some strong conservative power that would step in at a time like this and compell Congress to act for the whole country instead of for the few.

I am not attempting to write a brief for the railroads nor to offer argument against the demands of the railroad employees. These are questions that ought to be settled by some impartial tribunal authorized by the government of the United States to pass on such matters and with power to enforce their orders.

There are more than six million farm families in this country and a much greater number of adult farm laborers but when they ask Congress for some relief from high interest rates, or from price fixing and unfair competition of the great corporations which have been sapping the very life blood out of farm profits our members of Congress pass them by with indifference.

If this strike should be carried into effect it may prove a blessing in disguise for it will surely bring the people to see the utter helplessness of the general public under present conditions.

Farmers, why not wake up now? Why not organize so as to hold your proper balance in the settlement of all public questions? This is the only way out of the present unsatisfactory conditions and we hope to see the farmers of Missouri become leaders in this much needed movement.

LIME OR FERTILIZER?

A Cooper County farmer writes that he wants to sow wheat on land that is rather poor and will need a fertilizer but is hesitating whether to use lime or fertilizer. He says he is not able to buy both and that he wants to use the one that will give the best profit for this year's crop. The liming of soils is explained in another column of this issue and our correspondent will understand by reading the article that lime is not strictly speaking a fertilizer. Lime may dissolve some of the plant food in the soil and put it in shape for the wheat plants to use and in that way increase the crop. Lime will also improve the physical condition of wet land and it will also sweeten sour land. The latter is very important if clover is to be sown next spring and we would recommend sowing clover on this land if it is at all adapted to clover. If a good stand of clover can be secured and a crop of green clover turned under the first important step in the improvement of this land will be made. The great need of most of the old land in Missouri is humus or vegetable matter and the only way to get this is to turn under some cultivated crop or a crop of weeds and summer grasses or the application of coarse manure.

We are of the opinion that our correspondent will find it profitable to use both lime and a good grade of fertilizer but of course that means a greater outlay of money just at this time. If a ton of limestone an acre could be applied to this land at a cost of $2 or $3 the interest on that money at 6 per cent would be 12 to 18 cents. It would take very little benefit to the land to pay for the lime and pay the interest in the course of five or six years. We realize however that even borrowing money is under some conditions not possible.

The application of a high grade fertilizer containing 2 per cent nitrogen and 10 or 12 per cent soluble phosphoric acid ought to pay a profit on this land and this should be applied at the rate of about 150 pouds per acre and besides the benefit it will be to the wheat crop if the land is seeded to clover or timothy it will show a considerable improvement on these latter crops. If but one of the two, fertilizer or lime, can be bought at this time the most profit for the first year will be in buying the fertilizer.

FREE TEXTBOOK LAW

In the session of the General Assembly of 1913 a law was passed that will put free school textbooks into every school in the state if only the people of the district want free books, and this can be done without any expense to the people of the district. There is a tax imposed by the state of 2 per cent of all premiums collected by Foreign Life and Fire Insurance companies doing business in Missouri. One-half of this tax is apportioned to the counties, apportioned on the basis of the number of children of school age. The sum distributed annually to the counties amounts to $300,000 to $325,000. To each city and town within the county, the county court apportions what it is entitled to and the balance goes into the general fund of the county. This is the money available for free textbooks.

The proposition for free books must be submitted to a vote of the district either at the annual school meeting or at a special meeting and it is decided by a majority vote. If the proposition carries, the school board must then purchase the books needed in the first four grades and pay for them from the "incidental" fund of the district. When the fact is certified to the county court, the district is entitled to its pro rata share of the Insurance Tax when the money is received in December. The following year, books are bought and paid for in like manner for the fifth and sixth grades and the third year for the seventh and eighth grades but the county court continues to apportion the money to the district which will make a fund sufficient to renew the books.

It is estimated that the cost of free textbooks will not exceed 50 cents a year for each pupil which is very much below what it costs when the books are furnished by the parents. Quite a number of districts have already adopted the free textbook plan and most teachers and superintendents favor the plan because of better results.

If our readers want to make further investigation they should consult their county superintendent.

C. B. HUTCHINSON GOES TO CORNELL

How long will Missouri continue the practice of training up her brightest native sons just to let them go and serve some other state? Do we not need the very best intellect and the ripest experience to direct our agricultural problems right here at home? For some reason about the time a man begins to make good in the Agricultural College of Missouri he is offered greater opportuity to pursue his work in some other state and he is induced to leave and his place is filled by an inexperienced youth to be trained at the expense of the agricultural progress of the people who foot the bills.

The latest one of our Agricultural College leaders to leave Missouri is C. B. Hutchison, head of the department of farm crops who goes to Cornell, New York. Mr. Hutchison is a native of Livingston County, graduated from the State University in 1907 and with the exception of one year has been with the University since that date, doing teaching and investigational work. If Mr. Hutchison's nine years of experience and research has made him valuable to New York it certainly has fitted him for better service to our own people with whom he has been working and whose problems he understands at least better than any new man can possibly know them.

The State University of Missouri owes it to the people of the state who willingly tax themselves for the support of a great institution to either hold the good men who have been developed in the institution or else to fill their places with better men of equal experience. This is no reflection on the ability of the young men who are selected to fill the vacated places in the University but a truth that can not be disputed that if Missouri would build up a great educational institution, the pride of every citizen of the state, she must fill the professorships with men of experience as well as ability. It takes several years in many instances for a man to understand the people and the agricultural problems new to him and until we realize this fact we are not going to keep pace with other states which are taking our experienced men.

We think a close observation on the part of those in authority would prove to them the great cause why we are making so little progress in the betterment of the agricultural practice of the state is the lack of knowledge of those problems by the teachers and the lack of understanding of the sentiments, customs, and provincialisms of our people.

HOMES FOR ORPHANS

Within the past few years THE MISSOURI FARMER has appealed to its readers to take an interest in the little homeless children cared for by the Sheltering Arms Childrens' Home of St. Joseph, Missouri, and our appeal has met with very satisfactory response. We learn that this institution has now in the Home a number of fine boys and girls for which homes are desired. The Superintendent writes they now have ten little girls from one month to thirteen years of age and five boys from four months to three years and would like to place them in good homes in Missouri.

Many homes not blessed with children have been made happier and better in every way by the adoption of an orphan and here is your opportunity to make the life of at least one child happy and give it the opportunity to fit itself for manhood or womanhood. If interested write direct to Sheltering Arms Childrens' Home, St. Joseph, Missouri, and you will receive description of the children and terms for adopting them.

GOES TO CALIFORNIA UNIVERSITY

The livestock readers of THE MISSOURI FARMER who have come to know our livestock representative, R. P. Royce, will be interested to know that he has accepted a position with the livestock department of the University of California, and will enter upon his duties with that institution on September 1. Mr. Royce is a young man of splendid ability as a livestock judge of the very highest moral character and we bespeak for him success in his new field of endeavor in this western field.

Mr. Royce is a native Missourian, a graduate of our Agricultural College, a practical farmer and we regret to see him leave the state.

BARNYARD GOSSIP

It is about time for the opening of another school year and I imagine that thousands of anxious fathers and mothers are just now debating earnestly and prayerfully the question of whether or not they should send the son or daughter away to school. Not many parents who would not willingly make the sacrifice necessary to send their children to college if they were sure it was the best thing to do but they hesitate because they see a great many failures among those who have tried it. But along with these failures, dear parents can you not count at least four who have made good to one who has turned out bad? That, then, should be the deciding factor if you can not decide after looking at all other angles of the question. Not all young people are benefitted by a college course but a majority of them are and it is your duty as a parent who will be held responsible to the extent of your ability for the training of your child to look at him as others see him and be sure first that he has the mental capacity for a college training before you try to force it on him. Then, if he has mental capacity it is just as much important that he has the moral character, strong enough to withstand the temptations which college life will open up to him once he is away from the influence of home. Quite a number of boys have their lives blighted because they are not morally strong enough to withstand the temptations of college life for the first year or two they are away from home.

I am not trying to give advice to any parent on this subject but hope I may raise some questions that will cause a little more serious thinking on the part of some of them who may be up against the proposition of whether or not to send the son or daughter away to school and if they are to go, where shall they go?

In the ordinary course of events, these days, the child will finish the eighth grade when 14 years old and the high school at about 18 years of age. Not many young men or young women who at 18 have their future course so well marked out and their moral character so firmly established that it is safe to turn them out without the restraining influences of home life. But you say it is impossible to take your home to the college town and the only hope is to take the chances and let the boy or girl go among strangers and hope for the best. One thing you can do to lessen the dangers of college life for your boy or girl is first to select the institution which he or she will attend with a view of its home like and Christian influences. There is a vast difference in this respect between different colleges and universities. We think the small institutions with an attendance of 150 to 300 students as a rule are decidedly preferable in this respect to the larger instituions. In a large school little effort is made by the officers and teachers to get in personal touch with the individual students. The heart to heart talks given by the president or teachers in the small college where every teacher is in personal touch with every student is a factor unknown in our great universities where there are four thousand students enrolled.

There is no doubt some advantage to the young man or woman who holds a degree won from the larger schools with its greater reputation but you can give them that advantage and the better moral training offered by the smaller school by doing what a few have already found the wise thing to do. Pick out some high class small college and start the son or daughter in there after the high school course is finished. With two or three years work in the college, the boy or girl will be much more mature and stronger in character and will be in much better position to take care of himself or herself among the thousands in the University. They will graduate in the same time, the cost will be no more, probably less and will have a better moral training and as good intellectual training as the one who has gone through the whole course at the greater school.

But no matter where you send your son or daughter to school you should know something of the home they choose. I have seen many boys come to the university, perhaps the first time they had been away from home alone, and left to choose without help a temporary home. A few dollars spent by the parent for a trip to the college to help the boy to select a good home where good Christian influences will be felt may be the very best investment you can make. There are many good homes of the very best moral environment in all college towns and it is worth your while to know that your boy is in such a home.

Indulgence of fond parents has been the ruin of many boys and girls. A few years ago two friends of mine told these different stories: Friend M had two boys in the state university. He was a well-to-do farmer and the boys were good average boys. The father made them an allowance of $250 a year, each, for their total school expenses and he required a monthly itemized statement with receipts for bills paid at the end of each month before he sent the next month's check. These two boys graduated with honor and were soon filling good salaried positions. The business like methods their father taught them have been the means of establishing them in a successful business career and while at times they may have chaffed a little at father's insistence they now acknowledge that it was one of the best things in their education. Friend G had a son in the university and being the only son he felt like he must "give him a chance" and he made the boy an allowance of $750 a year for his expenses at the university. This young man fell into bad habits, finished school finally by taking one year extra, has never up to this time, 17 years since he graduated, been able to hold a position for more than two or three years at a time and apparently is waiting and hoping for his father's fortune to fall to him that he may spend it in the same kind of riotous living he got in the habit of at the university.

A BIG MEETING IN CHARITON

On the 24th and 25th of August the farmers in central Chariton County held a big two days Picnic for the purpose of stimulating the organization of a Farm Club in as nearly as possible every school district in the County and the gathering was perhaps the biggest and most successful of the kind ever held in Chariton. J. Kelly Wright and W. D. McKee of the State Board of Agriculture delivered addresses on the first day while on the second day the entire time was occupied by William Hirth, Publisher of THE MISSOURI FARMER who devoted himself entirely to the question of Farm Club organization. The crowd was estimated at from 1500 to 2000 and at the conclusion of the meeting plans were made to organize the county from one end to the other and many prominent farmers agreed to go back home and call a school house meeting as soon as the arrangements can be perfected.

In order to assist in the work of organizing Farm Clubs, THE MISSOURI FARMER procured the services of B. P. Smoot who has been busy in the County during the past week—addressing school house meetings and organizing a Farm Club at some point each night. For a number of years Mr. Smoot has been a lecturer for the State Board of Agriculture. He is a practical farmer and understands his subject thoroughly. He will perhaps spend several weeks in the County and those of our readers who are located near Salisbury and Sumner should let us know at once whether they will not assist Mr. Smoot in organizing Clubs in their respective neighborhoods, when we will be glad to put them in immediate touch with him. Mr. Smoot has a program which will save the farmers of any neighborhood a lot of money during the coming winter and this is therefore a rare opportunity for farmers to procure the aid of an able man in perfecting a strong farmers organization in their school districts. Mr. Smoot however is wanted at many other places and there is therefore no time to lose. If you live in Chariton County and want a Farm Club in your school district, write to THE MISSOURI FARMER at once.

HIS HAT IN THE RING

The Missouri Farmer:

I have had the good luck to run across the issue of your paper of the 15th, and I must say it is certainly loaded for big game. Those have been my views for a long time and it certainly is very disgusting to see men dig from year to year and turn a deaf ear to such entreaties when you know they have enough intelligence to get in line. Not only, improve their own financial and social condition but teach the balance of the world that "We" are the the main spoke in the wheel of prosperity, without which business of all kinds must collapse.

My hat is in the ring with you, and at any time I am at your service for the mere might of help that I can do.

I see in same issue a card relative to fertilizers. What can I get a car of bone meal laid down at Holliday, Missouri? We have been paying a merchant a good profit each year for the privilege of writing an order for us. M. H. Gray, Paris.

Swine Houses

The National Lumber Manufacturers' association has published the fourth of its series of technical bulletins on the construction of farm buildings, the latest volume being on Swine Houses. The bulletin was written by Prof. K. J. T. Ekblaw of the University of Illinois Agricultural College staff. In his bulletin Prof. Ekblaw says, introducing the descriptive side of the publication:

"Hog raising has probably returned proportionately greater profits to the corn-belt farmer than any other enterprise. In view of this, it might naturally be expected that the hog be the best housed animal on the farm. In the majority of cases, however, the opposite is true. The old-fashioned idea that the hog is a tough, filthy animal still persists, and many farmers believe and act in the belief that anything is good enough for a hog. As an actual thing, there is no farm animal that need care and protection more than the hog."

THE MISSOURI FARMER has made arrangements by which it can save farmers a dollar per ton on coal in many communities. This means shipping it direct from the mines in Illinois at the wholesale price. Get a half dozen of your responsible neighbors to go in with you and make up an order for a car load which means approximately 1000 bushels. This shows why you ought to organize a school district Farm Club. Write us at once.

WON HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION SAN FRANCISCO 1915 DEPARTMENT OF AGRICULTURE

Eight Feet Wide, or Better

ONCE you have seen both kinds of work you will say: "There is certainly a wide gulf between the ordinary spreader and the modern I H C machine, with its good, wide-spreading device. Give me the up-to-date, time and labor-saving spreader."

International Harvester spreaders—Low Corn King and Low Cloverleaf—are made with wide spreaders that throw the manure out in a wide, even spread, and broken up into fine particles by the disks that give it a second beating. In this condition the soil takes up quickly and evenly the fertilizing elements.

Though they are narrow, conveniently handled spreaders, easy to drive right into stables for loading, they spread to a width of 8 feet, or better. This cuts the spreading time in half, increases the tractive power of the spreader by keeping the wheels off the slippery manure, and gives you the best machine made for top dressing. **I H C spreaders** are simply built, and very strong. They are low for easy loading. They are built in sizes to suit any buyer, and they do work that is uniformly satisfactory.

Be sure to see the **I H C** dealer who can sell you a **Low Corn King** or **Low Cloverleaf**—or write us for catalogue.

MY MOTHER'S HOME GARDEN

By United States Senator Robert L. Owen, and here published by his personal permission.

In 40 years we shall have over 200,000,000 people, and this estimate does not fully take into account the geometric progression which immigration makes probable under the enormous growth of seagoing vessels of mammoth size.

Our breadstuff exports in 25 years has decreased 24 per cent, notwithstanding large areas of new lands producing wheat and corn.

Our home demand for wheat in a quarter of a century has grown 80 per cent more than the supply of wheat.

The object contemplated is to develop farm lands, encourage home building on the farm, increase the productiveness of our farm land, make our farms more accessible by the building of good roads and improved national and local highways, and make our farms a potential factor in promoting the wealth, the health, the beauty, and happiness of the Nation. Nothing could be of greater national importance.

With these objects I find myself deeply in sympathy. One of my earliest recollections was of the intensive farming of a piece of land in Lynchburg, Va., of about 2⅓ acres, surrounded by a high brick wall; the inclosed land was divided up into a dozen or more plots of ground, with graveled walks lined in cerain parts of the garden with dwarf box and with flowers.

Some of the squares were used for vegetables, Irish and sweet potatoes, beets, parsnips, salsify, okra, radishes, onions, lettuce, cabbage, mustard, asparagus, tomatoes, several kinds of sweet corn, the watermelon, cantaloupe, and sweet pumpkin for cooking, rhubarb and other succulents. Other beds against the brick wall had beds of strawberries, raspberries, blackberries, currants, gooseberries and various vines.

Even in the winter this land furnished the table with vegetables stored in sand pits, and with fruits preserved and canned, and with pickles, marmalades, and other things edible.

I remember sweet herbs in this garden—of thyme, sage, etc. I recall with affection certain arbors devoted to the grape, which, in their season, had a special charm for me. Around the edge of these squares were many beautiful varieties of fruit—of peaches, of pears, the sweet Sickle, the Royal Bartlett, the Damsom, the plum, the cherry, the apple. The yellow June apples in that garden were sweet enough to tempt, and often did tempt, a small boy about my size to risk an appearance before the Throne of Grace without any other preparation than an incredible number of June apples eaten in reckless disregard of consequences.

I have never seen anywhere a more beautiful variety of hyacinths and tulips than grew in this garden, with all the old-fashioned English flowers—the jonquil, the narcissus, the crocus, the lilies of the valley, the phlox, the snapdragon, and many others; the Easter lily, the tiger lily, and a great variety of roses.

I remember the yellow and red honeysuckle, covering a trellised summerhouse, mingling its fragrance with the pleasant odors of the climbing rose which helped to cover it.

As I used to enter this charming spot of land from the diningroom door, I recall passing between two trees of crepe myrtle and, a few steps further on, by two large shrubs of the euonymus. There were several large box trees in the garden, whose thick cover afforded a hiding place for many birds, whose twilight repose I used to disturb for my amusement by shaking the trees.

There was in this garden a large clump of cane which furnished the boys of the place with convenient fishing rods, and everywhere throughout this 2 acres was manifest the highest intelligence, the finest taste, and unceasing industry.

The guardian spirit of this garden was my mother, under whose hand everything which grew out of the ground always flourished. I have always thought that the ministering angles who supervise the growth of plants must have specially loved the gracious spirit of my mother, for her plants lived, no matter what happened to the gardens of other people. I shall never be satisfied until I am able to own and to enjoy such a garden as she had, and with which she made my boyhood days happy. Adjacent to the garden was a big smokehouse where we put up our own meat, and a yard where the chickens and ducks flourished and helped to feed the family.

I may be forgiven these personal reminiscences when I point to the fact that this two acres and a half of land furnished a very large household with the greatest abundance of food in the form of vegetables, fruits, berries, grapes, throughout the year, as well as with an abundance of beautiful flowers. It was intensive farming. Every foot of the ground was kept thoroughly manured, the plants were transplanted from time to time where their nature required it, and the life habits of every plant were studied and thoroughly understood.

In contrast to the productive power of this two and one-half acres, I have seen a poor farmer trying to cultivate enormous areas of land with a single team, and with the invariable result that his crop was so poor as to afford him and his family not even the necessaries of life, much less its conveniences or the luxury of fruits and flowers. Such a farmer, with bad and muddy roads to travel, is practically isolated from the market, from the school, from the church, and from other conveniences and pleasures of civilized life, and can not conveniently or cheaply deliver to market even those things which he does raise.

The man who works more land than he can cultivate thoroughly well wastes his time; he does more: He makes life unhappy for himself, for the faithful woman who loves him, and for the little children who look to him for guidance. He is not as useful nor as happy a citizen as he would be if he concentrated himself on 40 acres, cultivated a garden, kept a few cows for milk and butter, raised chickens and other fowls and domestic animals out of which the profits of the farm arises.

HOW LARGE A FARM BUSINESS BRINGS THE MOST PROFIT?

The size of farm business has a great deal to do with the profit that results. It is true that there is no size, either of farm or of farm business, that is best for farm conditions for all men. Some men can manage much larger farms than others but a moderate size of farm business is more likely to succeed in the hands of the average man than one extra large or small. This is the result secured in a farm management survey of a portion of Johnson County, Missouri, made by the Missouri Agricultural Experiment Station. The size of farm business instead of size of farm was studied because it counts for more and because it might be possible to find a farm of 30 acres on which the farm business would be much larger than on another farm of 300 acres.

The farm organization should include plenty of land, plenty of labor, and a fair amount of working capital and they should be in the right proportion.

In Johnson County, one group of men on 160-acre farms made more money than another group on 500-acre farms, largely because the men on the larger farms were owners who did not feel the need of working very hard and consequently made much less money than their industrious neighbors, struggling upward on smaller farms. Crop yields measure the quality of the land and go a long way toward determining how profitable the farm is to be. One group of men on 260-acre farms made less than another group on 100-acre farms, not in this case because of difference in ownership but because those on the larger farms had so much lower yields that they were much less profitable. This must not be taken to indicate, however, that the yields were smaller on the larger farms, for in general the reverse was true and the larger yield per acre were found on the larger farms.

We frequently hear the statement that land is so high now that it is impossible to make profit on it and the men on the high-priced land in the county seemed to be finding that true. While the yield and quality of the land did vary, they did not vary as much as the prices. That is, they did not rise as fast as the price of land. While the better land paid better rates up to $80, the increased value of higher-priced land made the interest charge so high that it was much harder for the farmer to make wages or any kind of fair income on the higher priced land.

The most successful farms included in the survey were those which had about four-fifths of the investment in real estate and four-fifths of the remainder in livestock, leaving only four or five per cent or about one-twentieth of the whole investment for machinery, feed, and cash on hand.—O. R. Johnson, Missouri Agricultural Experiment Station.

OPPORTUNITIES IN AGRICULTURE

Many a young man who has finished high school is now considering the question whether he will spend additional time in educational training to fit him better for his life work. Perhaps the boy has not yet fully made up his mind just what line he expects to follow. In fact most of us who are already engrossed with the problems of life did not consciously prepare in the most advantageous way for the particular niche we may now be filling.

While the opportunity to learn is always before us, no matter how old we are or the conditions under which we may labor, yet the years of conscious training and preparation come to the great majority during youth. If we do not take advantage of the opportunity then, the chance slips by and too frequently the regrets of after years are unavailing.

In the field of agriculture the opportunity for useful effort is unrivaled for there is no limit to the chance which the well trained young man has in this field. In the earlier years naturally a large majority of the graduates of our agricultural colleges were needed to fill the professional positions which were then open, but competition is now much keener for these positions, as in all other branches of the teaching field.

In the practical field, however, there is no need for the trained man to fear competition. The business side of agriculture like any other business, is held down and encumbered with the multitude who are unwilling to apply the results of modern science or indifferent to its value. Just so long as they are content to move along in the same rut, to ignore the findings of modern science and the tested experience of others, to let well enough alone and drift rather than to push, just so long will the returns of the average farm be absurdly low.

Why do the corn fields year after year of the members of the Wisconsin Experiment association run from 10 to 20 bushels above the average yield of the state? They have learned the lesson of good seed and good culture and reap the profits thereby. The man who is able to apply these lessons certainly is able to compete advantageously with the average.

No good farmer should keep a herd of milking cows and not know to a certainty whether the labor and feed he expends on each animal return an actual profit or not. The average yield of many a Wisconsin herd is 300 pounds per year, while the average of the state is only 175 pounds of butter just about enough to pay the cost of keep.

Food products are on the rise in value and will continue to increase so long as consumers multiply more rapidly than production. For this reason the product of the farm, as well as the land itself, is very unlikely to bring less returns than the average values now received. Neither does the farmer have to write off large sums for depreciation on his farm like the manufacturer on his factory or plant.

These facts are worth careful consideration by the boy who stands at the threshold of his opportunity and now has a chance to train his mind to think straight, as well as to learn how to handle effectively and efficiently his time and his talents.—H. L. Russell College of Agriculture, University of Wisconsin.

THE GRANGE AS AN INSTITUTION

(Written for the 1916 Missouri Yearbook of Agriculture by Miss Lula Fuqua, Secretary of the Missouri State Grange.)

The Missouri farmers and their friends are fast realizing the value of organization, and co-operative workings. As early as 1866 this was a dream which was realized by O. H. Kelley, who organized the Grange at that time.

This organization, starting at first with only a few members, has grown until today it is a national organization counting its members by the millions.

The Grange is the Rural Community organized, its purpose being to build up and make better the conditions morally, socially, educationally and financially.

The Missouri State Grange has a membership of about 3,000, in which it has the direction of four county Granges and fifty-four subordinate Granges, each Grange doing its own especial work for the benefit of its own community.

The Grange also opens the way for women and the boys and girls, and all get together twice a month on the broad needs of farm life. There are discussions on agricultural topics and things of interest both to the farmer and the farmer's family. There are social events in which all take part, and the feeling that "my boy or my girl" are going to the city to enjoy themselves is vanishing—for they are being entertained and trained for the better life right at home. They do not need to go to the city for the big things—they see them at home all around them!

Nearly all of the Granges have annually some event in which both the citizens from the town and the country get together and have what might be termed a "Fellowship Meeting". Topics of importance are discussed and better business methods of doing things are suggested and applied—and the social benefit of the day is not to be over-looked. The farmer gets acquainted with his city brother—and the city man gets acquainted with his country brother, and both become broader-minded and less selfish.

The State Grange has annually a three or four days meeting in which plans are discussed and adopeted for a year of work for the various Granges—and here, too, originate some of the big things for the farmer. Even here, the Grange blends business with pleasure and at some of its sessions the "neighbor" is invited. Thus we broaden and grow in grace.

Three years ago a movement was started in the State Grange for the benefit of the farm boy and girl. Today we have what is known as the "Students Foundation Fund", whereby numbers of boys and girls have received loans at a very small interest and have been enabled to finish their education and now are paying back the loans by their own labors—the results of the education received!

We may add, too, that the State Grange is taking a hand in the making of laws for the betterment of the farmers. We realize that, unorganized the farmer could take no part in the big things which go to make up the helpful side of life—and so we urge organization for the farmer. And as the Grange is doing more for the farmer than any other organization, it is growing more each year. The prospect for the future is bright, socially, educationally and financially. Get in line! Join the Grange! Help your community!

Alfalfa and Sorghum Silage

Indications are that excellent silage can be made with mixtures of alfalfa and sweet sorghum, according to silage investigations in progress at the Agricultural Experiment Station of Nebraska. Such mixtures containing one-half alfalfa and one-half sorghum cane, put up on a small scale, give perfect silage three months after siloing. The acidity is somewhat lower than normal silage but this does not seem to impair the keeping qualities. Further investigations of this subject are in progress, but the present results would indicate that a farmer might safely put equal parts of alfalfa and well-matured sorghum cane in his silo with expectation of securing a good quality of silage.

THE MILK QUESTION

By E. G. Bennett, State Dairy Commissioner.

There has never been a time when the consumers of milk and milk products were more exacting in their demands for purity, cleanliness and wholesomeness of these products than now. The public are well within their rights in making these demands, and they should know that never in the history of the industry were dairymen, creamerymen and others engaged in dairying and in manufacturing dairy products, better prepared to meet these demands than now.

Men who own dairy herds realize that they are producers of raw material. Their herds and equipment represent considerable investment. Their success depends on the satisfaction of those consuming their products, and they are (to a greater or less degree) responsible for the welfare of this great industry.

If the producers sell to manufacturers, they know that the quality of the manufactured product depends on the condition of their raw material. Their increased interest in the health of their herds, together with the building of better barns (seen the country over) equipped with modern appliances and conveniences looking toward the proper care of cows and careful handling of their product, indicates a growing desire of the producer to meet the consumer's demands.

The progressive dairies, milk distributing plants, creameries and cheese factories today are equipped with the latest devices for the proper handling of the products while undergoing preparation, preparatory to being placed in the consumer's hands in approved condition.

Far too often these products are improperly handled and badly cared for after reaching the consumer—dissatisfaction results, and the producer or manufacturer is unjustly criticised.

Milk bearing the stamp of approval and merit of those in authority is not a guarantee that it will keep wholesome if not properly cared for in the home or retail shop. Containers should be thoroughly sterilized and carefully dried; milk should be kept cold and at regular temperature, and should also be kept covered; milk absorbs odors very readily and should be kept free from contaminating influences.

While those engaged in the industry are to be congratulated on the improvement of the health of their herds and the methods employed in the producing and caring for dairy products, it should not be understood that all dairies are clean and producing safe milk. The laws of Missouri provide that every town and city can pass ordinances regulating their local milk supply. This should be done, and inspection made of all places where milk is produced for the public, and such rules and regulations enforced as will protect consumers against the sale and use of unwholesome milk or that which is unfit for family use.

STUMPS IN ROAD BUILDING

Good roads, according to Howard Rann, are something which everybody wants for nothing.

As there is nothing free in this country except elbowroom and the grip, the good-roads movement has had hard work in trying to break speed records.

Good roads agitation always shows a more rapid pulse during winter, and converts a great number of people who object to traveling over highways that look like an Alpine mountain range.

But man has a short and brittle memory. When summer comes and the roads lie down flat again public enthusiasm also lies down and buttons the flaps on its coin pocket.

There are more good roads enthusiasts during the rainy season than at any other time of the year.

If a vote on a bond issue could be taken immediately after a three-day cloudburst, the polls would be more congested than the tables at a 15-cent supper.

In many places the method of making "good roads" is to plow them down the center and decorate the roadbed with sod. This provides a surface which can be traveled only by the stiltwalking crane.

It is not at all difficult to convert the owner of a new automobile to the good-roads theory if he is caught at the moment when he is trying to worm his way through a fresh sod improvement, two miles and a half long and running from fence to fence.

The life is full of strange inconsistencies. People complain about the money wasted on chewing gum, false hair and skin foods, but it isn't the price of a hair-cut to the sums wasted in patching roads that refuse to stay patched.

The automobile is the evangel of the good roads movement. Every sale of a five-passenger touring car with tires subject to sudden and disheartening puncture means better roads and more of them. Therefore, every one should buy touring cars because he will then become a good-roads advocate.

Good roads are more conducive to human happiness than good digestion. You can coddle your digestion with malted milk, but there is nothing more certain to convert a cow path into a hard-surfaced highway than brains plus money, plus concrete. P. C. A.

LIME NEEDED FOR GOOD CROPS

Everybody knows that practically every farm crop must have lime for one or more of three purposes: (1) the soil must be kept sweet, (2) the plant food in the soil must be made available and lime helps in this, and (3) the lime itself is used by the plants as a food.

Some soils already contain so much lime that it is not worth while to add more but the Missouri Agricultural Experiment Station has secured increased profits by liming on all the twenty different experiment fields located in twenty different counties on which it has conducted such tests during the last ten years. Estimating the crops at the average farm prices, limestone has already increased the average value of the crops $5.80 per ton of lime applied and part of the lime is still in the soil where it will continue to do good for several years more. In these tests the same crops were grown side by side on limed and unlimed plots every year to be sure that they had exactly the same chances so far as soil, weather, and other factors were concerned and that the only difference was that one series of plots received lime and the others did not.

Whether lime is needed and how much should be applied, of course, depends on how sour the soil is or how deficient it already is in lime. The experiment stations in various states are practically always glad to receive samples of soil, test them for lime, and advise as to treatment. After a sour soil has been sweeteed with the proper amount, about one ton every six years thereafter should be applied.

Even limestone soils may need applications of lime after they have been farmed for a long time, especially if the region is one of abundant rainfall. Lime is much more quickly dissolved from the soil than other rock materials and those who live in limestone countries know how full the well and spring waters are of this material and what large caves are dissolved out of even the solid limestone. So even those who are most fortunate in living in limestone regions need to watch the soil. After years of cultivation, test it occasioally with litmus or in some other way to see whether it is becoming acid. If clover and alfalfa no longer do as well as they once did and the soil seems sad, a half pint of it, made up of soil from several places in the field, should be sent to an experiment station for tests. Of 268 samples taken from different sections of Missouri and analyzed by the experiment station of this state, 62 per cent or more than three out of every five were found to be sour.

In the middle west ground limestone usually sells for a dollar a ton, or less, at the crusher, and being much cheaper than either lump lime or slacked lime it gives more economical results. If it is to be hauled far, a very finely ground product, at least 90 per cent pure, should be demanded. Sometimes a large farm that has outcrops or limestone rock can afford to put in a grinder of its own at a cost of $750 but as a 12 to 18 horsepower engine is also needed the expense is usually too great for any one farmer and can best be handled by a group of men.—R. R. Hudelson, Missouri Agricultural Experiment Station.

FERTILIZER INSPECTION PROTECTS THE FARMER

Six inspectors from the experiment station of the University of Missouri are soon to start on their yearly fall collection of samples of fertilizers used by Missouri farmers. So much fertilizer is now being used in the state it has become necessary to protect the farmer from poor and adulterated goods. To do this the Missouri Fertilizer Law provides that all fertilizers offered for sale in Missouri should be registered at the experiment station; that registration must include a guaranteed chemical composition which, together with a registration tag, must be on every package of the fertilizer; and that the agricultural experiment station must collect and analyze samples of fertilizers used by the farmers.

The inspectors are sent out in September and October, when the greatest quantity of fertilizers is on the market. They collect samples from the dealers' cars, warehouses, farmers' wagons and other places, and send them to the laboratories of the agricultural experiment station. There they are examined to ascertain if the fertilizer offered for sale is in accordance with the registered guarantee. At the close of each year a report is published showing the results of all the samples analyzed. The published report also gives a list of all manufacturers offering fertilizers for sale together with a list of the brands which are on the market. In addition, farmers may send samples of fertilizer to the agricultural experiment station to be examined for them.

During 1915, 177 localities in 63 counties were visited by the inspectors. About 890 samples were taken representing 222 different brands of fertilizers. It was found that though the guarantees sometimes exceed the product, the composition of the product sometimes is better than represented, and that on the whole the farmers of the state are well protected in the purchase of fertilizers.

T. L. Haecker of University Farm, St. Paul, well-known investigator of dairy and beef cattle feeding rations, says that nearly twice as much grain is given fattening beef steers under ordinary methods of feeding as they can make use of.

Time of Seeding Wheat

As an average of 14 years' work to compare dates for seeding wheat ranging from August 31 to October 27, the Ohio Experiment Station has found that in Wayne County greatest yields have been obtained from seedings made in September 21-22, while those made a week later than this take second rank and those made a week earlier stand third. In central Ohio the most satisfactory date to seed is considered the latter part of September, while the first week in October may not be too late in the southern part of the State.

Select Seed Corn Now from the Standing Corn

Are you going to wait till spring to pick out seed ears for your next corn crop? Although this may be a custom, the experience of the most successful growers shows that seed selected from standing corn in the fall yields more than corn taken from the shock or crib. By fall selection the best ears growing under ordinary conditions may be chosen. By selecting seed either at husking time or from the crib, the grower picks out ears that on unusually fertile spots or often with a single plant in a hill. The Ohio Experiment Station has obtained gains in yield of more than 3 bushels per acre by selecting seed in the fall from standing corn. Circular 71, which may be obtained from the Station at Wooster, gives the points to look for in choosing seed ears in the field.

A Day's Work May Pay $25

Do you think a salary of twenty-five dollars a day would tempt you to work harder or for a longer time?

This what you may make by spending from one to five or six days selecting and caring for your seed corn. Good seed corn means at least $25 to $50 more money for the average farm next year. If every corn grower in this section would select seed corn carefully it would mean an increase of $50,000 in the community's wealth. Selection in the field may develop a variety that matures well, grows on a good stalk, and yields more grain in proportion to the total weight.

It will pay every corn grower to select his seed corn early this fall.—University Farm.

CO-OPERATIVE LIVE STOCK SHIPPING

In a recent number of THE MISSOURI FARMER we gave an account of the live stock shipping associations as operated in Minnesota and suggested that the same might be used to advantage among the live stock producers of Missouri. In the last issue of Wallaces' Farmer is a report of the operation of a co-operative live stock shipping association doing business in southwestern Iowa which shows some very favorable results for the farmers of that section.

"It was predicted from many sources that the shipping association would be a short lived affair, and that soon it would have to cease operations for lack of members. At the end of the first year, the twenty-one charter members had added more than that many more to their fold, and at the end of the second year, 130 had joined. As it has grown in membership, so has it grown and is growing in business. Now its good work includes not alone the selling of live stock, but also the buying of coal, feed, flour, salt, sugar, and other provisions, at a great saving.

"Last year the association shipped $65,590 worth of live stock, mostly to the Omaha market. This included nine cars of beef cattle and forty-five cars of hogs. For the 233 head of cattle, which averaged 801 pounds, the members received a total of $11,019, and for the 2,962 head of hogs, which averaged 283 pounds each, they received $54,302. The cattle brought an average price of $6.31 per cwt., and the hogs $7.03 per cwt. The actual shipping expense for the cattle amounted to approximately 31 cents per cwt., while that for the hogs was two cents per cwt. less. The shipping expense did not include any scalper's or buyer's profits, but simply the actual freight and cost in getting the stock to the buyers' hands in the big markets.

"Members get just what their stock brings, less the actual expense in handling it. When the market is fluctuating, the association may receive less than the price paid by the local men at a certain time. This has happened more or less frequently, but on the average the association gets the most. An experience of one of the members who joined not so much because of the advantages of co-operation as because of the higher prices generally received by its members, shows the worth of continuous support. The association guarantees no certain price, but simply pays the net amount received. A local buyer had tried to buy this member's stock at a certain figure, but he let it go with the association. While the car was on its way to Omaha, prices took one of those sudden slumps, and the member got less than he had been offered by the local buyer. This point was used as an argument the next time the member had stock to ship, and he let the buyer have it. The association also shipped at the same time, and members who had stock in received 60 cents per cwt. more than the local buyer paid. As the member mentioned had 17,000 pounds in the shipment, he lost more than $100 by letting an outsider handle his stock. Since that experience, he has not inquired about local prices.

"Success in selling live stock for which the association was primarily organized, led to the co-operative buying of provisions. Last year the members saved $1.50 a ton on six cars of coal, and they saved about 35 cents per cwt. on 40,000 pounds of oil meal; and 70 cents per cwt. on 85,000 pounds of flour. They also bought two cars of salt at a considerable saving, and recently they unloaded a car of sugar, saving nearly two cents a pound on 85,000 pounds. With the latter, a lucky buy was made before a big advance.

"The association was organized for a period of ten years. Any person making use of the shipping facilities is eligible, after paying a membership fee of $5, plus any amount per member in the treasury at the time application is made. It has the usual officers, a president, vice-president, secretary, manager, and board of directors, all elected at an annual meeting in February of each year. The manager acts as treasurer. The constitution allows him $5 a day for the actual time devoted to the work, this being one of the expense items deducted from each shipment. The board of directors includes the four officers and four members, officers holding the same position on the board that they do in the association.

"When a member wants to ship stock, he makes a report to the manager, stating the kind of stock, the number of head, the estimated weight and the time it will be ready. As soon as enough have been reported for a car, the manager orders the car and sends notice of its arrival to each member who has listed stock. The manager has to receive and weigh the stock, mark and load it, accompany it to market and direct the sale. After it has been sold, a statement is sent to each shipper, together with a check for the net amount due after actual shipping expenses have been deducted. The manager is required to keep a very accurate record of all business done, and to keep on file all papers pertaining to the association's business. These are open for inspection by any member at all times.

"A protection fund insures members against loss while the stock is in transit. If stock is delivered in healthy condition, and is injured or killed while in the hands of the association, the member owning the stock gets full value. The fund is raised by deducting seven cents on every hundred pounds of hogs or sheep shipped, and six cents on every hundred pounds of cattle shipped. This fund also is used for meeting expenses. Many members who formerly shipped their own stock on consignment, now ship through the association simply to be protected. The loss of one steer or a few head of hogs would be a big item out of a shipment by an individual, but when divided co-operatively it does not amount to very much."

PLEASURES AND PURPOSES OF PORCHES

In this day and age of the world the edict of the physician is for people to keep well they must sleep and live as much as possible in the open air. But how are we to do this? "Porches!" he answers. This out door living has revolutionized the style of houses. The architect complains that we plan our porches and expect him to put a house inside of them. "Do you want to bring the outside indoors?" he sarcastically asks. Exactly! that is just what we want to do. And to bring the outside indoors is the purpose of our modern porches.

To enumerate the pleasures of porches would be near an impossibility. On a hot sultry afternoon if there is a cool place to be found it will be on the shady, vine covered veranda. There is an air of informality about the porch which we do not find in the house. Your neighbor drops down on your porch and chats a few minutes when she would not think of coming into the house. Here, too, we are brought into contact with nature, especially is this true in the country, where for miles around we see, as the poet says "God's own handiwork and are better for the seeing."

But the style of porches has not always been the same as it is today. In fact many of us, myself for instance, have only to look at our own houses to tell that this is true. But let us go back to the time of our grandmother. If we were to arrive at her home some hot afternoon, it must be afternoon of course for they never thought of using the front porch in the morning, we might find her and her daughters sitting primly in a row, the chairs had to be in a row for the porch was too narrow to allow any other arrangement. They are dressed in their best and have the company sewing. To bring the mending basket out here would have scandalized the neighbors. We pass on around to the back porch. This is a queer looking affair, looking much like an overstocked store room. "But where do you sit out here we ask?" She holds up her hands in horror as she informs us that this porch is to be used for service and not pleasure. That it might be enjoyed as well as used has never occurred to her.

We look about for a sleeping porch, then we remember that she counts night air dangerous if not poisonous. We think what with our modern ideas we would like to do to these porches. Starting with the front porch, of course, how much better it would be if this porch had grown wide as well as long, for we know that a large porch gives appearance of hospitality. But we are not going to give up because of this. We know we must have a screen to protect the porch from the glare of the sun, also to give an air of seclusion which is very necessary especially if your porch is facing the road. Nothing can be better than nature itself so we plant a rambler rose or some hardy vine. But we want to use our porch right away so we also put in some quick growing vine such as the common morning glory, put up a few strings and lo! in a few weeks we have a screen of nature's own design. We bring out several easy chairs, and if our porch is large enough we put up a hammock and here we have a place that looks cool and inviting on the warmest day.

At the back porch we plant vines as we did in front, for we are going to enjoy it as well as use this place. We bring a chair out and here the busy housewife sits and prepares her vegetables and does other work. She will be surprised to find out how many things she can do out here just as well as in her kitchen by the hot stove. The time taken up in bringing her work out on the porch will be more than made up by the extra vigor gained by the fresh air.

Then last but not least comes the sleeping porch. We learn that the latest idea in that line is the roofless porch. Here we are lucky that the style of porches a few years back had flat tops. Any one with the least knack of carpentry can erect a low railing about this but even this is not absolutely necessary as I myself proved last summer. After a few nights passed in such a place you will not think of sleeping indoors.

So I think that if we try these plans we will find that the physician has added much to our pleasure as well as health when he ordered us to build porches.—Paper read by Mrs. Gertie Holland-Williams before the Rural Home Improvement Club near Montrose, Mo.

OUR BOYS AND GIRLS

We hope to begin another story in the near future that will interest the boys and girls who read THE MISSOURI FARMER but in the mean time if our young readers will write us some nice letters and stories we can keep up the interest until the story begins.

THE MAN WHO WINS

The man who wins is an average man,
Not built on any peculiar plan,
Not blessed with any peculiar luck,
Just steady and earnest and full of pluck.

When asked a question he does not "guess,"
He knows, and answers "No" or "Yes,"
When set a task that the rest can't do,
He buckles down till he's put it through.

So he works and waits, till one fine day,
There's a better job with bigger pay;
And the men who shirked whenever they could
Are bossed by the man whose work made good.
—Selected.

Lives in Town but Reads The Farmer

Dear Editor:

A friend sends THE MISSOURI FARMER to daddy and I am always anxious for it to come so I can read the letters from the boys and girls, I read the story "David Dunne" and think it was fine and hope you will print another as good. I live in town but like to read THE FARMER. I am eleven years old and am in the seventh grade at school.

Luella Strickler.

Jud is not All Bad

Dear Editor:

I notice that most of the boys and girls who write for THE MISSOURI FARMER say they like all the characters in "David Dunne" except Jud. Now I do not think Jud is all bad—he just can't resist temptation but there are a lot of other people who can not always resist the Tempter. I think Carey suits David and I hope David will find a man for Miss Rhody.

I hope to become a teacher some day and teach the poor in the city.

Mr. Editor my name is the same as David's sweetheart but it is spelled differently. You ask how we help our parents? My mother has been dead three years and I keep house for my father and little sisters and brothers. I think THE MISSOURI FARMER a fine paper. Carrie.

Likes Good Reading

Dear Editor:

I am only 12 years old and am in the seventh grade at school. We have been taking THE MISSOURI FARMER only a short time but we like it because of the good reading matter it contains. The story "David Dunne" was very interesting and I hope you will soon start another as good.

Mary L.

Mina Raises Ducks

Dear Editor:

I am interested in the boys and girls letters and thought I would write. It is soon time to start to school again. I am only 9 years old and I have 2 miles to go and have to go alone, for there are no little boys or girls to go my way. I am in the fifth grade but hope to soon gain the sixth.

I did not go to school the spring term but stayed at home and helped mamma to raise chickens.

One of my friends gave me 9 duck eggs and I set them under a hen and she hatched 7 little ducks, 3 white and 4 dark ones. I weighed one and it weighed 3 pounds.

I am sorry the story has ended and hope we may soon have another good one. Mina Butler.

Recipe for Canning Corn

Sweet corn should be canned the same day that it is picked. After removing the husks and silk, blanch the corn (before cutting from the cob) in boiling water from 5 to 15 minutes. Blanching is done by placing the corn in a wire basket or cheesecloth and plunging into hot water, or better still by steaming the corn. Blanching will make the texture more firm. Next plunge the corn quickly into cold water. Then cut the corn from the cob and pack tightly in jars until full. Add a level teaspoonful of salt to each quart and sufficient hot water to fill all crevices. Then put on the rubbers and tops and partially tighten the tops. Place the jars in a large wash boiler or kettle containing a false bottom. The water should come over the tops of the jars. Boil three hours. The false bottom may consist of wooden slats or any suitable material which will prevent the jars from coming in direct contact with the heated metal. After boiling, allow the water to cool partially, remove from the bath, tighten the lids, and invert to cool. If the wash boiler method is not used, boil 90 minutes in a water-seal outfit, 60 minutes under 5 pounds of steam, or 35 minutes under 20 pounds of steam. —Department of Home Economics.

Waste Grapes

Ordinary growers have little trouble in marketing the first class fruit, but lower grades,—undeveloped, shattered and straggling bunches, usually have to be marketed as a by-product. Of the many ways resorted to in the profitable utilization of this class of fruit, probably the most common are canning and the making of unfermented grape juice.

Unfermented grape juice:—On a small scale the berries may be picked from the stem and the juice pressed out by hand, while on a larger scale the entire bunch may be pressed by use of a common cider press. Do not allow the juice to feremnt. Heat nearly to boiling point and strain through fine cheese cloth, directly into bottles that have been sterilized in boiling water. Immediately cork bottles with tightly fitting corks, which should be pushed a little below the mouth of the bottle. Seal with wax or paraffin. If desired, the juice may be sweetened to taste. Where juice is pressed by hand, this can be done more easily if the grapes, with a little water, are heated sufficiently to loosen the hull.

Canning:—Select only the firm ripe fruit for canning. Pick the berries from stem, remove all trash and imperfect berries and blanch two minutes. Place fruit in cans firmly and fill with water (syrup, 2 lbs. sugra to 1 gal. water, may be used.)—U. S. Agricultural College.

VALUE OF TRAPNEST RECORDS

One of the most important problems connected with the poultry business is the selection of the profitable and unprofitable hens from the viewpoint of egg production.

Many methods have been tried in order to accomplish this, but the best method known to date is the trapnest. These nests are arranged so that when the hen enters to lay, the door closes and keeps the hen in the nest till the attendant releases her. The nests should be attended at least five times each day, which requires a great deal of time and work.

Many questions have been asked as to the value of the trapnest if used for a shorter period of time than a year. In order to answer these questions, the records of the four previous contests have been consulted, the object being to find the percent of high producing hens which can be selected from a single month's record.

The records used were of the previous contests composed of about four hundred pens containing 2000 hens. The five hens in each pen were placed in the order of their egg production at the end of one month, to see what percent of them held the same position as at the end of the year. To illustrate, the 100 hens which were the highest or first in each of 100 pens for one month, 52 were first at the end of the year, 26 were second, 13 were third, 6 were fourth, and 3 were fifth.

Of 100 hens which were first for one month 52% were first and 26% were second at the end of the year. Therefore, out of 100 hens selected by one month's record as highest producers, 78% stood first or second place at the end of the year, and out of 100 selected by one month's record as the lowest producers, 78% of them were the lowest or next to the lowest at the end of the year. Only a slight variation is found between different months. The indications are that it is better to select the high producers during the period of low egg production, and select the low producers during the period of high egg production.

Selections may be made from a six months' record in the same way as from a one month's record. The six months' record is better for selection than the one month's record.

Our results show that 92% of the hens which were in first place at the end of six months were first or second at the end of the year.

The calendar year will perhaps always be used by Agricultural Colleges, Universities, Experiment Stations, etc., but we believe that for practical purposes, the six months' record will become standard by breeders who are developing egg producing strains, while breeders who want to improve their flocks by taking out the poor producers and selecting the highest producers for a breeding pen will find the month's record valuable.

This test should be used only with hens the same age and kept under the same conditions. Some of the advantages of the six months' record are: By using the first six months of the year, we get the records during part of the winter, all of the spring, and part of the summer. During the spring season pedigreeing can be done if desired. Approximately two eggs are laid during the six months for each egg laid during the last six months, making the relative cost less. Then, too, the good hens can be rested during the last six months of the year, carried through the moult and put in good condition for the breeding yards the next spring. The low producers can be sold instead of feeding them through the period of low egg production.—C. P. Patterson, Mountain Grove.

THE MISSOURI FARMER has made arrangements with several Fertilizer manufacturers to supply fertilizers at the wholesale-price in car load shipments to Farm Clubs and also to those of our readers who succeed in making up a neighborhood order. This will affect quite a saving and those interested should therefore get in immediate touch with us.

By Old Jim Riley

There are some mighty queer things goin' on in this Country these days. On th' one hand Congress lets th' resolution to investigate th' Packers Combine die in th' Committee to which it was referred weeks ago—and there are nearly seven million farmers interested in it. On th' other hand, a few hundred thousand trainmen who want millions of dollars in extra wages make this same Congress eat out of th' holler of their hands. But maybe it won't always be like this. Maybe some day th' farmers will have sense enough to organize too—and if they ever do, Mr. Samuel Gompers will be mighty small pertaters.

BUCKSHOT BY THE PROFESSOR

Sour faces beget sour stomachs.

* * *

There is no greater coward in this World than the man who is unkind to his wife and children.

* * *

Keep your "weather eye" peeled for the fellow who insists that everybody else is crooked. He is no exception to his own philosophy.

* * *

So long as the "Love Lamp" shines brightly in the home, it doesn't matter so much how humble it is or how heavily the mortgage weighs upon it.

* * *

If the average man performed half as well or as much as he talks there would be mighty little "unfinished business" in the average community.

* * *

There is just as much sense in canning silage as there is in canning tomatoes. You can tomatoes because that is the only way to have any to eat in winter. You put silage in a silo for the same reason.

* * *

Just because some preacher hears the "call of the wild" and cuts a lot of monkey shines doesn't make me lose faith in religion or weaken my respect for the church—for neither religion nor the church can help it.

* * *

There are a pile of fellows writing editorials for the newspapers on the great public questions of the day who ought to be serving on a city council. You don't need any real information or brains to do the latter.

* * *

Hogs get their reputation for being dirty from the fellows who own them. A hog likes clean water to drink and a desent place to eat and sleep in as much as anybody—but usually the fellow on the outside of the pen doesn't know it.

* * *

I heard of a little Farm Club the other day which invites in the women folks once every month. They bring a lot of baskets full of good things to eat and put on a supper "fit for a king." Then everybody joins in singing some of the good old time hymns. Some of the men make little talks—and the evening is one of keen enjoyment for everybody in the neighborhood. Already plans are on foot to build a rural high school and make it the "Community Center." This little organization is putting real joy into farm life—and what I want to know is why can't every neighborhood in the state follow suit?

* * *

Some men live to eat three meals a day, work a little in between times and spend the balance of the day grumbling and kicking the dog around. Others live for their loved ones and to make the community better than they found it.

* * *

If you want to exercise real influence over that boy of yours, treat him kindly and enter into the things that interest him. Some fathers watch over a mule colt more carefully than they do over their boys—and then if, in the after years, the boy goes wrong they wonder how it happened.

* * *

I know the women folks chatter like a lot of geese—that they dearly love to gossip—that they won't know what to do with the ballot after they get it—and yet, they are so much sweeter and better and more tender and human than the average scowling, growling tobacco chewing animal called a man that I am for 'em first, last and all the time.

* * *

One reason why the farmer is always told to "throw his money in over the transom" is because he hasn't got sense enough—(anyway he don't do it)—to get up on his haunches and send a few big, brainy farmers to Congress. And this will continue to be the case so long as we keep on electing a bunch of long haired, fog horn voiced lawyers to represent us at Washington.

* * *

THE MISSOURI FARMER can save the farmers of hundreds of communities in Missouri nearly or more than a dollar per ton on your next winters coal supply by putting you in position to order it direct from the mines in Illinois at the wholesale price. It is also getting ready to supply its readers who will have to buy corn direct from the Farmers Elevators in Nebraska and Iowa, and thus save them a lot of money in needless commissions to middlemen. But it can't do these things for you and your neighbors unless you have gumption enough to organize a school house Farm Club. The thing to do is to get busy.

If you and your neighbors will get together at once and organize a school district Farm Club THE MISSOURI FARMER will help you to save a lot of money on your next winters coal bill by putting you in position where you can order it direct from the Illinois mines at the wholesale price. We can save several thousand dollars to the farmers of any county where there are no local mines. Talk it over with your neighbors and write us immediately.

It looks now as though Nebraska, Iowa and Northern Illinois are the only sections of the Corn Belt which will produce a big corn crop. THE MISSOURI FARMER expects to perfect arrangements with the Farmers Elevator Co.'s located in these sections to ship corn direct to those of our readers who will have to buy. This will save the money which usually goes to the Commission firms and local feed dealers. If you and your neighbors are going to have to buy corn next winter you ought to organize a school district Farm Club at once—for in this way it will be much easier to handle the matter in a business way.

SPOTTED POLAND-CHINAS!

All Spring Pigs Reserved for Fall Sale, October 18, 1916.

Thirty-five head will be sold and they are of the big boned, big type, spotted kind. Ask for catalog.

Live Stock Notes

R. P. ROYCE, Fieldman

Whiteford's Herefords

The herd of Hereford cattle owned by Hugh Whiteford, Guilford, Mo., is conceded by all to be among the really good herds of Missouri. In point of bloodlines, individuality and quality few equal this collection. Just now Mr. Whiteford offers two extra good long yearling bulls at prices that make them unusually attractive. One of these youngsters is sired by Parsifal 26th, a bull selected by John Goslin to head a Texas herd, and is out of the great cow Mapleton Queen. For our readers benefit, we want to say that Mr. Whiteford has an unusually high class lot of cows and that Mapleton Queen is one of his best matrons. The other bull is no less well bred, being sired by Parsifal 24th, a bull that his present owner has refused $1500 for on several occasions. The dam of the second bull offered for sale is by Imported Kenswick. Incidentally, it should be interest to know that this Kenswick cow was the dam of a cow that sold for $775 in the recent Blue Ribbon sale at Kansas City. Both of these bulls should make splendid herd bulls, and in view of their superior breeding and individuality can be bought at very reasonable prices.

Thomson's Durocs

With this issue, our old friends, W. H. & Geo. E. Thomson, Columbia, Mo., come before our readers with a very attractive lot of big, early spring Duroc boars. This herd is so well known to our readers ana has been patronized so extensively by them that it is hardly necessary that we say very much about it. The boars now in offer are by Col. Wonder II, and T's Cherry Chief—boars that are above criticism in every way. The dams of the boars are among the best in the Thomson herd. Our readers can at all times depend on getting a fair deal with this firm and we are glad to commend them to our readers who are in the market for dependable Durocs.

Moss & Son's Holsteins

Our readers who are in the market for grade Holsteins should look up the advertisement of D. D. Moss and Son, Columbia, Mo. Messrs. Moss are offering a number of high grade bull calves—sired by their splendidly bred bull Campus Josephine Lad and out of some of their highest producing cows. They also offer a yearling bull, well marked, well grown, sired by the above bull. This youngster is eligible to registry.

Besides the above stock the Moss' have two high grade stripper cows for sale. These cows are good producers and sell bred to Campus Josephine Lad, a son of the great producing cow, Pontiac Gerben Dekol, and a grandson of Missouri Chief Josephine.

Milk-fed Polands

Elsewhere in this issue, J. B. Smith, the well known Jersey cattle breeder of Platte City, Mo., is offering a choice lot of early spring Poland China boars. These boars are of strictly big type breeding, and have been raised on Jersey milk, so naturally, our readers will know that they have done well and are growthy.

Mr. Smith advises us that he is very anxious to despose of these boars and accordingly is putting the price down to move them. Mr. Smith is a high class breeder of live stock and our readers will do well to place their orders with him for Jerseys or Polands. Kindly mention this paper when writing.

PASTURING NOT ALWAYS PROFITABLE

One of the most common mistakes in the feeding of dairy cows on the farm is that the good cows are not given a sufficient quantity of feed above that required for their physical maintenance to obtain the maximum quantity of milk they are capable of producing. Successful feeding of dairy cows involves the providing of an abundant supply of palatable, nutritious feed at a minimum cost and feeding in such a way as to receive the largest milk production from the feed consumed. Feeding for profit is defined as liberal feeding, or feeding to the full capacity of the cow, in a new Farmers' Bulletin of the department, No. 743, The Feeding of Dairy Cows, which discusses many of the factors involved in economical feeding.

From the standpoint of economical milk production, a dairy cow generally sould be fed more than she will consume without gaining in weight. There are times, however, according to the bulletin, when it is desirable to make exceptions to this rule. Practically all heavy milk producers lose weight in the early part of their lactation period; that is, they produce milk at the expense of their body flesh. When such cows approach the end of their milking period they normally regain the flesh they have lost, and the farmer can well afford to feed them liberally, with the assurance that he will be repaid in the form of milk when the cows again freshen.

Pasture is the natural feed for cows, and for average conditions, with ample pasture of good grasses or legumes in good, succulent condition, good production can be secured.

The cost of land is a factor in the economy of using pasture, however. If pastures are depended upon entirely for from four to six months of the year, and production is kept up to a profitable standard, anywhere from 1 to 4 acres or more must be provided for each cow, says the bulletin. This is assuming that a permanent pasture is of good, clean turf, with few or no waste places, or that a temporary pasture has a good stand of grass or legumes throughout. Land that will provide such pastures frequently is high priced. The following tables show the cost of pasturing a cow on land ranging from $25 to $200 an acre.

Interest on cost of pasture per cow for the season; interest at 6 per cent on the value of the land, allowing from 1 to 4 acres per cow.

Acres per cow.	Value of land per acre.				
	$25	$50	$100	$150	$200
1	$1.50	$3.00	$6.00	$9.00	$12.00
1½	2.25	4.50	9.00	13.50	18.00
2	3.00	6.00	12.00	18.00	24.00
2½	3.75	7.50	15.00	22.50	30.00
3	4.50	9.00	18.00	27.00	36.00
3½	5.25	10.50	21.00	31.50	42.00
4	6.00	12.00	24.00	36.00	48.00

Cost of pasture per cow per day on basis of preceding table with a pasture season of 150 days.

Acres per cow.	Value of land per acre.				
	$25	$50	$100	$150	$200
	Cents.	Cents.	Cents.	Cents.	Cents
1	1	2	4	6	8
1½	1½	3	6	9	12
2	2	4	8	12	16
2½	2½	5	10	15	20
3	3	6	12	18	24
3½	3½	7	14	21	28
4	4	8	16	24	32

Where the value of land is so high that the cost of pasturing is excessive, or where the land may be more profitably used for growing crops, other methods of summer feeding are more profitable. It is stated that in some sections for average production a cow can be fed on dry feed for 20 cents a day, and when the cost of pasturing exceeds that amount some other method of feeding should be considered.

Grain should be fed to heavy producing cows under all pasture conditions, says the bulletin. The following table is furnished as a guide to feeding grain with an abudant pasture. Variations should be made to suit different conditions and individual cows.

Jersey cow.		Holstein-Friesian or ayrshire cow	
Daily milk production (pounds)	Pounds of grain	Daily milk production (pounds)	Pounds of grain
20.....	3	25.....	3
25.....	4	30.....	5
30.....	6	35.....	7
35.....	8	40.....	9
40.....	10	50.....	10

Grain fed to cows on pasture need not contain the same percentage of protein as for winter feeding. Pasture being an approximately balanced ration, the grain ration should have about the same proportion of protein to other nutrients. The following mixtures are suggested for supplementing pasure without other roughage:

Mixture No. 1 (per cent digestible protein, 10.3):	Pounds
Ground oats	100
Wheat bran	100
Corn meal	50
Mixture No. 2 (per cent digestible protein, 12.7):	Pounds
Wheat bran	100
Corn meal	100
Cottonseed meal	25
Mixture No. 3 (per cent digestible protein, 15.5):	Pounds
Corn-and-cob meal	250
Cottonseed meal	100
Mixture No. 4 (per cent digestible protein, 13.6):	Pounds
Wheat bran	100
Gluten feed	50
Corn meal	50

To carry cows over a period of short

Holstein Bulls, Cows and Calves!

We are now offering for sale at $25 each, a number of extra good bull calves sired by Campus Josephine Lad and out of excellent producing cows. Also 2 high grade strippers, bred to above bull. Also one yearling pure-bred bull—will make a herd header—priced to sell.

D. D. MOSS, - - - Columbia, Mo.

HAMPSHIRES

BROOKVIEW HAMPSHIRES

Herd headed by GEN. TIPTON and SIR BROOKVIEW, both grand champions. Spring bears and gilts of choice breeding and individuality. Prices reasonable.

ISOM J. MARTIN, - Kahoka, Mo.

Look over the offerings in our columns and when writing advertisers always mention The Missouri Farmer. We carry only reliable advertisers.

pasture without a falling off in milk, soiling crops are growing in favor. For this purpose second-growth red clover, alfalfa, oats, or peas are excellent. Corn is also available in August and September. What may be a disadvantage in the use of soiling crops is the extra labor required to cut and haul these crops from day to day, especially if field work is pressing.

On high-pricedl and, where the problem is to produce a sufficient quantity of roughage, or if the cost of pasturing is excessive, the summer silo may be used to advantage. An acre of corn in the form of silage will provide succulent roughage for several cows for a season. During periods of drought, when both pastures and soiling crops fail, a silo filled with well-matured silage grown the previous year is most valuable.

In planning a summer silo it should be kept in mind that its diameter should be in relation to the number of cows fed daily. As a general rule under summer conditions a cow will consume about 20 pounds of silage. Silage enough must be removed daily to prevent excessive surface fermentation. On this basis a summer silo for 20 cows should be 8 feet in diameter; for 30 cows, 10 feet; and for 40 cows, 12 feet. As 8 feet is about the minimum diameter of a silo for best results, a summer silo is most applicable in herds of 20 or more cows.—News Letter.

CATTLE FEEDING LESSONS FROM MISSOURI STATION TESTS

Steers that are full-fed from birth should not be held beyond 20 or 22 months of age because there is a decided falling off in the rate of gain. After this age the carcasses are overdone, there is an undue waste of excess fat and the gain in weight in proportion to feed consumed is much reduced as well as the gain per day per steer. These are the results secured in a recent test at the Missouri Agricultural Experiment Station in which some steers were full-fed while others received much less feed.

The steers which received feed insufficient for the greatest growth were most affected by such ailments as indigestion and pink eye, and their sickness was more likely to result in death. In fact, among more than a hundred steers in the experiments, all the losses except one were among the low-fed animals.

Steers fed for long periods such as three years and a half on feed insufficient for the greatest growth, did not seem to be able to digest their feed and to make good gains when later put on full feed. Even a steer whose growth was greatly retarded for only one year never equaled in weight a steer of the same age which had been full-fed from birth, although when put back on full feed he made very profitable gains and developed a very choice carcass of beef. These results do not disagree with the common observation that thin steers often make the most profitable gains. Such feeders have usually not been starved so long or so steadily. They have usually had bulky feed which kept up the stomach capacity even though it didn't furnish a great deal of nourishment and were very likely to have at least occasional large quantities of good nutritious feed while the steers in the test were kept regularly on small quantities of food for long periods so that they seemed to lose the capacity to eat and digest as large quantities as they must hadle to make the most profitable gains.

Thrifty yearlings put on feed that is not sufficient, even to keep up the body weight they already have, continue to grow in height and framework even when made to lose half a pound a day. Measurements of the skeletons did not indicate any decrease in the rate of growth for several months. Even when these animals were using the body fat to supplement the lack of feed there was a very noticeable addition of fat in the skeleton. Only when approximately all the fat was taken from the soft parts did the animals begin to draw on the fat in the skeleton to maintain existence.

The most economical choice beef resulted from the use of a feeder weighing about 750 pounds so fed as to make a gain of 500 pounds. Such a steer will probably not quite top the market but he should make the greatest possible profit to the feeder and furnish an economical carcass for the butcher and housewife and meat of a quality to please the most exacting. The carcasses show that of this 500-pound gain; 38 per cent is water, 49 per cent fat, and 12 per cent protein. When similar steers were fattened until they had gained another 500 pounds or gone from 1250 pounds to 1750 pounds, the carcasses were much overdone and the second 500 pounds was 76 per cent fat, 18 per cent water, and 5 per cent protein.—P. F. Trowbridge, Missouri Agricultural Experiment Station.

Bankers Aid Cattle Industry

The part that banks can play in promoting the local cattle industry is illustrated by the action taken recently by a group of southern bankers. A few farmers in Gibson County, Tenn., started a movement looking toward diversification of crops by raising less cotton and increasing the number and quality of cattle. The movement was encouraged by the beef-cattle extension agents of the State college and the United States Department of Agriculture. All the banks in the county grew interested, and as soon as the group was ready for buying a car of pure-bred cattle the bankers agreed to lend up to $15,000 to defray the cost.

Sixty-five head, including bulls, bred heifers, and cows with calves at foot, were delivered in the county, all in good condition, at an average cost of $150 per head, exclusive of the calves. These were distributed to individual farmers, not more than three head going to any farm. The owners than either paid for the cattle or gave long-time notes at reduced interest to the banks. One bank acted as agent in the transaction for all the banks in the county.

The bankers figured that by helping the farmers to buy a large number of pure-bred cattle they not only would get interest on safe loans but would foster an industry the beefits of which would be accumulative and permanent in the locality. This is borne out by frequent experiments which have established that even a few good bulls introduced in a county soon have a marked influence on the size and quality of all local cattle.

Dairy Sires Should Not Be Sold When Young

Can a bull be worth nearly $3,000 in one year in a dairy herd? The animal may be worth this much or even more, according to figures given by Prof. C. C. Hayden in the July Monthly Bulletin of the Ohio Experiment Station.

He shows that in the Station herd one bull produced daughters averaging 153 pounds more butterfat annually than their dams. If 10 daughters produced milk for six years, the total production of this sire would be worth $2,750 more than that of a bull that produced no increase, if butterfat is worth 30 cents a pound.

Since the value of the bull can be determined only by the milk and butter yields of his daughters, farmers are advised not to sell the dairy sire until is daughters have been tested. Buyers should not discriminate against an old bull if he has some high-producing daughters, for his value cannot be determined until he is at least four years old.

Meet the Market Demands

We must study the market demands carefully and select good sires of the types that will enable us to meet them. If we find that the butcher or packer likes an animal of extreme beef type because that animal yields a high percentage of the high-priced cuts, the sires must be selected accordingly. If we find that the horse buyer takes the big, drafty, sound horse in preference to the chunk when his order calls for horses for heavy work, we must secure sires that will get colts of that type. If we ship or sell to a market which demands bacon hogs, then the boar should be the best obtainable individual of a bacon breed which is in good demand in that market.

In any case we must strive to produce only the best animals and to be sure that they are uniformly good and that there are among them no misfits or inferior specimens which do not meet the consumers' needs.—S. T. Simpson, Missouri College of Agriculture.

Lime Causes Increase in Crop Yields

As an average of 10 crops of wheat in the five-year rotation at the Ohio Experiment Station, an expenditure of $5 for lime once in the rotation has resulted in an average gain of $16.47 an acre for all five crops, according to results reported in Bulletin 298 on Wheat Experiments just published by the Experiment Station at Wooster. From one to two tons of ground limestone is applied per acre in the spring to the corn crop.

Liming has returned 302 percent on the investment where nitrogen in complete fertilizer was carried in nitrate of soda. It has returned 261 percent when used with manure, and 234 percent in connection with acid phosphate alone, and has even paid when used with basic slag. On the Wooster soil liming has always been necessary regardless of any fertilizer treatment.

Filling the Silo

Where corn is injured by the drouth it should be allowed to stand as long as there is any hope at all of its getting rain to complete its growth. If it begins to die it should be put in the silo, as by this means what feed value it contains will be saved. If it cannot be put into the silo just then it may be shocked and put in later, as tests at the Missouri Agricultural Experiment Station have shown that shock corn makes good silage. Of course, it is not as good as that made at the usual time.

When filling the silo, remember that silage spoils if too dry or the air is not expelled by thorough tramping. The tendency of late years has been to put corn in the silo too dry. It should be moist enough to wet the feet of the men who tramp it. If too dry, add water by running it into the blower. At least two men are needed to tramp the silage at filling.

Special attention should be given to packing well around the edges. If the walls of the silo are not in good condition repairs should be made to keep out the air. If the doors do not fit well a good plan is to place a piece of tarred paper over the door on the inside allowing it to extend about two feet on each side.—C. H. Eckles.

"Knock-out Drops" for Moles

Moles are very active at this time of the year, and are a great pest to the roots of plants in the garden and field. Where they become too troublesome, they may be easily controlled through their weakness for good things to eat. Moles generally pass through their runs several times a day. The following methods have been found very effective in their control.

1. Stir unparched peanuts in the white of an egg and while still sticky sprinkle them with Paris Green. Mix well so that the poison surrounds all the seed, then let them dry. They will dry in about half an hour and can be easily handled. See below how to apply.

2. Roll raisins in strychnine with a stick or tooth pick. Do not use the hands and be sure not to spill any of the poison. When you are through, burn all the remaining poison so that children may not get it in their mouths. Strychnine is a violent poison.

How to Apply

Whittle a broom handle to a point. Walk along the runway and pierce it at intervals with the sharpened stick. Drop a poisoned peanut or raisin into the hole thus made and cover the hole with the foot. When Mr. Mole comes along he will eat the poisoned goody. Result, good-bye, Mr. Mole.—Clemson Agricultural College.

FARMER BOYS ATTENTION!

Here is Great News for You

A Bank Account of Your Own!

HERE IS A GREAT AND SPLENDID OPPORTUNITY!

SEVERAL WEEKS ago we announced that we would present a fine bred gilt to every farmer boy who sends us $50.00 worth of subscriptions to THE MISSOURI FARMER between the time the announcement was made and November 1st—and we have never made an offer which has aroused more interest and dozens of bright farmer boys are already at work, while fresh inquiries are coming in on every mail. This offer is open to any farmer boy in the state and all you have to do is to get 50 farmers in your neighborhood to give you a dollar each for three years subscription to THE MISSOURI FARMER when we will ship you a bred gilt selected from among the best pure bred herds in the state. You can select either a Duroc, Poland China, Berkshire, Chester White or Hampshire gilt—whichever breed you like best and between now and November 1st I want

ONE THOUSAND MISSOURI FARMER BOYS

to **make good** on this great offer. If you take good care of the gilt and her litter of pigs they will start you in the pure bred hog business and enable you to make a lot of money. You can go "halvers" with your Father in the profits—or maybe he will let you keep them all and soon you will have a nice bank account which will enable you to pay your way through College later on or build up a "nest egg" with which to buy a farm of your own some day. Now I am mighty serious about this proposition. The farmer boys of today will be the farmers of tomorrow. Upon their shoulders will rest the responsibility of citizenship—and therefore the sooner you have definite aims in life the better for yourself and for the great Country of which you are a part and which has a right to expect you **to become a real man and play a man's part in the World's work.** That's why I want you pitch in and win one of these fine gilts—for it will give you a greater interest in your Father's farm **and teach you how to become a business man in your own right.** Now just think how fine it would be to have a bank account **of your own** so that when you want to buy something which will add to your happiness you will not have to ask someone else for the money!

Get Busy at Once: Now think this proposition over carefully. Talk it over with your Father—then if he is willing for you to win one of these fine pure bred gilts—which I am sure he will be—write me at once for a bunch of samplecopies and subscription receipts—**and then pull off your coat, grit your teeth, and go in to win!** No doubt you can sit down right now and think of 25 farmers who will be glad to give you a dollar for three years subscription to a fine paper like THE MISSOURI FARMER—and with a good stiff fight during the next three months you can easily round up the balance. Go to every one of your neighbors and show them a sample copy of the paper. Tell them that it is the **best farm paper in Missouri!**—that its Managing Editor is Geo. B. Ellis who for years was Secretary of the Missouri State Board of Agriculture and who understands Missouri farm problems and conditions better than any man living—that it is their **home farm paper** and that they ought to read it in preference to farm papers published outside the state which do not understand Missouri farm conditions first hand—**and then tell them that you want them to help you win one of these fine gilts—and seven out of ten will do so gladly because everybody is anxious to help a boy who is a hustler!** Don't forget this last point, for it is the truth. That is where we got the splendid adage that the "Lord helps those who help themselves." Now make up your mind right away and write me **before some other boy gets your territory!** The boy who writes first gets the first chance in his neighborhood—**so fill out the blank below and mail it today!**

To Our Subscribers: If there is a boy in your family please call his attention to this splendid offer. If there is not, then I will take it as a great personal favor if you will bring this to the attention of some bright farmer boy in your neighborhood. It is a chance to do good.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

"Unto the End"

Some weeks ago, they laid James Whitcomb Riley to rest over in Indiana and not since the death of Mark Twain has an event called forth so many tender expressions in the editorial columns of the Nation's newspapers and magazines. And the Hoosier Poet richly deserved every kindly thing that has been said of him for he made the World a better place in which to live. He taught us once more that the lowly and commonplace things are, after all, the most beautiful and the most worth while—and because the most of us are lowly and commonplace we loved him for it. Even as he great painter Millet made us realize the devotion of the peasant as he bows his head to the Angelus and the dignity of the Gleaner, so Riley led us to a realization of the true beauty of the autumn days "When the frost is on the pumpkin and the fodder's in the shock"—and caused a lump to rise in our throats as we read the old man's admonition, "Good bye Jim, take keer of yourself."

"But, in reviewing the life and sayings of this Shepherd of the Lowly, most writers dwelt longest and oftenest on his poem, "That Old Sweetheart of Mine"—a beautiful expression of sentiment as pure and fresh as the water that ripples forth from a mountain spring and a classic which generations yet unborn will read with moist eyes and softened hearts and be the better for it. And may not those of us who are still in the midst of the struggle out in the highways and byways of life draw inspiration from its sweet tenderness—for, after all, is not love the holiest and purest thing that can enter the breasts of men and women in their march from the cradle to the grave? And thus I pause to ask of you, my friend, how about that "Old Sweetheart" of yours whom a kindly fate has spared and who is sharing life's trials and joys by your side at this very hour? Do you still regard her as your sweetheart as in the blessed days of old when her cheeks were red, and when, like a gallant knight, you swore to cherish her to the end—or has the struggle left your heart cold and hard and have you come to regard her merely as a wife whose duty it is to cook and scrub and look after your children?

Down deep in the recesses of your heart I have no doubt the old tenderness still linger. But, in the harshness of the conflict too many of us permit the better and kindlier sentiments of our hearts to become calloused and hidden from view—and hence the flame grows weaker and weaker. Because time and toil have driven the roses from her cheeks and because there are streaks of gray amid the fluffy hair of yesterday does not mean that she is less responsive to a tender embrace than during the old sweetheart days—for it is upon these things that a woman's heart feeds and lives and blossoms like a flower. Perhaps you have given her a good home and perhaps, too, you try to save her as much drudgery as possible—and yet this is not enough, for a good woman can be happy amid poverty and hardship if the love lamp burns brightly while she will be miserable in a mansion if the affection for which her heart hungers, is denied her.

And even so, there is something wrong in the makeup of the man who regards this manifestation of affection as beneath his dignity—for let me impress upon you that all the gold and fame and power in the World are still as mere chaff when weighed in the balance against the priceless treasure of love which has been the reigning impulse of humanity since the morning stars first sang together for joy and without which life would be as barren as a waste of desert sands. And what more beautiful picture than a pair of old sweethearts in whose eyes the love light still shines—who meet life's joys and trials hand in hand—who wander through the vales and valleys with a smile that never entirely leaves their faces—who approach the sunset with hearts more closely entwined than in the golden days of the long ago when first they plighted their love and promised to cherish and obey "unto the end?"

LYONS PRACTICAL FARM PAPERS

Well, I passed the sixty year mark with nothing especially startling to report, unless it might be the advent of three grandsons, all within a few days of my own birthday, one in Missouri, one in Illinois, and one a few miles from home. I am feeling so much better than I did a few weeks ago, and took a good hearty laugh at Sam Jordan's expense with chiggers and bumble bees, the Professors Buckshots, and even at Jim Riley.

During the past few days I have been cutting weeds in the young orchard, hoeing strawberries and late beans, and pulling weeds in the sweet potatoes.

I set about 1000 sweet potato plants this spring, and our first mess was on the table August 20.

As a coincidence, wife, who was spending a week with our daughter and new grandson, says that on that day they had their last mess of 1915 sweet potatoes, sound sweet and well flavored.

This will be in the homes of our readers near sweet potato digging time, and I want to give our method of keeping them the year through.

We use the utmost care in digging so as not to bruise the potatoes, and if possible try to get the entire hill out with the tubers clinging to the vine. They are allowed to dry well, and are carefully moved to a cool room, in smokehouse or barn, placed in a conical heap, covered so as to keep out the light, and left until frost threatens.

At this time, usually about October 20, they are sorted over, carried to a dry room in the house, near a flue, and where frost never penetrates, and are boxed to keep over winter.

The bottom of the box is covered with two or three layers of paper, a layer of potatoes placed on this, then a layer of paper and a layer of potatoes until the box is full, covering with paper and old carpet.

We used to wrap each potato separately, but some four or five years ago found that this was not necessary, we also find that almost any cellar is too damp to keep them well, and a chill, at near the frost point, will cause them to rot.

Some people say that they must be extra well matured in order to keep, but a sweet patoto never matures in the latitude of Ohio or Missouri, and it is also urged that they be perfectly dry, when dug, but in 1914 ours were dug in the rain and looked like balls of mud, but they dried out in the barn, and we never had them keep better.

We put down five or six bushels every fall, and nearly always have them until May, or I would better say, until they are eaten up, for we have never lost a dozen by rot, and the late experience of my son-in-laws folks, show that it is possible to keep them the year through.

But; they must be well dried out before storing away, all cut, bruised or broken tubers must be kept out, plenty of old paper must be used between layers, and they must be kept in a dry warm room.

Of course it is some trouble, but we think it pays, as we can have sweet potatoes on the dining table fully five months longer than by usual methods, and this year I am going to try a bushel to keep until next July—August.

We are not having as good success with beans and tomatoes as in years past, both seeming to be affected by some kind of blight or mildew. I planted a new tomato this year. It is called the Bonny Bert, is of the stone type only longer, and we like it better than any other for slicing.

Earliana is our favorite for extra early, and the old Trophy, Penderosa or Beefsteak, for they are all practically the same for canning.

By planting at several times during the season, we escape the blight to some extent as it does not seem to come until after the plants have been fruiting a couple of weeks.

Last year I gave away one wagon bed full of late cabbage, besides several sacks full, and this year have not a plant, on account of the July drouth. Neither have we any celery, as against 350 fine plants last year, nor have we any mangos.

I have several letters asking me about Colmans Rural World, with which I was connected, as correspondent and associate editor, from 1895 until 1914. The paper is no longer published, and for the past two years had entirely departed from the lines which made it of such a high standard under the eye of its distinguished founder, Norman J. Colman.

It is probable that I will continue to write for THE MISSOURI FARMER, clearly the best paper published for Missouri farmers, and I ask my old Rural World friends to do all they can to extend its circulation.

C. D. Lyon.

P. S.—September 5. The weather continues seasonable, a good rain every few days. Some tobacco is being cut, and the crop is going to be a heavy one. Corn fine, but down some. Health generally good.

A STATE FLOWER FOR MISSOURI

Twenty-seven states are said to have wild flowers as their official floral emblems. While Missouri has frequently been referred to as the "golden rod state" this flower has never been formally adopted. The Missouri Horticultural Society is to recommend a state flower to the next legislature. This flower will be either the wild aster, golden rod, wild crab apple, wild rose, clover, or corn flower. In explaining a reason for adopting a state flower the president of the State Horticultural Society said. "It is not chiefly for the sentimental reason of having a natural and beautiful expression of our affection for the state, but to have an accepted symbol of our loyalty and patriotism and to use this flower for decoration at all state and public functions." W. L. Nelson.

Little Hands

How will they grow? Trained or....untrained?

Those little hands are now in your care. You can train them to bring life-long happiness, or let them go untrained. But *now* is the time to begin their education. Today in twenty-eight countries the

GEO. A. COOK

2012 Main Street, Kansas City, Mo.

THE COUNTY AGENT IN SCOTT COUNTY

This question has arisen now that the proposition is again before the people, of continuing the work for another three years. One of the most important things is the educating of our farmers in hog vaccination. Prior to the arrival of the County Agent little of this was done; now hundreds of farmers all over the county can do their own vaccinating with the result that thousands of dollars worth of hogs are annually saved. The result is that the farmers are raising many hogs and a demand has been created for better males and sows. We feel confident that the agent has more than saved his salary in this alone.

In the pruning and spraying of orchards a splendid work has been done. Many farmers are taking courage again and are planting orchards now that they have been taught how to combat the San Jose scale and fruit diseases. One orchard of 4,250 trees was planted near Blodgett this spring.

It is impossible to place a money value upon the large amount of advertising the agricultural resources of Scott County have received. In 1914 an exhibit was shown at Poplar Bluff that attracted wide attention as the best educational display ever made from the county. In 1915 a splendid exhibit was collected and shown at the Southeast Missouri Fair at Sikeston. The County Agent was requested to show this at the State Fair at Sedalia. This was done and despite very keen competition third prize was won and 25 ribbons. The exhibit was next shown at St. Louis and won first prize and 35 ribbons. Thousands of farmers from Missouri, Iowa and Illinois saw this splendid exhibit and were anxious to learn about Scott County. At the Panama Exposition the only medals won for the State of Missouri on rye, oats, vetch, and alfalfa were won by material prepared by the Scott County Agent. Scott County won three of the four cups offered at the State Corn Show. Two of these were on corn, the third upon the largest yield of wheat.

In 1913 the Agent selected an improved type of St. Charles corn and in 1914 in the Boy's Acre Corn Contest one of his club boys won first for South Missouri. In 1915 the same boy won the State Championship with a yield of 118 bushels. Many counties in the state would gladly have paid the Agent's salary for this honor. Thousands of acres of this improved type of corn are now being grown. Watermelons and cow peas are doing poorly in places in Southeast Missouri, due to wilt disease. The agent introduced Feterita sorghum, Sudan grass, and soy beans to grow upon our sandy soils to take the place of so much wheat and corn. These crops have made good and a thousand acres of these crops will be grown in Scott County this year. The Agent has visited many of our schools and given lectures and material to aid them in their study of agriculture. Winter oats, vetch and crimson clover were unknown before the Agent's coming.

To show how the Agent has helped business, will say that in 1914 there were 15 barrel sprayers, and in 1915, 75 sprayers were sold. In 1915, 45 manure spreaders were sold in one town. When the Agent began work in 1913 there were probably not over 50 acres of alfalfa in Scott County; now there are over 700. Ninety-five per cent of the silos in Scott County have been built since that time. The development of the dairy industry in the northern part of the county is directly due to the County Agent and many splendid cows are now making money for their owners, where formerly little profit was made. The introduction of Sudan grass and soy beans into this county means thousands of dollars to our farmers on our sandy soils. These are only a few of the many benefits derived. No value can be placed upon the social uplift of our farming community. Look around and see better homes, better barns, painted buildings and better systems of farming as well. At a meeting composed of farmers and business men held in Benton on May 4, it was unanmiously voted the county had been many fold repaid for its investment in a Farm Agent during the past three years.—From a recent issue of the Sikeston Standard.

LOOK at the LOCK

and you WILL SEE WHY "SQUARE DEAL" Fence is the best fence to buy. Before you buy another rod of fencing, see for yourself why the SQUARE DEAL LOCK makes this the favorite field and stock fence of discriminating farmers everywhere. See how firmly it double grips the one-piece stay wires to the wavy strand wires without cutting, breaking or slipping—how it combines solid strength with remarkable flexibility—how its self-draining shape prevents rust—how it makes

Square Deal Fence

especially strong where others are weak. See the one piece stay wires that prevent sagging, bagging and buckling—save posts, time and trouble. See the wavy strand wires that give springiness, elasticity and life, keeping SQUARE DEAL FENCE tight and trim the year 'round. The Missouri Farmer

VOLUME VIII | SEPTEMBER 15, 1916 | NUMBER 18

Time for the Farmer to Take a Hand

By William Hirth, Publisher

The 50,000 farmers who read THE MISSOURI FARMER are familiar with the endeavor which has been in progress since last winter to induce Congress to order an inquiry into the Live Stock market conditions of the Country. At its annual convention at El Paso last winter, the American National Live Stock Ass'n pledged a fund of $250,000 to finance such an investigation. Shortly thereafter the farmers and cattlemen of Texas pledged $100,000 for the same purpose—while the farmers of Missouri, Kansas, Colorado, Iowa, Nebraska and other great Live Stock producing states stand ready to support the movement both financially and morally. Shortly after the National Live Stock Ass'n voiced its demand, Congressman Borland of Missouri introduced a resolution in the House Committee on Judiciary providing for such an inquiry at the hands of the Federal Trade Commission—and for want of better means to accomplish their end, the Live Stock men of the Country threw themselves solidly behind this proposal and many cattlemen have made long pilgrimages to the National Capitol praying for a favorable committee report. But the Borland resoultion has never seen the light of day. It has gone to sleep in the Committee—and for "lack of a quorum" as report has it, Congress will in all probability adjourn and the ides of November will come and go with the resolution slumbering quietly on.

And yet back of this resolution stand nearly seven million farmers who constitute the very bone and sinew of this mighty Republic—who feed and clothe its more than one hundred million souls—who furnish the true basis for its abiding prosperity—whose sweat and toil are largely responsible for a huge trade balance which promises to make New York rather than London the future financial center of the World—who have merely asked Congress to "turn on the light" in order that they may know, once for all, whether the prices paid for their live stock are based upon the great law of supply and demand or whether they are in fact being manipulated, as they believe, to their detriment. But that isn't all. Back of these nearly seven millions of farmers are scores of other millions who dwell in the towns and cities—that great and never ending cavalcade which makes its daily pilgrimage to the myriad butcher shops of the Country—the ultimate consumer who is staggering under a "high cost of living" and who has a right to know whether that cost is honest or ficticious.

We have heard much of the virtue of "publicity" in corporate affairs in recent years. It has been said that it will cure many of the real or imaginary ills of society—and yet, although the millions who toil in our fields and feed lots and the other millions who are struggling to keep body and soul together in our great centers of population are vitally interested in the above inquiry, a Congress earnestly appealed to for long weary months has turned a deaf ear to their entreaties.

A Remarkable Performance

But now let us turn for a moment to the recent remarkable performance of the Brotherhoods of Railway Trainmen—a feat without a parallel in the history of the Nation. Some months ago, the 400,000 conductors, engineers, firemen and brakemen composing the above Brotherhoods made a joint demand upon the various railroad managements of the Country for a so-called 8 hour day and time and a half for overtime. That the granting of such a demand was in fact impossible, was understood by no one half so well as by the trainmen themselves. Because of break downs, wrecks, faulty equipment, wash outs, unpreventable delays, storms and a hundred other causes which human ingenuity is powerless to prevent, it has always been impossible and will continue to be impossible to operate railroad trains like a factory which begins and stops with the blowing of the whistle—and just as the physician enters upon his profession with the kowledge that he must respond to calls upon the Sabbath or at midnight, so the railway trainman knows the uncertainty which attaches to his hours of service when he accepts his position. In order to compensate him in this respect however, an agreement has long been in effect which gives every trainman a full days pay for "10 hours service or less" and for assisting in the operation of a railroad train for a distance of 100 miles or less.". In other words, "10 hours or less" and "100 miles or less" has been the basis upon which, for years, these employees have been paid—and surely they have had decidedly the best of this arrangement for under its terms thousands of them are receiving a full days pay whether they render 5 hours or 10 hours of actual service. They also receive the same rate of pay for all hours of service in excess of 10 hours. In short, the 8 hour day in train service of which the public has heard so much in recent months was a mere pretext to gain popular sympathy on behalf of a more or less popular idea. Nor do the vast majority of trainmen want such a day in fact because it would deprive them of many millions of dollars in overtime which they have been receiving for years.

The "Milk in the Coconut"

But the "milk in the coconut" was the "time and a half for overtime" which, without in any wise shortening the hours of actual service, would pay a trainman 50% extra for every hour he works in excess of 8 hours—an additional tribute which the railroads estimate would cost them $100,000,000 per year. The point which the reader should therefore get firmly fixed in his mind is that this so-called 8 hour day was a mere subterfuge—a peg upon which, with clever dexterity, the Brotherhood Chiefs hung their demand for an enormous increase in wages.

Whatever else may be said of railroad managers, they are not a pack of fools and if by adopting a fixed number of hours of service they could have retained in their treasuries the tens of millions of of dollars which they have paid out for overtime in recent years they would have been the first to inaugurate such a change—and it is because such a thing is humanly impossible that they have been driven into giving trainmen a days pay whether they rendered 5 hours or 10 hours of actual service.

But now let us examine a little more closely into the conditions which surround these men who have seen fit to demand a $100,000,000 incerase in yearly wages. To begin with, they constitute only 20% of the railroad employees of the Nation and during the last few years their pay has been frequently advanced. The present average yearly wages of railroad engineers is $2067, conductors, $1850, firemen, $1203 and brakemen, $1095. Mind you, this is the average on railroads big and little, weak and strong—on lines which are floundering in the hands of receivers as well as on the great and powerful systems—while hundreds of engineers, conductors, firemen and brakemen receive as high as $3900, $3000, $2000 and $1700 per annum respectively. Let the average farmer who contends against drouth, floods, pestilence and fluctuating markets and who has perhaps thousands of dollars invested in land and farm equipment decide for himself whether the wolf howls around the door of the average railroad trainman—whether these men who haven't a dollar invested and whose pay checks come as regularly as the passing of the months are entitled to an increase of $100,000,000 per year without at least submitting their demands to impartial investigation? Are there not tens of thousands of farmers in Missouri and elsewhere whose intelligence and thrift compare favorably with that of any class of workmen in the land who would gladly exchange places with these men for the certain annual income they are receiving at this time?

The Refusal to Arbitrate

At the very inception of the controversy the railroad managers offered to submit the whole matter to arbitration either at the hands of the Inter-State Commerce Commission or under the Newlands Act which was passed only a few years ago specifically for emergencies of this kind and which act had the approval of both the railway managements and the railway employees. But the Brotherhoods flatly refused and gave the carriers a choice between granting their demands outright or submitting to a Nation-wide strike. The Railway Managers stoutly held out for the principle of arbitration which is almost as old as our insitutions of government themselves. They took the position that, in the interest of those whose millions are invested in the railroad properties of the Country—in the interest of the million and a half other railroad employees who were left "out in the cold" on this deal and who relatively receive much less renumeration than the

FARM CLUB ORGANIZERS WANTED

In order to push the organization of Farm Clubs into as nearly as possible every school district in the state, THE MISSOURI FARMER would like to employ at least a dozen organizers who are in position to devote the entire fall and winter months to this work—and to the right kind of men we will pay a salary worth while. To this end, if any of our readers know of a man who can make a good school house address and whose heart is in this kind of work, I will be greatly obliged if you will send me his name and address.

It goes without saying that I would prefer real farmers for this work—or at least men who are familiar with farm problems and who are not merely hunting a job. The Farm Club movement is too serious and important to be turned over to the latter class and men of this type need not apply. What I want is men of proven integrity—who stand well with their neighbors—whose hearts are in this work and who have had experience in addressing farmers and who can do so effectively. Possibly there may be an Ex-County Court Judge who has the above qualifications. Or, maybe there is a man in your County who has had experience in Grange work or some other farmers organization. Again, maybe there is a Country minister who could fill the bill. In any case, I will be glad to have every reader of THE FARMER think this matter over carefully and then write me if he can suggest a man who can "make good." Many of the Farm Clubs which have been organized since last winter have saved hundreds of dollars for their members—and the message must be "carried to Garcia" in every school district in the state. Also, when you write, tell me whether you will not undertake to organize a Farm Club in your district if I send you the necessary instructions and literature?

WILLIAM HIRTH, Publisher.

trainmen—and lastly on behalf of the great American public which in the end would be compelled to "foot the bill," they had no right to increase their costs of operation to the extent of $100,000,000 per annum until some duly constituted and impartial authority passed upon the justice and fairness of these demands—protecting the interests of all parties concerned.

In due time, President Wilson sent for the Railway Managers and the Brotherhood Chiefs and the long conferences which resulted are familiar to every reader of American newspapers. Equally familiar is the fact that the President asked the railroads to grant an 8 hour day, or 10 hours pay for 8 hours work—and that the Managers vainly protested that they had no right to barter away millions of dollars in increased wages except through an arbitration which, after due examination into all the facts, had a right to speak and judge for all the people. While the negotiations were in progress, practically every commercial organization in the Country telegraphed to the President and to Congress, pleading for arbitration. Ere the conferences were finally ended and before the President had abandoned his efforts to bring about a peaceful solution, a strike was secretly ordered and September 4th was set as the day when it should be carried into effect.

Throwing Off the Mask

Once this fact became known, the mask was thrown off and Congress was bluntly told either to pass an 8 hour law before the following Saturday night or submit to a strike which would have paralyzed and demoralized the commerce of the entire Country—and with a stop watch held upon its deliberations as one senator put it, Congress—trembling in its boots—abjectly and supinely submitted to a brazen effrontery and dictation which is without precendent in the proud history of the Nation. That the great principle of arbitration was ruthlessly trampled under foot—that there were a million and a half other employees who were forgotten—that this huge burden of increased cost must eventually find lodgment upon the shoulders of the people who always play the role of the innocent by-stander—all these things, profoundly serious as they are, are of as little consequence as the sands in the sea when compared to the humiliating spectacle of the Congress of this mighty Republic bending its neck to the brazen task masters who grinned down in sardonic triumph from their place of vantage in the galleries above! Shades of Daniel Webster, Thomas Hart Benton and those countless other statesmen of revered memory who in years gone by gave to this august tribunal a rank and respect second to that of no other deliberative body in the World! Truly, it is an hour when shame gains the mastery over anger—when one feels that a blow has fallen whose pain will increase as our minds the more fully comprehend all that was intended by those who dealt it and what was accepted by those who abjectly and tremblingly received it.

That it was praiseworthy in the highest degree for the President and for the Congress to do every thing in their power to avert the impending calamity which would have caused tremendous temporary hardship and suffering—on this point there is no debate whatever. But if Congress had turned in scorn and contempt upon the labor leaders and said, "We will take time to investigate this matter in the interest of all the people and we defy you to call a strike in the meantime"—does anybody believe the strike would have taken place? Nor can this remarkable performance be charged upon the ledger of history as a partisan deed. No doubt had the republicans found themselves in a similar position of responsibility on the eve of a Presidential election they would have been equally supine, for it is the natural outcome of the age of political cowardice and expediency in which we live—and it is against this cowardice that we wish to raise a solmen hand of warning at this time for, just as certain as there is a just God above, just so certain do these things mean that we are drifting upon the rocks of National disaster. Gentlemen may make light of it and excuse it on the basis of momentary necessity—but the cold fact remains that the spokesmen of 400,000 men in a Nation of more than one hundred million souls took the Congress of the United States by the throat and said in effect, "Either give us our 'pound of flesh' or we will wreck your Country"—and the sooner we accept that kind of a challenge the sooner we will learn whether this is still a Nation "of, for and by the people." There can be no decent compromise with such an issue, once it is raised, and "Peace at any Price" is as ignominious when suffered at the hands of those who seek to trample upon our National self respect from within as at the hands of those who seek to place this calumny upon us from without.

Unparalleled Arrogance

"If it means more railroad receiverships," said the spokesman for the Brotherhoods, "that is no concern of ours." In other words, if the swag or a hundred million dollars extra per year forces a lot of weak lines into bankruptcy, the people can pay enough extra in increased freight rates to put them back on their feet again. Nor did the fact that thousands of section men who work out in the summers' pitiless sun and walk the tracks at night amid the winters' howling blizzard for $1.60 per day while the trainmen receive $5, $7 and $8 per day in surroundings of comparative comfort disturb his sense of fair play in the least. And finally, he served notice of "unswerving opposition" to the Presidents reccommendation for a duly authorized arbitration of similar disputes in the future—and according to newspaper reports the balance of the Presidents legislative program will, for the time being at least, be abandoned. In other words, if during the next two or three years, the Brotherhoods can think of something else they want, they desire to be in position to repeat the performance of September 2, 1916—a day destined to be long remembered in the political history of the Nation.

In the meantime, it is not the purpose of this article to present a brief for the railroads. That, however, their courageous stand for the great principle of arbitration without which our industrial future will become one of terror and chaos deserves the approval of all right thinking men, this fact needs no emphasis at our hands. Again, their earnest endeavor to protect the public against an increase of scores of millions of dollars in the annual cost of operation—a cost which the public must finally bear or consent to the bankruptcy of every weak railroad in the Country—their insistance that the Inter-State Commerce Commission which is invested with authority to fix the income of railroads has no power to protect the people against unnecessary increases in rates unless it also be clothed with the power to prevent unnecessary increases in the cost of operation—that in this position they were fighting the battle of every farmer, manufacturer, merchant and railroad patron in the land also needs no confirmation from us.

Nor do we deny that the laborer is generously "worthy of his hire" or that collectively they have the right to organize and by this means gain that which is justly due them. On the contrary, the "man with the dinner pail" has, by common consent, been placed upon a pedestal by a preponderance of American public opinion and that eminence he will continue to occupy so long as the principle of "live and let live" shall be the guiding star of his citizenship—but when might tak the place of right—when the wellbei of those without the fold is ruthless trampled underfoot—when the spoke men of labor organizations become daring as to figuratively place a pist at the head of the greatest law ma ing body in the land—that is decided a "horse of another color" and cons tutes a menace so profoundly gra that the sooner the issue is tried o to a final conclusion, the better f the future of the American people.

That the vast majority of the 400,0 trainmen do not endorse what w done by their leaders at Washingt we have not the slightest doubt—f thousands of these men are as go citizens and have as deep and broad love for their Country as any men th live—but nevertheless it is up to the to lose no time in placing themselv right before the bar of public opini which has ruled this Country fr Plymouth Rock to the present ho and which, though temporarily thwa ed, will continue to do so. Let man or set of men mistake this fact.

The Farmers Duty

But, in conclusion, to return to t first paragraph in this article whi shows that the nearly 7,000,000 far ers in the United States wield an i fluence pitiable in comparison to th just demonstrated by the Brotherhoo —and the difference is due to the fa that while these nearly 7,000,000 far ers merely respectfully petitioned, t latter threatened—and promptly g what they wanted—and this brings r to the heart of my plea. The ho has finally struck when the farmers this Country must organize, not mere to gain a "square deal" in the mark place for themselves—but apparent also for the purpose of protecting weak kneed Congress against indu trial footpads whether those footpa speak for selfish capital or for a lab organization drunk with unholy pow If votes are to be the true measure influence, then the farmer has mo of them **than all the other classes co bined!**—and therefore the sooner marshall them in solid phalanx, t better for the Republic which can more endure under a condition of i dustrial terroism today than it cou remain half free and half slave in t days of Lincoln. From the beginni we have fed and clothed the Nation and now we face conditions whi mean that we must also save it fr the selfish forces which theraten destroy it. And thank God the farme of this Country possess both the pow and the patriotism to perform th service. They personify a sleepi giant who, when once aroused, c sweep aside with one stroke of h mighty arm those who menace o free institutions for which generatio have bled and toiled and which co situte a heritage that must be pr served for posterity at any cost.

Taken as a whole, the present a ministration has been one of the mo wholesomely constructive the Count has ever known—and it is all t more pity that the same Congre which gave to the Nation the Feder Reserve Act and the Rural Credi measure should have stooped to th ignominious performance.

THE LAND BANK BILL

The time is at hand when every farmer should bestir himself on the Land Bank Bill to the end that the necessary Constitutional amendment may not fail of adoption at the November election. As we have frequently stated in these columns we regard this as the most important measure in the interest of farmers that has ever been enacted by a Missouri Legislature—and yet, unless every farmer in the state gets busy, there is grave danger that the amendment will fail to receive the necessary votes. No doubt the Prohibition Amendment will cause an overwhelming "No" vote in the large cities and the greatest activity on the part of every farmer is therefore essential to assure the success of the Land Bank Bill at the coming election.

The fact that Congress has enacted a National Agricultural credit measure should in no wise lessen the interest of Missouri farmers on behalf of the state system, for there is ample room for both of them. Again, the Missouri Land Bank Bill does not require the subscription of stock on the part of borrowers—and in the end we therefore believe that it will prove the most popular of the two. And here let me suggest that no farmer permit himself to be led astray by political criticism of this act, it matters not from whom it emanates. The charge that it is a "single tax measure in disguise" is the merest twaddle and in an early issue of the paper we will touch more fully upon this point. The writer wrote the lions shore of the literature which was directed against the enactment of the Single Tax six years ago and believes therefore that he is reasonably familiar with the subject. Likewise, the claim that the State Treasury cannot supply the initial million dollars capital need frighten no one. If we could issue bonds to build a state capitol, can we not also issue a million dollars worth in bonds to give the farmers of this state the lowest interest rates obtainable? The thing is to adopt the Amendment and iron out the other details later on.

To this end, every farmer should find out how his neighbors stand on this great question and if there are those who do not understand it or who have been misled by mistaken criticism, write us when we will see to it that you are speedily supplied with literature.

WILLIAM HIRTH, Publisher.

WHAT MISSOURI NEEDS IS MORE ORGANIZATION

It was Saturday evening. The train that was to land us at home before midnight was leisurely making its way through the beautiful farming region of Southwest Missouri—a region unlike any other in this great state. On either side were well-improved farms, each with its grove of trees in the center of which was a house—yes, and more: a home. Back of this grove, or at the side, was almost sure to be a big barn. Perhaps, too, there were other barns or immense sheds for hay, for we were passing through a region where corn has no undisputed reign as king.

The surface of the land was only gently rolling—in some cases, most too flat for a wet season. It was beautiful, though, to look upon at the close of this cloudless early autumn day. As the September sun sank from sight behind the low hills beyond which was Kansas, the moon came up full-orbed and beautiful, flooding with its mellow light the wide prairie places. With only a little stretch of the imagination one could fancy that he looked upon the sea and that the lights, which one by one made their appearance in the farm houses, were from ships asail or from lighthouses along the shore. Always this figure of fancy comes to us as we travel through this level land. Especially is it true when we look upon the fields of waving wheat, of timothy or of prairie hay—the latter here plentiful. Sometimes, as the sun shines, cloud shadows float over this make-believe sea like magic ships, each guided by some unseen hand at the helm.

Pleasing as is the picture that fancy paints, it is not more attractive than that upon which we may in reality look. Surely this is a goodly land, largely made so through the worth and the persistence of the people whose homes are here—for nature did not favor it quite so abundantly, did not give to it a soil quite so deep and black, as she gave to some other sections. But she did give to it a citizenship unsurpassed.

Following the dark days of the Civil War there came to Western Missouri many men and women, strong and virile, from New York, Ohio, Indiana and other states to the east and north. These mingled with those from Kentucky and Virginia, not so numerous here as in the Missouri river counties. The two joining with the native Missourians whose very soul had been tried in the border warfare that here raged worst, nobly forgot the past as they built well and wisely for the future. Of such is the citizenship.

This diversity of peoples—yes, and their early struggles—applies with equal emphasis to the crops, many and varied. Here grew countless acres of "bluestem," or prairie grass tall and rank, and here the "longhorns," in great herds, were at home. It was a day of "soddies" rather than of silos. Oxen, three or four yokes working together, pulled primitive plows and slowly turned the tough sod. Crops of corn were planted. Time and again chinch bugs, grasshoppers and drouth came. The war, with its ravages, was over, but there were new battles to be fought and won. Some of the timid and less resourceful settlers, sick at heart and penniless, gave up the struggle. Others stayed. These willed to win—and won.

The growing of corn was not abandoned but new crops were introduced—crops suited to the soil and climatic conditions but less inviting to insect pests. The settlers who stayed had used their heads as well as their hands, had done some real thinking instead of determining to go ahead and farm "just as father farmed back in the old home state."

So it is in this section where the 66,430 bushels of flax that made up Missouri's 1915 crop were grown; where her more than a million pounds of broomcorn was harvested; where most of her 162,924 tons of prairie hay was cut, and where grows most of our English Bluegrass and much of our kafir, Sudan grass and the sorghums generally. Here, too, are clovers—red predominating, but with some of sweet, alsike, Japan and other sorts. And there are wide meadows of timothy and, perhaps best of all, some of alfalfa, soybeans and cowpeas. All these are grown in addition to corn, wheat and oats—yes, and Bluegrass. Never is there a complete crop failure as in a one-crop country.

The resourcefulness of the people and the diversity of crops had been proven at the splendid meeting we had that day attended. This was the sixth annual meeting of the Hudson Farm and Home Improvement Club. It was really a community fair, farmers' institute and neighborhood picnic combined, and seldom have we attended a meeting fuller of inspiration or that gave greater proof of the power of the people when combined and rightly directed.

"Some thought that we ought not try to have our little fair this year'," said one man, "as the season had been unfavorable, but we just didn't want to disappoint the girls and boys, many of whom had worked all summer in the hope of having something to enter. There (and he pointed to a big watermelon), for instance, is a melon grown by a little girl who week after week carried water to keep the vine alive. Do you think we would want to disappoint her? And there are others who worked hard, too. No sir, we can't afford to give our boys and girls—our best crop—a setback." This was the spirit of the occasion; this speaker was but the spokesman for many.

In the schoolhouse—a good schoolhouse, too—was a magnificent display of kitchen and pantry stores and of other work galore. But the real "display" was on long tables in the beautiful grove where a fine dinner was served with that best of sauce—hospitality. After dinner there was good music by the club orchestra, made up of farmers and trained and directed by a young farmer who only a few years ago came to make America his home. Speaking followed the music. Then there were games and contests for young and old. Ah, but it was good to see all the people at play and pleasure—none too dignified, too busy or too old to enter into the spirit of the occasion.

Among the many prizes awarded was one for the oldest couple. It chanced that in our four-mile auto trip from the train we had ridden with this splendid man and woman, whose combined ages total 154 years. But they are not old, not in thoughts. The wrinkles with which time has wreathed their faces are but the smiles of age. For more than a half century has this community been their home. As we journeyed out from town and as the car rounded a curve in the road below which spread a valley full of farms and beyond which were hills, the only ones in view, the car was stopped. Pointing to the hills, the good woman—the "better half" of that more than a century and a half—who helped win this region from the primitive prairie, said, "I call those my mountains and many have been the times when I have come up here and looked away toward them for help and rest and inspiration." As this nature lover spoke and opened her heart, even to a stranger, we thought of the hope once expressed by the late John Muir, the seer of the Sierras. Writing to a young friend, he said he hoped that she "would find that going to the mountains is going home and that Christ's Sermon on the Mount is on every mount."

So as our train carried us toward home at that day end and week end we felt that it had been a privilege to know more intimately such a land and such a people. And the thought came to us that what Missouri needs is more such organizations as the Hudson Farm and Home Improvement Club and the neighboring clubs that have grown out from it, not as competitors but as co-operators. Thus will be developed rural leaders, rural strength, rural pride and rural profit.

W. L. Nelson.

Have this even, healthful *heat* in your home—

No. 1. Heated "in spots" by stoves — **No. 2.** One-sided heating by hot-air furnace — **No. 3.** Evenly warmed by an IDEAL Boiler

The shaded portions of the rooms above show how much a house is heated when a cold northeaster is blowing

Study the above diagram! It is one of the best explanations ever produced as to just what you can expect from different kinds of heating—and it tells you *why* Radiator Heating is the *best*.

AMERICAN RADIATORS & IDEAL BOILERS

These diagrams show *results* and you will agree that the radiator warmed house (shown in No. 3) is the one way you want your house to be heated.

There is a direct rapid circulation of the heat from the fire to the Radiators—no matter how the wind blows! Then too, the IDEAL Boiler can be run with a *low* fire for chilly days or with a very bright, glowing fire for blizzard weather. Plenty of heat *all* over the house without coal-gas, ash-dust, lugging coal hods, or worry about the fire.

Basement or water pressure not necessary

IDEAL Boiler is set in cellar, side-room or 'lean-to'; and same water is used for years. Put an IDEAL Boiler and AMERICAN Radiators in your house *this* year. Call up the nearest heating contractor and ask him to give you an estimate. Don't put off any longer, suffering the chills of old-fashioned heating methods during these severe winters.

An IDEAL Heating outfit will protect and happify the whole family. It will keep away sickness due to chill spots and drafty floors. Less work than to run one stove. It will burn the cheapest fuel of your locality, screenings, lignite, wood, soft coal, etc.

Our IDEAL Hot Water Supply Boilers will supply plenty of warm water for home and stock at small cost of few dollars for fuel for season.

A No. 5-19-W IDEAL Boiler and 450 ft. of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

IDEAL Boiler fuel pots mix the air and coal gases as in a modern gas mantle, extracting ALL the heat from the fuel.

Write a postal now for "Ideal Heating" (free)

This booklet has full description and many illustrations—tells the whole heating story—send for your copy today

HEALTHY HOGS RESIST CHOLERA

Hogs are not as resistant to disease at this season of the year as they are in the spring when getting an abundance of green forage, and having access to a wide range. It is necessary, therefore, to give them more attention and better care to offset seasonal conditions and danger from new corn.

Do not feed in the same lot, or on the same acre of ground, day after day. This contaminates the feeding places, and also attracts crows, pigeons, and sparrows which may have been feeding with a cholera infected herd. Throw the feed out in a different spot each day, thus giving the pigs a clean "plate" from which to eat.

The water supply is of much importance to the health of the hogs at this time of the year. Old mud wallows are never good, but are not so bad if the hogs can have pure water to drink, but if forced to bathe and drink in the same "tub" serious trouble can be expected at any time. See that they have an abundance of pure water to drink, situated near the wallow holes or feeding places. Pure water will aid materially in keeping the herd cholera free.—E. R. Spence, University of Missouri, College of Agriculture.

THE STORY OF AN OLD FARM

Editorial Note.—If any reader has not read the previous articles in this series by Mr. Lyon he had better hunt them up and read them now to get the full benefit of what he has to say on keeping up the fertility for one hundred years. "It is interesting to note" says Sam Jordan" that while Lyon's farm has been in cultivation for over one hundred years there is no worn out land on it. Yet the hills are so steep that I would not know how to go about it to farm them. His system has and is producing gratifying results."

NUMBER 5

We have never made a practice of burning straw, corn stalks or weeds, in order to clear the land for breaking, although we have sometimes done so, one instance being last spring, when I burned thirty shocks of good corn fodder, and one time I burned some two tons of straw, but in both cases, it seemed that the time and labor necessary to remove the material, were more valuable than the straw and fodder as manure would be.

Certain it is, that I would never have done so thirty years ago, when I had so many bare places on the farm where neither weeds or grass grew. To balance this waste, I will say, that two seasons I cleared an acre or more of heavy thicket land, and did the work in July when the leaves were on. The bushes were piled in small heaps and these were loaded on the sled, hauled to some clay points and dumped off to rot down there, a little job that paid me as well as any work I ever did.

When we grew so much small grain that we failed to use the straw as bedding and feed, whatever was on hand when a field was to be broken, was scattered on the thin spots; this, of the wet half rotten stuff, the dry straw being put on bare spots on the unbroken fields.

There are many natural ravines or hollows on the farm, most of them being of such a character as to admit of their being crossed by farm team and implements, but all of them subject to washing when the fields are cultivated.

Blue grass is indigenous to this country, and in the three years between the seasons our lands are regularly broken for crops, the sides and the bottoms of these hollows get well set with it.

In breaking, we raise the plow and leave a strip of grass two to six feet wide where the water has to pass, but in the course of eight or twelve years of this practice, the natural bottom of such a hollow will become higher than the sides, and we may get two gullies instead of one, so this grass strip seldom stands more than eight years, when it is plowed with the rest of the field, the grass roots generally preventing washing.

In some cases I have hauled stone and built dams across ravines too large to cross with team, but the water tends to cut around such dams, and we find it a better plan to put one or two good loads of stone in a place and break them up well. I have patched four or five places, five feet wide and two or three feet deep in this way, so that we now plow across them, not touching the stone with the plow bottom. The stone catches the soil from above, the soil catches grass and weed roots, and in a few years a bad ditch is crossable, and what is better, the stone beds furnish good drainage.

In 1915 I saved tons of soil, by throwing a small locust log, eight feet long and six inches in diameter, across a hollow below its forks where two hollows came together, and making a sort of dam with brush and sticks.

I was surprised to see how much soil this crude dam caught, as the field above did not wash badly, and in July I sowed broom corn and millet seed on the field. Mr. Jordan can tell you what it looked like last August (1915), and I may say the soil is all there yet, with heavy grass growing on it.

On our steeper hillsides, we always sow rye instead of wheat, sow it early in order to get a good growth before winter, sowing a gallon of timothy seed per acre at the time of sowing the rye, with a seeding of clover in the spring.

The rye is not cut, and as we have some twelve acres not fenced, on this land it is not pastured. This twelve acres, being as Mr. Jordan said, "so steep I would not know how to go about it to farm," has probably grown more corn and tobacco per acre, and has made us more clean cash than any other twelve, or even fifteen acres on the farm, and a friend who has known it for fifty years says, "that land continues to get better year by year."

We use little manure on this land, and it is of a character that burns crops over fertilizer, yet the going down of the rye and clover, keep it in a high state of fertility, and absolutely prevents washing.

This series of articles has already overreached the original intention of the writer, and if I was on the institute platform before a MISSOURI FARMER audience, I could, in we will say an hours talk, tell of our methods and results with greater facility than I can record them here.

Fifty years ago, a thirty bushel per acre corn crop was considered a good one yet I have made a crop of eighty-three bushels by weight, in the '60s we seldom grew over eight bushels of wheat per acre, and my average, 1881—1897 was twenty-six and a half bushels, another of forty-five, and still another of twelve acres, forty-four and a half bushels per acre machine measure.

As a boy we grew 900—1100 pounds of tobacco per acre, and 1900 to 1906 our average was 1450 pounds, since that, two six acre crops of near a ton per acre. Last year tobacco was light, but we made 1300 pounds per acre, and count on 1600 pounds on seven acres this year.

As in the church service we may say, "We have done the things we should not have done, and omitted the things we should have done," but in the main, I think I can say without boasting few farms 125 years old are producing as good crops as this one of ours.

If there was not a family to keep, taxes, interest, insurance, and repair bills on farm buildings to pay, I would not fear to attack any worn down farm, and in ten to twenty years have it in a fairly good state of fertility.

I would expect to do this with cowpeas, clover, rye, sweet clover and perhaps soy beans, growing these crops, not for harvesting, but to go down on the land to seed future crops.

The man who has but a few acres of worn down soil, can, by beginning with cowpeas, growing a crop or two and letting them go down, then sowing rye and clover start the land on the up grade, and in a few years have it producing good crops.

Dairying is the quickest and surest way of building up worn land, but this is another story. C. D. Lyon.

For crime committed the penalty must be paid, some time, some how, some place by somebody.

If only the criminal had the suffering to do, it would not seem so sad.

SENSE AND NONSENSE

By Sam Jordan

If you think your neighbor not so good as you are, and not nearly so smart, your opinion differs widely from that of the country round you.

* * *

However, you are a very fair average.

* * *

Have you made a real estimate of yourself to find just how much you are worth to your community? Are you playing your best an honest part? Do you really think you are making the community glad to have you among them? If not why not go somewhere that you fit?

* * *

The quality of your neighborhood will attract the same kind of people. Good roads, good schools, good homes, clean fields and clean folks, will bring new-comers who like these things. Scrubs like scrubs and do not feel comfortable among any other.

* * *

Why has the world almost forgotten E. H. Harriman, the railroad man who had so many millions of dollars, and why will it never forget James J Hill, the railroad man with so many millions of dollars? Because in the gaining of their millions the one did not serve humanity, and the other one did.

* * *

Most people in this good old world have not been able to think out new ideas, but if we will just pick out the good old ones that some body else worked out, and make them a part of our life and action, we will not go very far wrong, will we?

* * *

Your "dreaming" may be worth while, even though you cannot "make your dreams come true." The great thoughts and ideas of the world have been worked out by dreamers who "made their dreams come true."

* * *

Did you ever notice how good our own children are, and how bad the neighbors kids are?

* * *

What angels the children would be if their neighbors had the management of them.

* * *

A man's credit is his greatest business asset, and his credit depends upon how good his word, not his bond, has been.

* * *

And did you ever notice that the man who will not pay his honest debts always dies poor?

* * *

Modern ideas are good nowadays in most every thing but politics. In politics the "ways of the fathers" are all that go.

* * *

Good Will Is Worth A Lot

If a passenger buys a ticket that entitles him to cross a state line he must pay about a half cent a mile more than the state rate. If you buy a ticket at Omaha or St. Louis for the east, or at Kansas City for the west the half cent is added even though in the two cases only the rivers are crossed and the other just the state line. Scores of people buy at Omaha to Council Bluffs then rebuy and at St. Louis to East St. Louis, and in going west buy only to the last point before crossing the line, then rebuy to destination. The people think they are imposed upon and that the railroads are taking advantage of a technicality.

The railroads have done much, at great expense to secure the good will of the traveling public, but it is a large question how much this practice has had in destroying the good will that has been secured at such an enormous expense.

* * *

Does it not look like a foolish thing for a parasite to kill its host, thereby destroying its own life? The meat packers are "killing off" the meat producers, and compelling the meat eaters to "let up" on eating meat.

* * *

Why can Congress not compel the packers to stick to the packing business the same as it compelled the railroads to stick to railroading, letting other lines of business alone? Or do the packers control Congress? Looks much like it.

* * *

A new farmers co-operative elevator at Sweet Springs, doing a fine business.

* * *

Why has the number of beef cattle in this country decreased from 50 million in 1900 to 37 million in 1915? Ask the packers!

In that time cattle production went down 25% and population went up 25%, yet less meat consumed by the 102 million people in 1915 than by the 75 million in 1900. Ask the packers why?

* * *

If the packers make small profits, how did it happen that the capital of one of them increased 800% in 17 years and others in a similar manner prospered. Now listen—If the Wall Street Journal is rightly quoted in 1915 Swift & Co. declared a dividend of 18.7 on their capital stock, Armour 55%, Morris 77.3% and Cudahy 17.6%. In 1914 Swift & Co. paid a dividend of $5,250,000.00 and placed $4,200,000.00 to surplus. Armour's net earnings in 1914 were $7,400,000 and in 1915 it was the enormous sum of $11,000,000. Yet producers lost money, and many were made bankrupt, and dressed meat prices went so high that many could not afford it very often. Maybe it can be seen from the figures as to how it all came about. Packers of course do not want any investigations by Congress, and it also seems that Congress does not want to investigate them, wonder why? Then what are we going to do about it? That is what the packers ask.

* * *

The packers are in almost complete control of the nation's food, but what are we going to do about it? Ask Congress to give relief when Congress does not want to render relief? Packers control if reports are true, the prices on all sorts of domestic meat animals, including poultry and poultry products, and very largely the dairy products. They control laregly the fruit and vegetable market, because they control cold storage warehouses and refrigerator cars, and terminal facilities. They control the fertilizer industry, and the shoe industry by controlling the price of hides. They control the industries where horns and hoofs are made into buttons, combs, etc., into glue. They control very largely the great city stock yards, and banks that lend money to feeders. They are great factors in controlling wheat and corn prices by manipulations on the boards of trade. They are in control largely of the output of cotton seed products, hence they have a barrier insurmountable at this time, between producer and consumer. But what are we going to do about it? That's what the packers want to know. Had we better ask Congress to investigate when Congress does not want to investigate?

THE CONSTRUCTIVE BREEDER

Most of us fail to appreciate what has been given us by the efforts of our forefathers. We are ourselves merely potentialities of our ancestors and therefore, periodic expressions in a never-ending strain of life. Life we now know to be guided and directed in some degree by the efforts of man and molded to meet his fancy for beauty, pleasure and profit. The theories and known laws of heredity have come to us through the experience of our forefathers and the research of modern scientists.

We see before us every day the fruits of these efforts. In the city streets we notice the sleek, attractive dappled gray or black horses moving immense loads with apparent ease. This power, weight, form, action and quality represent many centuries of selection which has finally molded this type of horse that the world pronounces today the greatest breed or draft horse, the Percheron. In a drive along a country road we admire a graceful, maternal, docile, fawn-like cow that we recognize as a Jersey, or the larger, more rugged, black and white kind known as Holstein-Fresian. These represent the animals that make it possible for the American farmer to supply with profit the necessary products from the cow, of milk, butter and cheese, to the city and farm home. The sheep that graze on the hillside are uniform in appearance and type; we know them as Shropshires, Southdowns or Merinos. Do we realize that the efforts of breeders of these animals are responsible for the clothes that we wear and the meat that we eat?

The breeder of livestock has, indeed, a calling of service for the welfare of humanity. The qualifications of a "true" breeder are those of a real man. The "master" breeder of livestock is rare; like the "master" painter, he is born and not made. We can become constructive breeders by study and application, but to be a "master" few can hope to attain. Can we learn anything from the lives and efforts of the men who molded our breeds? If so, what are the characteristics upon which their success was based?

Most significant of all is an inherent love for things that have life. In particular is this devotion associated with the special kind of livestock that is bred. In the breeding of livestock, as in almost every other phase of occupation, the specialist knows more about his animals and therefore can make better use of this knowledge. Devotion to the breed being bred gives pleasure and satisfaction through sentiment, but it also gives an intimate knowledge of the animals that are bred. Animals have their individuality as do humans; to know their qualities, both good and bad, is important. The breeder must weigh these qualities in his mind when mating takes place. Mating such animals that possess the greatest degree of merit in common and the least weakness, brings success when the ancestry of such animals are also of merit for the same characters.

The degree of success with which the breeder has purified his animals with reference to ideals of type and usefulness determines in a large measure the permanency of his efforts. Devotion to animals is therefore a trait necessary in the "master" breeder's character for pleasure and permanent success. Animals themselves seem to prosper and respond to devotion. The following quotation refers to Thomas Bates, one of the foundation breeders of the Shorthorn breed. "Those who walked with him in his pastures recalled how the cows, and even young heifers, would lick his hands and seem to listen to every gentle word and keen comment as if they penetrated its import."

The breeder is also an idealist to the extent that he pictures in his "mind's eye" his ideal. This requires imagination, because the ideal is not secured at once. Often its reward comes after years of effort and sometimes not at all. Truly, the breeder who can mold living flesh is an artist of rare merit.

Patience and steadfastness are traits that are well defined in these men. Success with no effort is rarely permanent and applies likewise to improvers of livestock. An ideal that is fixed and well defined usually is attained by the patient breeder. Along with these attainments comes honesty. Honesty in his dealings with himself as well as others is found in the breeder. Heredity does not follow the path of deceit, and the successful breeder soon learns that this is so. A breeder should be a close student of all things that will asist him. A thorough understanding of the requirements of the body in its nourishment, health and disease are fundamental. A knowledge of the kinds, amount and time to feed certain feeds is necessary. A good breeder is a good feeder and he always remembers that heredity will express itself only so far as environment will allow for its expression.

Knowledge of theories and laws of breeding are significant. With them the breeder can direct his operations with more certainty. In this respect the breeder of today has a greater opportunity than those before him, who had to rely solely upon their own experience for information. He is also a good judge of livestock and is able to carry a mental picture of an animal for years at a time. He makes a study of the ancestry of his animals and knows in detail their degree of merit.

His ideals are practical, his animals are produced with economy of production in mind and the special needs for which they are to be used. He is a man of business judgment, utilizing such feeds and pastures as are cheap and yet efficient for good results.

A study is made of the markets where his stock can be sold at a profit to himself and where the value of his stock will help others. A keen endeavor is taken in stimulating interest in behalf of improved livestock in the immediate community, at local fairs, at large fairs, at National and International shows. He is a regular attendant at these gatherings, meeting the men who are doing the things he is doing, learns from them their experiences of success or failure, and likewise gives them information when called upon. At these shows he studies the types of animals present and those receiving show ring rewards. He becomes familiar with these animals and their parentage. He exhibits his stock and is there with the idea of winning on merit. If he fails to receive an award he does not complain, but resolves to come back for another trial.

A breeder has resources from which to draw. Livestock means expenditure of money, but the "best" breeders have rarely began on a large scale. A simple beginning with gradual constructive forces at work is the surest and safest policy for the man who aspires to become a "master" breeder of livestock.—B. O. Severson, Pennsylvania Agricultural College.

BLIND MILTON DICTATING TO HIS DAUGHTER
From the original by Munkacsy, in New York Public Library

The Vision of the Blind

"Thousands at his bidding speed,
And post o'er land and ocean without rest;
They also serve who only stand and wait."

Was the spirit of prophecy upon John Milton when, more than two hundred and fifty years ago, he dictated those words to his daughter?

Did the "blind poet" have a vision of the millions of telephone messages speeding instantly over hundreds and thousands of miles of wire spanning the continent?

"They also serve who only stand and wait." The Bell Telephone is your servant even while it "only stands and waits." The whole system is always prepared and ready for your instant command.

Every wire and switchboard and telephone instrument is kept alive and responsive by an army of telephone workers.

Each one has his special part to do and, because he does it faithfully, countless messages speed throughout the length and breadth of the land, at every minute of the day and night.

AMERICAN ROYAL LIVE STOCK SHOW

The management of the American Royal Live Stock Show has provided a real thriller for the entertainment feature. This is a series of contests by cowboys, which will be given in Convention Hall five nights, starting Tuesday. The show itself starts Monday, Oct. 2, the judging taking place in the afternoons in the hall. At night, there will be parades of the prize-winning stock and the cowboy contests. There will also be at each evening program one or more horse show numbers, saddle and harness events.

The entertainment feature is a real wild west show. The impression seems to have prevailed that only in the broad expanse of Wyoming, and on the plains, could such an elaborate affair be conducted. But people who have seen horse shows and sports in Convention Hall at Kansas City know that the great arena of that building looks as big "as all outdoors," and that it is an ideal place for holding roping and bucking contests, and horse races. Harking back to the older days of Convention Hall, citizens remember the thrilling races in the classes for "4's" and the wild horse taming events.

There will be fancy and trick riding; bucking contests; cowboy and cowgirl pony races; wild burro racing; steer roping; fancy and trick roping; and many novelty events. Wild burros will be brought from Oregon, and longhorn steers will be shipped in.

The organization which stages these events is well established, and has a large following of the real thing in cowboy and cowgirls. There will be also many local entries, and entries of cowboys from nearby states, in numerous of the contests, but the success of the show will not depend entirely on such entries. The prizes attract the greatest experts. Homer Wilson of Mulhall, Okla., is manager of the show—and he's the champion roper of the world.

"Hogging Down" Corn

"Hogging down" corn is one of the most efficient ways of feeding the hog, in that it saves the labor of harvesting, provides exercise for the hog, and allows him to balance his own ration (a thing he can do better than the feeder) says the animal husbandry department of the college of agriculture, Lincoln.

Shoats weighing 100 to 150 pounds are turned into the corn as soon as it is well dented, and do best if they have access to an adjoining field of alfalfa. If this is not available, tankage may be fed in the self-feeder. When the grain is nearly cleaned up, the pigs may be removed and finished in dry lot.

Brood sows may take their place in the cornfield to finish cleaning up the grain. Alfalfa or tankage is used to supplement the corn and care being exercised not to permit the sows to remain too long in the corn, or eat too much tankage.

Pastures are commonly mown after most of the weeds have ripened seeds. That is almost a waste of time.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII September 15, 1916 No. 18

William Hirth, - - - Publisher
Geo. B. Ellis, - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

WHAT A FARM CLUB CAN DO

Sometimes we hear farmers say "we do not know anything a farm club can do" but if they would just get down to work they would find a lot of things they could do that would make or save them good money. Last spring we gave an account of the saving made by the farmers in the Hinton neighborhood in Boone County. By clubbing their order more than $50 was saved in the price of binding twine besides quite a lot on woven wire, flour and other things. By selling their wool as a whole a better price was received. Recently the club bought 10,000 pounds of flour at a saving of 52½ cents a hundred compared with the retail price, which made a total saving of $52.50 to the club.

Suppose this same rate of saving could be made in every one of the 10,000 school districts of the state. On this basis the farmers of Missouri would have a reserve fund of $1,500,000 coming absolutely as a windfall to their bank accounts. Most men will clearly see that this is only the beginning and that a saving of three or four times that amount can be made in most any district in the state.

Farmers, do you not think it is about time you should get busy? Will it do you any good to stand back and growl that some one has an axe to grind in this movement? The time has come when we must do something besides sow and reap our crops if we would get our share of the profits.

If THE MISSOURI FARMER could get the co-operation of 50,000 or 100,000 good farmers in this saving business we could give them a dollar for every cent that comes to us in subscriptions.

TWO DAYS FOR GOOD ROADS

The Governor has set aside two days, October 4 and 5 for Missouri good roads days and requests all road officers and all citizens to co-operate in improving the roads. The time is too late to do grading but there is a lot of work that can be done to good advantage if the people will turn out to do it. In places there are stumps and rocks that ought to be cleared off the road way and this is a good time to do that kind of work. There are many places where a new culvert is badly needed and if these two days were devoted to building concrete culverts all over the state perhaps more lasting benefit could be accomplished than in most any other way.

This is a good time to keep the roads smooth with the drag and it would not be a bad idea to have some one look after the dragging of all roads needing it on these days. The best time for dragging is just after a rain when the soil is moist but on these special road days if all the roads in the district which have not been kept in good shape by the use of the drag were smoothed over it would have some influence possibly on the people who have taken little interest in road dragging. There is no time of year when it is more beneficial to keep the road dragged than in the fall. Keeping the road smooth now will prevent ruts forming when the fall rains set in and if the road can be kept smooth until it freezes it will give a good road all winter.

Some neighborhoods have made good roads days a kind of social affair and the women prepare dinner and the whole neighborhood turns out to help improve the rough places and this is not only good for the roads but it is good for the neighborhood. It matters not whether we like the Governor or not we should show an interest in our community affairs and when everybody does that there will be great forward strides in this state. Every neighborhood, every county and the whole state need team work and to have team work that counts every man must find his place and then do his part.

IGNORANCE IN HIGH PLACES

It is astonishing how much ignorance there is among some of our public men concerning the every day practical things which are of benefit to the people. What has called forth this statement is a purported interview with a United States Senator, Hon. Thomas Taggart of Indiana, in which he flayed Congress for its extravagance in the appropriation of money. We think Congress needs lambasting for its extravagant waste of the peoples' money but all the money that is appropriated is not wasted and surely it is the business of a member of the United States Senate to investigate and find out the things which demand the aid of Congress. To show how utterly ignorant Senator Taggart is, he crticised the expenditure of money for the eradication of the cattle tick as a useless expenditure. Millions of dollar have been saved to the cattle raisers of this country by the work of the Bureau of Animal Industry in co-operation with the different states in eradicating the cattle tick. Before this work was under control frequent outbreaks of tick fever occurred throughout the principal cattle growing states and the loss was many times the annual expenditure of the Bureau in cleaning out the ticks. Gradually the line of tick infestation has been moved south and there are now thousands of square miles absolutely safe and free from ticks and without an outbreak of tick fever as compared with a former loss of hundreds of thousands of dollars. This free territory is found in most of the southern states including Virginia, the Carolinas, Georgia, Tennessee, Arkansaw, Missouri, Oklahoma and Texas.

One of the benefits accruing from this work has been to afford the cattle breeders of the North a place to sell their breeding stuff while on the other hand it has enabled the southern farmer to get the blood necessary to improve his cattle. Before tick fever was under control the work of improvement in the scrubby southern cattle was very slow but now cattle are coming to our great markets from that section that compare favorably with the beeves of the Central West.

There is a crying need for cutting down expenditures by our Congress and by our legislatures but appropriations that are productive of so much real monetary benefit are not the ones to cut down. If we had a few big cattle men and farmers in the National Congress they could easily put the politicians of the Taggart kind right on appropriations.

SHOULD ENCOURAGE SHEEP HUSBANDRY IN MISSOURI

We have frequently called attention to the natural advantages offered to sheep raising by Missouri and we believe at this time too much can hardly be said for the encouragement of sheep husbandry in the state. Just now the price of both wool and mutton is attractive to the sheep grower and it is the belief of those best informed on the outlook that good prices are almost certain for several years. At this time there seems to be a shortage in the number of sheep and in the supply of wool and it will doubtless take several years after the European war ends to make up this shortage.

The man engaged in growing sheep does not have the uncertainty before him of the fruit grower or the grain grower because these crops are so easily overdone. The sheep and wool crops are increased so slowly and the products being among the actual necessities that the farmer who engages in the sheep business can at least count on a reasonable profit.

If those who are cultivating the hillside land of this state have not already found out they are plowing too much they will find out sooner or later but it may then be everlastingly too late.

It is much easier to begin with a half-worn soil and seed it to grass than it is to do the same thing with a field with all the top soil worn away. We have thousands of acres of hillside land in Missouri, some of it in the better counties, too, which are already in the half-worn state. Sheep and other live stock with blue grass, clover, alfalfa and other forage crops will redeem these lands and make them profitable and it is about the only way it can be done. Of course with a system of intensive cultivation and expensive manuring it is possible to redeem most any worn out land but it will be another century or more before we have reached a condition of markets and human labor that will make such a system profitable.

The extension service of the department of agriculture in Pennsylvania has undertaken a project to build up the sheep business of that state and we think a similar service could be started in Missouri to the great advantage of thousands of farmers. During the last six years the production of wool has decreased about one-third in Pennsylvania and it is stated that the greatest cause of the decrease has been the ravages of dogs. Missouri has probably just about held her own in the number of sheep but the fact remains that we have room for ten times the number now found on our farms. Not every farmer is favorably situated for growing sheep but certainly a survey of most any neighborhood will show a number of farms that could grow a flock of sheep on the weeds, brush and feeds which now go to waste.

The extension service in Pennsylvania proposes to gather directly from the farmers who keep sheep, accurate data as to breeds, methods of handling, pastures, feeds, etc., and to have the accounts concerning many flocks showing the profits derived therefrom published in the farm papers and in the county papers so as to make the farmers thoroughly familiar with sheep husbandry and the reasonable profits of the business.

We do not know of a better way to create an interest in any industry, or in any line of lievstock production than to get first-hand facts from farmers and publish them so other farmers can study them. Without wishing to appear in the attitude of a critic of our own Missouri extension service it does seem to us that the one greatest weakness in the plan pursued is in the lack of publicity. Where one will read a circular or a bulletin or a circular a hundred will read a farm paper and if plain stories of what certain farmers are doing in any line were obtained by the extension men and furnished the farm press no reading farmer need be in the dark very long. We think the results of all the work that is being done and all the money that is spent could be many times multiplied if a wider and better system of publicity was inaugurated.

This last suggestion may be a little off the subject we started to write about in this article but will help to get more sheep on Missouri farms if it is carried out.

THREE BIG FAIRS

The people of Missouri have ample opportunity to attend a big fair and to see the best live stock and grains and the improvement that is being made in farm machinery and many other lines of industry.

The first of Missouri's big fairs this year will be the State Fair to be held in Sedalia, September 23 to 30 inclusive. There are many educational exhibits to see at the State Fair, in fact most of the exhibits are educational but we think one of the most valuable features will be the machinery exhibit. Farm power and machinery has become a very important factor in the management of farms these modren days and no farmer or farmer's wife should attend the fair without making a close study of the improvements management of farms these modern equipment of a home with some kind of improved heating system and lighting system will give the farmer's family the same advantages as the city folks enjoy and will do much to stop the unrest of country life. The gasoline engine that can now be bought for a very moderate sum can be made to do the hard work of washing, churning, house cleaning, wood sawing, feed grinding, water pumping, turning the grind stone and many other things that have made farm life a burden but now turn it into a continuous pleasure. Most all these processes will be in demonstration and will not cost a penny to see after you get inside the gate.

One of the attractive features at the State Fair this year will be the exhibit in the University building which our readers will find near the main entrance to the fair grounds. This exhibit will be made up largely from the College of Agriculture and School of Engineering.

The week following the State Fair the American Royal will be held in Kansas City, this is the greatest exhibit of purebred live stock in America, if not in the world and no young man can spend a week anywhere and gain so much valuable information about the leading breeds of live stock as he can at the American Royal.

The great St. Louis fair will also be held the same week October 2 to 7 and this fair being under the management of John T. Stinson, who for several years so successfully managed the State Fair insures a high class exhibition.

BARNYARD GOSSIP

We often here merchants complain about farmers buying by mail order. Now, suppose a farmer finds he can buy an article by mail for 80 cents that would cost a dollar at home he sends away 80 cents, pays the railroad 5 cents and has 15 cents out of the dollar left in his pocket. If he buys the article from the merchant for a dollar his pocket is empty, the merchant has 15 cents to warm his pocket and the 85 cents finds its way to the railroad and the manufacturer just the same. You have a richer merchant and a poorer farmer in the latter case but I fail to see how you have improved conditions any. The thing to do in this case is for Mr. Merchant to wake up and find a simpler way of doing business so as to cut down expenses, to co-operate with his fellow merchants in buying in larger quantities thereby getting better prices and saving in freight so he can make me a better price. I want the merchant to live but not altogether at my expense—I want him to render some real service for what I pay him. I am not willing that all the cost of the community shall be charged up to Mr. Farmer. We need merchants, we want to preserve the town, certainly we do but we do not want to put too heavy a load on Mr. Farmer to do it—else all we will have will be the shifting tenant farmer and he does not make the best customer for the merchant.

Do merchants think there is no way to compete with mail order houses? There is a way and merchants must find it or take the consequences.

But while I always try to defend farmers in their rights in buying where they can buy to advantage I do not overlook the fact that it is a good thing for a farmer to live close to a good live town. You can not have such a town unless the farmers patronize the merchants and co-operate with them in all matters looking to the public good. We have often pointed out the disadvantages of patronizing mail order houses and we believe that the farmers around any good town will find it to their advantage to buy most articles of ordinary retail merchandise from the home merchants. The competition is so sharp in most lines that goods are usually sold at a close margin. But when the buyer feels that he is not getting a fair price it would be better to quote prices to the merchant and compare the quality of articles and give him a chance to meet them. In most instances you will find you can meet the mail order prices and have the satisfaction of standing by your home town.

Recently the farmers of a Missouri neighborhood thought they were paying too much for flour. They clubbed their orders, went direct to the mill and the miller gladly gave them the same cut on prices that were given the grocery men and the farmers saved 12½ per cent on the price. Where there is a mill in a town what sense is there in the miller selling his flour to a groceryman in the same town at a price 40 to 60 cents a hundred below the price he charges the farmer. It is the grain grower who makes the miller and the miller should protect the men upon whom he depended. The greatest saving farmers can make in buying is, first, to club their orders wherever that is possible and then give the local merchant a chance to furnish the goods. But in buying heavy articles such as salt, coal, feed, grain, etc., the farmers can usually save money by getting in touch with the growers or dealers and by buying direct in car lots thus saving commission, storage and extra handling. This is a business however that farmers can handle only by and through farm clubs.

AT THE FORK OF THE ROADS

There shall be strikes and rumors of strikes. The railway men, the coal miners, the drivers of milk wagons, and the car men pass in continual procession in front of us, impressing us with the fact that the toilers of the city find it harder and harder each year to keep the wolf from the door. Once in a while, the spirit of greed dominates, rather than the spirit of need, but usually a strike is the answer to necessity. As food goes higher, wages must keep apace. But what of the toilers at the other end of the line? Are farmers getting rich as the price of food goes higher? Statistics say no. Who then profits from the toil of the men of the farm and the toil of the men of the city?

When the middlemen charge 54 cts. for carrying 46 cents worth of farm products to the consumer, it is easy to understand one reason for the high cost of living. Pirates once sailed the seas and took their tribute from commerce. The modern pirates don't sail the seas, but they get their tribute just the same. Shall we continue to live here in this "Land of the free and home of the brave" and allow the pirates of industry to exact their toll?

It was written in the Book, "The husbandman shall partake of the first fruits of his toil." The pioneer farmer took for himself the first fruits of his toil and so received his reward. When we sit down at the banquet table to partake of the fruits of our toil, the modern vampires worse even than the vampires of old mythology times, reach forth and snatch the fruits away. Mythology describes this vampire as a winged monster, ravenous and filthy, with the face of a woman and the body of a vulture; long claws and face pale with hunger. "Before it, every good thing vanishes quite." When whole flocks of these vampires circle above us, it is time for us to get together for protection. Our forefathers handed down to us the spirit of independence. The way for us to retain our independence is by being dependent on each other. We must decide to day. The crisis is here. We are at the fork of the roads. One road leads to the land of run down people on run down farms—to the land of poverty and peasantry; the other road leads to the land of plenty and prosperity. Which road are you going to travel. Are you waiting for directions? On the road which leads to the land of prosperity is a sign board, and on this board is written these two words: Educate and Co-operate. Educate ourselves so that we may bring science to our aid. Science is knowledge. Knowledge will enable us to maintain the fertility of our soil and to get the maximum returns for our labor. But we must do more than educate. We must do more than raise the big crops. We must get a just reward for it after we have raised it. We must co-operate if we are to get a square deal in the halls of the law makers and the markets of the land. Are our interests respected in either place? "Fall to each, whate'r may fall, The farmer, he must feed them all." Yes, we feed the world but we have little to say, even about the things that concern us. Is ours to be the lot of the toiler and nothing more? It was written, "In the sweat of thy brow shalt thou eat bread," but never was it written "In the breaking of thine heart." Is the spirit of freedom which burned in the hearts of the heroes of the Revolution, to die? Is ours the fate of the peasant farmers of the great nations of the past? Are we to descend to the plane of the peasant farmers of Europe and Asia? Hordes of toilers on the farms of India receive as little as 5 cts. per day. The Chinese farmer raises but little more than he needs to keep from starving. Is the time coming when the successful American farmer is to be the one who can live the cheapest? Some tell us the time is coming. Some say peasantry is in store for us. It depends upon us. We are living "in an age upon ages telling." Ours is the grand duty of deciding the future standing of the American farmer and the American nation. Are we to drift along in the course mapped out for us or are we to don our fighting clothes and fight a manly fight. If we can not make enough money to maintain our position in society, government, and the economic realm, we will have to descend to a lower plane.

Is there light? Yes, there is light. The dawn of a new era is here. Increased yields obtained by the application of science and labor saving machinery means increased profits if we get an honest market for those products. So ours is a bigger problem than growing two blades of grass where one grew before. After we have garnered the fruits of the soil we must co-operate so that we may get our reward.

But immediately there comes to us the mournful wail, "It can't be done, it can't be done." That's what they exclaimed when Columbus said "I am going to sail around the world. "That's what they exclaimed when Edison said, "I am going to talk along a wire." The way of the transgressor is hard. So, also the way of a new idea is hard. Say not that we can't co-operate. It can be done, it has been done, it is being done. With the fact staring us in the face that it is being done, some will still wail, "It can't be done." That is either foolishness or coward-

(Continued on page 12.)

MY 1917 MODELS NOW READY!

NO OTHER SPREADER COMPARES WITH IT

COSTS ONLY $87.50

JUST READ THESE 1917 IMPROVEMENTS!

They mean that every Galloway Spreader is **built stronger and better than before.** The beater bolts are 1-16 in. larger with lock nuts. Beater bar bolts increased in size and strength. Beater teeth longer and stronger than ever which means they now tear the toughest manure finer than ever and spread it easier. Heavier bolts hold the beater bars in the beater head Rear shaft increased in strength—higher carbon steel used. Additional bolts strengthen (beyond actual necessity) the beater bracket. Larger drive sprockets, which mean **lighter draft than ever.** The fifth wheel castings are larger and increased in strength—spreader box **steadier in turning.** Rear conveyor shaft now made of No. 40 carbon steel. All steel tongue. All metal parts thoroughly coated with asphaltum weather-proof paint. Spreader box better finished and painted.

Galloway WIDE SPREADING V-RAKE on every machine WORTH $15 on any spreader, COSTS YOU NOTHING EXTRA. INVINCIBLE, IRRESISTIBLE, PATENTED ROLLER FEED—an EXCLUSIVE GALLOWAY FEATURE, makes it SUPERIOR to all other feeds on all other machines—the SECRET OF OUR LIGHT DRAFT. The mechanical principle is the same as MOVING A HOUSE ON ROLLERS. THIS FEATURE ALONE WORTH $25 on any spreader, EXCLUSIVE AGAIN on the Galloway, costs you NOTHING EXTRA. PATENTED AUTOMATIC STOP, uniform clean out push board, WORTH $10 EXTRA on any spreader, EXCLUSIVE on the Galloway, costs you NOTHING EXTRA. These are a few of the features you will find on the Galloway, which are PROTECTED BY GALLOWAY PATENTS. Don't buy a spreader of any make or kind until you have tried a genuine GALLOWAY 1917 MODEL No. 5, No. 1A or No. 8 at our risk, without obligating yourself in any way. Thirty days' field trial and returnable to us within one year if not perfectly satisfactory. Remember, we manufacture this spreader in our own factories and sell it direct from factory to farm. Do not confuse the Galloway spreader with lower priced machines made to sell for a price, which are all cheap, worthless imitations. Over 60,000 Galloway Spreaders in use. These and other features make the Galloway Spreader more invincible than ever in actual field work. No big, cumbersome, four-horse team or three-horse team needed to handle a Galloway. Two average horses can spread with the Galloway anywhere.

Complete particulars and details of this 1917 model spreader now ready.

A Postal Gets These Two Books---Write Today

Which tell the whole story. No. 1 is my 250-page four-color catalog. No. 2 is my 100-page fall supplement to the big spring book. **YOUR** copies of these books are now ready to mail. **Ask for yours today.** Remember a postal gets them. **They will save you from $100 to $200** on your fall purchases because they are crammed full of standard quality merchandise priced at **one small factory profit. Gasoline engines, farm tractors, farm implements** of all kinds, household goods, clothing, sewing machines, furniture, kitchen utensils, **automobile accessories, sporting goods,** shotguns, ammunition of standard high quality makes and grades, all priced to you at **one small profit** based on **great volume.** Ask for these books **now!**

Box 593 WM. GALLOWAY, Pres., THE WM. GALLOWAY CO., WATERLOO, IOWA

Solve the drainage problem. Write for free book and letters from hundreds of farmers telling what they do with the Martin.

THE Martin O.D.&G.CO.

Farm Ditcher and Road Grader

cuts ditches, throws up terraces, levels bumps, fills gullies, makes levees, builds roads. All-steel, adjustable and reversible for wide and narrow cutting. 10 days' trial. Money back guarantee.

Owensboro Ditcher and Grader Co., Inc., Box 311, Owensboro, Ky.
Branch: Traders Building, Kansas City, Mo.

Indoor Closet

More Comfortable, Healthful, Convenient

Eliminates the out-door privy, open vault and cesspool, which are breeding places for germs. Have a warm, sanitary, odorless toilet right in your house. No going out in cold weather. A boon to invalids. Endorsed by State Boards of Health.

ABSOLUTELY ODORLESS

Put It Anywhere In The House

The germs are killed by a chemical process in water in the container, which you empty once a month. **Absolutely no odor.** No more trouble to empty than ashes. Closet absolutely guaranteed. Write for full description and price.

CO-OPERATIVE LIVE STOCK SHIPPING IN WISCONSIN

For several years the marketing of livestock was an interesting problem to me. It had always seemed to me that there must be some method by which a farmer could get his stock to market without putting a profit into the pocket of a local buyer. The farmer was the one man who "got his" both going and coming. I know of no place in marketing that the farmer sets the price upon his product. In other lines of work the producer usually sets the price on his wares. Prosperous farmers in every community have for years shipped their own stock to market provided they were fortunate enough to have a car load. In our little community we reasoned that if it was profitable for the farmer who had a car load of his own livestock to ship, it would be profitable for several farmers to go together and make up a car load and ship it. Our experience has proven that our reasoning was correct and that all that was needed was an organization and system to make it effective.

Our organization is very simple, consisting of a group of farmers who have agreed between themselves to ship their livestock together. This group got together in November, 1913, decided to give the plan a trial and selected a president, secretary-treasurer or manager, and yard man.

A farmer who desires to ship stock with us must list his stock with the manager. The manager keeps a book in which he puts down the name of the farmer, the number and kind of animals he has to ship, and the approximate weight. One farmer may have a dozen hogs, another twenty hogs, another one hog, another a calf, another a cow, etc. When the manager sees from his book that he has a car of hogs or cattle or sheep, as the case may be, he steps to the telephone and calls the railroad company and tells it he wants a stock car on a particular day. He then calls up the various farmers who have stock listed and tells them that on a certain day they can bring in their stock. On the day appointed the stock is received at the yard by the man hired for that purpose, who weighs the stock and marks it. He keeps a list of the stock, the weight and the mark that has been given each shipper. The stock is then loaded and shipped either to Chicago or Milwaukee depending upon the size of the load, the quality of he stock, etc.

When the stock is received at the central market it is unloaded, fed and watered. If it is a shipment of cattle the cattle are sorted according to owners. If it is a shipment of hogs they are sorted according to grade. It is possible to sort hogs according to owners also but the result is a heavier shrinkage than by doing the other way. The stock is sold and weighed and the commission house to whom the stock was shipped deposits the money in a bank to the credit of the Shipping Association the day the stock is sold.

You may ask how does the commission man know how to sort according to owners? The manager prepares a shipping bill the day the stock is shipped setting forth the name of the owner, the weight of his animals and the mark. This shipping bill is mailed to the commission house handling the stock in the central market and reaches there as soon or sooner than the shipment. After the sale in the central market the commission house makes a report of the sale to the manager of the association, in which he sets forth the amount charged for freight, yardage, commission, insurance and feed and this is deducted from the gross amount of the sale. Upon receipt of the report from the commission house the manager prepares his sales sheet in which he sets forth the home weight, the central market weight, the central market price, what the individual's stock brought at the central market, the individual's share of the central market expense, the charge against the individual for feed put in the car at home and the charge against the individual in the way of commission to defray home expenses, and the net amount due the individual. He then prepares a statement for each individual and draws a check for the amount due.

It is a very simple matter to make out the sales sheet for a shipment of cattle because each man's cattle are weighed separately at the central market. In the case of hogs this is not the case and it is necessary to pro rate the shrinkage using home weights as your basis. The central market expenses are pro rated on home weights but it can be done on the central market weights just as well.

The charge for feed put in the car before the car leaves the home market is based upon the number of animals in the car. In the case of hogs the usual charge is from five to eight cents a hog, depending upon the amount of corn put in the car and the number of hogs in the car. To cover the home expenses and create a small reserve fund each shipper who belongs to the association is charged three cents per hundred upon cattle and hogs and fifteen cents a head on calves. If the shipper is not a member of the association he may ship by paying five cents per hundred commission on cattle and hogs and twenty-five cents a head on calves.

The revenue raised in this way goes into the treasury of the association and pays the manager his salary, the yard man and helpers for their labor, and the losses that occasionally occur through the loss of an animal by death en route or the lessened value due to being crippled en route. To charge the loss of a hog up to the car in which it was shipped would be a great hardship on the other fellows who happened to be unfortunate enough have hogs in that car, but by our method the individual shipper does not know that there was a loss unless he happens to see the sales sheet that comes from the central market.

Now, what about results? During the past year we shipped fifty-six car loads of stock as against forty-three in 1914. One hundred and fifty-five different farmers used the association during the year 1915. One individual shipped with the association during the past year nine different times, others six times, some five times and so on down to those who tried but once with the assurance that they would come again as they were well pleased.

It is difficult to say how much money has gone into the pockets of the farmer that would not have gone there had he sold his livestock at home, but I believe I am safe in saying that from five to twenty-five cents per hundred more. I have had men tell me that they have made twenty-five dollars on a single shipment but I believe these to be extreme cases and rare. The shipper stands a chance of losing as well as gaining unless the manager watches market conditions quite closely. If the load of stock gets into the central market and strikes a drop of twenty-five cents per hundred the shipper will probably wish he had sold to the local buyer.

Time does not permit me to go into the subject of preparing stock for shipment and other phases of the subject. But I find that the farmer who is using the association is watching the market closer than he ever did before and is getting to know livestock values better than he did before and you cannot offer him any old price and expect him to take it.—R. M. Orchard, in the Banker-Farmer.

ARE YOUR CROP YIELDS DECREASING?

There is no system of farming that can be considered entirely satisfactory that does not increase or at least maintain the fertility of our soil. Occasionally conditions arise that prevent us from taking the future into consideration as much as is desirable. In periods of low prices or when a large mortgage is staring us in the face, we are forced to cropping practices that we will discontinue when market prices become normal or when our debt is reduced to a safe minimum.

Farmer Must Know "Whys" of Handling Soil

There is nothing that can do so much in a business way for an undertaking, as a clear understanding of the facts and principles, which if intelligently adhered to and applied, lead with certainty to success. This holds true for the proper handling of our soils. Our system of farming in the past has been, and in the present is, to a large extent to crop our land without giving any study to the soil. Before we can successfully manage any soil that is to produce large yields permanently, we must understand the underlying principles of soil management. We must know the "whys and wherefores".

No land can produce large crops for any length of time without special care and treatment. All our poorly managed soils show a decrease in their crop producing power. While on the other hand soils that have been given good treatment not only retain their fertility, but show a gradual increase from year to year. These are not mere suppositions. They are facts. Look into the agricultural history of any community and we find that soils that have been given proper care, such as proper tillage, crop rotation, the turning under of green manure crops, the addition of the available barnyard manure and an occasional application of lime, are producing as much more or more than formerly. While the same kind of soil in the same community with poor care and treatment is producing crops that are no longer considered profitable.

Growing Crops, a Feeding Problem

The business of producing crops on any soil is primarily a feeding problem. As we look upon our green pastures for feed for our livesock, so we must look upon our soil as a pasture from which our crops obtain their food. Plants feed and they get their mineral food from the soil. The little plant roots, with their root hairs, push their way between the soil particles; and our crop yields are always in proportion to the success the roots have in getting food from the surfaces of the soil grains. Each crop has certain set requirements for its best development and it is the business of the grower to find out what these requirements are and then see if his soil can supply them; and if not, what steps are necessary to obtain them.

For best crop production, we must develop or have present in our soils three fundamental conditions. These are:

1.—The presence of an abundant supply of plant food material, not necessarily available to our crops but which becomes the business of the farmer to make available from year to year.

2.—A good supply of humus, which is not so much an element of fertility but rather a releaser of fertility.

3.—Our soil must be in good tilth or crumb-like condition.

What Causes Loss of Fertility?

Since then even our poorer soils contain sufficient mineral elements of fertility, what then causes this loss of fertility? If we examine a sample of one of these soils that have gone backward, we find it gray in color. It lacks that characteristic black color that we associate with a fertile soil. It breaks up in the field into hard clods even with the best cultural methods and in periods of drought crops growing on it suffer very quickly. The soil constituent which is lacking or has been reduced in these soils is the organic matter and humus.

Humus is that black waxy substance resulting from the breaking down of the organic matter in our soils. It is that substance that gives to our soils the characteristic black color that the farmer associates with a fertile soil. For many years prior to the time our soils were cultivated, they were covered with vegetation, grasses, trees, etc. These died from year to year and decayed on the ground. They became mixed with the mineral portion of our soil. Rains washed part of the material into the soil and together with the decaying roots our soils became well stocked with this vegetable mold and humus. They were productive when we first tilled them, due to then humus content and are becoming less productive due to this loss of humus.

Why Humus Makes the Soil More Productive

It has been said that humus is the life of the soil. It not only contains plant food material necessary for crop production, but in the breaking down of the vegetable matter organic acids are formed. These acids in turn work upon the mineral constituents of the soil and dissolve them so they charge the water surrounding the soil particles, where the root hairs have easy access to take up the plant food and build up the growing crop. It is in this indirect fertilizing capacity that we must look to humus in bringing up our worn out soils and poorer soil to a higher state of fertility. These soils contain the plant food but it is locked up and and our problem is to release it.

Humus also improves the physical condition of our soils. It increases the water-holding capacity and aids materially in putting our soils in good granular condition. It makes our heavy soils more friable and much more easier to work. With our sandy soils it lessens the tendency to blow and binds the individual soil particles together.

Good Tilth

In addition to having a good supply of plant food material and humus, we must also have our soil in good physical condition. Our soil must be in a good mellow condition so that our crops will develop root systems large enough to take enough plant food material to support a large crop. The roots are the foragers for the part of th crop that grows above the ground and the first requisite for a good strong vigorous root system is plenty of room. Our soil must be in such condition so that the roots can force themselves between the soil particles in their search for food without too much exertion. When the soil particles are close together as they are in our heavy clay soils a good root system cannot develop. Crops grown on soil in this condition are first to suffer from both lack of water and plant food.

A soil in good tilth has an open crumb-structure. The Individual soils particles are grouped into compound grains or crumbs, allowing space for root development not only between the particles themselves but also between the crumbs. The roots can push down through the soil with ease and come into intimate contact with the surface of the soil particles where the film water is charged with plenty of plant food. Each compound grain acts as a sponge taking in water and holding it against the force of gravity until the crop is ready for it. The surplus water drains off readily due to the larger channels between the soil crumbs. Ventilation is better as we have a condition developed which is not only favorable to the development of a large root system but also to the development of the activities of the various soil organism which are so necessary for the maintainance of soil fertility.—C. V. Ruzek, Oregon.

BLANCHING CELERY

Proper blanching is half the battle of successful celery raising. Most markets refuse the unblanched article entirely and those of us who grow it for home use know that green celery is unwelcome on the table. The heart blanched by the plant itself is much better, and properly blanched celery is all heart.

In the "new celery culture" the plants are set six inches apart each way in beds, so only the outer rows need shading, for blanching is really another name for shading. The plants are sometimes grown in double rows so as to reduce the labor and material to half of what is needed when single rows are used.

No matter which of the many methods of blanching is used the proper time is always the same—when cool fall weather has come to stay. Banking before hot, burning weather is over may induce rust, especially if earth is used.

Earth is the best and commonest blanching material as it is usually the cheapest and imparts a nutty flavor not secured without it, but its use makes it necessary to set the rows or beds far enough apart so plenty of earth for banking can be secured.

Hilling may be done by hand with a small turning plow or with a celery hiller, but when horse tools are used, it is usually necessary to finish the work with a hand hoe. A better job can always be done if tillage throughout the season has been so thorough and judicious that the soil is fine and easily handled.

The earth should cover the entire plant below the lower edges of the leaves in such a way as to drain the plants well, as too much moisture will result in dirty and perhaps rotten celery. Special care must be taken never

to hill or handle the plants in any way while they are wet. As the plants grow and the soil settles, a little more earth may be added to keep the mounds up to the leaves.

The greatest economy of garden space may be secured by using blanching boards, held together at the top by stiff, wire hooks and at the bottom by a little earth banked against them. The same boards can be used several years if carefully stored under cover, so the cost is not excessive.

Some less usual methods include the use of a drain tile carefully placed about each plant; building paper or even newspaper wrapped around the plants; and individual patented veneer sheets, similar to those sometimes used in protecting young trees from rabbits. These individual methods, however, require so much work, care, and patience that they are unprofitable on any but very small plantings for home use. Earth blanching is best, especially for the late crop.—J. S. Gardner, Missouri Agricultural Experiment Station.

FARMERS WANT A FAIR MARKET

Whereas, on about June 19, 1916, our Government did post advertisers (in Kansas City, and other places), for bids on 62,000 and odd, horses and mules, and in so doing, some corporation did get the contract to furnish same, said corporation not having said number of horses and mules, must purchase same from the farmers or producers, said corporation immediately sends out buyers with established price. Farmer or producer must accept said established price, or keep said horses and mules.

Therefore, be it resolved that this Farmers Club does condemn such a practice by our Government as tending to create a combination in restraint of trade, and be it further resolved that in the future when our Government needs such supplies, we recommend that said Government advertise for same, and throw the market open to all competitors alike; to the end that every producer may offer that which he hath to sell, and receive the same consideration from the Government, purchasing agent, inspector, as any other individual or corporation, thereby permitting each and every citizen to exercise his inalienable right to compete in the market.

And be it further resolved that we recommend that our Secretary forward a copy of said resolutions to our representative at Washington, Mr. C. W. Hamlin, and urge that he endeavor to obtain legislation to this end.

And we further recommend that our secretary forward another copy of these resolutions to THE MISSOURI FARMER at Columbia, Mo., and urge and request that he co-operate with us, in obtaining such legislation by communicating with other Farmer Clubs of this state, and ask their concurrence in these resolutions, to the end that all of Missouri's representatives in Congress may unite to obtain such legislation.—Elm Park School District Farm Club, D. M. Stoll, Sec'y.

JUST AS IT HAPPEND

The two boys and I were busy putting up hay, with Bob Broxton assisting at $2.25 per day of twelve hours. The boys and I worked fifteen hours, but Bob came rather late and had to get home before sundown, for Mag, his 186 pound wife, is "afeard of haunts."

Just seven candidates called in the four days we were haying, and each one took up at least an hour's time of three men, for son Bill is too young to vote and he worked on while the candidates told us three voters why it was necessary to vote for them.

Bob was more deeply interested in the talk than either son Sam or me, for we only pay $46 tax a year, while Bob does not pay any, and as he has four dogs, the prospect of dog tax worries him.

* * *

The fourth day, just at 10 A. M. up drove the preacher, his wife and three children in their new automobile. He came to the field and insisted that we keep on at work, but as Bob swears so awkwardly and so frequently, I lied, and said we were not so busy anyway, and went to the house with him, all the time with a "good eye Jerry" on the mean looking cloud in the northwest.

As we were eating dinner at 12:30, the thunder began to roll, and Bob, who was seated just as far from the preacher as we could possibly put him, said "—— —— ——"; my sentiments exactly, but by telephoning for Jones, and all of us but the preacher putting in two hours of the fastest work on record we only got about a ton of our best hay well soaked, and I did not care much, when I heard next day that the preacher stuck in the mud a mile and a half from town, going home.

* * *

The next imposition practiced on us came thus. About dark a young man came up to the house and asked my wife if we could keep him all night.

She has considerable confidence in my ability to judge a man's character, and after I had pried myself loose from the Jersey heifer I was milking for the first time in her life, looking the young man over and asking him if he was selling patent medicines or fruit trees, I told him to go up to the house, sit down on the porch and rest.

Supper was over, but the girls and wife lit up the oil stove, cooked him some ham and eggs made him a cup of coffee and gave him a piece of pie. The boys and I got in at 8 P. M. and a little inquiry proved that our guest was selling a book; a Guide to Success at $2.65; $3.90 in full morocco, in order to get money to put him through medical college in Virginia! !

* * *

The next morning wife and the girls subscribed for the book—$2.50 in cloth, the 15 cents reduction representing the agent's idea of pay for a bed and two meals. Three weeks later, another fellow delivered the book, and there in black on white, on the medical students order book, was my wife's order for a copy in morocco binding at $3.90, and hang me if he did not bluff the folks into taking it, for for I was not at home.

The sum of $1.40 was too small to pay to chase the fellow, but he has played the same game at other places. I could enter this in the profit and loss column:

Dr. To Seven hours, Bob, Sam and self, candidates	$3.75
Dr. To One ton hay spoiled, acc't of preacher	11.00
Dr. To Amount stolen acc't of Book Agent	1.40
Dr. To Two meals, Book Agent	.70
	$16.85

* * *

We had some twelve squares of roofing to do, and the pirate who runs the local lumber yard, asked me $4.25 per thousand for shingles, so I told the boys that we would use a felt or rubber roofing, and another home talent pirate wanted $2.40 per square for 3 ply. It is only 50 miles to a good city and there I went, at a round trip expense of about $4.00 buying from a reputable concern, fifteen rolls, mill end 3 ply roofing at $1.10 per square

Gray had paid $20.00 per thousand feet at the lumber yard for a lot of miserable cull stuff, so it was me for the train again, and for a saw mill fourteen miles away, where they sold me good mill culls at $12 per thousand, and the railroad charges on 1000 feet was $1.50 to our station, one square from the lumber yard. I measured it up when piling it, and had 1125 feet, while Gray complained that his fell short 75 feet.

* * *

The mill end roofing fell short from 10 to 12 per cent, as I expected it would, in all other respects it was as good as what Gray paid $2.40 for, and he had the same as I did, twelve rolls or squares. We will now compare our bills, as this time the profit and loss account is in our favor.

Gray—	
12 squares roofing at $2.40	$28.80
1000 feet lumber at $20	20.00
	$48.80
Us—	
12 squares roofing at $1.10	$13.20
Trip to city	4.00
Freight on roofing	.90
R. R. fare to saw mill	.45
1000 feet lumber at $12	12.00
Freight on lumber	1.50
Shortage in roofing	1.50
	$33.55

Only $15.25 saving, or if we add $1.40, the value of the extra lumber sent us $16.65, not to charge him with $1.50 shortage in his lumber—we both paid cash.

Brother farmers, do you know that very little organization would save every one of us many dollars a year.

Eli Kirk.

NATIONAL HOLLOW TILE SILOS

LAST FOREVER Test of years has proven the strongly re-inforced Tile Silo to be the most permanent, efficient and economical Silo in use. **Cheapest to Install. Freedom from Trouble.** No repairing or upkeep. No painting. No blowing in or blowing down. No cracking. No rusting or rotting. No freezing.

Write today for information—Prices.

Fill out coupon and mail to us. You will get the information by return mail. Get started on your silo NOW. Prices: 12x30, $169 14x30, $211 16x35, $224 18x35, $242 20x40, $313

NATIONAL TILE SILO CO. 511 R. A. Long Building, Dept. A. Kansas City, Mo.

I expect to build a silo about..... tons capacity..... feet in diameter by.....feet in height, about the month of..... Please send me information and prices.

Name..... Address.....

DO YOU SEE THE BEAUTY ABOUT YOU?

A long time ago a Grecian philosopher, Aristotle, said, "There is a relation between the beautiful and the good." This statement is just as true today as when first uttered. It is undoubtedly true that the desire for the beautiful, as seen in well kept city homes and in the splendid parks, has had its influence in causing many to move from the country to the city. This is true in spite of the fact that in the country there is beauty so superior that all the city can hope to do is to approach rather than equal or surpass it. The great trouble has been that our eyes have not always been trained to see this beauty. Did you ever have a stranger, as he passed your farm home, say, "What a beautiful, well kept place over there"? If so, you have felt a thrill or satisfaction, the value of which can not be measured in dollars and cents. Have you ever, as you turned in your own front gate, thought that here is one of the most attractive places I have seen on all the day's journey? If so, it is probably such a place as will continue to appeal to you and to your children.

Where do you and the members of your family find your recreation, pleasure and entertainment? When you have a few hours time to use just as you wish, do you take the children to the moving picture show in the nearest town, or do you, with an inviting lunch, go to some attractive spot in the country for a little picnic or outing? The manner in which the child spends his vacation will have much to do with his ideas and ideals in later life. The boy who knows nature, who has been taught to appreciate the beautiful in the country, who knows the many likely fishing holes where the perch or cat bite best, who can name the birds that he sees or hears sing, who can build a good camp-fire and fry bacon over the coals, will be very much more apt to stay in the country than will the child whose idea of entertainment is confined to the picture show, the circus or the store.

What the country needs most is not so much more beauty as a greater appreciation of the beauty that is there.

W. L. Nelson.

PEACH TREES CUT BACK NEED SUMMER PRUNING

In many parts of Missouri fruit buds of the peach were killed by late frosts. As a result of this the trees were usually and properly pruned back severely to renew this year's growth of wood lower down.

As a result of this heading back and the moist season, the trees are making an unusually vigorous dense growth of new branches. In order to secure the best form of tree according to the experience of the Missouri Agricultural Experiment Station this dense growth of new limbs should now be thinned. If all these branches are left crowding each other, they will fill the center of the tree which will result in their being shaded and weakened. This will prevent the proper fruit bud formation in the body of the tree.

Enough thinning of the dense branches in cut back peach trees should be done to open up the center of the trees to admit sunlight and air. Space the branches so each one will have room to make full development and mature its fruit buds for the coming season. Pruning should be most abundant in the center of the tree in order to form rather an open center and to encourage the formation of a low, wide, spreading head. The tendency of much of this new growth is directly upwards. In many cases strong inner branches growing straight up may be tipped back to outward growing side branches to secure lateral spreading form of the tree.

Give this strong new growth plenty of room and light and a fine crop of fruit buds will result next year, but if they are too densely shaded, the fruit buds cannot develop and mature to best condition.—J. C. Whitten, Missouri College of Agriculture.

No permanent system of agriculture has yet been devised which did not include live stock, and agriculture is the basis of our bank accounts. Upon it rests the commerce which feeds and clothes the world the transportation which distributes where needed and the banking systems which pay the bills. The prosperity of the farmer is the prosperity of the world and live stock is its carburetor.—I. D. Graham.

AT THE FORK OF THE ROADS

(Continued from page 9.)

ice. They say we can't stick together. I say we can stick together if the right sticking stuff is used. What is the proper sticking stuff? Necessity. Necessity pointed the Danish farmers toward co-operation; necessity points us in the same direction. Necessity pointed the toilers of the city toward co-operation in order that they might live; necessity drives us to co-operation in order that we can have more than a mere existence. The Mills of the Gods grind surely. So do the mills of the packers. They are grinding us down to the point of action. The challenge for a fight to the finish is flung into the teeth of each farmer of America. Are you going to fight or lay down?

When I look into the faces of the farmers gathered together in the school houses to organize, the whipped cur look is not there. On every face is stamped the same indomnitable spirit of the countryman, which in the past has conquered the wilderness and made this country the crown and glory of the nations. The call to day is for men.

"Men to match the mountains,
Men to match the inland plains."

The Macedonian call goes up from every country home in the land. How well we rally to the call will tell the story, for we are living "in an age upon ages tell, in a grand and awe full time."

B. P. Smoot,
Centralia, Mo.

SOME PRACTICAL QUESTIONS

To The Missouri Farmer:

I want to drill rye on my corn for fall and spring pasture and to improve the soil. To make it more valuable I want to sow hairy vetch with the rye and plow all under in May. Where can the culture or bacteria for inoculating the vetch be obtained? Would soil from an alfalfa field inoculte for the other legumious crops? Since the bacteria is similar I thought it might be possible to use the alfalfa soil in the spring on land to be sown to soy bean or oats and vetch. Where can I obtain lime for liming old corn ground to get it in readiness for seeding to alfalfa. I have been fairly successful with alfalfa but after taking every precaution as to seed bed, seed, etc. I find it difficult to get a really good stand.

The last issue of "THE FARMER" contained an article that gave me exactly the help needed in saving the hay—the idea of leaving it and letting it heat without being disturbed is contrary to general practice but is exactly what I had thought to be the right method but very few know this. Lyon's Practical Farm Papers gave it very explicitly and I greatly value the suggestion or advice.

I have one field of 35 acres that slopes in such a way that I find it difficult to farm it so as to prevent washing and the major part of the land is too valuable to put into pasture. It is largely rich branch bottom but rises to a point. The corn washes out on the slopes and covers up in the bottom to a great extent. It would lend itself perfectly to terracing and that would solve the problem but where can the right help be obtained for this work. This would not be done until spring as it has a corn crop on it at present but I should like very much to do this work the coming season.

In preparing a yellow clay hill-top for a lawn I will plow deep and dress heavily with barnyard manure—clean manure from fattening cattle pens—disk in and work down for a seed bed. Now, I would like to know what else I should do to prepare for sowing blue grass this fall. The top of the hill was graded somewhat for building which of course leaves only clay but I have a spreader and as much manure as needed. If you can suggest a fertilizer, kindly tell me what kind and where to obtain it. Although I take and read a number of farm papers, I see very few advertisements of fertilizers except ready prepared and practically none for cultures for the legumes.

Hattie D. Sutton.

Sowing rye and vetch in the corn to afford fall and spring pasturing and to give a cover crop for the protection of the land is a most excellent practice and ought to be more generally practiced than it is. Just now vetch seed is so high in price that it is doubtful if farmers can afford to pay the price but it is a good plan to sow rye alone. If farmers would try they could grow their own vetch seed and solve that problem. Hairy vetch or winter vetch as it is sometimes called is the only variety to sow. For the culture for inoculating vetch write the bureau of plant industry Department of Agriculture, at Washington. A number of firms make these cultures and sell them at a reasonable price.

The bacteria from an alfalfa field will not do for vetch. Alfalfa and sweet clover have the same bacteria but the other crops, vetch, clover, soy beans and cowpeas must be inoculated with their respective bacteria.

There are a number of places where crushed lime can be bought. Your nearest being at Breckenridge and Kansas City. Generally speaking the better class of soils in Northeast Missouri do not seem to be in need of lime but where the land has been farmed heavily it may be profitable to use. The only way to determine this accurately is by making a trial with the application of a ton or more per acre. Wherever there is a good quality of limestone it will pay farmers to form a club and buy a crusher and operate it among themselves. Quite a large saving can usually be made by doing this. Your failure to get a good stand of alfalfa may have been due to inoculation and it may have been poor seed. In buying seed it is a good plan to first get a sample and have it tested by the Seed Testing Laboratory in the Agricultural College. This will cost you nothing and will show you the purity of the seed and the percentage of good seed.

The method of curing clover you mention has been explained in THE MISSOURI FARMER but is not always entirely satisfactory. If green, clover or alfalfa is put into a tight mow and enough of it put in at one time to give weight enough to pack the hay well so as to exclude the air the results ought to be satisfactory. The principal is about the same as in siloing green crops. Sometimes legume hay is put in green in large stacks and a few inches on the outside will cure out then a ring of mould a few inches deep will form which excludes the air and inside that ring the hay will cure out by its own heat. In using this plan the hay should be entirely free from any moisture from dew or rain. The hay should contain nothing but its own moisture.

In our own practice we have generally aimed to use a modified plan of the green method. We like to cut the hay in the afternoon, say from 2 o'clock until sundown and let it lie until well wilted, say about noon the next day, then put into the barn. If the hay is heavy it will be only partly cured but will be very much lighter to handle. There is always some danger of spontaneous combustion when handling green hay, but the danger is much more if there is dew or rain on it when going into the barn. The hay will get very hot but it must not be torn up or aired out in any way else it will be damaged.

For help in laying out a system of terracing we suggest you write the department of soils, University of Missouri and the United States Department at Washington for bulletins and suggestions if you may need an engineer to help lay out the terraces.

For preparing a clay soil for blue grass, we would suggest a very liberal use of the manure and coarse manure will be all right if you can get it well worked into the clay. Apply the manure before plowing, then if available put on some well rotted manure after plowing and when a good seed bed is obtained seed with a mixture of grasses. September is a good time for seeding. A number of mixtures may be used but the following suggested by the U. S. Department is perhaps as good as any: In the proportion of 17 pounds of blue grass, 4 pounds recleaned red-top, 3 pounds perennial rye grass and 1 pound of white clover mix the seed and of this mixture sow from 4 to 5 pounds for every 1000 square feet of surface. This is very heavy seeding but as a lawn is not usually very large it is better to seed heavily than to fail to get a good stand.

$1,000,000 for Furs!

We have a million in cash ready to pay you for your furs. This means safe, prompt returns. We pay full prices shown on our price list. No deductions made on pretext of commission, transportation or anything else. **No one pays more.** If higher prices are quoted beware of deductions. Thousands of hunters and trappers make sure living by depending on our fair dealings. Farmers who quit others stay with us. Why run risks of losing a whole season's work by sending furs to someone you are not sure of? Remember, $1,000,000 in cash and a thirty-year reputation are behind our offer. Write today for price list. Then we will keep you posted on every turn in the fur market, so no one can mislead you. Originators of Classified Price List.

Becker Bros. & Co. Dept. C5, 416 N. Dearborn St., Chicago Dept. C5, 129 W. 29th St., New York

SPECIAL JERSEY BARGAINS!

The famous Blue Belle-Golden Rosebay breeding. Send for circular. No reasonable offer will be refused for this stock. All registered.

THE ENNIS STOCK AND DAIRY FARM,
(Just south of St. Louis.) HORINE, MISSOURI.

FARM WIFE NEEDS SCREENED PORCH

(Prepared for The Missouri Farmer by Nellie Maxwell of the Department of Farmers' Institutes of the University of Wisconsin.)

The screened porch opening into the kitchen and overlooking the flower garden, which every woman loves and should take time to enjoy, is one of the delights that is coming for every farm wife. This porch may be used all summer for the outdoor dining room and for a sitting room, too, if there is not another porch, (also screened) on the other side of the house

This porch with its view of the lovely garden and shrubbery is a delight from early spring when the first plum and cherry blossoms come, to the time of late autumn flowers. Why should the view which is seen so often from early dawn till dewy eve be a chicken coop or a pig pen?

Chicken coops, pig pens and barn yards are indispensable but why not arrange to have the often unsightly spots screened by shrubs? The beautiful elder grows in profusion nearly everywhere and there is no expensive shrub bought in a nursery which has more grace and beauty. It grows easily and spreads so that in a few years one may have a lovely background for the garden in front. It is doubtful if the Psalmist could have written so charmingly if he has not been able "to lift his eyes to the hills, whence cometh my help."

The tired housewife standing behind the washtub or dishpan who is able to lift her eyes to the hills or woods or a beautiful stretch of waving grain, is rested and inspired by the sight. Have the window over the table or sink looking out on the most charming view to be had. Most of us spend the greater part of our daylight in the kitchen.

On this porch she may prepare her vegetables for dinner, here she will pick over the fruit for canning, even iron and mend, and the porch might be extended to the upper story making a delightful sleeping place for the family. How nicely this would save the care of the bedrooms, for when we camp out each is supposed to make his own bed. There is absolutely no chance for debate as to the value of a screened-in porch; the sleeping porch has come to stay.

The expense of screening a porch is an item that must be considered and yet where the man of the house is at all handy with tools it may be done with little expense outside of the cost of lumber, screens and paint. The amount of comfort enjoyed by the family on such a porch can not be estimated in dollars and cents.

In ordinary seasons it may be used for an outdoor dining room, and sleeping porch for baby from four to six months of the year. What home convenience at the same cost would be the comfort to the entire family?

WHY SOME BOYS LEAVE THE FARM

The case in mind is that of boys who have been born and reared on the farm. Their fathers went in debt for their farms and by good management and with the help of their boys' labor succeeded in paying for their homes. They had plenty of work to keep their boys busy. The fathers did the planning and the boys did the work with the help of the hired men. The fathers handled all the money. If the boy had any money he got it by asking his father for it. For from four to seven years before they became of age most of these boys did a man's work; but it was for their father, and they considered it due them from their children.

So when these boys became of age, they knew how to work but they did not know anything about how to use money and very little about farming. In most instances, the father would give the son, when of age, a hundred dollars, a horse, or something of about equal value. The son would like to go to farming for himself, but he hasn't enough capital to make the start. What is he to do? He knows that a farm hand's time is worth from twenty to thirty dollars and board per month for about six months out of the year. And he reads the papers enough to know that in the cities some employees are receiving seventy-five dollars or more per month. The industrious, worthy farm boy goes to the city in order to get a start. Since he must work for wages, he goes where he thinks he can get the most for his time.

Sift the facts out in the case of plucky, industrious farmers' sons and you will find them to correspond with the foregoing. Too many men raise their sons as farm hands rather than as farmers.

The dutiful son who has done his father's bidding until he became of age knows far less about the value and use of money than the young fellow of the same age who has had to rely upon himself for four or five years or more.

If the farmers would give their sons when seventeen or eighteen some land to work on the shares and some stock on the same conditions and act the "father" rather than the "boss," it would keep many a young fellow on the farm.

Some children have an insight into numbers but not into language. While with others it is the opposite way. Time, patience, and a good teacher can give any child of good mind a working insight into any subject that may come up in the course of study. So of farming. Many boys reared on the farm do not see into farming. They could be shown, if they had a good teacher.

L. C. McLeod, Taylor.

BUCKSHOT BY THE PROFESSOR

In an early issue of this paper, I trust that "Jim" Riley person will please inform us why he hasn't paid his last years' taxes.

* * *

This is a grand old state but we'v got a lot of barns that are better than the school houses we compel our children to go to school in.

* * *

Some fellows can't do a good job of "whittling" until they get about a nickles worth of Horse Shoe stuck in on the "off" side of their faces.

* * *

I can hear the low rumble of distant thunder—and I believe it means the "gathring of the clans" for the greatest farm organization movement this Country has ever known.

* * *

We'v heard a lot about "swatting the fly" and "swatting the rooster" but what we really need is to "swat" the fellows who are fixing an unfair price on the fruits of the farmers toil.

* * *

Judging by the number of fires, the convicts down at Jefferson City evidently prefer to take their chances in burning up rather than in staying in that institution as it is now conducted. Surely there's something wrong with it somewhere.

* * *

Please don't ask me how I stand on Woman's Suffrage. I got up the other morning feeling grouchy and after kicking the cat off the back porch, I incidentally remarked to my wife that I thought a woman's place was in the home and kitchen—and for the next five minutes I was busy dodging frying pans and numerous other things.

* * *

Like as not, if you and your neighbors would organize a Farm Club and then get in touch with THE MISSOURI FARMER it would help you to save about a dollar per ton on next winter's coal supply. It would also put you in position to buy bran, shorts, flour, cotton seed meal, fertilizers and coal at the wholesale price. Now can't you take a "hunch" when a mule kicks you straight in the face with both feet? Get busy!

* * *

Old "Sam" Jordan wouldn't cut much ice at a beauty show but all the same he is one of the most useful men this state has ever produced and if you fellows have never heard him you ought to write to the State Board of Agriculture and have them bill him for a speech in your neck of the woods real soon. Then you ought to give him an audience of a thousand farmers. He may "hang your hides up to dry" on a barbed wire fence—but a lot of you need "skinning" anyyway and old "Sam" knows how to do it to a queen's taste.

* * *

A new visitor arrived in Hades the other night and with a great deal of pride the Devil was showing him around over his establishment. Finally they came to a big room which seemed hotter than the rest where a lot of fellows were hung up by their heels on big pegs in the wall. The newcomer surveyed the scene critically and then inquired, "What's the matter with them fellers?" "Oh," replied the Devil, "those are farmers who don't believe there is anything to farm organization. You see they'r so d——— green we have to dry 'em out a bit first."

* * *

I see where the Agricultural College has hired E. H. Bullock of Edina to help out in lecturing on Agricultural Extension Work—and thereby they have displayed almost human intelligence for this man Bullock is a real farmer and one of the biggest farm leaders in this state. He is President of the County Farm Bureaus of Missouri and every Farm Club in the state should write to the College at Columbia and ask them to bill Bullock for a speech. Then be sure to give him a good crowd—for he will give you one of the best talks you have ever listened to. But when you ask for a man like Bullock or "Sam" Jordan, give them a big meeting—for these men are too useful to be raced half ways across the state to talk to merely a handful of farmers. They can talk to a thousand at no greater expense—and it will inspire them to the best effort there is in them.

Why not help out the "kids" in getting their lesons a little bit these long evenings? It's a mighty fine way to entwine their heart strings around yours.

* * *

Don't you let any politician get you prejudiced against the Land Bank Bill—for the politicians to the contrary notwithstanding, it is the greatest act in the interest of farmers ever passed by a Missouri Legislature.

* * *

If you and your neighbors should organize a fine little school house Farm Club—and if once every two weeks you met to discuss farm problems and the other great questions in which every farmer is vitally interested—don't you think farm life would look just a little brighter to you?

By Old Jim Riley

I see where some durn fool Professor says there aint no "soul element" in kissin' a pretty woman—that you kin git th' same sensation out uv strokin' a cats back. Well, there aint no "soul element" in a mules kick neither—and if a mule was to land on his head with both feet he couldn't give him concussion of th' brain 'cause he aint got any. Most Professors ought to be took out and drowned like stray cats shortly after they are born. If there's a Professor feller around in these parts that don't like my smoke, he kin locate me down at old "Hez" Brown's store whenever he gits ready.

A Gratified Subscriber

Dear Mr. Editor:

I have been a subscriber to your paper for a number of years. And have only one thing to say. "An editor that tries in so many ways to help the farmers as you do, and if you have not a great host of friends there is no use for the other fellow to try to be friendly to the farmers. We certainly are grateful to you for your help.

Enclosed please find an addressed envelope. Please send me information concerning the buying of coal direct from the mines, and oblige.

Very truly yours,
J. L. Buntin.

Two New Livestock Associations

Missouri is boasting of two new livestock associations as well as good records made by a number of older ones. The new ones are The Johnson County Livestock Association and the Knox County Poland China Association. In Johnson county the president selected is George Russell of Chilhowee, and the secretary is F. A. Gougler, Warrensburg, County Agent employed by Johnson county, the Missouri College of Agriculture, and the United States Department of Agriculture co-operating. In Knox county the president is E. B. Baker, Knox City, and the secretary is E. P. Byrne, Edina.

The St. Francois County Hereford Association has sold a great many animals already, although it is not very old and has promoted the interests of its members in a number of ways. Its latest sale being one of 83 Hereford bull calves to one man at one time for the range trade.—S. T. Simpson, Missouri College of Agriculture.

WON HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION SAN FRANCISCO 1915 DEPARTMENT OF AGRICULTURE

Eight Feet Wide, or Better

ONCE you have seen both kinds of work you will say: "There is certainly a wide gulf between the ordinary spreader and the modern **I H C** machine, with its good, wide-spreading device. Give me the up-to-date, time and labor-saving spreader."

International Harvester spreaders—Low Corn King and Low Cloverleaf—are made with wide spreaders that throw the manure out in a wide, even spread, and broken up into fine particles by the disks that give it a second beating. In this condition the soil takes up quickly and evenly the fertilizing elements.

Though they are narrow, conveniently handled spreaders, easy to drive right into stables for loading, they spread to a width of 8 feet, or better. This cuts the spreading time in half, increases the tractive power of the spreader by keeping the wheels off the slippery manure, and gives you the best machine made for top dressing. **I H C spreaders** are simply built, and very strong. They are low for easy loading. They are built in sizes to suit any buyer, and they do work that is uniformly satisfactory.

Be sure to see the **I H C** dealer who can sell you a **Low Corn King** or **Low Cloverleaf**—or write us for catalogue.

Mississippi Farms for Sale

For sale, Mississippi farms in the Vicksburg district. Grasses green nine months in the year. The best location for stock raising. Prices $7 per acre and up. Barbour Realty Co., Vicksburg, Miss. 1t

Need Any Jersey Cows?

Elsewhere in this issue, the Ennis Stock & Dairy Farm of Horine, Mo., is advertising a fine lot of Jersey cows, heifers and young bulls and those of our readers who are in the market should read this advertisement carefully. The dairy game is a safe game for many farmers to play and here is apparently an opportunity to pick up some registered stuff at a low price.

Williamson's Polands and Shortorns

Mr. H. G. Williamson, the well known breeder of Big Type Polands and Shorthorns at Centralia, Mo., writes us that he has 24 gilts and 72 boars left from his spring crop that are as fine as any he has ever raised—and he is an old hand in the breeding business. Continuing he says: "These animals were sired by five as good boars as any herd can boast and are out of tried herd sows whose pigs have always given complete satisfaction to my customers. All my hogs are immune and I guarantee all stock to be exactly as I represent it in quality and value—or I will refund the money if the stock is returned to me in good condition. Could any man ask more?

In Shorthorns, I have a splendid working herd of 60 head and can furnish almost anything wanted. Many of them are extra fine milkers. My prices are reasonable and I guarantee satisfaction." Last spring Mr. Williamson sold 60 head of his fine Poland gilts to the Missouri Agricultural College—the buying having been done by Prof. Weaver. This shows that Mr. Williamson breeds the right kind.

BOWSHER Feed Mills

Crush ear corn (with or without shucks) and **grind** all kinds of small grain, cotton seed and **head kaffir.**

Stock Thrive Best on Ground Feed

Bowsher Mills are differently constructed from others. **Light running**—handy to operate. In 10 sizes from 2 to 25 H. P. Sold with or without elevator. We also make Sweep Grinders. Write today.

Live Stock Notes

Seed Wheat and Rye Wanted

THE MISSSOURI FARMER is receiving numerous inquiries for good wheat and rye seed and those having any for sale will please advise us of the variety, quality and price.

Shetland Pony Sale

Geo. Aid of Gallatin, Mo., is closing out a herd of Shetland ponies and those desiring to buy should get in touch with him. Here is a chance to make a start in a paying branch of live stock.

Cottingham's Closing Out Sale

Elsewhere in this issue appears notice of J. A. Cottingham's closing out sale of stallions and jacks at Moberly, Mo. Those of our readers who are in the market for stock of this kind should look up the advertisement and read it carefully.

Blackwell's Angus Cattle

J. D. Blackwell of Fayette, Mo., offers well bred registered Angus cows, also two year old heifers, bred to one of his show bulls, due to calve in early spring; also, yearling heifers, yearling and two year old bulls ready for service, at reasonable prices.

Taylor's Durocs

Chas L. Taylor, the well known breeder of Durocs at Olean, Mo., writes us that he has some extra fine spring boars and gilts by his Champion boars out of large, mature sows which he says are good enough to go into anybodys herd anywhere. Those of our readers who are in the market will do well to get in touch with Mr. Taylor who owns one of the best herds of Durocs in the state.

Brockman's Durocs

A. C. Brockman, the Duroc breeder at Centralia, Mo., is offering some high class boars and gilts of March, April and May farrow. These animals are out of splendid boars and big, growthy sows and have the best dark cherry color. They represent the best Duroc breeding all the way through and Mr. Brockman guarantees satisfaction. He will exhibit at the State Fair this fall.

Cooke & Son's Holsteins

"We are pleased to report very substantial sales from our Holstein herd in the past year. We have sold over $12,000 worth of breeding stock, and can truly say we are more than pleased with the individuality of the calves sired by our new herd bull, Prince Segis Walker Pietertje 123995, recently purchased of Emblagaard Herd, Mich. We now have 20 of these from 1 month to 10 months old. That these are going to add to the high standard of our herd is certain, for their sire's dam, grandam, and the 10 nearest dams of his sire, average for the 12, 29.75 lbs. butter in 7 days. Six of these are 30 lbs. or over. His five nearest dams all test over 4 per cent; his dam, 30.13 lbs. butter, tested 5.07 per cent; his grandam, 30.80 lbs. butter, 4.68 per cent, and the lowest testing dam in five generations is 4.15 per cent. Two of the dams in this five-generation line are two of the only four 30-lb. cows of the breed who have produced 30-lb. daugthers, who in turn have also produced 30-lb. daughters." —Holstein-Friesian Register.

Hill's Offerings

"For the next few weeks I am going to make a special offer on our spring boars. If the readers of THE MISSOURI FARMER are in need of boars, here is an opportunity to get a boar that will make money. I say this because these spring boars are properly bred, sired by big boars and out of big sows, and they should produce large litters of large pigs. These are spring boars, have been well grown, have plenty of size, stretch, bone, and quality, and are going to make big boars at maturity. Some of them are sired by Golden Tat, a big 800 pound son of Tatarrax Again, the reserve grand champion of Kansas State Fairs a few years ago. Others of these spring boars are sired by Col. Wonder II., the 2nd prize boar at the Missouri State Fair in 1913, he being a son of the grand champion boar of that show. Col. Wonder II is a lit or mate to the grand champion sow of the Missouri State Fair in 1914, so his breeding is excellent. Along with this breeding the boars by Col. Wonder II. have the size, substance and bone, the easy feeding qualities, and the conformation which most farmers and breeders desire to produce big pigs that make good breeding and market hogs. We are shipping out nothing but good boars, that the buyers will be glad to own, and boars that are a credit to our herd, and inquirers and purchasers can feel assured that they are getting good individuals. They can depend upon it that they will get a good boar, even though they do buy by mail order, and they can rest assured that we will stand behind our guarantee to please. We will ship out these boars and if the buyers are not satisfied with them on receipt, they can ship the boars back and we will refund the purchase price.

We have a few bred gilts left, due to farrow this fall, priced reasonably.

I have a good Shorthorn bull calf dropped May 19, 1916, that I am offering for sale. He is a bull with plenty of size and substance, good bone, a broad head, deep wide chest, a good top and underline, carrying his width well from front to rear, and well marked with white, the body being red. He is sired by College Knight, the bull which heads the herd of the Missouri College of Agriculture. The dam of this bull calf is Missouri Flora by Rejected Count, out of Shadewell Flora by Master of the Grove, tracing to imp. Flora 6th. College Knight is a straight Scotch bull. This bull calf will make somebody a good herd bull, and he is ready for shipment now."

Bob Hill, Columbia, Mo.

THE ADVANCE IN THE PRICE OF STOCK

Four or five years ago when the price of beef cattle in our markets showed such a rapid and unexpected advance in value, most stockmen began to realize that the announced shortage in cattle was something more than a prediction—it was a stern reality. The price of feed in the country had something to do with the sudden enhancement of values that sent fat steers up to $10 and $11 per hundred, but persons in touch with market conditions and with the cattle industry could plainly see that the question of supply was an important factor.

Livestock journals sounded a warning of depleted farms and abandoned ranges and counselled farmers to breed more cattle. At that time I contributed an article to farm papers calling attention to the fact that while there had been a large increase in the value of steers, both fat and stockers, there had been practically no enhancement in the price of purebred Shorthorns, and advising farmers to lay the foundations of herds while these cattle were going at such moderate prices and so be prepared for the brisk trade in cattle that there was good reason to believe was coming. Some took advantage of the opportunity and began breeding Shorthorns and so are now reaping a financial reward, but to many others, opportunity knocked in vain and they continued to grow corn and pay high prices for feeders.

The price of purebreds increased slowly, but hardly kept pace with the increase in the value of steers until during the last six months. A demand for them so sharp and insistent has sent values up to a level that will give abundant reward and great encouragement to those breeders who were loyal to the breed and who maintained their herds during years when prices were low and profits small. And while it is a hopeful and an encouraging condition of this active buying that among the buyers are many new it is one of the anomalies of trade that farmers who refused to buy cattle when they were selling so low a few years ago are now eager to get them at four or five times their values at that time. But in this case, as in some others, it is "better late than never." The purchase of a foundation at that time would have been a very wise investment, but purchases of good cattle made now and handled with intelligence will give a good return to the investor.

The success of raising and selling purebreds depends on the quality of stock and on the intelligence and skill of the breeder as a feeder, fitter and salesman, but to the farmer who does not wish to raise purebreds, there is still strong encouragement to grow steers for the markets, either finished or as feeders. For this purpose Shorthorns have always held favor with me.

The prices for steers that have pre-

POLAND CHINAS

SPOTTED POLAND-CHINAS!
All Spring Pigs Reserved for Fall Sale, October 18, 1916.
Thirty-five head will be sold and they are of the big boned, big type, spotted kind. Ask for catalog.

Look over the offerings in our columns and when writing advertisers always mention The Missouri Farmer. We carry only reliable advertisers.

vailed for five years should encourage farmers to raise them in every community, as they did in the days before the competition of free grass on the western ranges drove cattle from farms in the corn belt. So whether it is to be production of purebreds or grade steers, Shorthorn blood will be found an important aid to success farm life. B. O. Cowan.

COMMON DIGESTIVE DISTURBANCES OF THE HORSE

Probably at no time of the year should the farmer be more careful in feeding the horse than now. This is due to the fact that new hay and grain, most of which is not yet thoroughly cured, are now being fed, and that the horse is required to work long hours with short time for feeding, so that it may be said that he has to engorge himself with an entire change of feed in from ½ to one hour.

New hay and grain are not as digestible as the older feed. If fed in large quantities it frequently is not digested but ferments and causes the bowels to become greatly distended the gas bears so hard on the import- the gas bears s ohard on the important organs as the heart and lungs that they cannot function properly. In some cases rupture of the bowels or diaphragm results with death in but a very few minutes.

Another result of improper feeding is what is known as spasmodic colic or cramps, in which the animal has very severe bowel pains at intervals between the pains the animal is quiet and may even feed. This is brought on by drinking large quantities of cold water while warm, sudden change of feed and exposure to cold, as standing out on cold nights without blanketing.

Musty and mouldy feed frequently cause diseases as digestive disturbances, heaves, pneumonia and especially nervous troubles. While the majority of the moulds do not produce disease themselves, they leave the feed on which they are growing a suitable seed bed for other growths which may cause numerous disturbances. However a few moulds are poisonous. These canot be distinguished on the feed but require laboratory examination for their classification.

Other causes of digestive troubles are, feeding grain before hay, and watering the animal after feeding. As oats requires more time for stomach digestion than hay, it can be seen that the practice of either of these methods will produce the same result, oats not having enough time for proper stomach digestion, will also not digest as thoroughly in the intestines, indigestion being the final result.

In summary it can be said that most bowel troubles are due to improper feeding. Improper feeding implying, feeding too large a quantity at a feed, too sudden change of feed, feeding musty or mouldy hay, feeding grain before hay and watering after feeding.

No one treatment can be given that will prove successful as each case requires a definite diagnosis and a study into the cause of the condition.

Preventative means are the most successful in the eradication of this trouble from the farm. A close study of the food requirements, which differ greatly in different animals, and supplying the animals with clean, sweet, well cured hay and grain, in amounts which he will just clean up at a feed, will prevent the majority of digestive troubles so common at this season of the year.—A. R. Hahner, Veterinarian, Idaho.

CORNFIELD LAMBS PAY

The light corn crop this fall makes it necessary to get the most possible out of the field. The practice of utilizing the undergrowth in the cornfield and the lower leaves of the corn stalks by pasturing the field with lambs has become quite a common one.

Fifty-three to sixty-pound western feeding lambs are used. The lighter lambs are used by those who wish to make a 90 to 120-day feed, finishing off the lambs in dry lot the last 30 or 40 days. The heavier lambs are used by feeders wanting to make a 60 or 70-day feed. Good to choice lambs are commonly fed. The number of lambs per acre will depend upon the amount and condition of the forage. Usually three to four lambs per acre will be sufficient.

A single deck carload of lambs will be about 150 or 160. Lambs can be purchased at the Kansas City, St. Louis, St. Joseph, and Omaha stock yards through any reliable commission house.

The following is a reliable quotation from a sheep commission company on the Kansas City yards: "Lambs have been fattened very successfully in the cornfield by a good many of our customers. Conditions may be a little different on account of the dry weather, and no doubt the lambs will require a 30-days' feed in the feed lot before they are considered finished.

"We look for a good high market throughout the fall, and if we are going to make a guess as to the market the first of December, we would say from $10.50 to $11.00. There is more reason for us to expect high prices this year than last."

The Department of Animal Husbandry of the Missouri College of Agriculture will be at the service of any Missouri farmer who wishes help in buying lambs or assistance in the management of them.—H. Hackerdorn, Missouri Agricultural Experiment Station.

SHELLED OR EAR CORN FOR HORSES?

A Cole County correspondent asks which will give best results for work horses, ground corn, shelled corn or ear corn? For horses with good teeth the ear corn is preferred. Corn that is kept over winter is fresher and sweeter if kept with the husk on and ear corn that is husked will be more free from dust and moulds than shelled corn. Another advantage in feeding ear corn is that it is masticated better because it is eaten more slowly. In the summer time corn meal does not keep long without the oil in it becoming rancid and for this reason we would place shelled corn second to ear corn and the meal last. When corn is ground for feeding only a small amount should be ground at a time. Ground corn and oats or ground corn and bran or shipstuff mixed with cut oat straw or with hay makes a good feed for horses. The cut straw gives bulk and also compels better mastication than where the meal is fed without it.

A variety of corn that gets very hard or for feeding old horses it will be better to grind or to soak in water before feeding. When the corn is soaked care should be taken not to let it sour. The better way for soaking is to have two tubs putting enough corn in the water at morning for the noon and night feeds and at night for the morning feed using fresh water each time.

Corn and oats one-half each we think make a better ration than either one alone and when these two grains are worth the same per pound we would feed one half ration of each to all work horses with two parts oats to one of corn for young horses.

Cut sheaf oats make a good feed to go with corn for horses but the custom is not very common in the Middle West, perhaps because of the extra labor in cutting the oats.

Only Healthy Animals Profitable

Sunlight is a most effective germicide. To prevent the contraction or spread of disease it is therefore important that the stables of farm animals be well lighted, with the possible exception of fattening animals feeding for short periods of time.

For the maintenance of health, exercise is another essential. The only exceptions to this rule are fattening animals soon to be marketed which make more rapid gains if not allowed to move about too freely. Abundant exercise is of special importance with breeding animals.

Farm animals are creatures of habit, and once accustomed to a routine of living show unrest at any change. The feed stable or lot, therefore, should be free from disturbance, and the providing of feed and water should be uniform in time and manner. Animals soon learn when these are to occur and as feeding time approaches the secretions begin pouring from the various digestive glands in anticipation of the coming meal. The system of feeding and watering and the character of the rations should be changed gradually, and only for good cause. In feeding operations a changing period is usually a losing period.—University of Wisconsin.

Worm Remedy For Hogs

If your hogs show indications of worms try this remedy which is recommended as a good worm extinguisher:

Santonin, 35 grains.
Areca nut, 15 drams.
Calomel, 15 grains.
Sodium Bicarbonate, 15 drams.

The above should be fed mixed with corn meal and shipstuff or tankage, feeding one-tenth of the above amount for each 100 pounds of live weight. Vermifuges should always be fed after the hogs have fasted for at least 12 hours.

Holstein Bulls, Cows and Calves!

We are now offering for sale at $25 each, a number of extra good bull calves sired by Campus Josephine Lad and out of excellent producing cows. Also 2 high grade strippers, bred to above bull. Also one yearling pure-bred bull—will make a herd header—priced to sell.

D. D. MOSS, - - - Columbia, Mo.

Closing Out Sale of Stallions and Jacks

One imported and one American bred Percheron Stallion, big kind, both registered in the Percheron Society of America, imported horse also registered in the French Percheron Society and the National French Drafthorse Association.

One standard and registered trotting stallion, big and well finished and a fine breeder, developed and raced as a three year old.

Three mammoth Jacks, one 16, one 15-3, one 15-1 standard measure all registered.

This stock has proven good breeders, plenty of colts to show. Sale commences at 2 P. M. Oct. 4th, 1916. Rain or shine. Time can be arranged for. Catalogues Sept. 10th.

Farm Manager Wanted

Wanted a man about thirty years of age as a farm laborer, one with theoretical and especially general farming experience. Advertiser has three hundred acre farm close to a large city and has had several managers who were given such position without trial and have proved failures. If applicant for this position proves himself competent he will later be placed in charge of farm. Address C. L. P., Missouri Farmer, Columbia, Mo.

Farm Wanted

Wanted to rent a good 160 or 200 acre farm. Land must be good for corn and small grain and be well improved, fenced and watered with some good pasture so I can handle live stock. Desire to rent for from 3 to 5 years on shares or for cash. Location desired in North Central part of state. Would consider raising live stock on shares. Can give best of references. H. H. Waugh, Rfd. 19, Chilhowee, Mo.

JERSEY CATTLE

REG. JERSEY BULLS

Choice Registered Jersey bulls at bargain prices. Grandsons of Noble of Oaklands and out of heavy producing dams. Yearlins, $50; Calves, $20.

BLUE CLIFF FARM,
BLUE SPRINGS, - - MISSOURI

JERSEY CATTLE

Bulls ready for service. They are sired by the Owl's Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

SUNSET CORRECT TYPE JERSEYS

To keep our herd within 100 head we will offer at private sale fifty Jerseys, consisting of cows, bred and open heifers, young bulls, heifer and bull calves. Can fit out small herds for beginners. 125 head to select from. The famous Blue Belle-Golden Rosebays. Send for special circular before buying elsewhere. Bargains. Mention your wants.

"THE CRUSADERS"

That the great Farm Club movement has taken a real hold on the farmers of Missouri there is no longer the slightest question for every mail brings us many requests for a suitable Constituion and By-Laws and other helpful literature. In this connection, we desire to state that we have recently prepared a new pamphlet on Farm Club organization which will be ready for distribution in about a week and we will mail it free to every reader who sends us a two cent stamp to cover postage. We believe you will find it the most helpful thing ever published on this subject, for it tells you what a Farm Club can do for the farmer and how to go about organizing one in your school district. We have only printed 5000 copies for general distribution and those who desire a copy of it should therefore lose no time in writing for it—for the supply is certain to be exhausted very soon.

We also wish to announce that we have engaged the services of Mr. B. P. Smoot as Farm Club Organizer—and elsewhere in this issue you will find an article from him. For several years Mr. Smoot has periodically lectured all over Missouri for the State Board of Agriculture. He is a young farmer of near Centralia, Mo., and one of the best posted men on farm problems in the state and a forceful speaker whose heart is on fire with the great Farm Club movement. Mr. Smoot has spent the last two weeks in Chariton County where he has organized a Farm Club at some school house every night. If there are any communities which desire his services the farm leaders in those sections should make application to us at once. Before we will consent to send Mr. Smoot to you however, you must agree to plan at least a dozen good school house meetings for him in advance—or one meeting each night for two consecutive weeks and the meetings must be thoroughly organized so that Mr. Smoot will be sure of a splendid audience at every school house. We make no charge for his services but the above co-operation we must have without fail before we will feel justified in incurring the expense of sending him to you. We will positively not send him to Clubs which are already organized or merely to make two or three addresses. Our sole object is to organize at least a dozen new Farm Clubs in each community to which Mr. Smoot goes. Then, later on, when these Clubs are in a flourishing condition we will try to send another Organizer so that the good work may be still further extended.

One trouble with such organizations as the Grange, Farmers Equity Union and other similar splendid organizations in the past has been that they have been too scattered and isolated and hence the co-operative good which they could have accomlpished has been enormously minimized—and THE MISSOURI FARMER is trying to overcome this in the present movement by organizing a Farm Club at as nearly as possible, every school house within a given county. Once this has been done, we can organize a County Farmers Ass'n and with this larger and more efficient machinery we will be in position to really do effective work. The two great elements we are after are power and enthusiasm and these can be obtained only when our system of organization reaches into every school house and when these small units are placed in position to finally speak through a strong county President, Secretary and Board of Directors.

In the meantime, THE MISSOURI FARMER is the friend of every Grange or other farm organization which is now in existence and we welcome an opportunity to aid them in every possible way—for it is results we are after and the name of an organization is a mere form which is of little consequence.

Many Farm Clubs which have been in existence only a few months have already saved a lot of money for their members and we are merely standing on the threshold of these possibilities. But the need of the hour is for those Clubs which are already on their feet to help organize neighboring districts. The other day we received this letter from an enthusiastic Farm Club leader: "We have a half dozen fine Farm Clubs in our community and the other day we got all the officers together and got a dozen farmers to agree to take three automobiles and organize a new Farm Club at some school house every night until snow flies. We have already tried it out at two school houses and had a crowded house each night. After we told these farmers how much money our Clubs had already saved and how enthusiastic all our members are—how it is giving all of us more interest in our farm work and the hope we have of eventually forcing a "square deal" for farm products—every man in the house voted to organize at once. We call ourselves "The Crusaders" and are enjoying the work immensely. And you would be surprised to listen at some of us make speeches. Some who could hardly get up to "second a motion" a few months ago can make the "rafters ring" almost as well as some of the old trained spell binding politicians—and what is more, we believe what we say which is more than most of the politicians do. We are going to make the "fur fly" from now on and before the snow flies we expect to have 25 or 30 Farm Clubs doing good work in our part of the countf. In the meantime, please send us a lot of sample copies of THE FARMER and some more Consitution and By-Laws. Our hearts are with you in the great work you are doing for no other farm paper ever tried to do half as much for us—and all of us are going to show our appreciation by planking down a dollar on subscription."

Now why can't a lot of other Farm Clubs follow suit? Why not put one thousand Farm Clubs on their feet in Missouri between now and the time "snow flies" as this man puts it? While the politicians are tearing their hair because they are having to talk to empty benches, why not set this great state on fire with the greatest farm organization movement the Country has ever known? In the first place, it means money to every farmer who joins a live Farm Club. In the next place it means that he and his neighbors will get together at stated periods to discuss the great farm problems and public questions of the day—and it will put new zest as well as new dollars into farm life. If there is a Farm Club in your neighborhood which isn't doing good work, call a special meeting at once and put new life into it. Have your Secretary to write us at once for the things we are co-operating on with Farm Clubs at the present time. Get busy. You will enjoy life more and you will be contributing your share toward making the World better.

In conclusion, those communities which desire the services of Mr. Smoot should plan a series of a dozen good school house meetings without delay and then get in touch with us. Also do not fail to apply for a copy of our new pamphlet on Farm Clubs.

William Hirth, Publisher.

20 Extra Features
73 New Conceptions

Mitchell MID-YEAR MODEL

20% Extra Value
Due to Factory Efficiency

20% Extra Value

Due to John W. Bate, the Efficiency Engineer

We intend that the Mitchell shall offer 20 per cent greater value than a like price can buy elsewhere.

We save at least that in this factory. It was built and equipped by John W. Bate to minimize every cost. It has reduced our making cost one-half. It has given us an advantage of 20 per cent, we believe, under any rival Six.

90% In the Chassis

About 90 per cent of this extra value goes into this Bate-built chassis. It goes largely into extra strength. There are 440 parts which are drop-forged or steel-stamped — three times as strong as castings.

The major strains are met by Chrome-Vanadium steel, costing up to 15 cents per pound. To every part is given at least 50 per cent over-strength. The rear springs are Bate cantilevers, not one of which has ever broken.

We include a power tire pump, an extra-cost carburetor, a ball-bearing steering gear, an easy type of control.

There are in this car 26 extra features which other cars omit. And those extras will cost us about $2,000,000 on this season's output alone.

Aims at 200,000 Miles

Mr. Bate has aimed at a lifetime car. Two of his Mitchells have already run over 200,000 miles each. That's forty years of ordinary service. Seven of them have averaged about 175,000 miles each.

See what Mr. Bate's genius has done for the Mitchell. His improvements number more than 700. See what his efficiency gives you in extra values. A half-hour spent with a Mitchell dealer will win you to Bate-built cars.

A Many-Year Decision

The decision you make on a fine car now will affect you for many years. If you get the right car, you may never need to buy another. If you buy the wrong car you are likely to change before long.

Don't judge by demonstrations only. All new cars run well. Go into the hidden facts. Get the records on endurance. Above all else, judge by the man who builds it.

Go deep enough, and you are bound to choose the Mitchell. Many noted engineers have done so in buying cars for themselves. Your Mitchell dealer will show you a list of them.

You will get in addition the most complete car that's built. In the Mid-Year Mitchell you will get 73 new conceptions. Our designers examined 257 of this year's models before completing this one.

Ask us the name of the nearest Mitchell dealer, if you do not know him. For your own sake, see the car he has. (122)

Mitchell Motors Company, Inc.

The School Boy

The other day, as I looked out of a train window, I saw a little group of school children wending their way homeward along a quiet country road—and as I watched them wave their hands at the speeding juggernaut, it brought back a flood of memories of my own school days in the long ago. Once again I saw myself as a tow-headed youngster with tufts of hair sticking out like the quills of a porcupine on that "first day" when, standing awe struck before the fat old school master he asked, "Do you know your A B C's?" to which I returned a muffled "No." Next he inquired, "Can you count?"—and again I muttered "No." Then, with mock severity he roared, "Well what do you know?"—and not without a degree of challenge I blurted out, "I don't know nuthin!"—whereupon he threw back his head and laughed a laugh in which the whole schoolroom joined while I, with the lurking tears not far off, glared around defiantly at all of them. But soon we were fast friends and as time passed, the friendship grew—and many were the occasions in the after years when he recited with shaking sides the little dialogue above. They buried him a few years ago and when I read of it, it seemed to me the World was more lonely and less bright than it had been before—and yet this is but one of life's tragedies which the high and the lowly must endure.

Once more I wonder whether the noon hour will never come. Once again, after hurriedly gulping down a couple of biscuits sliced with ham I am out on the play grounds with the other boys "choosing up"—and then the ball flies and again I experience the joy of "stealing a base" or hear the jibes and taunts at being "put out" when I failed to make the final slide fast enough. Once more I am swopping jack knives and marbles. Again I hear shrill voices recite, "The Boy Stood on the Burning Deck" or "Curfew Shall not Ring Tonight." Again I wander down to the old crabapple trees in Devanny's slough or divide my hickory nuts with Mary Pierce whom I liked just a little better than any of the other girls—and once more I hear the whispered joy as the first snow flakes, like the soft down of Angel wings, come silently sifting through the lowering skies of a bleak December afternoon.

But my purpose is to give a little helpful advice to the school boys of today: In the first place, get it out of your head that the schoolroom is a "necessary evil." On the contrary, it is life's greatest "door of opportunity" for every boy who makes the most of it—for, until you have "made good" at your books, destiny will not give you the key to the realm of victory and accomplishment which lies beyond. So, realize in the beginning that going to school is a very serious business. Try to get the fundamental facts of all your studies firmly fixed in your mind and when you don't understand things, go to your teacher openly and frankly—for she will be glad to patiently explain the matters that trouble you and it will save you a lot of mental worry and make things easy that first seemed hard. And here let me suggest that you make the teacher your firm friend if you have not already done so. The teachers position is a trying one at best and every boy and girl should strive to make it just as pleasant as possible—and rest assured that he or she will deeply appreciate it. Keep your books clean and your desk neat—for the habits you form now will cling to you in the after years. Be courteous to the girls—for courtesy to a girl or woman proclaims the gentleman—and this is a title for which every boy should strive. So live, act and play that the other boys will respect you—and if you do this you will have few quarrels. Remember that brains rather than fists win the World's battles—that it is the clean faced, clear eyed boy rather than the bully who succeeds and thus, let each passing day find you a little bit better equipped for life's great struggle than the day before. The World is anxiously waiting for you to become a man—a real man—for there is so much for a real man to do.

ROTATING WHEAT AND GRASS

A few miles from Monroe City, Missouri, is located the 350-acre farm of Tom Dawson. The farming methods on this farm differ from those followed on most farms, in that wheat and grass are the only crops grown.

"In this loaclity it is desirable to plow for wheat as early as possible," said Mr. Dawson to me. We would like to get the ground plowed in July but it is seldom that we can do that when we follow wheat with wheat, on account of delay in threshing, and delays in haying when we plow sod. We can generally get onto the ground early in August. Getting it plowed early gives the ground a longer time to settle and pack. My experience is that the harder the ground packs before the seed is sown, the better it is for the crop of wheat that is to follow. One trouble this Fall is going to be that the soil at the time we sow the seed will be loose and soddy, because it is being plowed so late on account of the delays in harvesting and in haying. Also, we have the additional complication of big weeds this year. While the rains have delayed threshing and harvesting generally, they have helped the growh of the weeds and grass in the stubble. As I plow shallow—not more than three inches, —it is going to be very hard to bury the weeds deep enough so that they will rot and allow the soil to pack hard in the short time that must elapse between plowing and seeding this Fall. I am a believer in shallow plowing on this soil, for I notice that the shallow-plowed fields have the best crops. After we plow our ground, we generally harrow twice and then drag and roll to get the ground as compact as possible. I usually sow the wheat about the 10th of October, but some years I sow as early as the latter part of September. As to sowing late to escape the fly, one man near here waited until the next Spring to sow his wheat and then had flies in it.

"I have been using fertilizer on my land for the past 15 years; and have used several different combinations in my fertilizers. All seem to produce good results, but during the past two or three years I have been using fertilizers high in phosphoric acid. I apply 150 pounds per acre. I have brought the land up from a point where it would produce but little wheat to a point where we are sure of a good crop every year. This year we have threshed out 27 1-2 bushels to the acre, and some that we have not yet threshed will yield more. Some years I have left unfertilized strips to compare with the fertilized ground and have found a difference as great as 8 bushels per acre. And it must be remembered that I am using a fertilizer only a part of which is available the first year. Therefore the difference was made by only a part, perhaps less than half, of the fertilizer I applied. There is another thing that counts greatly some years, and that is that the fertilized wheat ripens up fully a week ahead of the unfertilized grain. This often facilitates the harvesting and gets the ground clear for early plowing.

"One man living near us says he does not believe in fertilizing. But one year we induced him to check fertilizer in his corn. As he left no unfertilized corn for comparison, he was not impressed with the fact that he had a good corn crop—said he might have gotten that anyway. But the next year he put wheat on that ground, and when his wheat came up it began to show the checks on the corn the previous year. By the time the wheat was fully developed the wheat over the places where the fertilizer had been on the corn hills stood several inches higher than the rest of the wheat, and the whole field presented a most unusual and beatuiful sight, of those elevations in the wheat all over the field. It was a most convincing illustration of the value of fertilizing, to any fairminded person."

Henry F. Thurston.

WHAT PROFIT DOES A FARMER DERIVE FROM A COLLEGE EDUCATION?

My attention has just been called to circular No. 77 issued by the University of Missouri on the above subject in which the writer, Mr. O. R. Johnson shows by comparison that the college educated man is much more prosperous and, of course if the more prosperous would naturally be of more benefit to his surrounding neighbors by leading in the business of farming. He arrives at this conclusion by the comparison of the rural educated man and the college educated man and from his data as he gives it this conclusion is formed from the wealth of the two. Mr. Johnson says "The farmers were divided into two groups containing respectively 554 farms whose operators have received only a rural school education and 102 farms whose operators have gone further than the rural schools. The training received by this second group in addition to their common school education amounted on the average to practically two years in the high schools of today. Further down the circular shows that the better educated man operates 44.2 more acres or 33 per cent more land. He owns four-fifths of the land he operates, while the man of inferior education owns only a little over three-fifths of the land he farms. The man with more education has about 11 per cent higher investment for each acre of land he operates. The higher investment per acre usually means better land—in other words, land that will give higher yields.

In making this investigation did Mr. Johnson investigate the different environments that surrounded the college man and the rural man to see if there was not something besides education that had a bearing on the difference between the two groups. Might it not be that the parents of the college group were more wealthy than the parents of the rural group and were able to give them a college education while it is possible that the parents of the rural group could hardly give their boys a scant rural education and not being able to give them only scant rural schooling were unable to give them the necessary outfit for high grade farming including farm implements and a good piece of land, while the father that could give his boy a college education could, and in many instances, did outfit the boy with all the necessary implements and a good piece of land? No doubt that many of the 554 farmers who were under this investigation commenced farming for themselves by first being a hired hand on some rich man's farm.

The statements as made by Mr. Johnson are very unfair and misleading and at first glance would leave the impression that the rural educated farmer was inferior to the college educated one, while upon fair investigation, we find it different; my observation has taught me that that college education has nothing to do with farming. The boy may be sent to college (I don't mean an agricultural school) until he has mastered all the science of mathematics, can read Greek and Latin, studied the dead languages until he can "talk to the dead" and may not be able to tell a tobacco plant from a rag weed and if he was to see a tobacco patch and told what it was would want to know when it would "plug out." No; college education has nothing in common with farming.

I can call to mind several cases where the college fellow and the rural fellow farmed side by side with the result that the rural farmer came out ahead. The richest and best farmer that we have in our neighborhood can barely write a legible hand, while by the side of him is a farm that one of these college fellows tried to run—having the farm left to him through the death of his father—and made a failure and left the farm. Another case near me is a college learned man and a very poor scholar lived near by, the rural farmer always had plenty, while the college farmer lived in poor circumstances and yet had much the best tract of land.

In doing institute work once I heard Prof. Carrington, who at that time was state superintendent of public schools, make the statement in a public address that "the best educated man he ever knew could neither read nor write. He was a tobacco grower in Kentucky and had his business so well in hand that the tobacco dealers were anxious for this man's tobacco and paid a little more for it because it was better."

Education is all right if educated along the right line, but it is a piece of folly to send a boy to college to make a farmer out of him for the more college education he gets the further from the farm he gets. He gets the idea that he must be a professional of some kind and loses his taste—if he ever had any—for farming.

If Mr. Johnson will talk about giving the boy an agricultural education, I will say amen for that is what we need. If we can have agriculture taught in our common or rural schools then finish up with the agricultural college, there is no danger in giving him too much of agricultural education—we will soon be in advance of what we are today and can save the expense of the county farm advisor.

Such data as Mr. Johnson gives out in the circular is much inclined to discourage the farm boy who has been deprived of the opportunity of a college education. He feels that he is handicapped to start with and in many cases will give up at first little misfortune that he may have and quit the farm and try something else.—Geo. W. Williams, Humansville, Mo.

The Right Start in Music

You should be as careful in the selection of the piano as in the selection of the music teacher. Not only does a cheap piano, like an incompetent teacher, give the beginner false ideas and a poor start in music, but it discourages this great study as well.

Bent Pianos

boast of improvements found in no other make—improvements that make the Bent tone sweeter and more lasting—improvements which we want to explain to you before you buy.

Free—Valuable Booklets. Send for our booklets which explain piano value, also what to look for in the selection of an instrument for your home. These booklets contain real piano information and guided by them you are sure to select a good piano. They are FREE for the asking. Mail coupon Today.

Answers Almost Any Question That Arises on the Farm 42

Here is a book you can carry easily in in your coat pocket that will tell you instantly and to a penny just how much money is coming to you when you sell your hay, grain or stock at the market price. It is Ropp's New Lightning Calculator—a wonderful time and labor saver for the busy man. It never makes a mistake—and answers a thousand perplexing questions that arise on every farm.

FREE to LANDOWNERS ONLY

Hundreds of thousands of copies of this wonderful book have been sold and the regular price of this edition is 50 cents. However, to acquaint the readers of this paper with the unusual merits of **Square Deal Fence** we will gladly send a copy of Ropp's New Calculator just as illustrated FREE and POSTPAID. We will also mail our latest catalog of

Square Deal Fence

the favorite field and stock fence of discriminating farmers everywhere. The Square Deal Lock double grips the one-piece stay wires to the wavy strand wires without cutting, breaking or slipping. Combines solid strength with remarkable flexibility. The self-draining shape of the Square Deal Lock prevents rust. The one-piece stay wires prevent sagging, bagging and buckling, require fewer posts—the wavy strand wires give springiness, elasticity and life. Landowners! write at once for catalog and get your copy of Ropp's New Calculator free, postpaid. Address

Keystone Steel & Wire Co., 4042 Industrial St., Peoria, Ill.

Indoor Closet

More Comfortable, Healthful, Convenient

Eliminates the out-door privy, open vault and cesspool, which are breeding places for germs. Have a warm, sanitary, odorless toilet right in your house. No going out in cold weather. A boon to invalids. Endorsed by State Boards of Health.

ABSOLUTELY ODORLESS

Put It Anywhere In The House

The germs are killed by a chemical process in water in the container, which you empty once a month. **Absolutely no odor.** No more trouble to empty than ashes. Closet absolutely guaranteed. Write for full description and price.

ROWE SANITARY MFG CO. ROWE BLDG., DETROIT, MICH.

Ask about the Ro-San Washstand—Hot and Cold Running Water Without Plumbing

BOWSHER Feed Mills

Crush ear corn (with or without shucks) and **grind** all kinds of small grain, cotton seed and **head kaffir.**

Stock Thrive Best on Ground Feed

Bowsher Mills are differently constructed from others. **Light running**—handy to operate. In 10 sizes from 2 to 25 H. P. Sold with or without elevator. We also make Sweep Grinders. Write today.

FREE *Catalog and folder on values of feeds and manures.*

5878 Industrial St. PEORIA, ILL.

Whether you want to buy or sell live stock, THE MISSOURI FARMER affords you the best medium in this state through which you can reach a good class of farmers by advertising.

The Missouri Farmer

VOLUME VIII | OCTOBER 1, 1916 | NUMBER 19

Lafayette County Points the Way

By William Hirth, Publisher

Slowly but surely the Farm Club movement is taking definite form in Missouri. On the 14th and 15th of September the farmers of Lafayette County held a big two days picnic or "round up" at Higginsville and it is doubtful whether any group of farmers in the history of the state ever came together with greater determination or with a more clearly defined idea of what they wanted to do than these men of Lafayette whose performance and plans merit the close study of the farmers of every county in Missouri.

On the first day, the big crowd was addressed by "Sam" Jordan who needs no introduction to the readers of THE FARMER and also by Prof. Childers of the Agricultural College of Missouri who, for a number of years, has contributed valuable services in soil work.

W. D. McKee of Polo was the first speaker on the second day—and like Mr. Jordan he is personally known to many of our readers..

The question of Farm Club organization which was the object and culmination of the big two days meeting was then taken in hand by the writer in an address of an hour and a half's duration—and the action which followed deserves the close study of every thinking farmer in Missouri, for it furnishes a pattern which should promptly be taken up by the farmers of every community in the state. Since last winter, when in response to the appeals of THE MISSOURI FARMER, the Farm Club idea was first taken up in Lafayette, perhaps 15 clubs have been organized in as many school districts—and through these organizations the big "round up" meeting was planned and carefully organized in every township. Fully six weeks of this preliminary organization work preceded the "round up"—and to this the splendid meeting owed its chief success.

A County Ass'n Formed

At the conclusion of the writers address, a motion to organize a Lafayette County Farmers Ass'n was carried unanimously and John Dryer, President of a Farm Club near Lexington was chosen President of the County Ass'n, while E. Showengerdt of near Higginsville was made Vice-President and H. E. Slusher, of near Lexington, Secretary. All of these three men are "wheel horse" farmers who are known all over the county and whose names carry the highest of respect in every community—and what is more, every one of them is a fighting Farm Club man. A Campaign or Organization Committee of seven leading farmers was then named in every township in the county and by this time these different committees, under the direction of the County officers, are at work organizing Farm Clubs at the different school houses all over the county—and the reader can get an idea of what these men have in view when he is told that they expect to organize a Farm Club in at least 100 out of the 129 school districts in the county between now and the first of the year. Assuming that the Clubs will average a membership of 20 to the Club, this will mean that 2000 farmers will soon be marshalled under the banner of the Lafayette County Farmers Ass'n.

And one of the fine things about this movement is the fact that it is fast developing farm leaders—farmers who can get up and make a forceful school house address and instead of waiting for outside help, these Lafayette County farmers will divide up and several "Organizing Squads" will be busy addressing the farmers of several new districts every evening in the week until the county has been fully covered. As one enthusiastic Farm Club worker put it to the writer, "When we first organized our Club there wasn't a one of us who thought he could get up and talk. Now we'v got a half dozen, anyone of whom can help to organize a new Club"—and thus it goes. The word is telephoned to a few leading farmers in an unorganized district to get all their farmers together at the school house on a certain evening. Then an "Organizing Squad" of four or five farmers get into an automobile and before the evening is over a new Farm Club has been brought into existence. In the meantime, the organizers have lost little time from their work—and every one of them enjoys the experience immensely, secure in the knowledge that they are fighting for a "square deal" for themselves and for their fellow farmers.

The Objects in View

And now, what is it these Lafayette County farmers have in view? Is it, as so many of these movements have been in the past, a mere sentimental affair? Not at all. On the contrary, it is more practical than any other farm organization plan that has ever been proposed—and much farther reaching and comprehensive. To begin with, the Lafayette County Farmers Ass'n expects to take over the entire buying of such commodities as coal, bran, shorts, flour, potatoes, hay, corn, farm seeds, cotton seed meal, cotton seed cake, fertilizers and salt. It is not making war upon the country merchant in the regular fields of merchandise where close competition usually guarantees a fair price—but the above commodities, the most of which are produced on the farm and which are "side lines" in many small country towns, the Lafayette County Farmers Ass'n proposes to furnish at the lowest wholesale price to all its members—and that the saving will be worth while goes without saying. Through the Marketing Dep't of THE MISSOURI FARMER—whose services are at the disposal of every Farm Club in the state—the arrangements for the above wholesale prices were made months ago and scores of Farm Clubs have recently bought their coal at a saving of from 50c to $1.00 per ton. Likewise many of them have saved an average of $3 per ton on fertilizers, $2 per barrel on flour and they will also be able to save from $3 to $5 per ton over the average retail price of cotton seed meal—and on other like commodities in proportion. The saving in the buying of farm seeds will also be considerable, once this phase of the plan has been fully worked out. Arrangements have also been made to buy potatoes in carload lots direct from the Northern growers—and at this writing we believe that these potatoes can be laid down at the average point in Missouri at from $1.20 to $1.25 per bushel and if the reader will ascertain the present retail price at his market he will have a definite idea of the saving. Likewise, corn and hay will be shifted from those communities which have a surplus to those which have a shortage—eliminating all the middlemens profits. Had this plan been in working operation in every county in the state during the drouth years of 1913 and 1914 when the farmers of Missouri were compelled to ship in trainloads of hay from other states, it would have meant the saving of hundreds of thousands of dollars—but that in any year, good or bad, the buying and selling of the above commodities will affect a saving of millions of dollars to the farmers of Missouri there is not the slightest question.

Concentrating Power

By being able to speak for 1500 or 2000 farmers, the officers of the Lafayette County Farmers Ass'n will have much more power than a dozen or so little Farm Clubs could exercise by merely speaking for themselves—and hence the effort to organize a Farm Club in as nearly as possible every school house in the County. Relations have already been established to sell Missouri apples by the carload to the farmers of Nebraska, the Dakotas and other states where few apples are grown—and that this dealing direct has tremendous possibilities and that it will mean more money to Missouri growers as well as a lower price to these farmers in other states is apparent to any one who has ever inquired into the subject—and the same is true of the potatoes we buy from them. Then there are the splendid possibilities of the fresh egg trade for farmers wives with the big metropolitan hotels, cafes, dining car systems and well-to-do private families

NOTICE TO OUR READERS

Since the first of the year the cost of print paper has practically doubled and as a result, hundreds of publishers throughout the Country are facing the necessity of either increasing their subscription price or discontinuing their publications. In common with other publications which use large quantities of paper, this advance is visting a tremendous hardship upon THE MISSOURI FARMER—and after viewing the matter from every angle we feel we have no other alternative except to advance the yearly subscription price from 50c to 75c or two years for one dollar instead of three years as formerly.

However, this new subscription rate will not be put into effect until October 20th—and all of our old readers therefore who send us a dollar between now and that date will receive the benefit of the old offer of three years extension. Hence, if your subscription is not paid in advance at this time, we trust you will take advantage of this opportunity at once by sending us a dollar by return mail. A dollar bill can be sent at our risk. If you haven't a dollar bill at hand, a check will do equally as well. Also, if you have some neighbors who are not receiving the paper at this time, ask them to give you a dollar under the old offer.

Stern necessity alone compels us to take this action—but, after all, we believe that whether he gets the paper two years or three years for a dollar will make little difference to any real friend of THE MISSOURI FARMER which is fighting the battles of the farmers of this state as is no other farm paper in the Corn Belt. The hundreds of Farm Clubs which have been organized throughout Missouri during recent months are the direct outgrowth of the fight which THE FARMER has made—and through our Marketing Dep't we are making it possible for every member of these organizations to save many times the subscription price of the paper. And that a few cents more or less in our subscription price will make any material difference with the thinking farmers of the state whose hearts are with us we do not believe for one moment—for the great movement which we are leading, if the farmers of Missouri will rally to our support, means not merely the saving of millions of dollars to them during the next few years but a happier and more enjoyable farm life in general. The new rate simply means placing the paper on a 50c yearly basis because 90% of our readers will remit a dollar for two years instead of sending 75c for one year—and if THE FARMER isn't worth 50c a year it isn't worth anything.

WILLIAM HIRTH, Publisher.

—all questions which farmers cannot solve in their present disorganized state. In other words, for the first time these Lafayette County farmers are about to take in hand the great question of "Farm Marketing" of which we have heard so much in recent years and yet which, up to this time, has never progressed beyond the "talking" and "theory" stage.

And yet, splendid as is this program, it is merely the beginning of the greater tasks ahead—the rumbling of the distant thunder of a storm which shall gather force until we are strong enough to shake off the strangle hold of the Packers Combine, the Grain Gamblers and others who have been crushing the joy and profit out of farm life in recent years—until, like the manufacturer, the merchant, and other forces we are in position to demand the production cost, together with a reasonable profit for the grea staples of the American farm. It is therefore a demand for a "square deal" in the Market Place rather than an effort to "buy everything cheap that actuates the thinking, earnest men back of this great new movement —and those who are under the impression that it presages a reign of the "Farmers Store" of the old "Wheel" days are greatly mistaken. Every intelligent farmer knows that we must "live and let live"—that we sell the lions share of our surplus products to those who live in the town and city and that therefore we cannot afford to annihilate such communities.

Saline Getting in Line

The Lafayette Farm Clubs also expect to meet at least twice per month during the fall and winter months to discuss pertinent questions in which every thinking farmer is interested. In other words, they expect to "gird up their loins" and in the "Melting Pot" of these little school house meetings thresh out the great questions which confront the farmers of the Nation at this hour. And now why not follow suit in your county? A delegation of Saline County farmers who watched the way the Lafayette County "wheel-horses" performed at Higginsville held an informal caucus at the conclusion of the meeting and here is the program they mapped out: They said, "We are going back to Saline and call 25 or 30 leading farmers together from different parts of the county at once. Then we will ask these men to act as an executive committee which will address an appeal to three leading farmers in every school district in the county to meet us at Marshall on a given day—and then we will adopt the Lafayette County plan and organize a County Farmers Ass'n." The writer has agreed to address the Saline County meeting and we believe the program here outlined furnishes a splendid plan of "setting the ball rolling" in any county in the state. And here is an appeal to every farmer who reads this article to "pull off his coat" and "get into the fight." There is no time to lose. The hour for action has come. Let us set an example here in Missouri of what farmers can do, once they are aroused. Then let's send the good tidings to the farmers of Iowa, Kansas, Nebraska, Illinois and other states and bid them do likewise—and surely the "game is worth the candle" for it means justice not only to those who toil in the fields and feed lots today but justice also to our children in the years to come who will be even more helpless than we are at this hour if we fail to go to their rescue while rescue is still possible. We have recently published a splendid pamphlet on "The School House House Farm Club" which we will gladly mail to any reader who sends us a two cent stamp to cover the cost of mailing. It explains fully how to organize a Farm Club in your school district and contains a suitable Constitution and By-Laws.

SENSE AND NONSENSE

A Dog Show

Not long since I had the pleasure of attending the Missouri Valley Fox Hunter's Ass'n meeting and was billed to make a speech. Of course it was presumed that I would talk "dog" and not having much experience along the dog line, I feared that I was going to have some hard sledding, or rather some difficulty in talking "dog," but on looking into the subject diligently for some weeks, I found men and dogs alike in so many respects that it was not so difficult after all. I once in awhile got a little mixed as a part of my talk will show, and it was somewhat as follows—"Ladies, gentlemen, and fellow hound dogs:—After that eloquent introduction by my friend McKee, I feel much like an unfortunate dog I once heard of and feel that after you have heard my speech you people will feel like disappointed dogs.

From that fine introduction one would infer that I am going to talk "corn," but I am not going to do it, for I assume that on this momentous occasion, you do not care any thing about corn nor soil, nor cattle, nor hogs, but that it is dog you want, so I am going to talk "dog." Will say that I don't know much about dogs, but do know a lot about folks and since I have for this occasion looked up dogs a little and find them (men and dogs) a lot alike. I owned a dog once, myself. I don't know what kind of a dog he was, just dog, I guess, but he was a pretty onery cuss.

I think it was Sam Jones that said "We are all born equal, half human and half dog. Some of us are feeding the human and starving the dog, and others feeding the dog and starving the human," and that seems about right on a careful examination. I am some dog myself, that is I belong to a secret dog order. The ancient ana illustrious order of little yellow dogs," so you see I am a yellow dog at that. This order is supposed to have been founded before the building of the Egyptian Pyramids, and that Julius Caesar and Alexander the Great were members, and I am told that Charles Evans Hughes and Woodrow Wilson are "brothers of the same 'kennel'." So you see to belong to this order you must have some "class" about you. The initiation ceremony consisted, in part, of questions to indicate the applicants dog knowledge, and one was whether or not I had ever kicked a dog. I plead guilty, then I was asked if I ever tied a can to a dog's tail. Having been a boy once I had to plead guilty; then "Did you kick the dog and tie the can to his tail to gratify yourself, or for the good of the dog?" I assured them that it was always for the good of the dog.

Now, I assume that this great audience are not here primarily for the good of the dog, but to emulate those traits in dog character, that commonly surpass that of men—namely—Loyalty to his master, true friendship, and defense. Many fine stories might be cited in evidence, and this is well.

Dogs and men are alike in many things. They both stay out late of nights, they growl a lot some times when there is nothing to growl about, they are brave when they have the other fellow on the run, and when they want to "kill sheep" they go away from the "home grounds." There's a few differences, though, in the dog favor, one is he never gets drunk, th he neither swears nor abuses his wi

Another thing about dogs, there a so many kinds. Long dogs, short dog hound dogs and "dog days," and de ones. Then there are four legged dog those with two legs, and some wi no legs at all, but have only two en and a middle, mostly middle. Th are so long that they travel in se tions, and are served the same w at lunch counters. Some dogs have very fine scent and some men ha a lot of it, then there are dogs th ought to be shot.

I never could get it through my he why a man should like a dog so we when so many beautiful ladies a not yet captured, but when I look in a mirror, and also recall some of n gentlemen acquaintances, I can rea ily see why so many women are fo of dogs. They just must love som thing, you know.

I read in the paper not long ag about a lady whose dog died and t paper said that she was prostrat with grief, and went into "half mour ing," of course I do not know whi half, the paper did not say, but a way her "man" went to fight Germa and got shot, and I presume she p the other half in mourning for hi the paper failed to state, or maybe s will not take up his case till she done mourning for the dog, when doubt, she will give him proper atte tion, if she does not secure anoth "man" in the meantime.

Another thing about some men a some dogs—they have fleas!

There are many fine stories of t dog's true friendship, devotion a loyalty. Not long since I read of soldier whose dog persisted in follo ing him to the trenches. In the e gagement the master was dangerous wounded, and when the battle w over and the dead were placed in t shallow trenches for burial, the dog master was thought to be dead, a he was covered with dirt, but t faithful dog refused to leave the gra and he was allowed to remain. T dog then dug the dirt away and lick his master's face. A sentry saw t dog and upon looking down he sa signs of life in the man's face, and a result he was taken to a hospit where he recovered. He owed his li to his faithful, dumb friend.

The dog is loved if he is a goo sport. And a man who loves goo clean sport is nearly always a might good fellow, and this "dog show" I understand it is to emulate good fe lowship.

Thus ended the dog (tail) tale.

Sam Jordan.

A LITTLE HEART TO HEART TALK

I want to have a little heart to heart talk with the readers of THE FARMER about a number of things. In the first place, I want every farmer who believes in the great fight we are making for farmer organization to write me a letter by return mail because there are certain things I want to say to you. The time has come for every thinking farmer to get into this great fight. We have been drifting with the current long enough. Why should the farmers in your community be stumbling along in the same old rut when the farmers of Lafayette County and many other sections of the state are so splendidly aroused? I want every farmer who is living in a school district in which as yet no Farm Club has been organized to get in touch with me at once—for between now and New Years I want a thousand new school house Farm Clubs to be brought into existence—and I want you to be one of the leaders. Inclose a 2c stamp to pay postage on our splendid new Farm Club pamphlet which includes a Constitution and By-Laws and which tells you just how to proceed in every detail. You owe it to yourself, your family and your Country to shell off your coat and get busy—and every neighbor will thank you for helping to point the way.

And now here is a thing for you to bear in mind: This movement does not rest upon mere theory or sentiment. If you and your neighbors will organize, we will immediately put you in position to save a lot of money on coal, bran, shorts, flour, cotton seed meal and cake, fertilizers, salt, etc. In other words, we are ready to help you begin saving money right now—not in the dim and distant future. And now here is another important matter: We can buy a carload of Northern potatoes for you at from 90c to $1.00 per bu. F. O. B. the shipping point —and this should lay them down at not to exceed $1.25 at your station. Already in many towns the local price is $2.00 per bushel—and since the Country is harvesting the shortest Potato crop in years they are certain to go higher. But if you and your neighbors want a car of these Potatoes there isn't a moment to lose—for within two weeks they will have been bought up by the dealers.

So let me once more entreat you and your neighbors to wake up! Before the coming winter is over, I want to see the farmers of Missouri organized as the farmers of no other state ever were before—and it is up to the farmers of your school district to say whether you want to have a part in this, the greatest and most practical farm organization movement that has ever been started.

WILLIAM HIRTH, Publisher.

IS OUTDOOR EXERCISE NECESSARY FOR HOGS?

Editor of The Missouri Farmer:

Dear Sir—I have a book on Feed and Feeding by W. A. Henry. In th book I read that the Danes excel th world in bacon production. I wa talking one time with a Dane (rathe an old gentleman who talked broke English) about their method in the ol country. He said the Danes in the ol country kept their hogs up in clos quarters in buildings all their live and that they hardly had a chance t see out doors. Now the query: Wha is the crying need for out door exer cise for a hog? Why do we Amer cans lay so much stress on exercis or how do the Danes affect the deman if nature requires it?

I have been studying the care an management of breeding hogs and pig

uite a good deal, but have never had ings shaped up to suit me and do ot know whether I could design plans at would just suit me but the ought occured to me that if out door xercise was not essential for the hog e matter of planning for convenience handling them would be much simified. Of course under American onditions of farming, hogs will be out oors a great deal of the time any way, rowsing over pastures and fields in ixed fashion but such weather condiions as we have much of the time xes my wits. Old sows and pigs ipping down on the ice part of the me and at other times draging rough mud and snow and slush in n effort to get to and from ther feedg places. No place out doors fit for lay ground.

Then again the matter of keeping ach sow with litter of pigs separate rom all the others. It is easy enough a building, but the matter of keepg up lots and pastures and fences condition for out door exercise beomes a problem and also entails a lot f extra work at feeding, watering, etc. would like to know just what is reuired and then plan to meet it. If here is any good way to eliminate the actor of exercise without detriment o the hog I would like to know how, o I could keep them up or let them ut just as it suited my convenience. When it comes to fattening time that s easy because the closer the quarters he better. The whole pen can be overed over for that and the whole arth cemented. But keeping the old ows and boar in proper condition and rowing the pigs up properly especially winter pigs so as to develope bone nd muscle and bacon qualities--there s the problem. I would be pleased to get the best advice you or any of your readers can give. W. T. Cary.

Editorial Note: The above article was submitted by Mr. Cary some time ago and was accidentally misplaced but it brings up the question now just at the time when farmers should be thinking about the proper housing of their hogs.

We would like to hear from our experienced breeders on this subject and will be very glad if they will use our columns freely to discuss the question in all its phases.

FARMERS OF ADAIR INTO THE FIGHT

The farmers of Adair County held a splendid "get together" meeting some miles north of Kirksville on Thursday, Sept. 21 and perfected plans to form a County Farmers' Association at once. The meeting was addressed by the Publisher of THE MISSOURI FARMER and a new note of determination and enthusiasm was manifest upon the part of every farmer in attendance. A strong Executive Committee of 30 farmers representing every section of the county was named and this committee will at once get in touch with three leading farmers in every school district who will be called together at an early date—and then the active organization of schoolhouse Farm Clubs will be pushed in every direction.

Chief among those who "set the ball rolling" up in Adair, were D. V. McClelland and G. A. Leavitt, Secretary and President respectively of a splendid community farmers' organization which has been in existence for some time and which has been doing splendid work. It would be difficult to find two more enthusiastic farmers for Farm Clubs in the state than these two men who stand high in the estimation of their neighbors and who are body and soul back of this great new movement. Others who are also putting their shoulders to the wheel in fine fashion are John Dye, S. A. Vaughn, S. E. Capps, John C. Mills, Jr., E. A. Ross—for to this bunch of determined men was largely due the success of the initial steps which will soon lead to a strong Farmers' Association in Adair county.

One of the noticeable things about the Farm Club campaign is the fact that the big, well to do farmers as well as the little ones are fighting side by side and that with such a condition of affairs success is assured in almost any county there is little question. It is not an uprising of calamity howlers. For the first time the big and little farmers are moving off together and doing real "team work."

THE GRANGE IS RETURNING

The series of Field Meetings held this year, by the local Grange accounts for the above condition.

The meeting held near Tina, on Aug. 29, in Carroll County, was a success and will result in greater work for the future. The crowd was estimated at from three to five thousand.

The meeting near Avalon on Aug. 30 held under the auspices of the local Granges of Livingston County was well attended and already the patrons of both counties are planning to repeat the work next year.

The meeting near Kirksville, Audrain County on Sept. 1st was up to the standard of former years.

The work of the order was expounded by National Master Oliver Wilson, of Peoria, Ill. A review of commercial conditions was given by Hon. L. D. Lozier, of Carrollton. Mr. Naylor, with the Cement Manfg. Association discussed the needs of the farmer and some needed legislation in his line of work.

On Sept. 2nd the Ninth Annual Corn Roast was held by Maywood Grange at Maywood, Lewis Co., and was well attended. Hon. Noah W. Simpson, Hon. Oliver Wilson, and Rev. Scott, Pres. of LaGrange Baptist College were the speakers.

On Sept. 6th the writer in company with National Lecturer Edw. E. Chapman of Ludow, Mass., and Farm Adviser, Mr. C. M. Long of Pettis County, attended a meeting of farmers at Maplewood Hall near Sedalia and after the speakers had spent the evening in discussing measures of direct interest to the rural community, we left the people in a friendly mood, looking to the organizing of a Grange at that place.

On Sept. 8th the second annual Field Meeting was held by Masonic Hall Grange, 4 miles south of Centerview, Johnson Co., with a large crowd in attendance. Bro. Chapman kept the audience in fine humor from start to finish. The Farm adviser of Johnson County, Mr. Gangler was present and the audience appreciated his presence and the splendid address on the work of Farm Adviser.

On Sept. 9th the patrons of Cass County met near Pleasant Hill and again a feast of oratory as well as that of fried chicken was enjoyed by a large crowd, and Bro. Chapman returned to his home well pleased with his first visit to the Central West and the patrons of Missouri.

I forgot to state that on Sept. 6th we were invited to attend the first annual chicken dinner, at the park in Sedalia, held under the auspices of the Pettis County Sr. Poultry Association, and the dinner was all that the name implies. It was presided over by its Pres. Mrs. Stevens, and after all visitors had partaken freely and the table was cleared, Mr. Long, organized the Junior Poultry Association and the interest manifested by the boys and girls present was evidence that Mr. Long has the work well in hand.

Since this series of meetings were held one Grange has been organized in Carroll Co., with 36 charter members and one in Pettis Co., with 32 members, with several good prospects in view.

Never since I have been connected with the order has the interest been more pronounced among the farmers for organization and even with a great political struggle on the farmers are ready to lay aside all party differences and come together for the betterment of the rural districts.

The question of Rural Credits is being discussed and the farmer will vote on November 7th for the Amendments, on the Missouri Land Bank Bill and are not so much concerned as to the present bill, believing that if any changes are needed the next Legislature will make all needed corrections.

If there are any communities that believe a Grange would help them solve some of their problems, we are ready to help, we need your help also.

C. O. Raine,
Master State Grange,
Canton, Mo.

Will Help You with Your Concrete Work

Rural contractors specializing in concrete work, especially those building silos and other farm structures, also contractors or others who would like to specialize on such work, will be interested in knowing of a cooperative plan now being carried out by the Extension Division of the Portland Cement Association.

Any one interested in concrete contracting work or in taking up such work, is urged to address a letter to the Director, Extension Division, Portland Cement Association, 111 West Washington Street, Chicago, for some information that will prove valuable, and that can be obtained without cost or other obligation.

A Fine Opportunity

The good housewives in the homes in which THE FARMER is a regular visitor should read the advertisement on the last page in this issue carefully —for if you are in need of a new dinner set, here is an opportunity to get a good one mighty cheap. In any event, it will not hurt to look into the matter and ask for further particulars.

Why not send us a dollar bill at our risk and have us renew your subscription for three years while the old offer still holds good? This dollar will help us to pay some of our debts and give you a better paper.

Buy an International Hay Press

IT turns out the tight, smooth bales of hay that ship well, and sell readily, because pressed with our famous pull-power toggle-joint plunger, and smoothed with our special roller tucker.

It is made in styles to suit the needs of every farm—one-horse and two-horse presses for farmers who have no other power; motor presses for the men who wish to get through with baling in a hurry; belted jack presses for farmers who already own engines; and fast working belt power presses for baling large crops, or for custom work. The line is complete.

All working parts of **International Hay Presses** are made of steel. The sizes are standard, 14 x 18, 16 x 18 and 17 x 22, and the capacity of the different styles ranges from 6 to 35 tons of baled hay per day.

Write for illustrated folders and catalogues showing these baling presses in color and giving complete specifications. You can see an **International** press at the place of business of the local dealer who handles it. We will send you his name if you will write us.

THE CHALLENGE

When Napoleon led his soldiers beneath the shadow of the pyramids, he said to them "Forty centuries look down on you." Forty centuries yet to come now look down on the American farmer. We are at a critical point in our journey. We are at the fork of the road. Shall we slink along the road that leads to poverty and peasantry, or shall we rekindle the fires of freedom that burn in our breasts, give fight to the vampires that suck our life blood, and assert our right to travel the road that leads to the land of prosperity? Truly, we are living "in an age upon ages telling." Shall the story be told of a noble class of farmers sinking lower and lower till ambition and independence are dead, or shall the story be told of a triumphant fight against poverty and peasantry? It is for you to say. The challenge is to you.

Is your blood thick and red, or is it thin like water? Are you going to fight or are you going to slink along and whine at your fate?

When I look into the earnest faces of farmers gathered together in the little school houses of the country, I see it is to be a fight. The sturdy spirit of the countryman has never yet been cowed and never will be. Other farmers, of other lands, have slipped backward into oblivion, and they didn't have the chance we have. With science as our servant and cooperation as our slogan we will win. This is the game of life. Clubs are trumps. Get into the game. Play your best card. If you havn't a club, organize one. Primitive man conquered the beasts that roamed the forests by using a club; we will conquer the monsters that grapple at our throats if we will only use clubs. Clubs are trumps. Organize!

B. P. Smoot.

"WISE OR OTHERWISE"

Editor, Missouri Farmer:

Would it not be well for us as farmers in the great Commonwealth of Missouri to take a backward look over the past year (one of the most unusual from several viewpoints for a number of years), and try to find some lessons, that will be of benefit to us in the years to come? First, a rather late cold spring. Many early planted potatoes rotted and had to be planted over. About the only safeguard against that would be to be sure to plant on well drained soil, well filled with humus, so the soil will not become heavy and clamy. Then do not cover too deep. All ground intended for early gardens should have a good coat of coarse manure like an old stack bottom, or horse manure. After spring opened up toward the last of March the ground got in nearly perfect condition for working, also for washing, which it surely did good and plenty. Thousands of farms lost tons upon tons of the best of soil, and many ditches started that may take considerable effort to stop, and some will never be stopped. It seems a disgrace to the business of farming to see the way some of the best farms in the country are cut up with ditches. Each with its accompanying fringe of weeds and bushes from five to twenty feet on each side.

Many a farm in this vicinity where forty years ago no ditches to speak of were to be seen, now have great gullies from five to forty feet wide and from four to ten feet deep, which could have been prevented if taken in time. A few bars of hedge brush, trimmings from the orchard or brush from the timber well staked down, with a little straw, corn fodder or refuse of any kind thrown on the upper edge to catch the wash, will surprise one who has never tried it, to see how soon a bad wash can be filled. I have seen washes four to six feet deep completely filled in two years by putting poles across every few rods according to the slope of the ground, staking them in place and stakes driven into the bottom of the ditch and a few forkfulls of straw thrown in to catch the wash. On Valley View farm we try to nip every ditch in the bud, either with rock, brush, or straw bars, and as our land is quite rolling it takes some work.

Where a fence crosses a draw we put in rock high enough to spread the water out and prevent cutting out below. Not one of those beautiful weed fringed ditches can be found on the 240 acres comprising the farm.

We have used the crab rooted slough grass, where washing was unusually hard to control as no amount of water will cut it out after it gets rooted and it grows very readily anywhere. I wish every Missouri farmer could read an article in the National Geographical Magazine for June describing the manner the ancient Toltec and Astec races of South America gained a living from the rocky slopes of the mountains, digging out the rocks and building terrace above terrace and filling in a certain kind of subsoil and putting on a soil layer carried sometimes for miles in baskets from the stream beds, with irrigating ditches sometimes cut in the solid rock and sometimes built up with rock, aquedocts ten to fifty feet high, and compare if comparison were possible with the conditions as they are with us.

It might start a train of thought that would cause our surroundings and advantages even in a cold, wet, hot, dry, cold season like the present to be better appreciated. Well, I did not get very far along with the subject matter, but may try another chapter later on. Uncle Rube.

EFFECT OF RATION AND AGE OF CALVING ON DAIRY COWS

Many of the most thoughtful breeders are asking agricultural experiment stations if it is possible to follow any method of feeding and management of dairy heifers that will make it more certain that the heifers will be good producers. It is another application of the question as to the relative importance of heredity and environment. Does a good dairy cow or an inferior one derive her special dairy characteristics by inheritance, or is it a result of her treatment from birth to maturity? Is a good dairy cow born that way or made what she is by her owner?

It is a well-known fact that there is considerable difference in practice among cattlemen in regard to the feeding and handling of dairy heifers. We find radically different views on some points. Some hold that a cow should be fresh at a very early age to insure the best development of the milking functions. Others take a directly opposite view and prefer a cow to be quite well-matured and state that only in such animlas are the milk-producing functions the most highly developed. Some who raise dairy cattle feed their calves only bulky feed and in rather scant quantities. Others feed largely with grain and grow them as rapidly as possible. Some hold that if a heifer of a dairy breed is allowed to get fat when young she develops a tendency to use her food for body fat all her life rather than to produce milk. Others hold that the dairy qualities of a cow are not influenced in any way by the method of feeding when young and that no harm comes from a heifer being fat. Some desire to develop the largest animals possible for the breed. Others prefer cows medium-sized or small for the breed.

There must be some general law or laws in regard to these points that can be found by experimental work. Apparently there are a number of questions along this line which cannot be answered definitely as a result of common observations or there would not be this wide difference of opinion. Having these facts in mind, the Missouri Agricultural Experiment Station in 1906 undertook an investigation for the purpose of determining, if possible, some of the principles upon which practical methods of raising dairy cows should be based. It was thought that by raising dairy heifers in the University of Missouri herd under different conditions and keeping full records from birth until the cow had been in milk two years it would be possible to come to some more definite conclusion regarding the possible influence of the treatment when young upon the future usefulness of the animal for dairy purposes.

The general conclusion from the work of the Missouri Agricultural Experiment Station investigations is that "it is possible to influence the rate of growth, size when mature, and type to some extent, by the liberality of the ration during the growing period, and the age at first calving. Within limits of variation, even far beyond the normal, the character of the ration with reference to amount of nutrients supplied does not exert any appreciable effect upon the milking functions of the cow when mature.—C. H. Eckles, Missouri Experiment Station.

FERTILIZING THE WHEAT CROP

Eleven years' work on the soil experiment fields in practically every section of Missouri has shown on most of the soils—especially the thinner and more worn ones—that the addition of available plant food has materially increased the yield and quality of wheat and has paid good returns on the money invested in fertilizers. On medium to poor lands the amount of available plant food is always one of the limitnig factors in wheat production.

The average farmer cannot greatly change the fertility of his soil in a

When Nature Turns Outlaw

"Blow, winds, and crack your cheeks! rage! blow!—
You cataracts and hurricanoes, spout . . . . . ."

Thus King Lear, in Shakespeare's tragedy, defies the elements. But man, even today, cannot challenge nature with impunity.

The unsinkable ship goes down like a rock from the impact of an iceberg. The fireproof building is burned. The monument, built for unborn generations, is riven by lightning or shaken down by an earthquake.

There are storms which make train service impossible, which delay the mails and which close the public highways to the usual traffic. Even in the cities there are times when the street cars do not run, and neither automobiles nor horse-drawn vehicles can be driven through floods or high-piled snowdrifts.

Such conditions increase th dependence on telephone wire which themselves are not exemp from the same natural hazard Fortunately, however, the Bel System has faced these danger and well-nigh overcome them Masses of wires are buried un derground and lonely pole line even the most stoutly built, ar practically paralleled by othe lines to which their business ca be transferred.

Each year the lines are stronge and the guardians of the wire are prepared to make repairs mor quickly. So each year increasin millions of subscribers find thei telephones more dependable and within the limits of human powe they count upon their use in storm as well as in fair weather.

AMERICAN TELEPHONE AND TELEGRAPH COMPAN
AND ASSOCIATED COMPANIES
One Policy *One System* *Universal Servic*

short period of time, but he may often temporarily increase its productiveness to a very marked extent. This is most commonly done by the addition of barnyard manure or some form of commercial fertilizer. Manure is, of course, the material most advisable so long as it lasts, but most farmers, especially those on the thinner lands, find their manure supply exhausted long before their fields are covered. Then in order to obtain the best yields from the rest of their land an application of some soluble plant food must be made. It is a general practice among farmers to add manure to the corn crop and apply commercial fertilizers when necessary before wheat. Wheat is the most universally fertilized cereal This is largely because it responds more readily to treatment than the other grain crops. Like cotton it is a cash crop of considerable value and the money expended for fertilizers is recovered as soon as the crop is sold.

Nearly all of the thinner soils of the state are comparatively low in available phosphorus. Applications of this element in soluble form usually gives the largest and most profitable returns. It is the cheapest and most easily obtained of any of the important plant food elements. The supply for this part of the country is found mainly in bonemeal, acid phosphate, or in various mixed fertilizers. Bone meal may be applied at the rate of from 125 to 150 pounds an acre but sixteen per cent acid phosphate should also give good profit if applied at the rate of about 150 or 200 pounds per acre, and mixed fertilizers which carry a small supply of nitrogen as well as considerable phosphorus will give good results on lands that are deficient in nitrogen and organic matter. Most of them should be applied at the rate of 125 to 150 pounds an acre. Nitrogen gives good results with wheat but it costs so much in fertilizers containing more than two or three per cent of it. Potash is another fertilizer that is good in increasing wheat yields but is entirely too high for use at present on account of the European War which has cut off the supply from Germany.

It must also be remembered that the use of commercial fertilizers alone is not to be considered a reliable or practical means of keeping up soil fertility or insuring high yields, but rather as a temporary method of increasing crop yields and enlarging the profits from thin or worn lands. In this way they enable the farmer to put more money into the improvement of his soil. However, the sensible use of fertilizers must go hand in hand with the best systems of crop rotation, manuring, green manuring, and systematic soil management that will tend to maintain or increase the organic matter and nitrogen content of the soil.—F. L. Duley, Missouri Agricultural Experiment Station.

GALLOWAY'S 1917 MODEL NO. 8 SPREADER

NOW READY

JUST READ THESE IMPROVEMENTS S-24

They mean that every Galloway Spreader is BUILT STRONGER AND BETTER THAN BEFORE. The beater bolts are 1-16 in. larger with lock nuts. Beater bar bolts increased in size and stength. Beater teeth longer and stronger than ever which means they now tear the toughest manure finer than ever and spread it easier. Heavier bolts hold the beater bars in the beater head. Rear shaft is increased in strength--higher carbon steel used. Additional bolts strengthen (beyond actual necessity) the beater bracket. Larger drive sprockets, which mean LIGHTER DRAFT THAN EVER. The fifth wheel castings are larger and increased in strength; spreader box STEADIER in turning. Rear conveyor shaft now made of No. 40 carbon steel. All steel tongue. All metal parts thoroughly coated with asphaltum weather-proof paint. Spreader box better finished and painted. Galloway WIDE SPREADING V-RAKE on every machine WORTH $15 on any spreader, COSTS YOU NOTHING EXTRA. INVINCIBLE, IRRESISTIBLE, PATENTED ROLLER FEED--an EXCLUSIVE GALLOWAY FEATURE, makes it SUPERIOR to all other feeds on all other machines--the SECRET OF OUR LIGHT DRAFT. The mechanical principle is the same as MOVING A HOUSE ON ROLLERS. THIS FEATURE ALONE WORTH $25 on any spreader. EXCLUSIVE AGAIN on the Galloway, costs you NOTHING EXTRA. PATENTED AUTOMATIC STOP uniform clean out push board WORTH $10 EXTRA on any spreader, EXCLUSIVE on the Galloway, costs you NOTHING EXTRA. These are a few of the features you will find on the Galloway, which are PROTECTED BY GALLOWAY PATENTS. Don't buy a spreader of any make or kind until you have tried a genuine GALLOWAY 1917 MODEL No. 5, No. 1A or No. 8 at our risk, without obligating yourself in any way. Thirty days' field trial and returnable to us within one year if not perfectly satisfactory. Remember, we manufacture this spreader in our own factories and sell it direct from factory to farm. Do not confuse the Galloway spreader with lower priced machines made to sell for a price, which are all cheap, worthless imitations. Over 60,000 Galloway Spreaders in use. These and other features make the Galloway Spreader more invincible than ever in actual field work. No big, cumbersome, four-horse or three-horse team needed to handle a Galloway. Two average horses can spread with the Galloway anywhere. Complete particulars and details of this 1917 model spreader now ready. Ask for my BIG 250-PAGE CATALOG, also my FALL BARGAIN BOOK. A postal gets them.

WM. GALLOWAY, Pres., WM. GALLOWAY CO.
F99 Galloway Station Waterloo, Iowa

SEED SELECTION IN THE FIELD

Autumn is the time to prepare for a profitable corn crop the following season. At corn-ripening time drop all other business and select an abundance of seed corn. The process is too important to be conducted incidentally while husking. When selecting seed corn give the process your entire attention. Get the very best that is to be had and preserve it well; and your increased yields will return you more profit than any other work you can do on your farm.

In 13 years' investigations conducted upon Scioto River bottom soil near Piketon, Ohio, with Woodburn White Dent, U. S. Selection 77, the yield was raised from an average of 63 bushels of dry shelled corn from 1901 to 1907 to an average of 75 bushels from 1907 to 1913. The principal influence producing this increase in yield was the selection and the care of seed corn.

The only proper way to select seed corn is from the stalks standing where they grew, as soon as ripe and before the first hard freeze. As soon as the crop ripens, go through the field with seed-picking bags, and husk the ears from the stalks that have produced the most corn without having any special advantages such as space, moisture, or fertility. Avoid the large ears on stalks standing singly with an unusual amount of space around them. Preference should be given the plants that have produced most heavily in competition with a full stand of less productive plants. In all localities the inherent tendency of the plant to produce heavily of sound dry, shelled corn is of most importance. Late-maturing plants wih ears which are heavy because of an excessive amount of sap should be ignored. Sappiness greatly increases the weight and is likely to destroy the quality. In the Central and Southern States, all other things being equal, short, thick stalks are preferable. Short stalks are not so easily blown down and permit thicker planting. Thick stalks are not so easily broken down and in general are more productive than slender ones. The tendency for corn to produce suckers is hereditary. Other things being equal, seed should be taken from stalks that have no suckers.

The same day seed corn is gathered the husked ears should be put in a dry place where there is free circulation of air and placed in such a manner that the ears do not touch each other. This is the only safe procedure. Good seed is repeatedly ruined because it is thought to be already dry enough when gathered and that the precaution mentioned above is unnecessary. Many farmers believe that their autumns are so dry that such care is superfluous. Seed corn in every locality gathered at ripening time will be benefited by drying as suggested. If left in the husk long after ripening it may sprout or mildew during warm, wet weather or become infested with weevils. The vitality of seed is often reduced by leaving it in a sack or in a pile for even a day after gathering. During warm weather ,wih some moisture in the cobs and kernels, th eears heat or mildew in a remarkably short time. The best possible treatment immediately after gathering is to string the ears . Ordinarily the best place to hang strings of ears is in an open shed or loft. Wire racks are more convenient, and in the end cheaper than binder twine. Such racks may be made from electrically welded lawn fencing. The cutting of the fencing ino seed-corn racks is done without any waste.

Only during unusually damp weather at seed-gahering time will fire be necessary. If heat is employed in a poorly ventilated room it will do the seed ears more injury than good. If used, the fire should be slow, long continued, and situated below the seed ears, with good ventilation above them.

After hanging in the shed or lying on the racks for two months the seed ears should be as dry as a bone and contain less than 10 per cent of moisture. They can remain where they dried or be stored in mouse-proof barrels, boxes, or cratse during the winter, but in either case they must not be exposed to a damp atmosphere, or they will absorb moisture and be injured. Some farmers place the thoroughly dried seed ears in the center of a wheat bin and fill the bin with loose, dry wheat.

In localities where weevils and grain moths injure stored grain, the thoroughly dry seed ears should be stored in very tight mouse-proof receptacles with 1 pound of moth balls or napthalene inclosed for each bushel of corn. This quantity tightly inclosed with the corn will prevent damage from these insects and will not injure the seed. If at any time signs of weevils or grain moths show on the corn, it should be inclosed with carbon bisulphid in practically air-tight rooms, bins, boxes, or barrels for 48 hours. The bisulphid should be placed in shallow dishes or pans on top of the seed. One-half pint is sufficient for a box or barrel holding 10 bushels or less. One pound is sufficient for a room or bin 10 feet each way. After fumigation the ears must be thoroughly aired, taking care that no fire is present when the fumigating box is opened.—U. S. Department of Agriculture.

Inoculation For Legumes

A correspondent wants to know if the land where Japan clover has been growing will be inoculated for alfalfa or sweet clover. No, the bacteria which grow on Japan clover are not the same as that growing on alfalfa or sweet clover and will not inoculate the latter. The bacteria growing on alfalfa and sweet clover are identical and for this reason the soil from a sweet clover patch is frequently used to inoculate the alfalfa field.

Where Japan clover has been growing for a few years the soil will doubtless be in better physical condition and for that reason the alfalfa sown on such a field will grow better than on land which has been in a non-leguminous crop.

Cost of Keeping Horses

What is the expense of keeping your horse? We do not mean for feed, but for shoeing and harness. In one of the municipalities of England where more than 100 horses are used on paved streets the expense of shoeing for each horse was from $16 to $19 annually and the harness cost per year was from $6 to $10 per head. The average working life of a horse has been 7.7 years. Some individual horses have done good hard service for twelve to fourteen years but these are exceptions. Of course these conditions are very much harder than those on the average farm.

Perfection Smokeless Oil Heater

—a Household Necessity

In the fall before the furnace fire is needed—in cold weather, when the furnace fails to keep the corners warm, a Perfection Heater takes the chill away and makes the whole house comfortable.

The Perfection Smokeless Heater may be easily carried about from room to room—the handle does not get hot.

No smoke, no dust, no ashes.

It Is Odorless

Can be regulated so the heat will radiate straight up or outward—pure and sweet air.

Burns kerosene — cheap and always available. Any good kerosene will give satisfaction, but for best results use Perfection Oil.

It is easy to fill and regulate. 25 inches high, 12 inches in diameter—finished in polished steel or blue enamel—trimmings are nickel or black Japan. It is an ornament—and in use in more than 2,000,000 homes.

Price varies from $4 to $7.25, according to finish. Look for the triangle trade mark.

Rayo Lamps give that soft mellow light which enables you to read without eye strain. Get one.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII October 1, 1916 No. 19

William Hirth, - - - Publisher
Geo. B. Ellis, - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

POLITICS AND RURAL CREDITS

It is unfortunate that the Missouri plan for a rural credit system has been made more or less a political issue in this campaign. Questions of this character which affect the economic conditions of the whole country can be approached in a much sounder way if kept free from partisan entanglements Fortunately the National Farm Loan Act got through Congress without in any way becoming a political question and its organization and execution can easily be kept entirely free from partisan influences.

Both New York and Wisconsin have adopted a farm loan act without either becoming endangered by political interference. The Missouri Land Bank Law is now on the statute books of the state as the result of practically a unanimous vote of both parties in the state legislature. In proportion to their numbers one party is as much entitled to the credit for passing this bill as the other is. It is unfortunate, therefore, that the discussion of the Land Bank Amendment which is to be voted on at the general election in November has been made an issue between the two leading candidates for governor. The voters, however, should not allow this condition to affect their views on the amendment nor to influence them in the way they are to cast their ballots. If a majority of votes are cast in favor of this measure it will be mandatory on the part of any governor or state legislature to put the law into practical working order. And so we urge our readers to give careful consideration to the Land Bank Amendment and if they think it is a step in the right direction they should vote for it regardless of who they may favor for governor.

We believe the Missouri Land Bank as provided for in the Act of the last Legislature is a feasible plan and can be put into effect with a much lower rate of expense than the Federal plan can be operated. The Missouri plan is not an innovation in rural credit legislation for it is funndametally along the same lines as the law in Australia which has been very successfully operated for a number of years. If there are any defects in this law the Legislature has full power over it and can amend it as future experience may demonstrate it should be changed.

One objection urged against the law is that the charge of one-half of one per cent to cover all expenses and to create a reserve fund will not be sufficient for that purpose. We answer that by saying that in Australia, the same charge has paid all expenses and has created a reserve of more than $500,000 in about eight years. A close study of the probable operation of the law will prove that this same result or even a much better showing is possible in Missouri.

If the average loan amounts to $2,500 it will take only 400 loans to make a million dollars. Any one who has kept in touch with the demand for this kind of legislation certainly will not deny that the placing of 400 or 500 loans amounting to $1,000,000, will be an easy matter for the first year of the operation of the law. The reserve and expense fund of the bank will receive one-half of one per cent on this amount or $5,000. Possibly this may not more than cover the expenses for the first year but it should be remembered that this payment will be made every year until the debt is amortised and if it runs for 25 years the borrowers will pay into the reserve fund for the whole time $120,000. Now there are practically no expenses on these loans after the first expense of making them and if it should take $20,000 to pay the expense of making loans to the amount of $1,000,000, there would be a balance in the reserve fund of $100,000 at the end of the amortization period of 25 years. Under this law the bank can loan $40,000,000 without increasing its capital stock and upon the above estimate there would be a reserve in that time of $4,000,000. So if we cut out one half for unforseen expenses we will still have $2,000,000 or enough to repay the state for the money advanced and a million dollars left for working capital. Furthermore in these calculations we have not given any credit for the interest that will be earned by the capital stock and reserve fund which alone will amount to several thousands of dollars annually. These results are possible with any ordinary business man as manager of the Land Bank.

It has been urged by some that it will not be possible to place so large an amount of loans as the Missouri law provides for, but these critics have surely not looked up the data on the amount of farm loans in existence at this time and even a school boy knows that as the price of farm lands advances the number and amount of mortgages must inevitably increase. According to the U. S. Census for 1910 it was ascertained that 46.3 per cent of the farms which were operated by owners were mortgaged. No figures were obtained for the farms operated by tenants or managers but if we assume that the same percentage of these farms are mortgaged we have 128,364 farms with mortgages as compared with 148,880 farms free from mortgage. The average amount of indebtedness on the farms in 1910 was $1,758 which would give a total farm loan debt on Missouri farms in the year 1910 of $225,663,900. On the first capitalization of the Missouri Land Bank only $40,000,000 can be loaned and the Federal Land Bank can loan but $180,000,000 on its original capital so it will be seen that Missouri farmers alone could not quite all be accommodated by both systems operating together and confining their business to this state.

It has been charged that the Federal and State Land Banks will be unfair to all borrowers who do not get their money from these banks. In the light of the practical working of any loan system this criticism is without foundation and it is no doubt made by those who want to confuse the mind of the voter. The opportunity to borrow is open to all alike and the man who can not get cheap money from private sources will get it from the Land Bank. Then the loaning of large amounts by the State and Federal Banks will have the effect of standardizing both terms and rates of interest which will benefit all whether they borrow of the Land Bank or from private instituions.

The inauguration of Land Banks giving the farmers loans at a reasonable rate of interest and on long time with the privilege of paying a little every year is not an untried theory for this system is more than 150 years old in Europe and the United States is the only great country in the world that has not long ago established government controlled loans for the benefit of the men who till the soil and who want to own their homes.

BORROWING TOO EASY?

At the recent meeting of the American Bankers Association held in Kansas City, the president of the association, James K. Lynch of San Francisco, California, is quoted as saying "The men who have the most intimate experience with farm conditions generally believe that borrowing is already too easy for the farmers." Who are the men with "the most intimate experience" who are referred to by this great banker? Let Mr. Lynch go among the thousands of mortgaged farmers of Missouri or any other state and ask the men who are doing the borrowing if the conditions under which they get their loans are any too easy and he will find the answer no every time. If conditions are now too easy then farmers must demand an increase in the rate of interest. Instead of paying 2 or 3 per cent commission as thousands of them now do when they get a loan, they ought to pay 5 per cent or more according to this great financier. Instead of making the time five years as it is with nearly all loans I suppose he would have the time reduced to three years so as to make the conditions a little harder and the commissions a little fatter for the loan agent. Under the present easy (?) conditions President Lynch is talking about, mortgaged farms have increased both in number and in the amount of indebtedness. In 1890 according to the Federal census, only 36.4 per cent of all farms in Missouri were mortgaged, while in 1910 the percentage had gone up to 46.3. In 1890 the average amount of the mortgage was only $853 as compared to $1758 in 1910.

We heard a retired farmer express the same sentiment the other day that is accredited to Mr. Banker Lynch. This farmer by being frugal and farming his land for "what there is in it" accumulated several thousand dollars which he loaned at 10 per cent until the laws of Missouri fixed the contract rate at 8 per cent and the farmer placed his loans in Arkansaw and Oklahoma where he could find 10 per cent borrowers and make it easier to hide his money from the tax assessor. This man says farmers borrow too much money because they get it "too cheap" and that "farmers would be better off today if they had to pay 10 per cent interest for all the money they borrow."

Fortunately not all bankers are so narrow in their views as President Lynch nor retired farmers so selfish as the one quoted but these are enough to show the "meat in the cocoanut" shown in the fight against the Missouri Land Bank and the National Farm Loan Law. Unless conditions are made more equitable for the men who till the land it will not be many decades before we will see a landed aristocracy owning the land and able, by reason of their monopoly, to impose intolerable conditions on their tenants. Only about one-third of the farms of Missouri are now operated by owners who are free of mortgaged indebtedness and if conditions are made any harder it will not be many generations until we will have the same troubles that have forced Ireland and Mexico into revolution and anarchy.

REGISTRATION OF LAND TITLES

Because a better system of making farm loans is now assured under the Federal farm loan law which will be supplemented by the Missouri Land Bank it is now more necessary than ever before that we have a better system of registering our land titles. Under the present system there are frequent law suits to settle disputes about titles and every time a sale of land is made it costs the seller several dollars for an abstract of title and if the buyer is a careful business man he prefers to pay an attorney a fee for examining the title rather than take the risk of some technical defect in his claim to the land.

Several states have adopted a system of land registration known as the Torrens system which provides that the state shall give to the land owner a certificate of title. Before this certificate is given the title must be examined and certified by the state officials. When the owner sells, all he has to do is to surrender his certificate of title and have a new one issued to the buyer. There is no need of abstract or attorneys fees for any subsequent transfer. In order to protect the buyer against claims that might arise from possible error or the rights of minors it is very easy to provide an insurance fund by the payment of a small fee when the land is registered. If a claim is then established it is paid for out of this fund and can not affect the rights of the one who is in possession of the land. Such a law would doubtless be opposed by those who are in the abstract business as well as by attorneys who occasionally get a fee for examining titles but if it is a good thing for the owners of land and for those who loan money on land there is no valid reason why we should not adopt it.

HAM AND BACON SHOW

One of the most important features that has been added to the attractions of Farmers Week is the Ham and Bacon Show which was organized by W. L. Nelson assistant secretary of the Missouri State Board of Agriculture. Only cured hams and bacon may be entered in the show and farmers who have any good cured meats on hand should save out the finest specimens and send to Columbia for the exhibit which will be held in January.

The cash prizes will amount to $150 making it profitable to the winners to exhibit and in addition there is an advertising advantage gained by any exhibitor who wants to build up a trade in high class cured meats. During the present week good country hams have been marketed in Columbia at 30 cents a pound, a price that ought to make it possible for farmers to build up a profitable trade in cured meats.

BEGINNING TO SQUEEZE

It seems that it is not enough that farmers should stand their losses from hog cholera and other diseases of live stock added to one of the worst drouths which has ever visited the country but indications are that they must endure the annual "squeeze" of the packers made on the price of hogs.

The United States Department of Agriculture estimates something like four per cent fewer hogs than last year, the short corn crop will mean that thousands of hogs must be sent to market lean and short fed and in face of this the demand for meat is good but in spite of all these favorable aspects packers have already hammered nearly a dollar a hundred off the price. Last year more than $1.25 a hundred was taken off prices in less than a week. For the last six years there has been a decline of the price of hogs in the St. Louis market from September to December of $1.30 to $2.35 a hundred. In not one of the six years has the drop within these dates been less than $1.30 and in two of the years it reached $2.00 and $2.30.

If our readers think the fight is over just because hogs have been bringing good prices for the last few months it may be that a close watching of the daily market manipulations may chang their minds.

BARNYARD GOSSIP

Sometimes the lot of the farm boy seems a hard one—and it is really so any one will admit, who has experienced this life, but many a boy who has tried to get away from his hardships has found to his sorrow that there are other places where to hard work there is added abuse and misery. Many a time the writer of this paragraph has thought the life of the farm boy hard after following the plow or worse the harrow or cultivator from early sunrise to sunset except barely an hour at noon. The horses were fed, brushed and harnessed before breakfast and supper was usually eaten after dark and after that the cows were milked, the pigs and calves fed and about nine o'clock he got to bed. He was tired enough that sleep was truly sweet to him and he did not wake until called at four in the morning. This rushing lasted during crop planting and harvesting and while there was plenty of work during the rest of the year there was also plenty of time given for recreation.

Since our lot has been cast in the city we have had a chance to observe the lives of numbers of city boys. Occassionally there is a boy in the town who seems to have nothing to do but smoke cigaretts and play pool but pity such a boy! He is never tired and therefore can not know the sweetness of rest. He never feels like going to bed and consequently never sees the sun rise nor breathes the pure morning air that every farm boy has experienced and knows the pleasure thereof. But most town boys must work. It may be that he works in somebody's garden, drives a delivery wagon or runs errands in a store, or may be rubs down the horses in a livery stable.

There is one marked difference between most boys of the country and those of the city. The country boy has a healthy glow on his cheek a smile on his face and looks you square in the eye when you meet him, while the unemployed city boy, the one you think has an easy time smoking cigaretts has a sickly pallor on his face, never gets to rest because he never works and never feels the joy of the boy who is doing something useful every day. No, boys don't get it into your heads that such a boy has a better time than you do, because he don't.

26 Extra Features
73 New Conceptions

Mitchell
MID-YEAR MODEL

20% Extra Value
Due to Factory Efficiency

$6.62 Per 1000 Miles

Bate-Built Mitchells Have Run 200,000 Miles

Two Bate-built Mitchells have already exceeded 200,000 miles each. One has to its credit 218,734 miles. Seven have averaged 175,000 miles each.

Think of 200,000 miles. That is forty years of ordinary service. And at $1325 a Mitchell which did that would cost $6.62 per thousand miles.

Mr. Bate's Lifetime Car

John W. Bate has aimed in the Mitchell to give you a lifetime car. The Mid-Year Mitchell is his 17th model with this aim in view. It is the final result of 700 improvements.

Part by part he worked for perfection. To every part he has given at least 50 per cent overstrength. Castings are almost eliminated. There are 440 parts which are drop forged or steel stamped.

Chrome-Vanadium steel, costing up to 15 cents per pound, is used to meet major strains. The Bate cantilever springs are so strong that not one has ever broken.

The Mid-Year Mitchell, with its 127-inch wheelbase, weighs under 3000 pounds. It runs from 16 to 22 miles on a gallon of gasoline. Yet the high-grade materials make it the wonder-car in endurance.

20% Extra Value

A car of this grade has never before been sold at the Mitchell price. In addition, the Mitchell has 26 extra features — things which other cars omit. We include them all in the Mitchell without extra price, though they cost us this season over $2,000,000.

In the Mid-Year Mitchell you get a 22-coat finish. You get French-finished leather. You get 73 new conceptions, all added within a year. You get all the best new ideas which our designers found in 257 of the latest European and American models.

Compared with other cars in this class, you get, we believe, at least 20 per cent extra value. And that is all due to our factory economies, worked out here by John W. Bate.

This efficiency engineer designed all our new buildings. He equipped them with 2000 up-to-date machines. The reasult is a model plant, where our factory cost has been reduced one-half. That is the reason for the Mitchell extra values.

$1325 F. o. b. Racine
For 5-Passenger Touring Car or 3-Passenger Roadster
7-Passenger Body, $35 Extra
Equipped with Demountable Top Only, $300 Extra
High-speed economical Six—48 horsepower—127-inch wheelbase. Complete equipment, including 26 extra features.

You will want these extras in your car. You will want this strength and endurance. You will want these new ideas and touches. Go and see what they mean to you, at your nearest Mitchell dealer's. If you do not know him, ask us for his name.

He will show you a list of great engineers—men of nation-wide fame—who bought the Mitchell for their personal cars. You will gladly take their judgment on the best-built car. (124)

Mitchell Motors Company, Inc.
Racine, Wis., U. S. A.

ADVISES FALL PLOWING

Plowing in the fall for next spring's crops should be encouraged in most cases, because it distributes labor more evenly throughout the year, favors earlier seeding, improves soil structure and kills many insects, says F. A. Welton, of the Ohio Experiment Station. Only on soils subject to washing, on fine clay soils and where catch crops are seeded in the fall is this practice not recommended.

Usually there is a rush at spring planting time. Farm labor can be used to advantage in the fall when work is slack. Thus crops can be seeded earlier next spring. At the Ohio Experiment Station a difference of a month in time of planting corn made a difference of 24 bushels to yield as an average of 7 years. Furthermore, the early planted corn had about 10 per cent less moisture in it.

Freezing and thawing during winter make plowed soils finer. More moisture has been found in the in soils fall plowed than in unplowed land.

White grubs, wireworms, cutworms and corn-ear worms live over winter in the ground. Plowing in the fall kills many of them.

Housewives Attention!

On the last page of this issue will be found an advertisement which every housewife should read carefully. If you are in need of a new dinner set, here is a great opportunity. The company in question is perfectly reliable—and if you don't like the dishes when you see them you are at liberty to return them. In any event, read the advertisement carefully.

Why not go to some of your good neighbors and ask them to give you a dollar for three years subscription so they can get the old price before the new price goes into effect Oct. 20th? This is the best and quickest way to get them interested in the great Farm Club movement—and then too, we need this kind of help from every friend.

THE EDUCATIONAL ASPECT OF FARM LIFE

Agriculture is not only the basis of our civilization in the mere economic sense of affording food to support our physical existence, but in a still more fundamental, biological sense. It is only in an agricultural state that the human individual attains a normal acquaintance with his environment and a full endowment of intellectual and social faculties of this race. Wandering savages and shepherds may be strong and cunning as individuals, but in other ways they are lacking, and this is true of people raised in cities. Rich and poor alike are defective, deprived of normal existence, lacking in normal development, and unable to maintain themselves continuously, from one generation to another. It is for this reason that cities have to be recruited continually from the country. The biological fact is that the human species does not thrive in towns. The second generation is generally inferior and the third generation usually fails. A few by reason of strength of character and of family ties are able to survive longer, but even the Jews, who excel other races in these respects and withstand urban conditions better, are not a prolific or a numerous people. They have continued to exist as urbanites but have not prospered or replenished the earth. Perhaps the promise to the seed of Abraham awaits a return to an agricultural state.

From an enlightened eugenic standpoint every child should be born and raised on a farm, in contact with the actual world of kindred, neighbors and friends, the domesticated plants and animals that represent the basis of our existence, and the wild things that live without our assistance or even in spite of our efforts to destroy them. To grow up under these condotions of family, farm and out-of-doors is necessary for normal development, in order to allow the normal human characteristics to come into expression.

A Return to Barbarism

It is obviously unreasonable to expect that children who are deprived of intimate contacts with nature or with the older generation can attain a complete development of their natural powers. The effect of the urban conditions and of the system of elaborately graded schools is to take the children out of the family group and limit their contacts largely to other children of the same age—contacts that do not make for any full development of the child in the direction of general intelligence and responsibility. The bonds of the family and other social ties are loosened and there is a real return to conditions like primitive barbarism, among our urban populations.

The transmission of desirable characters from the parents is not enough. In addtion to the prenatal inheritance there must be a postnatal acquisition of civilizing habits and accumulated experience of the race, or children with the best blood may grow up ignorant and irresponsible, as many do. Eugenics is conceived very often in too narrow a sense, as relating merely to the transmission of desirable characters, as though this alone would solve the problems of our civilization. There needs to be a sister-science of euphanics, to treat of the expression of desirable character, the biological factors underlying the problems of education. Eugenics without euphanics can get nowhere. The best seed is wasted unless the plants can grow to normal maturity. Breeding a crop to its highest possiblities is of little avail unless there are to be farmers who know how to give the cultural treatment that will allow the characters of superior varieties to come regularly into expression. Practical eugenics must look forward not only to the provision of normal parents and normal children, but to parents who shall be able to care for the normal development of their children.

Children Need Farm Conditions

Not to be raised on a farm is a cruel privation, a denial of the normal childhood of our race that no previous eugenic precautions or subsequent educational manipulations can make good. Many excellent and very intelligent people do not know that children need farm conditions, but it is true nevertheless, and needs to be recognized before we shall have any just or practical appreciation of eugenic or educational values. Many of our educators know how hopeless the urban children are, under the urban conditions, but they are engaged to handle such children and are doing the best they can. The urban problems are pressing and cities pay high salaries to get capable men. The result is that not only our educational institutions, but our educational ideas as well, are being cast almost exclusively in the urban mold, with no recognition of the educational value of rural life. Every year thousands of misguided parents, all over the United States, are moving to towns in order that their children may have the "advantages" of the large graded schools, the over-crowded education-factories where the city children are put through the elaborate machinery that is necessary to handle helpless humanity in large masses. The school is no substitute for the home, much less the city school for the farm home.

In cities the little children have to be sent to the school, the kindergarten, or the day-nursery, to keep them out of danger while the parents are at work or at play, but in the country where the children can be out-of-doors they do not need to be caged. The projection of urban ideas and methods of educaion into the country makes needless difficulties. The little children not only do not need to be sent to school, but are much better off, educationally and otherwise, if allowed to stay at home. There is no good reason why normal children of normal, intelligent parents living in the country should be sent to school before the eighth or ninth year. Nor is there any reason why any favorably situated country child should go to school for more than six months in the year. Country schools need to be improved in many ways, but running them longer is not an improvement.

It is true, of course, that many children, and especially urban children, are better off at school than at home, but that some children lack favorable home conditions does not make it reasonable to keep others from such an advantage. It would not be argued that all children should be taken away from their parents because some children are orphans, or because some parents are incompetent, careless or cruel. Yet there can be no doubt that this is very frequently the effect of our system, to make children practically orphans by turning them over wholly to the school.

City Populations Superior

Instead of being composed of naturally inferior stocks, city populations are probably superior to the residual population of the rural districts. The general tendency in each generation is for the best of the rural population, the most energetic and capable, to be drawn to the city. If city populations average better in some respects, as statisticians have claimed, this does

I've always noticed that when a man's wife loves him and thinks he is fine and splendid, that there is a great deal of good in him. In other words, its mighty hard to fool a good woman. not prove that the city is a better place to live, but only shows the more definitely that the drain of the city is a menace to the race in sterilizing and destroying the superior elements of the population. The aggregate losses are probably much more serious than those caused by war, because more general and continuous.

If the time has really come for the consideration of practical eugenic measures, here is a place to begin, a subject worthy of the most careful study—how to rearrange our social and economic system so that more of the superior members of our race will stay on the land and raise families, instead of moving to the city and remaining unmarried or childless, or allowing their children to grow up in unfavorable urban environments that mean deterioration and extinction.

Until recently cities have been distinctly in advance of any of the rural districts, not only in holding out greater inducements in the way of income, but in many other ways. Not only schools for the children but many other conveniences, luxuries, pastimes, and amusements are supplied in cities much more easily and abundantly than in the country. But it must not be taken for granted that all of these things are as desirable or as necessary as they seem to be to people who have become accustomed to city life. Comfort should not be confused with civilization, as Disraeli pointed out. Living easily is not necessarily living well, or in a way that will give the most satisfaction to the individual or contribute most to the progress of the race. Most of the people who really want to live want to live in the country. Those who are intent upon some special pursuit of wealth or pleasure or freedom from responsibility must hold to the city as the only place to follow the courses they have chosen. But these professional urbanites are attempting to grasp a small part of life without feeling the need or accepting the responsibility of a complete existence.—O. F. Cook, U. S. Bureau of Plant Industry in Journal of Heredity.

WHY BOYS AND GIRLS LEAVE THE FARM

There is one question often asked THE MISSOURI FARMER that I think I can partially answer, "Why do so many boys and girls leave the farm?"

It has occurred to me that perhaps at least a part of this might be stopped if farm homes were better equipped with modern conveniences such as furnace heat, running water and bath, and sewerage, electric lights, laundry, ice-house and so forth.

Now I am not picturing to you a farm home such as mine is but such as I should like for mine to be, and such as I hope to make it as soon as possible. In other words, I would speak to my readers as the minister spoke to his congregation when he said "Do ye brethern, not as I do but as I say."

I believe that many a country lad and many a country lass, too, has first conceived the idea of migrating to the city, from a visit to some relative in the city whose home was well equipped with a lot of "conveniences" which in the average farm home would be called "luxuries."

You say, those things all cost money. To be sure they do but a lot of farmers could have them who haven't. Automobiles cost money too but farmers are buying them by "wholesale" though perhaps not at wholesale prices.

The auto probably is a big factor in keeping the boys and girls on the farm but I believe modern home equipment would do as much or more in that way than the auto is doing.

Wm. J. Britt, Audrain Co.

TO GET RID OF MOLES

Getting rid of moles in yard or garden is a difficult proposition. In our experience, which has been a trying one, we have resorted to many methods, but have found none that is unfailing. The first rule, we believe, though, is to keep the runs tramped down so that it may be known when the moles are active.

By making observation from time to time the watcher will eventually be rewarded by finding the mole at work. The next move, then, is to secure a spading-fork, go quietly but quickly to where the dirt is moving, insert the fork with one deep, rapid thrust and land the mischief maker out on the ground. One hard lick with the fork will mark the mole's finish. In inserting the fork or spade, do not touch the ground until ready to strike. To do so would probably cause the mole to hurriedly retire to another part of the run. In a single season we have killed a number of moles by this method. It is a common belief that moles are more active about sunrise and sundown than at other periods of the day, but we have not found this to be true.

We have also found the spring trap, set over the run and having long points on which the mole is impaled, quite effective, especially where the ground is not too hard.

Carbon bisulphide is an effective agency in ridding the premises of moles. This chemical is placed in the runs, all openings, through which the gas which will be formed, might escape, first having been closed.

One man, who had tried poisoned corn and other alleged riddance remedies without success, made use of his auto—not to crush the moles but to suffocate them. The method used was to attach a common water hose or other rubber tube of sufficient size to the exhaust pipe of the auto and force the gasoline fumes into the run. Following this treatment every mole either died or disappeared. It is, of course necessary, in making use of the auto as a mole eradicator, to first carefully close all openings through which the gas might escape from the runs.

W. L. Nelson.

SOME VALUABLE MEN

Among the different men connected with the State Board of Agriculture and the Agricultural College are a number who compare favorably with the best agricultural speakers in the United States and whom the farmers of Missouri should utilize much more effectively than they do. At the head of the group stands "Sam" Jordan—one of the best known agricultural thinkers and talkers in the entire country. Until he took up lecturing on farm subjects, Mr. Jordan was a farmer up in North Missouri and no man knows the trials and hardships of farm life more intimately. And not only is he a tireless agitator for better farming methods, but with his whole heart and soul aflame with his great work, he longs and fights for a broader and happier farm life in general—a higher and broader farm citizenship. As homely as Lincoln and with a sincerity that grips his audiences from the moment he opens his mouth, he can nevertheless "skin" the things that need skinning with a mercilessness that would have done credit to Sam Jones, the famous Georgia evangelist of other days. And yet, no sooner has he finished flaying his auditors for some glaring dereliction when his face breaks out into an irresistible smile—and then he tells some joke of which he himself is usually the victim—and everybody laughs and not only does he "get by" with his criticisms but the crowds like him the better for his candor. In other words, in order to drive home his truths, this fine man whose splendid service the farmers of this state will never be able to repay is willing to sacrifice himself, if by this means he can the more strikingly call attention to the things that are wrong with the farm methods and life of the present day. A firm believer in the idea that Farm Club organization is the only hope for the farmer, no man in Missouri is destined to play a greater part in this great movement during the next year or two than "Sam" Jordan.

Another man who is splendidly useful is J. Kelly Wright who is known to many of our readers. A forceful speaker who is thoroughly grounded in the practical side of farming and a graduate of the Missouri College of Agriculture, Mr. Wright has a worth while message for the farmers of every community—for the heart of no man in the state beats in deeper sympathy with the farmer and the problems which confront him at this time and few are as able to discuss them as Kelly Wright who stands merely on the threshold of his splendid usefulness in this great state.

So, also, is W. D. McKee of Polo, known to many of our readers and here again is a man of whom farmers throughout the state should make effective use. The owner of a fine farm in Ray County, McKee is a sort of "Good Samaritan," who goes around over the state lecturing to farmers more for the love of the thing than for the small recompense he gets out of it. Somewhere in the makeup of Mr. McKee there is a strain of the poet and when he talks of his "flocks," the "Shepherd" and "green pastures" one is reminded of some of the beautiful Bible stories of old—for he is one of those rare characters who sees hidden beauties in the trees and rocks and in the hills and valleys—things which the most of us fail to note as we go stumbling on through life.

Another man whom all the readers of THE FARMER should learn to know at closer range is W. L. Nelson Assistant Secretary of the State Board of Agriculture, who frequently contributes such splendid articles to these columns. Ranking easily as one of

the best writers on agricultural matters in the country, Mr. Nelson is a man who has a great career of usefulness ahead of him in Missouri—for few, if any, are more familiar with the agricultural possibilities and problems of the state while no man is in position to render more intelligent and effective aid in the solution of farm questions which are pressing at this time than this able and yet modest young thinker from Cooper county. While the most of his time is taken up with his official duties, our readers should induce him to make as many addresses to farm audiences as possible.

Recently the College of Agriculture added E. H. Bullock of Edina to its corps of extention workers and a better man for this line of work it would have been difficult to find in the state—for as the owner of a fine Knox county farm and as the President of the Farm Bureaus of Missouri he has a message of deep interest to the farmers of any community in the state He is a forceful public speaker and a man whose heart beats in deep sympathy with the trials and problems of the farmer.

Messrs. Jordan, Wright, McKee and Nelson are connected with the State Board of Agriculture of which Hon. Jewell Mayes of Columbia is the head, while Mr. Bullock is connected with the College of Agriculture and we suggest to those communities in which farmers are interested in the Farm Club movement, that they plan a three or four days campaign for one of these men in their respective counties and then ask for dates for whichever one of them may be available—and then see to it that big crowds greet them at every meeting place. While they are discussing better farming methods they can also discuss Farm Club organization and thus contribute tremendously toward arousing your county on this great question. But don't ask for them until your metings are fully organized—until you know that you can assure them of the kind of audiences to which their ability entitles them and which will enable them to do the maximum amount of good.

William Hirth, Publisher.

CO-OPERATIVE PURCHASE OF FARM SUPPLIES

A careful examination of the methods of a large manufacturing establishment shows that the success is due largely to the ability to buy its raw material at the lowest prices to sell its finished products through an efficient distributing system, and to take advantage of more economical methods of production. By means of a thorough organization of all its forces it overcomes much waste, inefficiency and extravagance, and every branch of its work is a part in one great system. The small factory buys its materials in small quanities for cash, or credit extended on high rates of interest, or from brokers or small dealers, but the large factory arranges for a line of credit at low rates and maintains a purchasing department, which buys carefully in such large quantities as to secure close prices from producers. The quanitity of these materials purchased justifies the expense of a testing department to make sure that all purchases are up to the standard.

The average individual farmer is himself a small manufacturer, working with the forces of nature to produce certain farm products. There are two distinct ways by which he may hope to improve his financial condition—first, by lowering his cost of production, and, second, by increasing the income received from the sale of his products.

It has been found from the surveys made by the Office of Farm Management that the minimum efficient unit is the farm that furnishes adequate employment throughout the year to the average farm family. Experience has also shown that combinations of farmers for co-operative production are rarely advisable, but the farmers in a given section usually produce the same assortment of crops, and their farm needs for supplies, such as implements, fertilizers, seeds, spray materials, and packages, are practically the same. Many of these requirements can be anticipated, but the common practice is to depend upon local dealers to carry these standard articles in stock, awaiting the day when the farmer wishes to use them. In many sections it is customary in the spring for farmers to ask the local merchants to charge the amount of all purchases until harvest time in the fall. This practice compels the merchant to buy in small quantities, shipments being received under relatively high local freight rates. He must buy on credit or else borrow large sums of money, for the use of which he must pay interest. The dealer must pay cartage charges and must own or rent stores and warehouses. He has taxes and insurance to pay on his stock; he must employ clerks to wait on his customers, and pay liberal advertising bills to attract trade. Frequently there are expenses for the delivery of goods. Usually where credit is extended an advance in prices must be made to cover the occasional loss due to bad accounts.

If customers need or require such forms of assistance, they have no right to complain if the merchant includes a reasonable charge for the service in making the price for his goods. In fact, much of the complaint about present-day high prices is unreasonable, as increased prices frequently are due to the increased service required by consumers and rendered by dealers. If people insist upon being waited upon, they must expect to pay those who thus serve them

Elimination of Waste.

In the farmers' general plans for improving their condition it is necessary for them to take advantage of the co-operative principles for conducting their business, to the end that they also may be able to eliminate waste. Efficiency is the watchword, and the farmer should pay for necessary and efficient service only. In case he finds that he can serve himself more efficiently than others are serving him, if he can install and operate his own business machinery, arrange to pay cash, or furnish his own credit, he should do so. The trade should and usually will consent to meet him on this thoroughly sound basis.

If it is good business and entirely proper for manufacturers, wholesalers, and retailers to unite in their respective organizatinos, not to control prices or restrain trade, but for greater business efficiency and to eliminate waste, what argument should induce farmers to refrain from similar action o improve their business? What can the manufacturer gain by such organization which the farmer can not? Is the average intelligence of the manufacturer less than the average intelligence of the American farmer? If it is advisable for the manufacturers and dealers to federate into State and National associations for the above-named purposes, by what line of reasoning do some conclude that it is unnecessary or absolutely improper for the farmers to organize even on a community basis?

Securing of High-Grade Goods.

The farmer is interested first of all in securing goods of standard quality. Large amounts of spraying and fertilizing chemicals are now used on many farms, and it is essential that these materials be of high grade and free from impurities. The amount purchased by each grower is not sufficient to warrant having chemical analyses made, but where full carloads are purchased by a group of farmers a composite sample may be taken, and one analysis will show the average quality of the whole.

Standardization of Supplies.

Another effect of co-operative purchasing has been to bring the farmers together in the use of the same make of implements, fruit packages, etc. One western fruit association agreed on one style of power sprayer where a dozen or more were formerly sold. Not only did they save a large sum of the purchase price, but one line of repairs now supplies their needs, and parts can be kept on hand for sale to all members at a great saving.

Another association secured the adoption of one style of fruit package where no less than eight had formerly been in use. Manufacturers who formerly had to keep in readiness eight styles of basket forms and eight kinds of supplies can now devote their entire force and factory to the making of one style, thus lessening the cost of making and decreasing the selling price, while insuring a constant supply.—C. E. Bassett, Specialist in Co-operative Organization, Office of Markets and Rural Organization.

FARMING THE GREATEST CALLING OF MAN

If the words of our lamented James S. Rollins, The Father of our great institution of learning at Columbia, in his memorable address at the St. Louis Fair several years ago be true, and no profound thinker, or true scholar endeavors to deny—that, "The Honest industrious farmer bravely gathering the fruits from the fields of his own cultivation is nearest to nature, and he who is nearest to nature is nearest to God". His dependence is upon the blessings of God, and his own intelligent industry. The blessings of Almighty God no doubt are ever present in some form but man's conception fails or he errs in judgment. He fails to follow that course that experience and observation of his own and others tells him is sure.

The illustrious Franklin, to whom the lightening of heaven yielded, said "that, he road to weatlh is as plain as the road to market, spend less than you gain. Then soon your hide-bound pocket will begin to thrive." "Why don't the average farmer make more money?" His practices are wrong. Maybe gaited too fast, or trying to hit the right target with the wrong kind of artillery—don't use foresight and push his work. A successful farmer must plan the future at least three years ahead and work the present and wait from one to five years for good profits. Farming and stock growing is a special calling and for the average man to succeed in it he must not mix with any other business.

In many instances, the average farmer fails to keep up the fertility of his farm Fertility is his capital stock and when the farm depreciates in fertility it fails to produce paying grain crops and also makes it more expensive to cultivate. Consequently surplus is soon gone and drafts made on capital.

He buys too much . A farmer never ought to buy anything he can raise on his farm at a profit. His farm ought to be a factory upon which are manufactured the main things necessary for his subsistance. He ought to raise his own meat and cure it in his own smoke house, besides plenty of hogs, cattle and sheep to make meat for the laboring, professional and business world who on account of their calling are consumers and necessarily must look to the farmer to provide for them from his fields and flocks.

The average farmer ought to raise in his own vegetable garden, potatoes, cabbage, onions, celery, etc., have them good and fresh at first cost and convert his idle time into cash and never miss it. He ought to raise his own fruit. Not necessarily a merchantable orchard, but a nice little family plat of say one acre in apples, peaches, grapes, berries and cherries. These properly looked after will produce the major portion for an ordinary sized family and add lots of pleasure. Plant no ground to grain that of an ordinary season is too low in fertility to grow a good crop. Sow all thin land in grass, clover predominating, pasture and manure it up. Diversify, intensify, economize. Failing to do these things is another reason why the average farmer don't make more money. Another reason is that the ordinary farmer in many instances gets gaited too high. Figuratively, he notices that his neighbor has a coach and four-in-hand and a coachman in livery and also gets himself the same outfit, never once considering that his neighbor is worth $50,000 which he has properly been fifty years in accumulating and is now in advanced age enjoying the fruits of a well spent youth. While he is only a journeyman with good credit on a quarter section of good land worth $12,000 and only $4,000 of it his own. A ten mile horse trying to keep pace with one whose reserve power is fifty—a 22 target rifle trying to pierce an armor plate built to resist a siege gun.

Gentle reader and brother farmer don't think for a minute that I wish to convey the idea that to be a progressive, thrifty, and up-to-date farmer one must be a millionaire. Such is not the case. Any healthy industrious man that has stamina and grit, combined with common honesty who will take the time to prepare himself for the calling and then fall in love with his work, can commence at the bottom rung and in a few years have a comfortable nest egg for his declining years and have had a good living during this time, and also a considerable amount of wholesome healthy and innocent pleasure. But to make a success measured by finance and character, in this calling the same as all others, as Rev. Dr. Prickett said recently in preparing the youth of today for tomorrow's work: "They must have intellectual development combined with morality, and the heart must be in the right place."

And friends you will find this combination a fine stock in trade, in any calling. Blue Jay Farmer.

Build Your WORN OUT SOIL SWEET CLOVER

The great crop for soil fertility and animal feed. Exceptionally rich in nitrogen and humus. Higher protein content than alfalfa. Sow in spring, summer or winter. Write for prices.

Fatten Mules and Horses Before Selling

A great many men make a mistake by selling mules and horses in only medium flesh. This is so common a fault that buyers make good money by picking up the animals and feeding them a few weeks to make them fat. A good ration for fattening horses is made up of corn, oats and good alfalfa or clover hay. A little corn fodder and timothy is all right for variety. Where fodder and timothy are used exclusively for roughage it is well to feed a little oil meal, say one to one and a half pound a day which will keep the animals in better condition.

LYON'S PRACTICAL FARM PAPERS

I am asked, "What is the best cheap roof for farm buildings?" and without h sitation answer, any of the three ply, so-called "felt," and "rubber," roll goods, which sells at from $1.85 to $2.25 per 108 square feet. I have some put on eleven years ago last August, and it turns water as well as when it was put on. An experienced man tells me, that a good solid base of roof boards or sheeting, is more necessary in using this roofing than for either shingles or metal, and he says, to lay the sheeting close as possible.

I figure it about this way; shingles not less than $3.25 per square, and $1 per square for driving. Metal roof, according to grade, tin, painted steel or galvanized steel, from $4.00 to $6.50 per square, laid. The shingles will last twelve to sixteen years, the metal roof from twelve to perhaps thirty years, with the added cost of painting once in five years.

If the roll roofing, at $2 per square, and two men can lay twenty squares a day, only lasts eight to ten years, which it will easily do, it seems to me to be 30 per cent cheaper than any other. There are three or four regular grades of this roofing from 1 ply to 4 ply, weighing from 25 to 70 pounds per 108 feet roll, the kind in most general use being 3 ply, weighing 55 to 65 pounds per roll.

I have just looked over U. S. Farmer's Bulletin No. 745, Waste Land, and Wasted Land, on Farms. Like a good many other recent government publications, it is a labored effort of some employee of the Agricultural Department, who has to do something in order to pretend to be earning a good salary.

We all know that most of us have land in our farms, which is not paying us a profit every year, but, generally speaking, it would be impossible to learn what to best do with such land from reading and even by a careful study, on the spot, with labor as scarce as at present, it is not possible to change our plans as when I was younger, I have dug up the soil on rich steep banks, and raised fine crops, corn, tobacco, tomatoes, melons and other vegetables. but the prime object was to get the wild stuff out, and grass set. In the case of tobacco at 15 cents per pound, or tomatoes at $1.50 per bushel, even with potatoes at $1 per bushel, such work may pay, but with corn, wheat or oats, a man would not make 40 cents a day.

One point in the Bulletin, referred to by a cut and three lines of print, is where the writer missed a chance to impart some knowledge, if he had it, and that was along the line of straightening small streams.

In two hours work with team and plow, and one days work with pick and shovel, in 1897 I made a crooked stream run straight for 40 rods, and made a small bottom of perhaps an acre and a half cultivable in long runs instead of in short ones.

I might liberally estimate the labor cost at $2.50, the bottom has grown six or seven heavy plow crops, corn, tobacco and potatoes, since 1897, has been in the finest and heaviest of pasture the other years, and if the farm was up for sale today, it would bring $100 to $150 more than when the branch meandered through that bottom.

It is not every small strip of land, cut off from the main body of a plow field that is wholly unproductive, for we have such strips, and when the land goes back in pasture next August, after having been broken last April, the heavy grass on such strips will keep the stock off the main field several days.

Of course a good many acres on most farms are unproductive, in the sense that they are not producing cultivated crops, one on mine for example, being perhaps two acres of the best land on the farm, in lawn, buildings, driveways, a few fruit trees not worth much but still we like to preserve them, and a few trees valuable only as shade.

Cold economic principles, might warrant the cutting down of all this to what would barely satisfy our needs, but warmer sentiment, demands their maintenance.

The labor problem has us in its grip just now. From Sept. 1 to Oct. 5, the tobacco crop must be housed, the corn cut, and a part of the seeding done. Month hands have been getting $26 to $30 per month wih board and washing since April 1, and day hands get from $1.25 to $2.00 and three meals now, with the supply not half equal to the demand.

It keeps one man moving to warm, sucker, cut, and house, an acre of tobacco per week, and my two sons have seven acres to put in between September 11 and October 1, the biggest tobacco I ever saw.

A neighbor has five acres, not as heavy as ours, and is by himself, so the boys have joined in with him, as it takes three to make a full crew at the work. Another old man and his son have ten acres, and so far have no hand, scores of others in the same fix. Not an acre of corn land can be seeded to small grain until the corn is cut, as it is down very bad and an army of men will be needed for that work. This condition obtains, not only in the tobacco belt but all over the farming country, and a few tens of thousands of our strongest young men are on a frolic, preparing themselves for a war which we are in no danger of.

With all this, the fairs, state and county, are on, and other tens of thousands will attend them, losing a day or two or three days from the suffering crops. When I was a boy, and went to the fair one day per year in the old spring market wagon, I had a dime, and on rare occasions a quarter to spend, but now, a boy of 16-17, must have a new buggy, a fine horse, go two days and spend $5 per day.

It is not only the sons of fairly well-to-do land owners who do this, for only last Sunday, the 20 year old son of a tenant farmer, who only had $250 as his share of crop money in 1915, was at my house, in his own new buggy behind a special light driving horse.

There is too much time wasted, and too much money spent for things which people could do very well without, things that add little to comfort or pleasure.

The hands we get are not nearly as good as those of thirty or forty years ago, and even in the busiest season, every hand takes Saturday afternoon off. They all go to town, some go to the wet town, but this is not nearly as common as it used to be, but the dry towns all have pool rooms, and these are but a slight improvement on the snake remedy stores.

The city gets our young men, and while this county had 32,000 population in 1870, the 1910 census gave it something over 24,000. Even part of our towns fell off in population in this 40 year period, one from 3,000 to 1,900, and another from 850 to 450.

In 1892-1893, I had a hand, and as good a worker as I ever saw, from April 1 to October 1 at $16 per month, 50 cents a day when he worked in winter. He married in 1894, and I turned down an applicant for his place because he was somewhat under size. This man hired to a neighbor, and worked for him five years at $14.50 per month the year round, then, as wages went up, to another for three years at $16 per month by the year. He saved every dollar he could and is now the owner of a good 80 acre farm, the first $1,350 of the $3,300 purchase price, being the wages saved, working by the month.

Of all the hundreds of young men who have left this county to seek easy jobs in the city, I cannot recall a bakers dozen who are any more than wage hands yet and not half a dozen who own the roofs over their heads. I see some of them every time I am in the city, and it is seldom that one or two are not ready with a hard luck story.

C. D. Lyon.

Is there Music in Your Home?

If you haven't a good piano in your home, look up the advertisement of the Geo. P. Bent Co., of Chicago, elsewhere in this issue and have them send you full information about their splendid but low priced pianos. If there is a daughter in your home you owe her a piano as soon as you can afford one—for this is an accomplishment which may mean much for her happiness in the years to come. Again, the whole family will enjoy the music.

EFFICIENCY OF THE FARMER

To The Missouri Farmer:

The question has been asked, What is the matter with the farm? The answer, judging from something I have read is, lack of rural credits and farm organization or failure to get the full value of our farm products. These things no doubt to some extent curtail the farm profits. But there is another question equally as important, if not more so. What is the matter with the farmer? William E. Gladstone said, "Its not from without, but from within that makes a man." You may surround one man with all the facilities that make for success and he will lose all, or a part of his holdings. Put another man on a desert claim and in a few years he will own the adjoining claims. Its not the lack of things that are helpful that causes the one to fail, nor the possession of such things that makes the man on the desert claim succeed. The man is the vital factor that invites failure or success as the case may be.

One of the divine writers wisely wrote to a fellow worker, who was a younger man. "Study to show thyself approved unto God a workman that needeth not to be ashamed." We may put it this way to fit us as farmers: Study to show thyself approved unto your fellow man a farmer that needeth not to be ashamed of his results. Did any man ever succeed that didn't make his business a study? Success is not given away, it must be earned The methods in nearly every line of production are changing as the years go by and every man must study the latest approved methods. Gordan Graham, the old packer said to his son, who was selling goods on the road, "Son know your goods." So the farmer must understand his business. Some farmers have not studied the latest methods or if they have, fail to put them into practice. While others farm as their fathers did. We must acknowledge that some farmers are making good. Go to their places and see how they do things. Ask all kind of questions about their methods, then go home and try and put these things into practice. Absorb as much reading matter on agriculture as you have time for—remembering, "Luck is infatuated with the efficient."

I am not taking a knock at farm credits or organization as I have often said, if the farmers were organized, they could compel the world to bow at their feet and so they could, but the lack of these things ought not to keep a farmer down.

We must ever keep in view the vital factor that makes for success, the efficiency of the farmer.

Wm. Wiswall Pulaskico, Mo.

WHITHER ARE WE TENDING?

Transportation conditions have vastly changed in the past generation. With improved road beds, heavy rails, decreased grades and curvature, steel and concrete bridges, automatic and manual block signals, power brakes, automatic couplers and plain and simple rules, which any ordinary man can learn in a week, the occupation is probably less hazardous than farming.

In every town along the line of every railroad, young men help train crews do their work, are familiar with signals, have some knowledge of air brakes and rules, and can speedily fill places vacated by firemen and brakemen.

Automobiles are making a nation of engineers—any good stationary engineer and fireman can handle a locomotive. They will have much to learn but they can, with help of dispatchers and block signals, move trains safely and every trip will increase there knowledge.

On through freight trains brakemen do little but ride and open and close switches, conductors work can be largely done by yard clerks at terminals.

With train auditors, passenger conductors are practically supernumaries and train porters can, if necessary do the brakeman's work. Therefore if public authorities had enforced the law the recent threatened strike could not have been serious nor of long duration.

When a gentleman with a club meets you at a dark alley and you hand him your watch, you have won peace, but—you have lost your watch. The railroad brotherhoods are jubilant. They believe they have won an unprecedented victory. The railroads with their hundreds of thousands of stockholders have been robbed and the public, "the carcass," as the leader aptly terms it, which will eventually pay the price, has won peace—not peace with honor, but peace at any price.

Probably ninety-nine per cent of our people want labor treated fairly and justly and when the railroad brotherhoods made their recent radical demands, it was assumed the matter would be carefully and thoroughly investigated and justice done the men, the railroads and the public. Instead we have seen the President of the United States and both houses of Congress scared into an hysterical blue funk by one man backed by 400,000 votes. Even the Senate, "the greatest deliberative body on earth," the balance wheel in legislation, those grave and reverened seigniors, those sticklers for senatorial courtesy and free speech, adopting the cloture, for the first time in history and rushing through, without debate and without consideration a bill affecting the most important and far reaching legislation passed by the present Congress, and which for injustice has probably no parallel in our history.

A distinguished (?) gentleman in a recent Senate speech (his party organ says he "roared") told how "babies would be starved and the ghosts of dissolution stood over the cradle" had the strike occurred, but with the blindness peculiar to such individuals, failed to perceive that he was condemning as monsters the very men whose support he was seeking, and it is of course absurd to claim that the action of any 400,000 men can vitally affect the welfare of 100,000,000 people.

It is undoubtedly true that neither the owners nor employees of a public utility company have the right to cause the public inconvenience or loss by lockouts or strikes. Are we sufficiently civilized to enforce this? Will the next Congress dare pass a compulsory arbitration law? Will they be just to the railroads and compensate them for their increased expenses. Will the railroads reduce wages of enginemen and trainmen to balance expense of the eight hour law? Will they refuse arbitration? Will the Government pass a law compelling the men to accept the reduction? It has as much right to penalize the employe as the employer.

Can any organization secure the passage of any law demanded, though unjust, if it controls 400,000 votes? Will similar demands be made in 1920 and thereafter? Are we to be governed by coercion? Have the brotherhoods won? Have they lost, what is of far more value to them, the good will of the public? Will political realignment be necessary?

These are questions for thinking men—Whither are we tending?

Farmer.

Cheaper Feed for Hogs

With our frequent drouths and the lowering of crop production it is absolutely necessary that we find some cheaper substitutes for corn in pork production.

The Iowa Experiment Station has completed a five-year trial to determine the value of Canadian field peas for feeding hogs. The peas were hogged down, some without other feeds and some lots were fed barley to supplement the peas. The average return for all the lots in the five years has been $50.89 an acre. This was for the peas in the field and after allowing for the cost of all other feeds used. The time has come when no farmer should depend on corn alone for making pork.

Experienced Hog Man Wanted

I need a man to take charge of my hog department, October 1, 1916. A man who knows hogs, is willing and anxious to work and get ahead. A permanent position to the right party. Write me giving experience, wages wanted and reference. Must come well recommended. D. Schilling, J. O. D. Ranch, Aroya, Colo.

Mammoth Poland China Sale Nov. 3d

HERD BOARS

Long Wonder Timm, 75707,

Bridges Bob Wonder, 76481,

Greatest pair of yearlings in any one herd.

SALE OFFERING;

Consists of 20 Spring boars, 20 Spring gilts, 5 Fall gilts and one tried sow, sired by such boars as Long Wonder Timm, Bridges' Bob Wonder, Model Big Bone 3rd, Long Big Bone, Fesey's Timm, Wondermaster, King of Wonders, Master Orphan, The Giant, and others.

Model Big Bone 3rd, 76482, Monster March Yearling by Long Big Bone out of a Big Bob dam, will weigh around 800 lbs. sale day.

Herd Sows Sired By

Big Bob, Big Bob Wonder, Smooth Big Bone, Grandmaster, Smooth Columbus, B. Wonder, Wedd's Long King, Trusty King, Big Joe, Moores Halvor, Long Jumbo 2nd, Long Price, and others.

BRIDGES BROTHERS, - - - - SLATER, MO.

By Old Jim Riley

This campaign is just about as hilarious as a funeral. They don't even call each other liars—and I couldn't imagine what was th' matter until I hapened t' think that "Teddy" and Bill Bryan aint leadin' th' procession. Whether you like 'em or not, you got t' hand it to 'em for bein' "live ones." All th' rest uv 'em are pikers in comparison. That fool professor feller couldn't have got by in Zululand—for there they kill all weak minded children th' minit they are born.

BUCKSHOT BY THE PROFESSOR

As Mark Twain once said of himself, the death of Villa has been "greatly exaggerated."

* * *

Whenever I see a farmer lugging home store hams and bacon I feel like giving the tip to the fool killer.

* * *

Some men are more particular in selecting a new span of mules than they are in picking out a son-in-law for their daughters.

* * *

The politician isn't cutting as much ice as he used to—and I am mighty glad of it because it indicates that the people are coming more and more to do their own thinking.

* * *

About the only thing in this World that is as free as air and sunshine is information—and the more of it a man gets the more he is like what God Almighty intended him to be.

* * *

Suppose you burn the weeds and underbrush that have grown up along your field fences and your sloughs? They furnish hiding places for insect pests that may descend upon you and plague you next year.

* * *

Every home ought to have some kind of music—even if it is nothing more than a cheap phonograph. A man can't very well listen to music and be cross and ugly to his wife and children at the same time.

* * *

Speak kindly to the boy—whether he belongs to you or to someone else—for boys need kindness and friendliness from older men and if they got more of it our penetentiaries would do a less thriving business.

* * *

Why not go out into the field and select your seed corn now while you have a chance to see what kind of a stalk stood behind each ear? Like begets like you know—and it will mean more bushels to the acre next year.

* * *

Everybody almost but the farmer has struck for higher wages. He, apparently, is willing to stumble along "single file" and "hold the bag" for the whole outfit. But maybe he'll wake up some day—and if he ever does he will tell a pile of people where to "head in."

* * *

On that last day—when your life book closes to reopen nevermore—what will they say of you? Will they say "he tried to make the World just a little bit better"—or will they go through the formalities as quickly as good taste permits and talk of the crops and weather?

* * *

It's an old saw I know—and yet life is largely what we make it. The more we go about with a countenance that resembles that of a bull dog, the more employment we find for a bull dog's proclivities. The more we are determined to smile the more we discover that really deserves to be smiled at.

* * *

Whenever I see a young bride I always feel as if I'd like to get a club and take the chump that was lucky enough to win her out behind the barn and maul him within an inch of his life on general principles—and then say to him, "If you don't treat her right, I'll put you in the hospital the next time."

* * *

I was roasting that "Jim" Riley person to old "Hez" Brown the other night—and he called him the "Jimpson weed Philosopher." But old "Hez" cautioned me not to quote him because he says "Jim" owes him $7.65 for "smokin' terbacker"—and "Hez" is first and foremost a "man of business." But just the same I thought it was a "fittin'" title.

* * *

One of the things that's the matter with many farms is that the men who are on them don't do enough reading and thinking. We need trained minds not only to farm right but to think right—and we can't have trained minds without reading a lot of good literature. The man who doesn't use the brains that God gave him is little higher than the beasts of burden that pull his plow.

* * *

Suppose that for once in your life you don't act like a hound dog farmer? Suppose this fall you put every piece of machinery in under some kind of shelter where it will be protected from the elements? If you haven't a machine shed you can easily build one and cover it over with straw. A farmer who permits his machinery to rust and rot out in the weather is not only a poor farmer but a poor citizen—because a good citizen doesn't do things like that.

* * *

Take this "tip" from the "fool professer feller." Get together with the other farmers in your school district right away and organize a Farm Club. Write to this paper for a suitable Constitution and By-Laws and full instructions. Send a two cent stamp to cover postage on the new Farm Club pamphlet, for it will tell you just how to go about things from start to finish. It also tells you how you and your neighbors can save a lot of money and how, by providing yourselves with the "Farm Club Discussions," you can have a fine subject to talk about on every meeting night during the entire winter. A good Farm Club will give you a new interest in the old farm and life will seem more worth while—for you will feel that you are contributing your mite to the World's work.

Apple and Corn Show

The Second Annual Apple, Corn and Farm Products Show under the direction of the Commercial Club, the Mississippi Valley Apple Growers' Ass'n, and Stark Bros's Nurseries & Orchards Co., will be held at Louisiana, Mo., the later part of October. This show is known as "the show that attracts national attention" by reason of the large number and high class varieties shown. At the 1915 show one well-known variety of apples was shown from twenty-seven states. The corn display, which was judged by the University of Missouri, represented many states and affored the keenest competition. Neither show entrance nor admission fee is charged. Premium list, program and dates of the show will be furnished those interested in the corn and farm products department by application to the Secretary of the Louisiana, (Mo.), Commercial Club. Those interested in the apple and fruit section should write to Stark Bro's., Louisiana, Mo. Thousands of trees are to be given away as premiums.

Fertilizer for Roses

As the result of a series of experiments carried on by Dr. F. W. Muncie of the Department of Floriculture at the University of Illinois, the interesting conclusion has been reached that the use of acid phosphate as a fertilizer increases the rate of production of roses to a remarkable extent, perhaps a hundred times.

Hog Raisers Attention

Elsewhere in this issue the reader will find the advertisement of the Rowe Hog Oiler Co., 103 Liberty St., Galesburg, Ill.—and we suggest that every farmer who raises hogs drop the Co'. a postal card without delay and ask for full information concerning this new device which is such an effective destroyer of vermin and which adds so much to the sanitary conditions of the hog lot. Hundreds of these Hog Oilers are being successfully used and you owe it to yourself to find out all about them—for hog health pays.

Read the advertisements in THE FARMER carefully, for many of them contain information of value. Always mention the paper when you write for this not only helps us but will insure your inquiry the best of attention.

You Men Who Know Good Farm Land

GET the facts about the **Louisiana Highlands.** Get them **NOW!** Virgin soil that produces 50 bushels of oats and 60 bushels of corn: And only $22 an acre! Learn why this is the biggest opportunity in farm land today and why the property is being offered at a price far below its true agricultural worth. Send for the big book mentioned below. Remember this is not the advertisement of a land selling agency but the announcement of a substantial corporation whose integrity you may easily investigate.

Only $22 An Acre On Easy Terms

Climate mild the year around; rainfall certain. Land adapted to diversified farming. Conditions good for stock raising. Transportation facilities adequate; fine markets accessible. Several up-to-date towns with good schools, churches and all modern conveniences. Send for our big sixty-four page illustrated book—**"Where Soil and Climate are Never Idle."** It's **free,** absolutely without obligation. With it comes a map of Louisiana in full colors; plat of the land; and our latest Bulletin—all **free** to you. Send today and learn about the wonderful development now going on in this region. A postal brings it.

BIGLER COMPANY, X , SPRINGFIELD, ILL

Worth Looking Into

Write to Dept. F 32, American Radiator Co., Chicago and ask them to send you full particulars about the cost of installing a Farm Home Furnace—a thing which means that your house will be evenly heated the whole winter long and which will do away with the unsanitary stove and building fires on cold mornings when the thermometer hovers around zero. You don't have to have a basement to install these furnaces for they can be put in a side room or "lean to." Anyway, the company will be glad to give you a lot of free information which you will find interesting.

"Some bank first sent me your paper—but here is a dollar for which please mark me up. I feel ashamed for not having sent it before because you are doing a great work and deserve the support of every good farmer in the state." Thus wrote a farmer from North Missouri the other day. How do you feel about it?

Look up our special offer and renew your subscription before October 20.

Live Stock Notes

Bennett Bros. & Belcher's Poland Sale

Elsewhere in this issue will be found the announcement of Bennett Bros. & Belchers sale of Poland China hogs at Lee's Summitt, Mo., on Oct. 21 and the occasion is worthy of note by all who are in the market for high grade animals of this breed. Included in the offerings will be Master Orphan, one of the finest sires developed in recent years. He was sired by The Big Orphan out of Lady Rose, the greatest brood sow Jim Newhofel of Central City, Neb., ever owned. Sows bred to this great boar averaged $95 per head at Bennett Bros. Sale last February. The get of Smooth Columbus, twice proven Missouri's record sire will also be featured. Also the get of Master Orphan. Also 9 sired by Big Bob, 3 by Long Big Bone, Champion Iowa Fair, 1916, 4 by Tessy's Tim, Junior Champion at Nebraska, 1915, 1 by Big Tim, Grand Champion Neb., 1915. In short, this offering of 45 spring boars and gilts represents the tops of two of the best herds of Polands in the state. Sows in the sales conducted by Bennett Bros. have topped the state the past two seasons. The majority of the boars will enter the sale ring at close to 300 lbs. Everything immune by simultaneous treatment. Sale held at Bennett's farm, at Lee's Summit, Mo., under cover on Oct. 21. Free auto transportation.

LIBERAL FEEDING PAYS BEST

Steers that are full-fed from birth should not be held beyond 20 or 22 months of age because there is a decided falling off in the rate of gain. After this age the carcasses are overdone, there is an undue waste of excess fat and the gain in weight in proportion to feed consumed is much reduced as well as the gain per day per steer. These are the results secured in a recent test at the Missouri Agricultural Experiment Station in which some steers were full-fed while others received less feed.

The steers which received feed insufficient for the greatest growth were most affected by such ailments as indigestion and pink eye, and their sickness was more likely to result in death. In fact, among more than a hundred steers in the experiments, all the losses except one were among the low-fed animals.

Steers fed for long periods such as three years and a half on feed insufficient for the greatest growth, did not seem to be able to digest their feed and to make good gains when later put on full feed. Even a steer whose growth was greatly retarded for only one year never equaled in weight a steer of the same age which had been full-fed from birth, although when put back on full feed he made very profitable gains and developed a very choice carcass of beef. These results do not disagree with the common observation that thin steers often make the most profitable gains. Such feeders have usually not been starved so long or so steadily. They have usually had bulky feed which kept up the stomach capacity even though it didn't furnish a great deal of nourishment and were very likely to have at least occasional large quantities of good nutritious feed while the steers in the test were kept regularly on small quantities of food for long periods so that they seemed to lose the capacity to eat and digest as large quantities as they must handle to make the most profitable gains.

Thrifty yearlings put on feed that is not sufficient, even to keep up the body weight they already have, continue to grow in height and framework even when made to lose half a pound a day. Measurements of the skeletons did not indicate any decrease in the rate of growth for several months. Even when these animals were using the body fat to supplement the lack of feed there was a very noticeable addition of fat in the skeleton. Only when approximately all the fat was taken from the soft parts did the animal begin to draw on the fat in the skeleton to maintain existence.

The most economical choice beef resulted from the use of a feeder weighing about 750 pounds so fed as to make a gain of 500 pounds. Such a steer will probably not quite top the market but he should make the greatest possible profit to the feeder and furnish an economical carcass for the butcher and housewife and meat of a quality to please the most exacting. The carcasses show that of this 500-pound gain, 38 per cent is water, 49 per cent fat, and 12 per cent protein. When similar steers were fattened until they had gained another 500 pounds or gone from 1,250 pounds to 1,750 pounds, the carcasses were much overdone and the second 500 pounds was 76 per cent fat, 18 per cent water, and 5 per cent protein.—P. F. Trowbridge, Missouri Agricultural College.

TREATMENT OF PINK EYE

The true cause of pink eye in cattle is unknwon. Its infeciousness cannot be doubted. It travels through a herd rapidly, apparently irrespective of the age of the animals, although more prevalent in older cattle. The disease runs its course in eight to twelve days and may result in a satisfactory recovery or the animal may be partially or totally blind in one or both eyes as a result of the attack. Apparently animals do not become immune to this disease. It is manifest by a watery appearance of the eye, which later becomes more or less prurient and the eyelids become gummed together. This attracts flies and is a very unsightly thing as well as a torture to the affected animal. The treatment should be as follows:

Segregate the affected animals by putting them, if possible, in a shady pen. Keep an abundant supply of pure, cool drinking water before them, and treat the eyes twice a day as follows: First wash off the lids and eyelashes with warm water and castile soap, then open the eye by catching up the upper lid with the thumb and first finger and rolling it back over the second finger. By means of a medicine dropper or cotton swab, wash the eye out with the following solution:

Pyoktanin 10 grains, boric acid 4 drams, lead acetate 1 dram, water sufficient to make 8 ounces.—Oklahoma A. & M. College.

ARE YOUR HORSES BOARDERS?

One of the hard jobs on the average farm is keeping horses profitably employed throughout the year. It is necessary to have enough to do the work at the busy season but very expensive to feed the horse that stands at the rack and "eats its head off" the rest of the year. In its study of the question, the Missouri Agricultural Experiment Station found one young farmer who kept his horses working and costs down to 6 7-10 cents an hour, per horse, as compared with 7 9-10 cents on the average farm. The horse which did the most work, worked nearly three and a half times as many hours a year as the one which did least, and nearly twice as many hours as another. The actual numbers of hours they worked were 1340, 1239, 1028, 702, and 391.

In these days of efficiency and economy it is highly important that every man should do everything possible to reduce the total number of horses it is necessary to keep and increase the ways of finding profitable employment for them. Of course, livestock is very necessary if the soil fertility is to be kept up, but aside from work animals the stock should be something that will produce meat, milk, or eggs in return for the feed it uses.—R. M. Green, Missouri Agricultural Experiment Station.

THERE'S MONEY IN SHEEP-RAISING

The breeding flock of sheep has been one of the best paying investments the Missouri farmers have had. Native or western ewes crossed with a good mutton ram produce good marketable lambs and with present prices of wool, the fleece will more than yap the cost of keeping the ewes. Native ewes will be high in price.

Western breeding ewes can be purchased in carload lots at any of the stock yards. One hundred and thirty to one hundred and forty will be required to make up a carload.

One ram to from 35 to 50 ewes will

POLAND CHINAS

Sale of Poland China Hogs October 21

BENNETT BROS. & BELCHER'S SALE OF P. C. HOGS
Featuring the get of the great Smooth Columbus and Master Orphan.

45 head and the tops of the two herds. Also boars by Big Bob, Long Big Bone, Tessy's Tim, Big Tim and other noted sires.

C. W. Chandler, Kellerton, Iowa
80 miles north of St. Joseph, Mo.

be required. The Department of Animal Husbandry of the Missouri College of Agriculture has a list of many Missouri breeders who have rams for sale.

The following is quoted from a reliable sheep commission house: "We believe breeding ewes will be in good demand throughout the season as the good kinds only come at intervals. We believe it would be the best thing for anyone figuring on buying stock of this class to place their order at once for we do not think they will get any cheaper any time this season than they are at present."

Good range ewes sorted up for good mouths and udders should cost from $7.00 to $7.75 per 100 pounds. These ewes would range in age from 4 to 6 years. The Department of Animal Husbandry of the Missouri College of Agriculture will be at the service of any Missouri farmer who wishes assistance in buying ewes or rams, and will be glad to help breeders as much as possible in the management of the flock.—H. Hackedorn, Missouri Agricultural Experiment Station.

WEANING THE FARM COLT

To keep the colt growing without interruption during weaning time and afterward is a most important consideration in producing horses profitably. A good horseman aims to replace the milk that the colt has been accustomed to secure from its mother. He tries also to reduce the worrying and fretting of the colt to a minimum. To wean a colt appears to be a simple matter. It is simple as many do it; yet the very low degree of success that is shown on many farms by their unthrifty colts is evidence that there is something wrong or that there is something lacking. Often in a few weeks during weaning time the youngster changes from the growing, sleek, milk-fat colt to a stiff-haired and unthrifty, stunted individual. The colt if properly cared for, need lose but little of his flesh, bloom and sprit.

Grain must be used as the milk is taken away. It is necessary that the colt has been taught to eat grain before weaning is attempted. Oats have always been preferred by horsemen for young colts. They are undoubtedly superior to any other single grain. The colt likes a mixture or a variety of grains and will thrive best on such a ration. He relishes corn and it may well be fed as part of the grain ration. It may be said that corn contains a rather high percentage of fat. True it does and so does milk which is as nearly ideal food as nature can make. Corn should not be fed alone, nor in too great quantities. Bran is a splendid feed and contains material for bone and muscle. A mixture of oats 60 per cent, corn 30 per cent, and bran 10 per cent, makes a ration that will enable any colt to grow rapidly. A handful of oil meal may be profitably added. Then he will be more likely to eat enough to almost make up for the lack of milk.

Hay should be provided in plenty. Doubtless alfalfa or clover is the most desirable for young growing colts. Both grain and hay should be of the very best quality. If it is at all possible to furnish succulent grass for the colt it should be done. This is a big factor in preventing any check in the growth of the youngster.

Naturally the colt will miss the company of his dam. If he has been accustomed to stay in the stable or yard while the mother is out at work there will be less fretting on that account. If the youngster has followed the dam constantly and has never been kept separated from her, he should be broken gradually to stay away from her if it is at all convenient to do so.

If there are several colts on the farm it is best to wean all of them at the same time. The youngsters love company and if there are two or more of them together, they will fret and worry less.

The stall or pen where the youngster is confined should be such that he cannot injure himself. The door and fence should be high enough so that he will not try to jump out. Nothing but a clean and comfortable place with plenty of sunshine and proper ventilation should be used for the colt during weaning time. It should be made possible for the colt to exercise freely every day.

Just before weaning it is best to change the dam from succulent pasture to dry feed. If she is being fed grain the amount should be reduced to a minimum. This will have a tendency to reduce the milk flow. The colt should then be allowed to suckle only two or three times per day instead of being with the mother all the time or at least over night. It may be necessary to milk out the mare occasionally for a few days, in the case of large milk producers and where there is a tendency for the udder to swell. Having done these things it will be comparatively simple and easy to keep the colt away from the mother entirely without injury or handicap to either the dam or her foal.

Having made the change slowly and gradually the youngster will not miss the milk greatly. He will eat grain and hay, will take exercise and will grow without any set back. If he is kept healthy, thrifty and growthy, the very best of results will follow.—H. E. McCartney, Assistant in Aniaml Husbandry Extension, Purdue University.

HE BLAMES THE DOG

John A. Baldwin, a well-known farmer and feeder of Carrollton, Ill., believes the sheep raisers are not getting a square deal. He says:

"There is just one reason for the short supply of sheep at markets, and this county will compare with every county in the state, and that is the country and towns have a surplus of worthless dogs that prowl the country every night in the year and kill and cripple the sheep until the farmers have been forced to quit the business. Only those who shed or lot their flocks at night and watch them through the day can continue in the business.

"Sheep pay a greater profit for their cost than any other live stock on the farm, as they grow two crops a year, the lamb and wool, besides they are weed destroyers and fertilizers.

"The earnings of 20 breeding ewes on every farm at less than present prices will pay the real estate taxes annually. If there was a law to keep every dog at home the country would soon have a good supply of sheep and that would mean cheaper mutton, cheaper wool and cheaper clothing.

"Not only is the surplus of curs a menace to the sheep industry, but they have been and are now a great detriment to the hog industry, as dogs can scent decomposed flesh for miles when the wind is favorable, and have been known to carry parcels of hog cholera carcasses for miles in one night and bury it on the land where they are owned, distributing cholera germs from one farm to another and one county to another until the country is thoroughly inoculated.

"A sure remedy is to keep the dogs at home. The dog tax is a failure as a protection to the farmer, as only a few are taxed, and still they are allowed to run at large.

"A useful dog is valuable, but the owner should take care of him as he does other live stock and keep him at home.

"The shortage of hogs and the great scarcity of sheep brought about by the surplus of dogs at large has forced the price of beef up at least $1 per hundred, and if there is no protection to the producer the costs of meat will go much higher, as farmers will not chance 75 cent corn fed to hogs and money invested in sheep at a great cost, knowing they have no protection from the worthless curs running in numbers from two to ten together, carrying cholera germs from distant neighborhoods home to their hogs and running down and killing their sheep.

"The government has gone to a great deal of pains and expense protecting the fish and wild game, and the surplus of dogs at large can lose the people more money in sixty days than all the fish and game is worth in twelve months.—National Live Stock Reporter.

Effect of Early Breeding on Gilts

The growth of young gilts does not seem to be checked by breeding, according to the results of the tests recently made at the Missouri Agricultural Experiment Station. The carcasses were analyzed but the composition did not seem to be different from those of animals not bred until they were older. Although gestation did not retard, the lactation period did so and a sow suckling a good litter of pigs cannot eat enough to maintain her weight or condition of fatness. During this lactation period or when she was suckling pigs, the demand for mineral matter in the feed is much greater than during the gestation period preceding birth.—P. F. Trowbridge, Missouri Agricultural Experiment Station.

WHERE TO BUY JERSEYS

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

A Tall Oak

Frequently as you look out upon a great forest in the distance you will observe one tree which raises its mighty head high above all the others—so high that it can be plainly seen for miles. When the storms come and when the lightening flashes it is always the target for the anger of the elements—for its very prominence deprives it of that collective protection which nature vouchsafes to things that are equal. In the same way, now and then, you will observe a man whose head and powerful shoulders are clearly discernible above those of the crowd—who leads and drives on and ever onward—who scorns opposition and fights from sheer love of fighting—and like the towering tree in the forest he becomes a target and around his head there surge storms of which those below hear only the distant rumble.

Of this class was the late James J. Hill whose life and career will ever remain one of the most remarkable romances known to the history of this Nation which, from the days of Powhatan and Pocahontas to this hour has been a realm of romance compared to which an ordinary Arabian Nights dream becomes commonplace. All of us are justly proud of those great actors who played leading parts in that great drama which gave undying fame to Bunker Hill, Valley Forge and "Crossing the Delaware." Likewise, we love to think of Lincoln fighting his way to immortality from a little log cabin hidden away amid the wildwood of Kentucky—and it is well that we should for stranger and more beautiful web the spinning wheel of destiny has never spun. But frequently we lose sight of other men equally big who choose to tear down mountains and compel deserts to blossom as the rose —who toil and battle in the great fields of constructive industrialism rather than upon the more conspicuous and dramatic stage of public life.

But come with me for a moment while we review in brief the wonderful career of this "Empire Builder"—this "Collosus of the North" whose like we shall perhaps not see again for many a day. Emerging from a little Canadian farm home around which the timber wolves prowled by night, he had neither education nor powerful friends to give him the "start" which cowards and timid souls seem to think so necessary. But he needed none of these. Doubtless he would have scorned the latter while through sheer power of will he made himself the master of the former until there was not an audience in the land which did not hang with bated breath upon his every utterance. Falling in love with a pretty but penniless girl, he sent her away to college for a number of years in order that she might qualify herself for a richer womanhood—and this sweet and splendid woman, the mother of a fine family knew better than any other human being in the World the inward tenderness and greatness of this great man who played such a leading part in the constructive affairs of the Nation during the last half Century.

The Lord "moves in mysterious ways His wonders to perform"—and thus, somehow, sooner or later, He seems to give to society some man better equipped than the rest to do the great things that need to be done—and even so, when weaker souls had tired of the struggle to tame the Northern wilderness, along came this giant with the vision of a prophet and equipped with a spirit so indomitable that it challenged and laughed at adversity. With his own hands he toiled and fought day and night. When those beside him faltered he coaxed and threatened by turns—whichever means proved most effective. To him temporary failure was no evidence that the thing could not be done but merely that for the time being he had chosen the wrong method—and thus he fought and struggled on and ever on until finally fate seemed to smile at his very stubborness and, as if to prove to future generations that vision and iron will are not without reward, it opened its golden horn and the erstwhile wilderness gave way to a land of happiness and plenty. That he accumulated some scores of millions of dollars in the process is of minor consequence—for the purpose of this commentary is to show once more that Destiny almost invariably finds the material it is looking for among the ranks of the lowly. It rarely ever knocks on the door which a butler opens—for Destiny knows its business.

PROFITABLE FEEDING OF DAIRY COWS

The feeding of a dairy cow should be governed by the cow's capacity to produce milk. By keeping a daily record of each cow's production the skillful feeder soon finds that some cows in the herd respond to an increased allowance of feed and return a good profit on it, while others are limited to milk capacity and overfeeding them is unprofitable. Profitable feeding requires a thorough knowledge of the individual cows as well as of the values of feeds.

The following general rules are given in a new Farmers' Bulletin of the department, No. 743, The Feeding of Dairy Cows, as a guide for winter feeding by the inexperienced feeder.

1. Under most circumstances the cow should be fed all the roughage that she will eat up clean, adjusting the grain ration to the milk production. Only when the cow tends to become overfat should the quantity of roughage be restricted.

2. A grain mixture should be fed in the proportion of 1 pound to each 3 pints or pounds of milk produced daily by the cow, except in the case of a cow producing a flow of 40 pounds or more, when the ration can be 1 pound to each 3½ or 4 pounds of milk. An even better rule is 1 pound of grain each day for every pound of butter fat produced by the cow during the week.

3. Feed all the cow will respond to in milk production. When she begins to put on flesh cut down the grain.

For the most profitable milk production, the cow must be fed a balanced ration at the cheapest price such ration can be provided. By balanced ration is meant the combination of such a proportion of nutrients and in such quantities as the cow requires to maintain her bodily functions and as she can utilize in the production of milk. These nutrients are classified as protein, carbohydrates, and fats. Protein is one of the principal constituents of milk; fats and carbohydrates perform much the same functions, that is, produce energy and heat, and in the balancing of a ration are usually classed together. If the cow is given a ration containing an excess of either element the excess is liable to be wasted; hence the economical importanc of a balanced ration.

Corn silage, corn stover, timothy hay, millet hay, prairie hay, hays from the common grasses, straws of the various cereals, and cottonseed hulls may all be classed as low in protein content, while legume hays, such as alfalfa, the clovers, cowpeas, soy beans, and oat and pea, are classed as roughage high in protein. Grain and concentrated feeds are the chief sources of protein, and the mixture should be made to fit the class in which the roughage belongs.

Compounding a Grain Mixture

A few simple rules for making up a grain mixture are given briefly below:

1. Make up the mixture to fit the roughage available. With roughage entirely of the low-protein class the grain should contain approximately from 18 to 22 per cent of protein, while with exclusively high-protein roughage the grain ration need contain only about 13 to 16 per cent.

2. Select grains that will furnish the various constituents, especially protein, at the least cost, using home-grown grains if possible.

3. Be sure that the mixture is light and bulky.

4. The mixture should be palatable.

5. See that the grain has the proper physiological effect upon the cow.

All these suggestions should be kept in mind in order to obtain the best possible combination of grains. The following table shows the digestible protein content of the more common grains and by-products feeds. The precentage columns are arranged in 5 per cent divisions.

Approximate digestible protein content of various grains and by-products

Average, 5 per cent (2.5 to 7.4 per cent). Corn meal. Corn-and-cob meal. Hominy feed. Dried beet pulp.

Average, 10 per cent (7.5 to 12.4 per cent). Wheat, ground. Oats, ground. Barley, ground. Rye, ground. Buckwheat, ground. Sorghum grains, ground.

Average 15 per cent (12.5 to 17.4 per cent). Wheat bran. Wheat middlings. Dried distillers' grains (rye).

Average, 20 per cent (17.5 to 22.4 per cent). Gluten feed. Malt sprouts. Dried brewers' grains. Dried distillers' grains (corn). Cocoanut meal. Peanut meal with hulls. Cowpeas.

Average, 25 per cent (22.5 to 27.4 per cent). Buckwheat middlings.

Average, 30 per cent (27.5 to 32.4 per cent). Gluten meal. Linseed meal (both processes). Soy beans.

Average, 35 per cent (32.5 to 37.4 per cent). Cottonseed meal.

Average, 40 per cent (37.5 to 42.4 per cent). Peanut meal (hulled nuts).

The percentage of protein in a grain mixture may be found as follows. Take say number of parts of any number of feeds in the table, and for each part put down the percentage of the column in which it is found. Add these numbers and divide the sum by the number of parts.

Examples

1 part wheat bran	15
1 part cottonseed meal	35
1 part gluten feed	20
3	3)70
Per cent protein,	23.3
3 parts wheat bran (3X15)	45
2 parts cottonseed meal (2X35)	70
1 part gluten feed (1X20)	20
6	6)135
Per cent protein,	22.5

The approximate price of a ration per pound of protein may be ascertained as follows: Divide the total price of the mixture by the average protein content as derived above. The mixture costing the smallest price per pound of protein, other things being equal, is the most economical. Unfortunately, other things are never exactly equal, for the physiological effect of the grain, bulk, and palatability must also be taken into consideration. Practically all the grain feeds low in protein are rich in carbohydrates, but grains are used primarily for their protein content, as almost invariably the carbohydrates can be produced more cheaply in the form of corn silage, cornstalks, etc. While the above-mentioned method of testing the economy of a grain ration is not entirely accurate, it is usually a safe method to follow.—Weekly News Letter.

High Quality Farm Land In the South

GOOD, fertile land that will grow all the crops you are familiar with in the North, and many more besides. Here is a wonderful opportunity to get away from the bitter winters, the short growing season and the frequent drouths of northern states. We offer you a new home in a mild climate of generous rainfall, where live stock thrives and vegetable growth continues the year 'round. Well drained, gently rolling upland, in the "Ozone Belt" of the southwestern Louisiana Highlands, "the land of perpetual growth."

$22 An Acre Until November 2 Easy Terms

After that date **the price will be** $25 per acre. Climate, soil, shipping facilities, market—all combine here to make this the ideal locality for dairying, cattle feeding, hog and sheep raising. All-the-year pasturage; two and three crops a year on the same ground. Beef, pork and mutton can be produced far more cheaply than in any northern state. **You can grow**

Corn.....40 to 70 bu. per acre.
Oats.....40 to 50 bu. per acre.
Corn Silage.....12 to 20 tons per acre.
Cane.....10 to 20 tons per acre.

Send for our big sixty-four page illustrated book—**"Where Soil and Climate are Never Idle."** It's **free,** absolutely without obligation. With it comes a map of Louisiana in full colors; plat of land; and our latest Bulletin—all **free** to you. Send today and learn about the wonderful development now going on in this region. A postal brings it.

SAW YOUR WOOD

With a FOLDING SAWING MACHINE. 9 CORDS by ONE MAN in 10 hours. Send for Free catalog No. E46 showing low price and latest improvements. First order secures agency. Folding Sawing Mach. Co., 161 W. Harrison St., Chicago, Ill.

CLOVER New Crop Iowa Grown Recleaned TESTED

and inspected Red Clover. Also Mammoth Alsike, Alfalfa and Sweet Clover of choicest quality. The Iowa crop this year is the best ever. Prices are very low. **Now is the time to buy.** Ask for samples and special red ink price list. Large illustrated catalog of all kinds of Seed free.
IOWA SEED CO., Dept 103 DES MOINES, IOWA

Baled Hay at Lowest Cost

THE price of hay, and the profit in it for the grower, depends upon the condition in which the hay is marketed. Hay of the same quality, in tight, smooth bales, brings a higher price than when shipped in loose, ragged bales.

International Hay Presses, with their powerful toggle-joint plungers, produce tight, solid bales. The roller tucker makes the bales smooth. The bale chamber tension produces bales of uniform size. The presses work fast, the different sizes and styles baling from 6 to 35 tons per day.

The line consists of one and two-horse presses, motor presses, belted jack presses and fast power presses. The one-horse press is made in 14 x 18 size only—all others in 14 x 18, 16 x 18, and 17 x 22 sizes, the accepted standard. The capacities vary from a small horse power press for the man who wishes to bale a little hay, to the largest, fastest custom power presses ever required.

An attractive mailing folder, in colors, shows **International Hay Presses** as they are, and gives complete specifications. Write for it.

ROWE'S NEW IDEA HOG OILER

Kills Lice. Cures Mange. Disinfects Pens and Yards. Prevents Disease.

Sent Freight Paid on 30 Days' FREE Trial

Only Oiler made without valves, cylinders or wheels. Can't clog, stick, leak or get out of order. Guaranteed 5 years. Uses Crude or Medicated oil. Kills lice; keeps pens and yards disinfected. Order one or more on free trial today.

Send No Money

I pay freight and send one gallon of Medicated Oil free with each post. Test them 30 days on your farm—then pay if pleased. If not, return at my expense. You take no risk. Order direct from this ad. Catalog Folder sent free on request. ALVIN V. ROWE, Pres't

PRICES
1 Oiler $7.75
2 Oilers 15.00
Freight paid except in Mountain and Coast States

ROWE MFG. CO., 103 Liberty St., GALESBURG, ILL.

A Great Offer to Housewives

In our last issue the Crofts & Reed Co. Dept. C-346, Chicago, Ills., offered a beautiful Dinner Set to farmers wives for $6.45—and also agreed to send it to them on 30 days free trial without the payment of a penny in advance. After that housewives can pay for it in installments of $1.00 per month—and those who did not investigate this great offer should write for full particulars at once.

Is there Music in Your Home?

If there is a daughter in your home, don't you know it would make her heart glad if you bought her a piano and don't you also know that her accomplishments in this respect will have much to do with her future happiness and social standing? You can buy a piano and pay for it in easy installments—and where they can afford it parents should provide this greatest of all musical instruments for their daughters as soon as possible. The Geo. P. Bent Co. whose advertisement you will find elsewhere in this issue manufacture a splendid line of reasonably priced pianos. Write them for their beautiful catalogue and be sure to mention THE MISSOURI FARMER.

Wouldn't you read THE FARMER with keener interest if you knew your subscription was paid in advance? The old subscription price of 3 years renewal for $1.00 expires October 20th. There isn't a minute to lose if you want to take advantage of it.

Boys, Get the Steel Trap Ready

Farmer boys have a chance to make a lot of money this fall and winter by selling skunk and other wild animal furs, for they never were as high in price before. Elsewhere you will find the ads of several Fur Companies. Drop them a postal card for prices and ask them to send you their guides to Trappers which you will find mighty interesting. Mention THE MISSOURI FARMER.

If it were not for our advertisers we wouldn't be able to print the paper at all—and hence you will confer a favor on us by reading our advertisements carefully and then mentioning the paper when you write about the things in which you are interested. Every little helps—and the paper is trying so hard to help you.

The Missouri Farmer

The Land Bank Amendment

By William Hirth, Publisher

While every reader of THE MISSOURI FARMER knows how we stand on the Land Bank Amendment from the frequent articles which have appeared upon it from our Managing Editor, yet inasmuch as the election is fast approaching we desire to present a final review upon this great question and answer as nearly as lies within our power some of the criticisms which have been made against it. In this connection, permit us to say that we are not interested in any political significance which may attach to this measure—for this publication is not concerned in the partisan quarrels or personal bickerings of rival candidates for public office. We reserve the right to praise or condemn any public act or measure as, in our judgment, it affects the interests of our readers—and where the chips may fall politically is of as little final consequence to us as the number of spots on the sun.

At the outset we wish to state that the idea that the so-called Gardner Land Bank Law is an amateurish or "half baked" attempt to supply the farmers of this state with an Agricultural Credit System is a mistaken premise—whether such a view proceeds from ignorance of the true facts or from a deliberate attempt to mislead the farmers of the state.

In other words, the Missouri Land Bank Act as passed by the Legislature two years ago has, for a number of years been the measure which, in all its fundamentals, has been recommended by the National Grange and other Agricultural organizations throughout the Nation—and therefore if it is a "half baked" or "crude affair" as has been charged in some quarters, that indictment is one which must rest not only against those who have stood sponsor for the measure here in Missouri but also against the greatest Agricultural thinkers and writers of the entire Country. The trouble with the average politician is that as soon as he strays away from the beaten path of the old threadbare issues—and especially when he invades the unfamiliar realm of the farmer—he immediately begins to flounder about like a drunken sailor. For 25 years the question of Agricultural Credit has had a prominent place on the program of every Farm Congress and convention in the Country and out of the "Melting Pot" of these discussions emerged the plan upon which the Missouri Land Lank Law is founded—and in our humble judgment the average farmer can better afford to pin his faith to the honesty and foresight of the greatest Agricultural thinkers in the Nation than to permit himself to be confused and misled by politicians with whom the "wish is father to the thought" and who see glaring defects where no defects exist in fact.

Surely the time has come when the farmer will demonstrate that he can do his own thinking—for have we not been the pawn of designing politicians long enough? Should we not so thoroughly understand the great questions and policies which affect American Agriculture that we can look with amusement rather than alarm upon those who would confuse us? One reason why we are pleading so earnestly for a Farm Club in every school house is in the hope that this goal may soon be reached and that we may thus, once for all, turn our backs upon political opportunists whether they wear the livery of a clown or the cloak of eminent respectability.

That the Land Bank Act is perfect as it now stands, we do not contend. That it is fundamentally sound, however, we have not the slightest doubt—and if this be true, then the overwhelming duty of the farmers of this state is to see to it that the Amendment is adopted in November—leaving it to the Legislature which will convene at Jefferson City next winter to iron out the lesser details and defects. The statement that the Act cannot be amended is not true—for specific provision for this is made in the Act itself. We have waited many long years to get an opportunity to inaugurate such a system in this state—and now that it lies within our grasp, will we permit ourselves to become confused at the hands of those who would profit by that confusion—by men who devoutly cross themselves and swear that they are the "farmers friend"—who insist that they are for a "real Agricultural Credit System"—whatever that may be—and who then proceed to demolish the thing which is before us without telling us what kind of a measure they would substitute in its place if they had the power?

The Whole Thing in a Nut Shell

For years the farmers of the United States have been compelled to pay a general rate of interest so high that it has made the greatest development of the farm impossible. Not only have the rates of interest been excessive but farm loans have run for comparatively short periods which have necessitated not only the annoyance and embarassment of frequent renewals, but always have such renewals been accompanied by new tribute to loan agents in the form of bonuses and commissions—and this, despite the fact that a loan backed by a mortgage on good farm land is better than a government bond because while governments may fall and pass out of existence, the land remains. Therefore, in order to enable the farmer to mobilize and standardize his credit, the leading Agricultural thinkers and writers of the Country have for years advocated the issuance of long time land bonds so safeguarded as to invite the greatest confidence from investors; and in order that these bonds may sell at the lowest current interest rate, they have suggested that they be exempt from taxation—and this is exactly what both the Missouri Land Bank Act and the recently created Federal Land Bank expect to accomplish and in this simple proposal is contained the heart and the essence of any Agricultural Credit System which may be brought into being now or in the future. The idea that it is a profoundly complicated matter of legislation and that it needs to run the gamut of long years of agonized political tinkering is the heighth of absurdity—for while the politicians were gnawing away at the tariff and quarreling over the distribution of political pork, the thinking farmers of the Nation threshed this matter out to their own satisfaction and today they know what they want and all they ask is the right of way.

It has been urged that exempting the land bank bonds from taxation is class legislation—and this, in a measure is true. But is it not also true of 75% of all the other legislation which we enact? When we granted protection by means of a tariff to steel, copper and a hundred other things in the past, was not this class legislation in the interest of those engaged in these particular industries? When we distribute tens of millions of dollars for rivers and harbors as we do during every session of Congress, does not the lions share of the benefit go to the classes who inhabit the favored sections of the Country? Has not the proposal to "subsidize" merchant ships been strongly urged during recent years—and, if after the great red tragedy which is now in progress across the seas comes to an end this policy becomes necessary in order to enable us to hold our own in the sharp fight for World commerce which will undoubtedly follow close upon the heels of peace, will any broad minded citizen oppose it?

The hour has come when every thinking citizen will pay profound heed to the needs of American Agriculture—for, from time out of mind it has been the goose that has laid the golden eggs. Upon this great industry is founded the Nation's abiding prosperity. From those who toil in the fields and feed lots come not only the food and raiment for the millions but the American farm rather than the American factory has vouchsafed for us a splendid trade balance against the other Nations of the World in years gone by. We have heard much in recent months of the crop of new millionaires who have sprung up and

WHAT CO-OPERATION MEANS

The writer had occasion some days ago to deliver an address to a big audience of farmers in a neighborhood where a number of fine Farm Clubs have been flourishing for sometime. At the wind up of the meeting a number of farmers got up to "testify" as they used to say in the old Camp meeting days. And this is what one man said who has the reputation of being one of the most successful farmers in his community: "Our little Club hasn't been in existence a year and yet the 18 or 20 farmers who belong to it have already saved several hundred dollars which we could not have saved if we had not been organized. We could have saved a good deal more if 500 or 600 farmers were co-operating in this part of the county instead of only perhaps 150—and I hope we will soon find ourselves in this position."

What this farmer said is possible in every community in Missouri—and in view of these facts is it not sheer stupidity for farmers to keep on drifting with the current? Does it not challenge our self respect as well as our common sense? We know of a Farmers Elevator in a certain county which is saving from $7,000 to $8,000 per year to its several hundred members. Likewise we know of several Co-Operative Creameries which are paying $75,000 per year into the communities in which they exist—enterprises which enable their patrons to turn their grass and forage crops into golden butter instead of permitting the greater portion to go to waste. These things show what co-operative effort will do and in the trail of such co-operation follow better bank accounts and happier farm homes. Surely the time is here for a "new deal" on the farm—but it will never come until you and your neighbors wake up and put your energy and enthusiasm back of the splendid Farm Club movement which is making such fine headway in many sections of the state at this time. I want every reader of THE FARMER to consider this appeal as personal. Send a two-cent stamp to cover postage on our splendid new Farm Club pamphlet. Then hold a conference with a few progressive neighbors and get busy. The long winter months are ahead of us. Lets put them to a better use than ever before. Lets light up the little school house and get together at least twice per month, not only for the purpose of saving money on certain commodities but to discuss the great farm questions of the hour. The time has come when the farmer should not only compel a "square deal" in the market but when, as a citizen, he should take a more active part in the affairs of the Nation.

WILLIAM HIRTH, Publisher.

flourished like green bay trees as a result of the traffic in foreign war supplies—and yet, during 1915 our factories and the Powder kings combined exported only $900,000,000 worth of commodities as against $1,600,000,000 of American wheat, cotton, beef, pork, mutton, horses, mules and other farm supplies. And yet this American farm which has been our Gibraltar of strength in the past and which is our chief hope for the future is in a bad way. During the last two decades covered by the federal census reports our farm mortgages increased over 106%—and the tendency to land tenancy in like proportion. Our erstwhile splendid soil fertility has been largely exhausted and upon every hand dishevelled and dilapidated farm buildings bear mute testimony that something is radically wrong. Thousands of the brightest country boys and girls have been and are flocking to the cities—and that this state of affairs can be charged up at one fell swoop to poor farming methods no one but a fool will allege. It is to bring a halt to these distressing conditions which threaten the stability of the Nation itself that has caused us to throw ourselves heart and soul behind the great farm organization movement—and lower interest rates and longer time money is an important milestone in the journey ahead. For years the farmer has stood aside in silence and without complaint. Disorganized and with no powerful friends at court, every other interest except his has been generously provided for—and if now, when at last it is proposed that he shall receive some slight consideration there are those who wish to raise the cry of "class legislation," they are welcome to make the most of it.

As to the Million Dollars

But, say some, the State Treasury is empty and in no position to supply the suggested capital of a million dollars. But what has that got to do with voting for the amendment in November? Is it not our first duty to build the foundation for the house and then look around for the other essential materials later on? To begin with, it isn't necessary for us to have a million dollars and never was—nor does this affect the Amendment in any material way for the time being. The debenture bonds can be issued in series of $250,000 at a time just as easily as a half million or a million. All it means is turning the bonds a little more frequently—and who shall say that the next administration will not be able to economize and find $250,000 somewhere to start the Land Bank in motion? Again, may it not be possible to provide this much revenue from some quarter which is not shouldering its just share of the burdens of government at this time? Should a system which means as much as this one to 275,000 Missouri farmers be held in suspense very long for so small a sum as $250,000—and does anybody seriously believe it will be? Will there be a solitary member of the next Legislature, either democrat or republican, who will dare place any obstacle in its way? Or at the very worst, why not go ahead and adopt the Amendment and then submit a small bond issue at the ensuing election? If we can afford to issue three million dollars in bonds to build a state capitol, can we not also issue a half million dollars to furnish the basic capital to provide cheaper and longer time money for the farmers of Missouri? The question we want to put squarely up to every farmer in the state is, "Do you want an Agricultural Credit System?" If you do, then vote and work for the Amendment and quit paying attention to this splitting of hairs which is done for political reasons pure and simple.

As to Creating "New Jobs"

Among other things, it has been charged that the proposed Land Bank will create a lot of new "political jobs"—and since this is so frequently true with reference to new legislation, the suggestion is pertinent. In the first place, the Act provides that the Land Bank shall be conducted by and be under the supervision of the State Bank Commissioner and that the employees and clerks of this Dep't shall attend to all the duties connected with its operation and that additional clerks shall be hired and paid for out of Land Bank funds only when the present force of employees in the Banking Dep't is insufficient. So it "gets away from the post" without creating a single new political job. Next it requires that the Attorney General, Prosecuting Attorneys, Sheriffs or other county officials of the different counties in which loans are made shall render any service required of them in this connection without extra charge. It also requires any bank or trust company to furnish information without fee—and lastly, in case of a foreclosure sale it provides that publication notice shall be given by hand bills instead of in a newspaper. In other words, the present official machinery of the state is utilized from beginning to end and the only new jobs for which the Act provides are a number of expert Land Appraisers who shall examine into the loans asked for and these men are to receive $2,000 per year and expenses—and we believe any fair minded man will admit that the System could not be put in operation without a few men in different parts of the state whose duty it will be to inquire carefully and fairly into the merits of the different loans which farmers may request. As a matter of fact, if the investors of the Country who are expected to buy the land bank bonds are to have the highest confidence in them, such appraisement by capable parties is of course vitally essential. In view of the above facts, we don't believe that an act was ever created in the history of the state which more studiously avoided unnecessary expense to the people than this one.

The "Single Tax" Bugaboo

However, in a final and supreme effort to scare and confuse the farmers of the state, the charge has been made that it is a "step toward the Single Tax." As a prominent critic recently put it, "I am told that many of the friends of the Single Tax are for this Amendment"—and thus the subtle poison which is expected to prove the final "knock out" is injected into the veins of this splendid measure. Who these "friends of the Single Tax" are, deponent sayeth not—for again "the wish is father to the thought." THE MISSOURI FARMER was the first publication in this state which raised its voice against the Single Tax when that heresy was proposed six years ago. It was more larely responsible than any other single influence for the convention of land owners which met at Jefferson City and which planned and waged a concerted fight against it—and the writer of this article wrote the lions share of the anti-Single Tax literature which was used throughout that campaign and hence this publication would be the first to raise a hand of warning if there was the slightest merit in this charge. Now what are the actual facts? Under present conditions, the farmer pays taxes on his farm whether he owns it outright or whether it is heavily mortgaged. Likewise, the man who holds the mortgage is supposed to pay taxes upon the money thus loaned—although in thousands of instances he never says anything about it to the assessor and thus avoids the payment. But, assuming that both the farmer and the man who holds the mortgage make an honest return, you have two men paying taxes on the same fundamental investment—while under the Land Bank plan the holder of the bonds (the equivalent of the mortgage under present conditions will be exempt from the payment of taxes and while the borrower will still have to pay taxes on his farm, he will be able to obtain his loan at a lower rate of interest because the land bonds are exempt—and hence will receive a benefit which it is impossible for him to obtain under the double system of taxation which prevails at the present time. So, as a matter of common sense and fairness the Land Bank plan is right—and instead of shifting the burden upon the land as is the purpose of the Single Tax, it actually relieves the land of the dual penalty which it is paying at the present time. Finally, has it not occurred to the reader that the Single Tax can never be fastened upon the land owners of this state without their consent—that it would require a specific Constitutional amendment and that every voter will be given a chance to vote upon it if it is ever again proposed? The recently created Federal Land Bank not only exempts its bonds from the payment of ordinary taxes but also from the payment of income taxes—and during the exhaustive discussion of this great measure in Congress the scare crow of the Single Tax was never once suggested by any democrat or republican whose practically unanimous support it received upon final passage. Unless land bonds, whether state or federal, are exempted from the payment of taxes, low interest rates and long time loans for the farmer are impossible—and all discussion on this point is therefore a mere waste of time. The Single Tax cry has been raised only to defeat the Amendment and the sooner farmers realize this the better for their own interests. In this connection, we also wish to state that the idea that the farmers of Missouri don't need a Land Bank of their own because of the Federal System is not true—for in substituting the new methods for the scores of millions of dollars in farm loans which are now in existence we will require the aid of the two systems to their fullest capacity. Again, inasmuch as the Federal System requires farmers to invest 5% of their loans in stock in the different Federal Land Banks, we believe that to this extent at least the Missouri plan is preferable.

The Missouri Law in Brief

And now we will state the Missouri Land Bank Act in a nut shell: If it becomes a law, loans will be made to farmers to the extent of 50% of the appraised value of their land. Farmers will give their notes to the Land Bank secured by a first lien mortgage. The loans will run for not less than 5 nor for more than 25 years—the borrower having the right to pay off all or any part of the loan at any interest paying period. No loan shall be for less than $250 nor for more than $10,000—preference being given to the smaller loans. The money thus obtained must be used for the following purposes: To increase the production of the land mortgaged, to make useful improvements thereon, to pay off liens or incumbrances or to make part payment on the purchase price where the borrower is paying part of the purchase money—and lastly the borrower may use 25% of his loan to buy live stock or needed farm machinery. Against the notes of farmers thus obtained, the Land Bank will issue debenture bonds which it will offer for sale to the investing public—and that these bonds will soon become the most sought after investment in the Country and that in consequence they will

A MAN WHO MEANS BUSINESS

The following letter from Mr. C V. Kerr, at Belton, Mo., shows such splendid appreciation of what THE MISSOURI FARMER is trying to do that we have, without Mr. Kerr's consent, taken the liberty of reproducing it:

William Hirth, Publisher Missouri Farmer,
Columbia, Mo.

Dear Sir—I have received several letters about the Farm Club movement from you during the last few weeks and for sometime we have been talking of organization. Until the last few days however, it was all "talk." But now we have gotten busy—and I herewith inclose check for $16.00 in subscriptions. During the next month or two I expect to run it up to $50.00 and maybe more. Our Club is going to want two or three cars of coal right away and I wish you would send me your wholesale prices by return mail. We will also be in the market right away for several mixed cars of feed and I want the wholesale price on that also.

In view of the money which you are able to save us on these commadities I feel that all our members should be willing to pay a dollar on subscription to THE MISSOURI FARMER which is leading this great Farm Club movement and I am sure that all of them will gladly do so, once the matter is brought to their attention—and surely there isn't a Farm Club in the state which will not be glad to do likewise. THE MISSOURI FARMER is the first farm paper that ever offered us this kind of help and now it is up to the farmers of the state to get up behind it to a man. Please let me hear from you at once on the coal and feed matters.

Your Friend,
C. V. Kerr, Belton, Mo.

Just think of the hundreds of thousands of dollars we would be able to save to the farmers of Missouri if we had a friend like Mr. Kerr in every school district in the state? And, if everywhere Farm Clubs would give us this kind of support on subscriptions, think of what a great farm paper we would soon be able to give you? The items which Mr. Kerr mentions will enable us to save $300 or $400 to his fellow Club members during the next several weeks. Truly, Brother, isn't it time for you and your neighbors to "fall in line?"

sell at a low interest rate to the farmer there is little question.

The first loans under the first series of bonds shall be made to borrowers at 4.3%, together with one-half of one per cent to defray the expenses of the Bank—or a total of 4.8%. Borrowers also have the right to amortize their loans during whatever period of years they elect—that is, to pay the annual interest and such a part of the principal as they desire each year. Thus, under the amortization plan, the payment of the interest and principal on $1,000 within 5 years would require an annual payment of $240; in 10 yrs., an annual payment of $124; in 15 yrs., an annual payment of $91; in 20 yrs., an annual payment of $75; in 25 yrs., an annual payment of $65. If, after the Bank has been in operation for 10 years or more it finds that the one-half of one per cent collected from borrowers for the payment of expenses is more than is necessary, it has the power to refund any available surplus to borrowers whose loans have run for at least a 10 year period. While the first series of loans will be made at the arbitrary rate of 4.8%, subsequent interest rates will be governed by what the land bonds sell for to investors—but that, in any case, the rate of interest will be considerably lower than what farmers have been in the habit of paying there is little question. There is a specific provision in the Act which stipulates that in no case shall the Land Bank charge in excess of 6% per annum upon loans, including the one-half per cent set aside for the reserve fund.

It has been urged by some that a loan of 50% against land is not sufficient—that "a farmer can borrow this amount anywhere." While this may be generally true, it must be remembered that what we are trying to do is to reduce the interest rate and provide long time loans rather than increase the equity against the land—for it is impossible to do both at one and the same time. The land bonds will be eagerly sought after and investors will be content with a low interest return only if the security behind them is beyond question. These facts, briefly stated, constitute the heart and the substance of the proposed Missouri Land Bank which, in our humble judgment, is the greatest act of legislation ever passed in the history of the commonwealth in the interest of farmers—and which therefore should have the earnest support of every farmer in the state irrespective of politics. For years the farmer has been struggling against excessive interest rates—and now that relief is close at hand, will we foolishly permit ourselves to become confused and demoralized by those who have personal axes to grind? The ides of November alone can tell. In conclusion, we will soon be ready to mail out a pamphlet fully explaining the new Federal Land Bank Act which we will be glad to send to any farmer for a 2c stamp to cover postage. It is a pamphlet which every farmer in the state should read carefully.

SCRUB CORN

Too many Missourians plant seed of not only poor breeding but also low in vitality.

Others plant some well bred corn that is low in vitality.

Some "send off" and buy shelled seed, and some get their seed from the common crib.

Knowing these things, one can readily see one of the reasons why our corn yield is not better than it is.

In many fields the scrub stalks will average six per cent "and up."

"Why the scrub," you ask? The two chief reasons are easy. One is that a scrub is commonly bred by a scrub, and the other may lack vitality in the seed grain.

In this last case it may not be a scrub, but a runt, the same as a well bred pig may be a runt.

But in the corn, how does the runt happen? It may happen through weak vitality caused by a lack of proper plant food, but more likely on account of the freezing while both grains and cobs are yet full of moisture.

Is your corn "mellow"? I do not know what other term to use, but try some of the ears by pressing hard on the ends of the grains and see if the grains sink lightly into the cob. If "mellow," the feeling is much the same as when you try an apple to find if it is mellow.

One cause may be the wet cob shrinking away from the grain—but this would be doubtful since this condition is not found much in the tight grained ears. It may be more likely that it is caused by heavy frost while the cobs are yet very wet, causing the grains to "heave" out like a post in wet soil, or as clover heaves out. When there was much moisture late in the fall, also early frost, it might readily be inferred that the last theory is the right one.

If three grains are given an equal chance, and two have good vitality and one low vitality, the three may grow—but the two good ones start first, and have an advantage over the other one, and one scrub or runt will be the result.

Plant runts and scrubs—and runts and scrubs will likely be the result.

Get rid of the scrub by breeding and selection! Get rid of the runt by selection and care! Sam Jordan.

Burn *less* Coal —and get *more* Comfort

A searchlight comparison as to the relative amount of coal required by the different heating methods to do an equal amount of heating work

When you honestly consider all facts and know what great savings and comforts will result from IDEAL heating, you cannot help but decide to have it.

Briefly—here is what you get:

AMERICAN RADIATORS & IDEAL BOILERS

A warm-all-over house. No repairs, no setting up or taking down. No labor, dust, gases, or smoke. An even, healthful heat all winter. A fuel saving that pays for the outfit. Adds big value to your home.

Thousands of farmers have found this out by installing IDEAL heating and their families now enjoy Winter better than Summer. There is such a thing as paying for IDEAL heating even if you don't have it *now* because in the meantime, you suffer all the ills and bills of old fashioned heating—but you can't get *real comfort* by only wishing for it. Why not decide *now* to have IDEAL heating and all the comforts and conveniences it brings to your home.

An IDEAL Boiler and AMERICAN Radiators can be put in any old or new house whether you have a cellar or not. Water system is not required as the same water is used over and over for years. IDEAL heating lasts longer than the building and frees you forever from labor, drudgery, and the dangerous effects of a cold, drafty house. Burn *any local fuel.*

IDEAL Boilers do not rust or wear out—no repairs.

A No. 020 IDEAL Boiler and 262 ft. of 38-in. AMERICAN Radiators, costing the owner $185, were used to heat this farm house, at which price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions. The IDEAL outfit is the *only* feature of the house which is never worth *less* than you paid for it.

Our IDEAL Hot Water Supply Boilers will supply plenty of warm water for home and stock at small cost of few dollars for fuel for season.

Get this book about Ideal Heating

Don't put it off another day. Read up and get all the information as to comfort, cost, and fuel economy that an IDEAL Boiler and AMERICAN Radiators will give you. Write today and get a copy of "Ideal Heating." Puts you under no obligation to buy.

Sold by all dealers. No exclusive agents.

AMERICAN RADIATOR COMPANY

SHOULD KEEP MORE CATTLE

Many a farmer does not want to milk cows and as a result does not keep as many cattle on the farm as he should because he has it continually harped into him that any profit is only in the dairy cow. I am not sure but that the beef cow can not always be made to return a profit provided we handle her as she should be for best results.

In the first place we must always calculate that the forage fed to cattle must be cheap, that it must be nutritious and plentiful. The cheapness must come from grass fed in our pastures. My practice has been to not pasture too closely as one would if from renting pasture year to year. I did not take the cows off of pasture for years until about Christmas then put them back about April 1, or in round numbers 100 days off of pasture. Don't understand me to say these cows were in show shape but they were in good enough condition to calve in a most satisfactory manner. Not too much milk still enough to start the calf along and as the grass increases the milk increases. In fact just what is in good natural condition.

But the great cost with the beef cow and calf proposition is in the wintering. Fortunately the cow is so consituted that she can consume a large quantity of comparatively coarse feed instead of grains and concentrates which are always relatively high priced and when fed cut the profits just that much. I have been in the cattle business in Southwest Missouri when it was impossible to feed corn in any shape and make a profit. Even had the silo been fashionable then, it would have been impossible to make a profit out of the seemingly cheap silage, as corn is corn, whether silage or in the crib. Good stalk fields and choice cane hay we all know how to make, make the bulk of the roughness on our farm. I think I lost four or five years of profits in this talk of corn, cotton seed meal and the like that ate the profits in cattle growing.

Should I feed these cows in the barn as the dairy cow is fed they would consume feed worth two and a half or three dollars a month and all sorts of udder trouble would come from high feeding. We are in such a rush to get our calves to market we cannot wait for them to get old enough to consume this world of coarse feed that is burned, wasted and thrown as refuse. The grain should be the small part of what is produced on our farms as it is an open question if the farms of Missouri can produce all grain at a profit. But roughness can be grown by the tons at a small cost. Let the slaughter of dairy calves go on, it is the salvation of the beef industry but to those that love that quiet pastoral, profit taking life, the well formed beef producing cow leads the world to my notion. E. E. Laughlin.

"TOM" AT THE UNIVERSITY

By "Tom"

Dear Dad—I guess you and Mother have been wondering why my letters have been so short since I got down here to Columbia—and, in fact, I have been ashamed of them myself. But, first of all, I had a hard time to find a room and boarding place which would enable me to keep within the expense money we all figured on—and even now I don't know whether I will be able to do it or not. All the boarding house keepers say they have to charge more because the war has put prices up and while I don't know whether its all true or not, it doesn't help out the student who is compelled to count every nickel he spends. Then too, there are over 3,000 students here—and so every place is full and there isn't much choice. I don't want you to get the impression that the boarding house keepers are "holding up" the students for, all of us know that every thing one buys to eat is high—but if it should take $40 or $50 more to run me through to spring, you will know at least one of the reasons.

I wish you and Mother and the rest of the "kids" could pay me a visit—and you must next spring without fail, for you have no idea what an immense institution the University of Missouri is and how beautiful the buildings and the campus are. I had no idea myself before I got down here and saw it all with my own eyes—and each day things grow more interesting. Then, too, Columbia is a very beautiful town and all the people are kind and courteous to the students, as is shown by the fact that dozens are working their way through—doing all kinds of odd jobs by means of which they square their board bills and room rent.

And the idea that students put in three-fourths of their time playing around is a big mistake. In fact the University of Missouri is a great bee hive of activity in which over 3,000 young men and women are trying to better prepare themselves for the great battle of life—and the student who isn't trying to "make good" in his classes seems to be under the ban not only with the Professors but with his classmates as well. President Hill is a tall, keen faced man about 45 years old and seems to be in for business from start to finish. He reminds one more of a man who is running a big business enterprise of some kind rather than a big school. What I mean is, that he doesn't waste time in long winded orations but when he talks to us he says what is in his mind—and it is always to the point. Then he quits. And the same is true of nearly all the other members of the faculty with whom I have come in contact. In fact, the University of Missouri is a gigantic workshop turning out thousands of educated young men and women—and it seems to me that not only should they make better citizens but that society should be better off because of the training they receive in this great institution. I am dwelling on this matter at this length because if the people of Missouri generally knew what a great work the University is doing, I believe they would feel more friendly toward it. I heard Dr. Hill say in a recent address that no other University compared with it in efficiency and thoroughness west of the Mississippi River—and I am sure he wouldn't have said it if he wasn't in position to furnish the proof.

Some boys undertook to "haze" a student a few evenings ago and wound up by landing in jail. When the University authorities heard of it they promptly started an investigation—and according to latest reports all directly concerned in it will be dismissed and sent home. Whatever may have been true about "hazing" in the past, it doesn't go these days, for President Hill has put his foot down on it hard—and hence no "rube" student has anything to fear. Of course we have some "bone heads" here who try to cut too wide a swath before they get their eye teeth cut and it really wouldn't hurt to take them down a few notches—but the trouble is such things are too frequently carried to extremes.

I haven't been asked to join a Fraternity yet and don't know whether I shall be or not. I know I won't join if it is going to run up my school expenses. I hope you won't get scared when I tell you that I am becoming enthused about football. I don't mean that I am trying to get on the team—but in another letter I'll tell you just what I mean.

And now I am going to give you and Mother a big surprise—and I hope you won't be angry with me. I know you have pictured me studying big musty law books until midnight every night, for this was what I went through high school to do—and I did enter up for the freshman law course. But I got to thinking things over and wound up by switching over to the Agricultural College. Now please don't get out of patience with me. I know its a funny way for me to do—but withhold your judgment until my next letter when I'll tell you why I changed my mind. With love to all, Tom.

ONE IDEAED ROAD MEN

Editor Missouri Farmer:

The writer has followed the editorials of a certain metropolitan newspaper with pleasure and profit for many years. He has followed its advocacy of various reforms with attention and appreciation. He therefore is surprised at statements concerning the wagon road problem which have appeared recently in its columns.

Let it be clearly understood that, while the writer's name is associated with the improvement of the earth and gravel roads by the split-log-drag-method, yet he is, nevertheless, an advocate of a hard surface for the main travelled roads, and is on record so in public print as far back as 1905. His boyhood days were spent in a region of such highways; he is ready today to pay his part of the cost for a hard surface on the road from his home to the town and railway station; he stands ready to cast his vote in favor of Township or County Road Bonds for any business-like improvement of the leading thoroughfares.

However, the writer realizes that for many years to come a large—very large—proportion of our roads must be built of the material now to be found between the fences. And he knows further that the simple, cheap, King pattern, split-log-drag is the best as well as the most easily available implement with which to build and maintain the average road throughout the world.

For these and other reasons he deprecates a recent editorial in this city paper which in effect condemns the policy of road dragging now followed by the states of Missouri and Kansas; charging (as it does by inference) that the money so expended is wasted, and concluding its indictment by saying:—"The work has to be done over again this year." Truly the work "has to be done over again this year." In enlightened communities the draggers and the road users agree that it ought to be "done over again" after each rain or storm, but this truth does not constitute a valid criticism of the method, and the editor is most deeply in error if he assumes that this truth is evidence against the value of the road dragging system.

When the city editor urges the building of more nearly permanent roads the writer hereof bids him God speed, for the writer asserts, as he has done for many years, that where farm land is worth one hundred dollars an acre the community is not living up to its opportunities unless the main arteries of traffic are hard surfaced. On the other hand when any city editor suggests that road dragging is wasted effort because it must be repeated, we hasten to remind him he combs his hair often, and that probably in bad weather he has his shoes polished as often as once a week.

What we need, and in time will have, is a system of highways which will ramify from the largest cities to the doorway of the humblest citizen,—be he villager or farmer. Such a system of highways will include trunklines with expensive concrete or brick surfaces for the very heavy traffic; including trucks and automobiles. Less used but important roads may be of waterbound macadam or gravel—perhaps in certain regions where stone and gravel are not at hand oiled roads may prove most economical and practical. Minor wagon-ways must remain of native soil, built and maintained with the road drag. Mean while, antagonism to road dragging such as is shown by the city editor quoted above, which has its equivilant at the other extreme in the rural banker or merchant who holds that "a good dragged earth road is good enough for anybody", breeds in a lack of information or a narrowness which fails to comprehend these last stated facts.

D. Ward King,
Maitland, Mo.

TAKE CARE OF THE LAMBS

To The Missouri Farmer:

This time of the year it is very important we look after the sheep especially the lambs. If the lambs are early they have been weaned since the first of August and have been on possibly short hard grass or we might say no pasture—just dry grass. Weaning time coming on dry grass or even pasture is the crucial time with all young animals. We find pigs are immune to cholera while suckling and lambs are free from the ravages of stomach worms, but as soon as the weaning takes place the lamb cannot digest the coarse grass, and before we know it they commence dying. We may be deceived in their fluffy fleece because we can't see the spine sticking up or the hip bones showing only when a rain comes, then we realize the condition but we let them shake around until the bones are covered up and we let the matter slip. The lambs, as all young animals, have an incomplete mouth, their teeth are few and possibly not in apposition, so mastication is incomplete.

We now have our ram lambs sorted and on bran and shelled corn. Thirty of this year's crop have eaten a half ton of bran and about five bushels of corn already. This corn was partly chopped to teach the lambs to eat the bran as they are slow to learn on the bran. Our troughs are in the sheep barn and always dry and clean and if not clean the broom is there to sweep them. I think some three years I have made gross mistakes with lambs by turning them in the corn field, I say corn field, but a great success one year was with a clover and corn field adjoining with a few rows of Kafir corn close. Cowpeas one year served fine while another year they failed, and as other things pressed I allowed the peas cropped too low and some of the lambs failed to learn the feed box for weeks. I have never fed out western lambs but am sure the troughs would be used as above indicated. For fear I might be misunderstood on prepared food will say whole grain has served me best, always.

You will say where is the worm feed? Why, salt and sulphur all the time before them and not only on Sundays or twice a week but all the time. These are nature's food or condiments and should never be neglected.

E. E. Laughlin,
Rich Hill, Mo.

FALL CORN WORK—PART II

The Harvest

On many well-managed farms the work of harvesting and storing the corn crop begins with the filling of the silo. Corn is one of the best crops for this purpose, if not the very best. Sorghum stands dry weather much better than corn and for dry regions is a surer crop, but it is more inclined to fall down and become tangled than corn, thus making it somewhat more difficult to place in the silo. This difficulty is overcome to a large extent by growing the two crops together, and the silage made from these two crops grown together is usually superior to that from either crop grown separately.

When the silo first came into use it was thought necessary to fill it with very green succulent growth. This is now known to be an erroneous idea, and the silo is regarded much as a storeroom or food preserver, the value of the silage depending to a very great extent on the nutritive value of the crop with which the silo is filled. To this end it is advisable that the corn shall have reached a degree of ripeness indicated by rather hard well dented or glazed kernels and partially dried husks before it is placed in the silo. There is a week or 10 days when the ears are in this condition and the stalks still contain sufficient sap to cause the silage to pack well in the silo. It is even better to add a little water to accomplish the latter purpose than to cut the crop before it has attained its full feeding value.

Stripping

In some sections the practice of stripping the blades by hand from the standing stalks was for years one of the established operations in connection with harvesting the corn crop. The blades when thus gathered and well stored furnish an excellent forage, but there are now cheaper methods of harvesting without any loss in quality.

Topping

It is still quite a common practice in some localities to top the stalks by cutting them just above the ear. By this method the portion of the stalk which is eaten by stock most readily and with least waste is obtained. When the grain crop is late in maturing, or wet fall weather prevents the proper drying of the ripening ears, the topping of the corn may be found ad-

visable. If the ears have become hard, the kernels dented, and the husks partly dry before the topping is performed, no reduction in yield will result. A heavy growth of cowpeas may make the cutting of the entire plant impracticable and warrant the topping of the crop. If the corn is desired for seed, topping will facilitate the drying of the ears and thus make it possible to select the seed before it is injured by freezing. Ordinarily, however, it is found more expensive to top a corn crop than to cut and shock the entire plant.

Cutting, Shocking and Husking

Over large areas in the principal corn-growing states corn is grown primarily for the grain, and each farmer decides for himself how much of the crop will be cut. This is usually determined by cutting just enough to feed the animals maintained on the farm. The chief objection to this method is that many farmers do not maintain enough animals to consume all of the corn stover produced. If the ears are gathered from the standing stalks and no use is made of the stover, fully one-third of the crop is wasted. The term "fodder" is applied to the entire plant as ordinarily cut and shocked, while the term "stover" is applied to the porion remaining after the ears have been pulled or husked.

Generally speaking, there is little difference in cost between husking and cribbing corn from the shock and husking and cribbing it from the standing stalk. In some sections men will husk from standing stalks at a lower price than from shocks, but the cost of teams, although they are not usually very busy with other work during corn-husking season, must be taken into consideration. Considering the expense of husking from the standing stalk and from the shock as equal, it is evident that the stover has been obtained for the money paid for having the corn cut and shoked. This cost of cutting and shocking is very much less than the value of the stover, if it be properly stored and fed. If left in the field until February or March exposed to the winds and rains of winter, it is questionable whether its feeding value is equal to the cost of cutting and shocking.

There are sections in the Central and Southern States where the soil is rich and the growing season long, causing the corn to make a large, tall growth of stalk which does not furnish a good quality of stover. In such sections it may be better to obtain the necessary quantity of forage by cutting several hay crops each year than by saving the corn stover. This is especially true in localities where warm, damp weather causes the corn stover to lose its feeding value rapidly.

Binders

The corn binder with bundle carrier is satisfactorily used in cutting corn of average or small size on land that is not very steep or stumpy. On the comparatively level prairie land of the North Central States the corn binder is very generally used in cutting and shocking corn. In light corn or on level land two horses will suffice, but for faster work or heavy corn the use of three or four horses is much more satisfactory. Three men, one to run the binder and two to shock, and two teams can cut and shock about 7 acres of corn a day. However, conditions vary to such an extent regarding the weight of the corn crop, the lay of the land, etc., that it is impossible to give figures that will apply to all cases. In sections where the corn binder is successfully used the principal objections to its use are the cost of twine which remains upon the fodder but a short time, and the knocking off of ears in the process of binding. In almost all cases the quantity of corn knocked off by the binder is great enough to warrant driving a wagon over the field and gathering the ears from the ground after the corn is cut and shocked. This is necessary, because the presence of the shocks in the field prevents the turning in of hogs or cattle to gather up the ears knocked off by the binder.

The use of a binder with a bundle carrier saves very much of the hard labor of cutting and shocking, and the greater ease of handling the fodder when bound into bundles of convenient size saves labor enough to compensate for the twine used.

Huskers and Shredders

The use of shredding machines is quite general in many corn-growing sections. Sometimes the machines are used for shredding the stover after the ears have been husked from the shocks by hand, and in other cases both the husking and shredding are done by the machine. The shredding of the stover puts it in a more compact form for storing and a more convenient form for feeding and avoids the troublesome work of handling manure in which there are long coarse cornstalks. Shredded stover is fed with much less waste than stover in any other condition. It has been estimated that shredded stover will go 40 per cent further in feeding cattle than the whole stalks and considerably further than when the stalks are put through a feed cutter. As there are shredders of varying capacities, a farmer may purchase a machine suited to his quantity of work to be performed, or a number of farmers in a community may own a machine jointly. Shredding fodder by the acre and shredding and husking by the bushel are common in many sections where crews operate huskers and shredders and travel from farm to farm. The blowing of the shredded material from the shredder and husker to the center of a feed shed, so that it can be fed in racks around the general supply, is a very economical way of using corn stover.—Weekly News Letter.

PROFITS INCREASED ON THE FARM

The harvest is over. Every machine and implement which is not in use should be under cover. The fall rains plant the seeds of rust which are harvested by the manufacturers of farm machinery.

The average life of farm machinery in this country is short, entirely too short, and for years has caused an enormous annual loss to the farmers, and large profits for the manufacturer. The best macihnery will wear out in time, but the life of any implement depends primarily upon the care it has received and the facility and ability of the farmer to do repair work.

The implements used on the farm represented a large investment, and this investment increases yearly. Every year that can be added to their life represents profit. This is the age of the "iron horse," and unless we take care of our machinery the annual loss is going to increase enormously.

Every farmer should study his machine and see where he can increase its efficiency. Oil is cheaper than repairs, and new tools, and when properly used will reduce the friction and increase the life of the machine.

If the binder has not already been housed, it should be done, as soon as possible. During a trip across the state last winter, the writer counted seven binders out in the field within a radius of fifty miles, and some of them were new machnies. Under such treatment a binder will not last more than three years. Then the total yearly loss on these machines, whose cost was about $900, would amount to $300 this is more than the yearly profit on some farms. With proper care the same machines could have been made to last ten or fifteen years.

"A high polish on the moldboard is of far more value than that acquired in high society." When you are through with your plow this fall cover the moldboard with any heavy grease that will keep the air away from it and put it away. This will keep the plow from rusting and can be easily removed. The same treatment to the disc harrow and cultivator shovels will protect them.

The farm machinery is only used for a short period, but must work continuously when being used. Hence it must be in good running order and properly adjusted.

When buying a new machine keep in mind these four words: Simplicity, Reliability, Durability and Accessibility. Then if the machine is given proper care, long life and greater profits are insured. Use plenty of oil and grease.—M. A. R. Kelley, Missouri College of Agriculture.

WHY USE LIME?

Half the soils of Missouri to a greater or less extent are in need of liming according to the results obtained at the Missouri Agricultural Experiment Station. This conclusion has been arrived at only after years of experimenting and observation. So far no great amount of liming has been done in Missouri as compared with other states, but the need of it is becoming more and more evident and as a result farmers are now showing a constantly increasing interest in the subject of liming.

Many do not understand the reason for applying lime, or the exact results to be expected. Most people expect lime to have an immediate effect on the crop, similar to that of a fertilizer. Lime, however, is not used as a fertilizer, but to correct the sourness of acid soils and make them better suited to the growing of crops, particularly the clover and alfalfa. It is not used for immediate effects except in the case of clover and alfalfa, although it will usually produce some increased return on the cereals and grasses. The principal reason for using lime is to make legume growing possible.

Although lime is an important factor in growing clover and alfalfa, it should not be inferred that all clover and alfalfa failures in Missouri are due to a lack of lime. As a matter of fact, a sour soil is only one of the causes of such failures. They may be due to poor drainage, to the fact that the land is badly worn by constant grain farming, to the fact that the land needs available phosphates, or to some other cause. But on land that is reasonably well drained and in a fair state of fertility, the chances are that the use of lime would be of benefit.

In applying lime it is best to apply a little more than is needed to sweeten the plow land at the first application and repeat with one-half to one ton once in four to eight years. The best time to put on the lime is after the land has been broken for a crop, such as wheat, allowing the preparation of the seed bed to work it into the soil.—M. F. Miller, Missouri College of Agriculture.

For Correct Lubrication
—Any Make Car at Any Speed or Temperature

It lubricates thoroughly the remotest friction surfaces.
It enables your motor to deliver the maximum power of which it is capable.
Polarine does away with excessive carbon and scored cylinders.
Cut down your repair expense and increase the resale value of your car by using Polarine.

Use Polarine and lubrication begins the minute your engine starts.

Indoor Closet

More Comfortable, Healthful, Convenient

Eliminates the out-door privy, open vault and cesspool, which are breeding places for germs. Have a warm, sanitary, odorless toilet right in your house. No going out in cold weather. A boon to invalids. Endorsed by State Boards of Health.

ABSOLUTELY ODORLESS

Put It Anywhere In The House

The germs are killed by a chemical process in water in the container, which you empty once a month. Absolutely no odor. No more trouble to empty than ashes. Closet absolutely guaranteed. Write for full description and price.

ROWE SANITARY MFG CO. ROWE BLDG., DETROIT, MICH.

Ask about the Ro-San Washstand—Hot and Cold Running Water Without Plumbing

Stop Crop Destruction

Solve the drainage problem. Write for free book and letters from hundreds of farmers telling what they do with the Martin.

The Martin

Farm Ditcher and Road Grader

cuts ditches, throws up terraces, levels bumps, fills gullies, makes levees, builds roads. All-steel, adjustable and reversible for wide and narrow cutting. 10 days' trial. Money back guarantee.

Owensboro Ditcher and Grader Co., Inc., Box 311, Owensboro, Ky.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII October 15, 1916 No. 20

William Hirth, - - - Publisher
Geo. B. Ellis, - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 75c Cents a Year in Advance or two years for One Dollar.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

INTEREST IN DAIRYING

Why is it that railroads, commercial clubs and various other industries should take such a lively interest in the development of the business of dairying? In Illinois, through the leadership of the State Dairy Commissioner the leading railroads of that state have given away several car loads of pure bred dairy bulls to bring about an improvement of the dairy business in that state. Leading bankers have become interested and are offering to loan money to farmers on favorable terms the money to be used for erecting silos, dairy barns and for the purchase of good dairy cows. There is a good reason for all this activity of these business men. The railroad operators know that a dairy community furnishes more business than the general farm community does. Bankers have found out that men who get a weekly or monthly milk check are more apt to have the money to pay off a short time loan than those who depend on selling their wheat or corn or some other uncertain product.

Recently a farmer who lives in a section where the drouth caused a bad crop failure this year said to the writer "I do not know how I could have pulled through without my silo and my cows. There was little grain on my corn but by putting it into the silo and feeding it to my cows with some alfalfa hay and a little cottonseed meal I get a good yield of milk. From ten cows my monthly cream check has brought me from $60 to $75 and the calves were raised on the skim milk and are worth $25 to $30 a head. While of course the drouth caused me a heavy loss I do not know of any other line of farming that would have brought me through in as good shape as milking cows has done."

Business men are finding out these things and that is why they are ready to risk their money with the industrious fellow who wants to try dairying. A movement was started by the Northeastern Missouri Industrial and Agricultural Association at Hannibal last week for the purpose of arousing a greater interest in dairying and we hope to see this movement spread to all parts of the state. A committee was appointed to confer with the bankers of that section to induce them to give better and more extensive credit facilities to farmers who want to go into the dairy business and to those who would enlarge their business already established.

THE MISSOURI FARMER has frequently pointed out the advantages this state offers for profitable dairying and there is no valid reason why Missouri should not excel any other state in the Union in the amount of dairy products. Under our present methods of too much grain growing or more accurately speaking too much grain selling, thousands of our farms are gradually growing poorer and in unfavorable years like the present one most of them are operated at a loss. Dairy farming intelligently followed is the surest way of restoring the worn out lands of the state to a profitable condition of fertility and to change the farmers business from a losing to a gainful occupation.

If every man who has lost money on his farming operation for the last five years would visit a few well regulated dairy farms and study their methods he might gain some information that would help him to make his own farm pay.

FALLACIES ABOUT ROADS

In another column of this paper will be found an article by D. Ward King in which he discusses some of the erroneous views held by many road enthusiasts who doubtless possess more enthusiasm than information about the economic uses of roads. We do not think there is another man in America who has done so much to create sentiment in favor of good roads as Mr. King has and this has been because he was acquainted with country road conditions and the practicable and possible ways of bettering them.

We have repeatedly said that substantial road improvement has been retarded many years by the fallacy that "no road is a good road except a paved road," and that "we should not spend any money for anything but permanent roads." There are approximately 125,000 miles of roads in Missouri and there is not a mile of the whole length but what is used by some one to get to his neighbor, to church, to school or to get his products to market. But thousands of miles of these roads are used so little that anything better than a good dirt road is out of the question.

Then there is a gross ignorance among the class of men Mr. King is talking about as to the dependability of a road that can be made out of the "material between the fences." With proper drainage and the intelligent use of the King split-log-drag a road can be made at nominal expense that is passable at any time of year and a first class road for most of the year.

A great deal of money has been wasted on our roads but the ordinary repair of any road is not a waste of money. Just as Mr. King puts it a man might as well say that it is a waste of time to comb his hair because it must be done over again every morning. The kind and amount of traffic that goes over a road must determine the kind of a road to build. There are a lot of silk stocking advocates of good roads who care nothing about the general economic value of good roads but all they want is a paved road from city to city to "joy" ride on and these fellows have had entirely too much to say for the good of the very important work of road improvement.

When we get a state highway department established with some authority to classify the roads and to determine in an inelligent manner the kind of road best suited to the travel on it we can proceed with our road work in some sort of sensible fashion.

Another thing that ought to be done by our highway department or by the school of engineering is to make some experiments or demonstrations in various kinds of road improvement so that we will know what kinds of roads to build under the varying conditions. We do not know of a better use that could be made of a few thousands of dollars than to put on a road dragging demonstration in every county in the state and if possible in every township. These demonstrations should be continued for several years and should be under the direction of a man like D. Ward King who has twenty years behind him to prove what can be done with the road drag.

The road proposition is a big one and a costly one but when we get rid of the demagogic politicians and the silk stocking agitator and proceed on the theory that the roads are the property of all the people and must be improved for the benefit of all the people we will be on the right way of a settlement of the question.

ATTENTION ALL FARM CLUBS!

We are beginning to hear from Farm Clubs which are located in communities where farmers will have surplus corn to sell. To this end, we are anxious that those Farm Clubs whose members will have to buy get in touch with us at the earliest possible moment—as we want to move the corn direct from communities which have a surplus to those which have a shortage and thus save Club members the tribute which will otherwise go to commission men and feed dealers. Only prompt action however will enable us to do this. Therefore if you and your neighbors are going to have corn to sell, please notify us at once. You will be paid the highest price the market justifies and in the meantime you will be able to save a lot of money to farmers who will have to buy—and one farmer helping another is what co-operation means.

We are also able to offer good, clean timothy hay at $10.00 per ton F. O. B. shipping point—and we should be able to buy good hay for less at many places. Write us what kind of hay you have for sale and what you want for it—being guided by the prevailing market price on the different grades and qualities. We can also quote you good prices on alfalfa hay—so again, whether you have hay for sale or whether you want to buy, let us hear from you without delay.

We are also in position to save cattle feeders several dollars per ton on cotton seed meal and cake, oilmeal and tankage—the saving on the latter item being from $4.00 to $7.00 per ton over the average local price. This is a matter on which all feeders should get in touch with us immediately.

The folly of farmers not being organized was never more vividly illustrated than during the last two weeks—for two weeks ago we had the refusal of 60 car loads of fine Northern potatoes at 85c per bushel F. O. B. shipping point in North Dakota. This would have laid these potatoes down at about $1.20 per bushel at almost any town in Missouri. A number of Clubs which were fully organized and wide awake promptly took advantage of the situation and the saving to them over the average local prices will be between $300 and $400 per car. Since that time the Northern price has been advanced to $1.00 per bushel—and the most of them have also been gobbled up by the commission men. The country has harvested the shortest potato crop in years and local prices are certain to go to $2.00 per bushel and higher before the winter is over. Had the farmers of Missouri been thoroughly organized we could easily have handled 500 cars of these Northern potatoes for the winters supply—and have saved to the farmers of this state at least $150,000. Do not these things show the folly of the present situation? Don't you begin to realize now why THE MISSOURI FARMER is fighting so hard for Farm Club organization? And isn't it time you and your neighbors got in line? All you need to do to avail yourselves of our co-operation is to manifest sufficient interest to organize a school house Farm Club. Send a 2c stamp for complete plans, Constitution and By-Laws.

WILLIAM HIRTH, Publisher.

THE FARMERS SCHOOL

Not every farmer's son has the available time or means to take a full agricultural course in the State University but most of them can find a way to take a term or two in the farmers' course usually referred to as the short course in agriculture. The work in the short course comes at a time of year when the young man can get away from home without any great inconvenience and he can get back in time to take up his farm work in the spring.

This year the first session opens on November 1 and will close December 21. The second session will open January 8 and will close February 23, 1917. Each session the work given is complete for each subject taken but it requires two years to complete the entire course and when the young farmer can do so he will find it profitable to take the full course through the two years.

There are two important things to be gained by an attendance in these schools. First, the technical knowledge gained will be found to be an excellent foundation for a life's work on the farm and second, the personal association with two hundred or more of the brightest young farmers of the state will be a valuable experience.

During the same time the instruction is given for young men a course is given for young women and besides taking any of the work they desire which is given in dairying, poultry raising, gardening and other agricultural subjects the young women can get instruction in home economics including the preparation of foods, planning and preperation of meals, canning and preserving fruits and vegetables, sewing, cutting, preventive medicine and home care of the sick.

In addition to these short courses given in the University at Columbia there will be about fifty extension short courses held in various towns and lasting for one week. While the instruction in these can not be so complete there are many things that can be learned in a week and where it is not practicable to attend the regular courses in Columbia no one should

fail to take advantage of the home school for one week.

For information about any of this work our young friends should address the Superintendent of Short Courses, Columbia, Missouri.

A CO-OPERATIVE CREAMERY

We know of a number of towns in this state where a co-operative creamery would pay for itself within a very short time if well managed. In traveling about over the state we see the cream cans standing in the hot sun after they have been brought from the farm and when the cream is handled in this way it is impossible to make a good grade of butter from it. Who is it that loses the difference in price between the high grade butter and the poor stuff that this gathered cream necessarily makes? Surely it is the man who sells the cream.

It is generally estimated that a well managed co-operative creamery which gathers sweet cream daily from its members can make enough better quality of butter to pay the patrons about 5 cents more a pound and this difference will soon pay for the erection of a creamery plant.

In any community where 500 or more cows within a radius of 5 or 6 miles are being milked there ought to be a local creamery and preferably it should be managed co-operatively.

THE WORLD AS WE SEE IT

The world never finds a man until he discovers himself.

* * *

The fellow who tries to "go some" on the wheel of fortune generally has a blow out.

* * *

Missouri is the leading mule state in the Union. Human kickers will please take notice.

* * *

Scrambled eggs, especially at present prices, are mighty fine, but scrambled egg farming is a failure.

* * *

Oh Agriculture, what political seed is sown in thy name! There's "free seed"—$252,000 worth—for instance.

* * *

One of the crying needs of the hour is more display of backbone and less of wishbone on the part of society.

* * *

He who makes two good country cured hams in the smokehouse where only one hung before is a public benefactor.

* * *

The man who "hasn't time" to select seed corn this fall will not find time to get good corn from the crib next spring.

* * *

The best investment on earth is Missouri earth. The end of the rainbow rests on a Missouri farm—perhaps yours.

* * *

Beware of gas in the silo—yes, and in some of the fly-by-night silo salesmen. Deal with honest agents representing reliable firms.

* * *

The greatest need of America is the kind of wholesome family life for which country homes of the right kind have ever stood.

* * *

If you are constantly bewailing the fact that you are a farmer, how can you expect that boy or girl of yours to love the old farm home?

* * *

Right now is a mighty good time to get rid of the "star boarder" in the stable, cow barn, pasture or pen. When corn costs so much and meat on foot brings so much per pound it will pay to do some figuring and culling.

* * *

Right now is a good time to determine what kind of a fair your community is to have next year. Is it to be for farmers or for fakirs?

* * *

A lot of one-story folks have their officers in 20-story buildings, and fellows with little ability sometimes try to do business in big blocks.

* * *

Placing a preacher in charge of a country church will no more make a country preacher than placing a city man on a farm will make a farmer.

* * *

Oh what is so rare as the pictorial page of a Sunday paper that doesn't show a group of half-clad women doing circus stunts in the name of art!

* * *

"Bob White" is a friend of the farmer. Save the quail and kill the insect pests. One live quail in the field is worth a dozen dead ones on a dish.

* * *

The man who finds fault with a movement before he has given it a fair trial is a bigger coward than the fellow who hollers before he is hurt.

* * *

Soon, on the farm, will come the season of samp and scrapple—or of the modernized dishes, hominy and headcheese. Good days and good dishes are these.

* * *

When it comes to promoting happiness, both here and hereafter, the Bible and the cook book are far better than the latest novel and a mail order house catalog.

* * *

The lad who, in pioneer times, buckled his "brace" about him and went West had a better chance of becoming a useful citizen than has the sissy son of today who, wearing a cigarette in his mouth, goes to the city looking for a soft snap.

* * *

Farming today is a very different proposition from farming in the time of our forefathers. How to succeed with the soil has become a more intricate proposition than in the past. That time is gone, were it ever here, when men had only to tickle the surface and abundant crops sprang up, only to stick a twig in the ground and garner a bumper harvest of fruit.

* * *

Many are the changes that modern life has brought. On our farms we are trying to make machinery take the place of men, and a kitchen cabinet to do the work of a cook. Even the shirt that had a "board bosom" and buttoned in the back and that never went from home without its owner, has given place to a modernized, mercerized, machine-made garment that, unaccompanied save for its kind, goes often to the city where it spruces up and loses its color. Yes, and our boys and girls are going to the cities and often they, too, take to starch and style and lose from ruddy cheeks the country color.

* * *

Nobody wants to tackle a nest of hornets. They are organized. See—or feel—the point? W. L. Nelson.

A Great Car

For farmers who have big families and who need a big car it is mighty hard to beat the New Mitchell which will outlast and outwear two ordinary cheap cars. If you are interested drop a line to The Mitchell Motors Co., Racine, Wis., and ask them for their beautiful catalog. Mention THE MISSOURI FARMER.

"It's not so important that WE are for Mr. Wilson—MR. WILSON is FOR US."

President Wilson's Record of Service

—TO THE FARMER—TO THE COUNTRY—TO HUMANITY

Demands Your Support

WE have never had a man in the White House who so thoroughly represented ALL the people of this country as the man who is there today. Representing no interest of special privilege, he has the interest of ALL at heart. He has been steadily and steadfastly "on the job" for us. Even now when the Republicans are doing all in their power to befog the issue, criticize and misrepresent his actions, impugn his motives—he has gone steadily on, **giving his time to the duties of his office rather than campaigning for re-election.**

President Wilson does not ask for a vindication of his administration by re-election to office. He does not ask for four more years for personal satisfaction—but the country demands it, because the country needs him.

He stands on his record and his record is clean—a record of service—a record of deeds, not words. Space is too limited to give it in full but as an illustration, look at this record of service to you, the farmer. Then remember that the same keen insight into conditions—the same rare courage that has achieved this bettering of conditions **for you**—has guided the administration's legislation for the benefit of the whole country and humanity. Here is the record:

President Wilson Has Maintained Peace With Honor

No greater service was ever renedered to any country by any man in any time. This alone warrants your support of him. But this is not all. On the record of his administration's service to you, see what has been accomplished. In brief, here is the record:

1—Appreciation of the importance of agriculture has been shown through greatly and intelligently increased appropriations for its support.

2—Greatly increased provision has been made, through the enactment of the Co-operative Agricultural Extension Act, for conveying agricultural information to farmers.

3—Through the Office of Markets and Rural Organization, systematic provision has, for the first time, been made toward the solution of problems in that important half of agriculture which concerns distribution, marketing, rural finance and rural organization. The appropriations for this office, including those for enforcing new laws designed to promote better marketing, have been increased to $1,200,000.

4—The United States Grain Standards Act will secure uniformity in the grading of grain, and enable the farmer to obtain fairer prices for his product.

5—The United States Warehouse Act will enable the Department of Agriculture to license bonded warehouses in various states. It will lead to better storage facilities for staple crops and make possible the issuance of reliable warehouse receipts which will be easily negotiable.

6—The Federal Aid Road Act will conduce to the establishment of better highways and better marketing.

7—The Federal Reserve Act benefits the farmer by guaranteeing better banking safeguarding the credit structure of the country and preventing panics, making larger provision for loans through national banks on farm mortgages and by giving farm paper a maturity period of six months.

The Federal Farm Loan Act

8—It was essential, however, that banking machinery be devised which would reach intimately into the rural districts, that it should operate on terms suited to the farmers' needs, and should be under sympathetic management. The need was for machinery which would introduce business methods into farm finance, bring order out of chaos, reduce the cost of handling farm loans, place upon the market mortgages which would be a safe investment for private funds, attract into agricultural operations a fair share of the capital of the nation, and lead to a reduction of interest. These needs and these ideals have been met by the enactment of the Federal Farm Loan Act.

So much for legislation. This is not all, but it is enough to indicate what has been accomplished. Now consider what just one recent act of President Wilson has done for the farmer.

Preventing Nation-Wide Railroad Strike Saved Millions

Despite the perverted arguments of opposition spellbinders and fact-twisters, the cold figures show that President Wilson's work in preventing a nation-wide railroad strike saved tens of millions of dollars for the farmer, without injustice to any class.

Take the value of the 1915 crop of apples, peaches and potatoes (comparatively perishable crops). The 1916 figures will greatly exceed them. Had the strike lasted only a week, shipments would have been thrown off schedule for a month or more—and at a minimum, 33⅓ per cent of these crops would have been ruined. **In the States of Washington, Oregon, California, Idaho, Montana, Utah, Colorado, Kansas and Missouri alone the value of 1915 Apples, Peaches and Potatoes was $82,875,380. A railroad tieup of one week would have meant a dead loss to FARMERS of at least $27,000,000.**

The Republican Party buncoed and bamboozled the farmer—that Wall street and allied interests might be benefited. The Wilson administration has fought the farmers battles for him. The 1915 value of farm crops and livestock products amounted to $10,500,000,000, as against $9,300,000,000 in 1912—a gain of $1,200,000,000, notwithstanding Republican prediction that Democratic administration would ruin the farmer and the prices of his products.

The Farmer Is Too Sensible to Exchange the Substance for the Shadow —Too Wise to Give Up Prosperity For Promises. That's Why the Farmer Will Vote to Retain President Wilson

The Code of the Mountains

By CHARLES NEVILLE BUCK

A STORY OF A MOUNTAINEER WHO BECAME CIVILIZED

CHAPTER I

This morning the boy from the forks of Troublesome Creek had back his name once more. It was not a distinguished name, nor one to be flaunted in pride of race or achievement. On the contrary, it was a synonym for violent law-breaking and in the homely parlance of the Cumberland ridges, where certain infractions are condoned, it stood for "pizen meanness." Generations of Spooners before him had taken up the surname and carried it like runners in a relay race—often into evil ways. Many had laid down their lives and name with abruptness and violence.

When the pioneers first set their feet into the Wilderness trail out of Virginia, some left because the vague hinterland west of the ridges placed them "beyond the law's pursuing."

Tradition said that of the latter class were the Spooners, but Newt Spooner had no occasion to probe the remote past for a record of turpitude. It lay before him inscribed in a round clerical hand on the ledger which the warden of the Frankfort Penitentiary was just closing. Though the Governor's clemency had expunged the red charge of murder set against his name at the tender age of eighteen, there was another record which the Governor could not erase. A sunken grave bore testimony in a steep mountainside burial-ground back in "Bloody Breathitt," where dead weed stalks rattled and tangled ropes of fox-grapes bore their fruit in due season.

However, even the name of Newt Spooner is a better thing than the Number 813, which for two years had been his designation within those gray and fortressed walls along whose tops sentry-boxes punctuated the angles.

This morning he wore a suit of black clothes, the gift of the commonwealth, and his eyes were fixed rather avidly on a five-dollar note which the warden held tightly between his thumb and forefinger. Newt knew that the bill, too, was to be his. Yet the warden seemed needlessly deliberate in making the presentation. That functionary intended first to have something to say; something meant in all kindliness, but as Newt waited, shifting his bulk uneasily from foot to foot, his narrowed eyes traveled with restlessness, and his thin lips clamped themselves into a line indicative of neither gratitude nor penitence. The convict's thoughts for two years had been circling with uncomplicated directness about one focus. Newt Spooner had a fixed idea.

The office of the warden was not a cheery place. Its walls and desk and key-racks spoke suggestively of the business administered there. The warden tilted back in his swivel chair, and gazed at the forgiven but, unforgiving prisoner.

"Spooner," he began in that tone which all homilies have in common: "Spooner, you have been luckier than you had any reason to expect. It's up to you to see that I don't get you back here again."

He gazed sternly at the boy, for he was still a boy, despite the chalky and aged pallor of his face, despite the tight-clenched line of the thin lips, despite the stooping and emaciated shoulders. The Kentucky mountaineer withers into quick decay between prison walls, and, unless appearances were deceitful, this one was already being beckoned to by the specter of tuberculosis.

"You have been pardoned and restored to all civil rights by the Governor," went on the official. "Your youth and ill health appealed to some ladies who went through the prison. You are the youngest homicide we have here. They interceded because you were only an ignorant kid when you were drawn into this murder conspiracy."

Newt's eyes blazed evilly at the words, but he only clamped his mouth tighter. He would not have called it a murder conspiracy. To him it was merely "killin' a feller that needed killin'." "Since," continued the warden quietly, "you were full of white liquor, and since you had never had a chance to know much anyhow, those ladies got busy, and you have another chance. You ought to feel very grateful to them. It's up to you to prove that the experiment was worth the risk it involves—the risk of turning an assassin loose on society."

The boy from Troublesome said nothing. From his thin chest came a deep, racking cough. He spat on the floor, and wondered how long this man would hold back the five-dollar bill and prolong the interview.

"Well?" The warden's voice was impatient. "Don't you hear me talking to you? Haven't you got any sense of decent gratitude?"

A fiercely baleful wrath shot instinctively through Newt's gray hawk-like eyes and smoldered in their deep sockets, but there still was need to leash his anger—and conceal his purpose.

"I'm obleeged ter ye," he answered in a dead voice of mock humility, though his tongue ached to burst into profane denunciation, "but I hain't axed nobody ter do nothin'. I didn't 'low ter be beholden ter nobody."

"You are 'beholden' to everybody who has befriended you," retorted the warden with rising asperity. "Do you mean to go back to the mountains?"

At once there leaped into the released convict's mind a vision of being spied upon and thwarted in his purpose—a purpose which the law could not countenance. To cover his anger he fell into a fit of violent coughing, and, when he answered, it was with the crafty semblance of indecision.

"I 'lowed I mout go back an' see my kinfolks fer a spell."

"And after that?"

"I 'lowed," lied Spooner cautiously, "thet atter thet I'd go West."

"Now take a tip from me," commanded the warden, and, since he still held the five-dollar bill, the boy from Troublesome was forced to accord unwilling attention. "Every mountain man that goes away drifts eventually back to the mountains. God knows why they do it, but they do. You have just one chance of salvation. I had that in mind when I spoke to the Governor and asked him to include in your pardon a restoration of civil rights. If you get well enough to stand the physical examination, enlist in the army. Once in you'll have to stay three years—and in three years a fellow can do a lot of thinking. It may make a man of you. If you don't take that tip I'll have you back here again—as sure as God made you—unless you get hanged instead."

The warden extended his hand containing the provision with which the commonwealth of Kentucky invited this human brandling to rehabilitate his life. The mountaineer bent eagerly forward and clutched at the money with a wolfish haste of greed. Ten minutes later the prison gates swung outward.

The Frankfort Penitentiary sits on a hill looking down to a ragged town which straddles the Kentucky River. In the basin below somnolent streets spread away and lose themselves in glistening turnpikes between bluegrass farms where velvet lawns and shaded woodlands surround old mansions that mirror the charm and flavor of rural England. The state capital is a large village rather than a city, but to this boy who had known only the wild isolation of the Cumberlands, where sky-high ramparts have caught and arrested human development, Frankfort seemed a baffling metropolis. In the lumberyards and distilleries that cluttered the steep river banks he saw only bewilderment and in the dome of the capitol the symbol of a power that had jailed him; that except for his youth would have hanged him.

One thing only he saw which struck a note of the nostalgic and brought a catch to his throat. That river had its headwaters in his own country. One branch flowed through his own county seat and those knobs that hugged its banks and framed the straggling town under the singing June skies, were the little cousins of the mountains where his forefathers had lived their lives and fought their battles for a hundred years.

If he followed them long enough they would mount from knobs to foothills and from foothills to peaks. The metaled turnpikes would dwindle and end in clay roads. These roads would in time give way to rougher trails, rock-strewn and licked by the little whispering waters that make rivers, and he would travel by creek-bed ways over which wagons, if they go at all, must strain their axles and where men ride mules with their luggage in saddle-bags. These forests of age-old oaks and spruce, pines and poplars and hickory and ash would troop down and smother in the hillsides, and the rhododendron would be in bloom just now. The laurel bushes would be all a-glisten and the elder tops would be tossing sprays of foam-like blossom between towering sentinels of rock.

But the beauties of the rugged home country had for him another meaning. At the roots of the laurel a man can crouch unseen with his rifle cradled against his shoulder to "lay-way" an enemy who has overlived his time.

When he had a certain man in rifle-range, the rest would be elementally simple. He had spent more than two years thinking of that and evolving every needful plan in detail. There was now no need of haste. After all this thinking he could afford to consult his leisure and enjoy the pleasures of anticipation. When once the deed was done, as the warder had reminded him, there was the probable shadow of the gallows. But it should be said for the late Number 813 that in his reflections was no germ of vacillation or indecision. His one definite motive in life was what he deemed just reprisal. He was willing to pay for that without haggling over the cost, but he was not willing to defeat his end by hasty incaution.

He had been in prison over two years and was still very weak. He recognized with contempt the tremor of his hand. Once that hand had been so steady that all his squirrels fell from the hickories pierced through the head. It would be a little time before he could again command that nicety of rifle-craft. But now he must get home and home lay about a hundred and fifteen miles "over yon." He could reach Jackson by rail, but that would cost money, and there was ammunition to be bought and other matters of importance, and his capital was precisely five dollars. Besides railroad trains were luxurious and effete; they were not for him. He would "jest natcherly take his foot in his hand and light out"—pausing only for a little "snack" to eat and a flask to cheer his journey.

He made his way slowly down into the center of the town; a town which had come to recognize at a glance these prison-given suits of black; these faces pasty with the pallor of confinement; this shamble fathered by the slouchy swing of the lock-step. For the June morning when No. 813 became again Newt Spooner was in the year 1897, and the ancient rigors of prison life still held.

Eyes turned curiously on the shambling derelict, but the only expression on Newt's face was one of surly defiance to the world. The only sentiment that stirred in his breast was such as might have brooded in the narrow and poisoned brain of a rattlesnake lying close-coiled by the laurel roots along his native creek-beds.

Prisons are to reform and teach lessons of law. Newt Spooner had been in prison and was now out. He had already known how to hate, but now he knew how to hate with a greater tensity. Also, he had learned to cloak his animosity behind a craftier concealment.

He had grown up as a cub among wolflike men, running with the pack. From his mother's shrunken breast he had drawn bitterness toward his foes and "meanness."

He remembered his boyhood surprise at the shocked face of the circuit rider when his father had laconically announced: "Stranger, thet thar boy's done drunk licker sence he was a baby. We weaned him on hit. Hit's good licker, 'cause we made hit ourselves—an' we hain't paid no damn' Gov'ment tax on hit, neither." But before him no Spooner had won felon stripes, though many had been felons. That he had done so branded him with disgrace, and until he should remove that stigma by punishing the witness upon whose sworn word his conviction had been based he must face the scorn of the battle-scarred members of the man-pack that still ranged free. So, as Newt Spooner turned his face homeward between sunny pasture lands and soft woodlands and golden grain fields and set his feet into the Lexington turnpike, young Henry Falkins became a man marked down for death.

CHAPTER II

Courts can not enforce laws upon which public opinion sets its embargo. The men of the mountains have lived isolated lives for a hundred years. They inhabit an island of medievalism entirely surrounded by civilization, but the civilization is no more a part of them than the water that surrounds an island is part of the island. "Leave us alone" has been the word of the hills to the gift-bearing Greeks of innovation. The right of men to settle their own quarrels after the method of the Scottish clans from whom they sprang, has been a thing which local courts have made only perfunctory efforts to deny—and which juries of the vicinage stubbornly refused to deny. Among their crude cabins one still hears phrases bequeathed by word of mouth from the England of Elizabeth and the Scotland of Mary Stuart. Immured behind their walls of sandstone, they have lived ignorantly—and fiercely.

Their peaks are heaped against the skies, and their fields are tilled with the hoe when mules and plows might fall down to destruction. With nature itself they pursue a constant and desperate quarrel for subsistence, and through generations of battle they have grown morose and sullen and vengeful and have lost all sense of life's humor.

But slowly the tide of outside influence is creeping in upon them and at the contact-points strangely anomalous conditions arise; the clash of incongruous centuries; the war between a stubborn old order and an inevitable new. In such a life there are here and there far-sighted men who, standing like great trees among stunted brethern, look out across a wider perspective with a surer vision.

The house of McAllister Falkins stands twenty miles from a railroad and is, for this crude environment, a mansion. It was built in the days when the first tide of pioneer life swept out of Virginia, and because it was, in that remote day, nearer kin to the culture of the Old Dominion than to the wilderness, it bore a strange blending of compromises between luxury and the exigency of the frontier.

The head of the house of Falkins, generation after generation, had clung to the old standards and old ideals. The children of this household had been reared like their cousins of Virginia and the bluegrass. Other branches of the family bearing the surname had gone to seed and lapsed into illiteracy. There were cousins who had to sign their names with cross-marks and who had been embroiled in savage animosities until the "Spooner-Falkins War" had become one of the sanguinary chapters of feudal history, but the head of the house had always stood apart and denounced the godless code of the vendetta.

And now the time was come when old McAllister Falkins could look ahead and begin to see the pale glow of a coming dawn. The railroads, whose surveyors and chain-bearers his neighbors had fought, were piercing and developing the hills. Here and there rose a circuit judge or a prosecuting attorney who dared to talk from an unterrified soul to grand and petit juries, and occasionally a panel harkened. District schools began to pass into the hands of teachres who could teach. In this place and that rose small colleges and the flickering

blaze of enlightenment was struggling into a semblance of steadiness. McAllister Falkins had sent his son Henry away to school and college, and had had the satisfaction of seeing him return unspoiled.

The life of young Henry Falkins therefore, had been cast both in and out of the Cumberlands, and he had reached the age of twenty-five with a minimum of enemies and a maximum of friends. His was the breadth of the lowlands and the unflinching strength of the hills. Then the lurking and inevitable shadow of that life had impalpably and suddenly fallen upon him.

When Bud Mortimer, a "marked man," riding home from Jackson, had slid from his horse and died in a creek-bed with a rifle-hole drilled through his chest, Falkins had been unlucky enough to have been squirrel-shooting near by and to have recognized one of three figures that left the open road and took cover in the laurel By one of the strange chances of fate, Falkins, who was tramping the woods with no idea of concealment, had been unobserved, while the three assassins, crouching along with all their covert art of hiding out, had not quite escaped his eye. He had not heard the volley because the murder had taken place at a distance. He would not have suspected the men who passed casually below him with their rifles cradled in their elbows, had not a word or two, in the stacato voice of a youth who walked third in the single file, come to his ears. These words were profanely triumphant and boastful of markmanship. The other two men, the squirrel-hunter did not recognize. Still, Henry Falkins might not have known that the bull's-eye alluded to had been a human breast, and he did not know it till later.

When the dead man's friends had carried the matter to the courts, with no better evidence perhaps than the bad blood which they knew existed, and when young Newt Spooner, aged eighteen, but precocious in crime, stood at the bar, charged with murder, Henry Falkins told the prosecutor what he had seen. The prosecutor instructed him to keep his secret until he was called as a witness. He knew the conditions and recognized that, should this evidence come prematurely to the ears of the Spooners, he should probably not only lose valuable evidence, but also be saddled with another prosecution for murder—and just now his homicide docket was burdensomely heavy.

When their cub was indicted, the Spooner pack laughed. When he was haled into court, despite his callow years, he ame with insolent confidence, as one above the law. He might have escaped and hidden out, since the court had allowed him bond, but that would have hampered his future freedom of action, so he preferred to go through the farce of a trial, and afterward be free.

He testified, and his alibi corps testified as one man, that he had been at Hazard, forty miles away, when Mortimer fell. The defense closed in sanguine trustfulness. Then, in rebuttal the prosecution sprung a surprise—a sensation—a bomb. The surprise was Henry Falkins, and when he took the stand, the hand-made alibi collapsed. Even then Newt Spooner had not been able to realize that the convincing story of one witness could destroy his carefully fabricated tissue of lies. But sundry unexpected things were happening in this dingy court-room. A new spirit reigned there. Vaguely the sullen lad, crouching back in the prisoner's chair, was aware of a hardening and petrifying resolve on the rugged faces in the jury-box. Heretofore the average venireman had thought there was no health in incurring the wrath of a family of terrorists like the Spooners. Heretofore Spooners had always "come cl'ar." Heretofore prosecutors had made only perfunctory attempts to convict them. Not so with the Honorable Cale Floyd. From opening statement to closing argument he leaped savagely at the throat of the defense. His cross-examination was a merciless hail of verbal rifle-fire. As he defied all the vicious animosities of the Spooner tribe, the court-room held its breath, and young Newt waited vainly for his kinsmen to rise en masse and silence his anathemas with a volley. Each night in his cell, young Newt Spooner wondered why he did not hear a sound outside the brick "jail-house," and see the doors go down before the wrath of his rescuers. It was incredible that the clan should stand by and permit him to be "penitentiaried." Yet it finally dawned upon him that precisely this thing was happening. The realization had dazed and embittered him. He knew that even among his own he was not accounted as of great importance, but he bore the name of Spooner, and in the old days that would have been enough. He was the first sacrifice to the changing order. He felt no resentment against the prosecutor in spite of his philippics. The prosecutor was paid to do it. He even rather admired the courage which gave strength to the attack, when every precedent told the lawyer that he was inviting death for his pains. But for the man who had volunteered to testify; who belonged to the family which his family had hated and fought; who had come back to the mountains with "fotched-on" ideas and attacked him with the despised weapon of the law; for that man he felt such hatred as can only come of festering and venomous brooding, which lasts while life lasts.

These thoughts Newt Spooner carried as companions as he tramped the first leg of his homeward journey. Until he had come to Frankfort, handcuffed to a deputy sheriff, he had never seen this land of "down below." Its softly billowing landscape was to him unfamiliar and unpleasing. The great columned mansions of time-stained brick set deep in parklike woodlands; the smoothness of velvet lawns; rippling acres of grain ripening into gold under the June sun; all these things wore on his nerves. He was accustomed to a country shut in and sequestered between eternal hills; of roads where footfalls were silenced; of ragged patches of cultivation pocketed in surrounding forests. In such places a man could step aside and be hidden. Here he felt exposed; his very thoughts seemed naked. That men should live in such great houses and drive such smooth roads seemed monstrous and incredible. He hated the "highfalutin" bearing of these "furriners," who carried their chins aloft like masters of creation. He hated the sight of the "niggers" who served them. He hated all the orderly smoothness and opulence of this level land where no ridges broke the sky. So he stalked along, his face set toward the far horizon, beyond which lay his mountains and his purpose.

It was a slow journey, for he was weak, but as he breathed the June air into his cramped lungs, his shoulders began to lose their slouch and his gait began to discard its prison shuffle for the long space-eating stride of the mountaineer.

At twilight, he came to a small house by the roadside. He had made a poor day's journey and, since night was falling, he turned in at the gate, as though it had been that of his own cabin. The place was shabby and its residents would have been characterized by the negroes as "po' white trash," but of social values the late Number 813 was ignorant. He saw only a roof and to the hills-man a roof is a shelter for whosoever may need it. Over the white-washed fence clambering roses hung in profuse invitation, spicing the air with their fragrance.

Newt made his way to the door where a slatternly woman confronted him. She stared with disapproving eyes as she wiped her hands on her apron.

"Well, what do you want?" she challenged.

"I 'lowed ye'd let me stay all night —I'm a travelin'," replied the boy from Troublesome. He spoke simply and without cumbersome explanation. At home it would have been enough. But this woman only stared at him disapprovingly and as she took in his sullen visage and dusty suit of black, she recognized in him the erstwhile convict. With a suppressed scream she disappeared indoors.

Newt stood gazing without comprehension. That he might be turned away had not at first occurred to him. He had not yet grasped the essential differences between highland and lowland etiquette. He accordingly mounted the steps, crossed the porch and entered the door without knocking. In the mountains no one knocks on a door.

But at the threshold he met a tall man, who thrust him violently backward and squared himself across the opening. As Newt staggered backward and brought himself up against one of the porch supports, the householder surveyed him from crown to toe, and then, waving a hand outward ordered briefly:

"Get out of here, you jail-bird!"

For an instant the pardoned prisoner stood rigidly at gaze, while his eyes gathered wrath and his ugly snarl became wolf-like. Never had he been so greeted when claiming the traveler's prerogative of shelter for the night. But he was unarmed; moreover, he had a mission. He was going to kill one man. Killing men was expensive. It cost liberty and sometimes more. He could not waste animosity. So he veiled his anger and turned away. "I didn't 'low hit war a-goin' ter make ye mad" he mumbled as he went out again to the road. But he had learned his lesson. The mountaineer is as proud as he is ignorant and, rather than risk another rebuff, he spent the night in a haystack, and the first rosy kindling of dawn found him again on his way; hungry, but setting his face stonily against the temptation to ask food.

(To be continued.)

WE ARE JUDGED BY OUR HOMES

When the white man first came to this country his whole effort was put forth to wrest from the soil the maintenance for life.

Every member of his family helped to clear the land, to plant the grain and to gather the harvest. The house was merely a shelter from the wolf, the bear, the winter's cold and the summer's heat. Little or no thought was given to its convenience, sanitation, or comfort.

As the forest lines moved farther and farther away from the little log house, the settlers realized that barns must be built to house the harvest and farm animals. Every dollar that could be earned had to be turned back into the farm to increase its yield and so the home, although the dearest thing to the heart of every man, was the last to be considered.

When great barns were raised and farm animals were comfortably housed, one by one comforts began to creep into the home. First, it was a good stove, then more convenient cooking utensils, then a white tablecloth and white dishes sent from the East, and then a room or two added and an adjoining wood shed built. With the increased bank account grew the hope of the new house, not a log house this, but a frame or brick house.

Today as we ride along the road we may not judge a man's prosperity by his broad fields or his great barns, but by the house in which he lives, and the way in which it is kept up. Unconsciously, when we see a house that is unpainted, the roof of which seems to be sagging in, blinds off, doorsteps broken down, dooryard littered with farm tools and no vestige of lawn or flowers, we say to ourselves, "that farm is not paying". As we judge a nation by the prosperity of its homes, so we judge the farm by the prosperity of the home.

The up-to-date farmer realizes that the greatest saving he can make is that of his wife's strength and health, because to her is entrusted the most precious thing on the farm—the rearing of boys and girls. If her nerves are not in the very best condition, it is impossible for her to enter sympathetically into the lives of her family; to help decide for the children the all important questions that come to them. It is impossible for her to take a vital interest in the affairs of her husband, to be ready to assist in the work of the community and to help build up the rural schools—the duties of every farm woman.

As machinery has taken the place of the hired man who often cannot be had for love or money, machinery must take the place of the hired girl who is today a scarce article in most farm homes. The farmer who does most of the heavy work on his farm with the help of a gasoline engine must realize that washing and cleaning in the home can be done for the same or a similar engine.

He must realize that the same law applies to the members of the family that applies to the dairy animals. The barns must be kept warm so that the cows use all her energy to produce milk. So the home must be kept warm by a furnace so the family will be saved their strength to do the necessary work.—Elizabeth B. Kelley, Agricultural Extension Service, of the University of Wisconsin.

Brother, why not send us a dollar to renew your subscription? Do you know of any other farm paper which is trying so hard to help you and your neighbors? Don't you know that if enough farmers would send us a dollar so we could pay all the paper's debts it would enable us to give you the greatest farm paper in the Country? Isn't the kind of a fight we are making entitled to this small support at your hands?

ORGANIZATION BOOSTS PRICES

Without organization the producers often lose thousands of dollars because they do not keep in touch with the advances in market prices. In fact it is impractical if not impossible for the small individual grower without the aid of some effective organization to keep in close touch with the various markets of the country. According to a news bulletin under date of October 11 by the Nebraska College of Agriculture:

"On September 20 the day before the Office of Markets of the U. S. Department of Agriculture in conjunction with the Extension Service of the University of Nebraska and the county agents opened an office at Alliance, buyers were paying 60 cents per bushel for ungraded stock delivered in bulk to cars at Hemingford. Within a week the price advanced to 70 cents for the same quality of potatoes and as high as 75 cents was being paid for the best. Meantime, however, potato markets like Kansas City were suffering a downward trend. This indicates that though the consumer was paying less for his potatoes, the farmer was getting more because he had become acquainted with the high prices being paid in the city market through the medium of the market service bulletin.

"Inasmuch as western Nebraska will ship something like a million bushels of potatoes this year, this increase in the price of potatoes means an increase of $100,000 for western Nebraska farmers.

"The market news service will undoubtedly eliminate the speculative element in potato buying and yet allow the dealer a fair margin of profit. In past years the farmer has generally been in touch with the price of grain and live stock, but has always been in the dark as to the condition of potato markets. The market news service places the following information before the farmers as well as the dealers: shipping point buying prices at Nebraska points and other centers of production; the prevailing jobbing prices in the markets receiving Nebraska potatoes, as well as the condition of the stock and quantity arriving, number of cars held on track and unloaded. The number of cars shipped from other states is also shown and this information is up-to-the-minute, being telegraphed direct to the Alliance office each day. Another feature of this report is that part showing the destination of all cars of Nebraska potatoes shipped the previous day. This is of great value to the dealers as it prevents the gultting of any one market."

If the farmers of the entire country were organized and maintained an office in every shipping station where they could get correct information from all the markets of the world every morning they would be in a position to demand a fair price for whatever they had to sell. This kind of service would have a tendency to both stabalize prices and standardize quality and would eliminate most of the speculation and be a benefit to both producer and consumer. We believe one of the greatest detriments to farm prosperity is the uncertainty of prices. A reasonable profit on every crop produced would be much more satisfactory than a big price one year and a loss the next.

When farmers undertsand that farm organization means nothing more than simple, common sense principles applied to the selling and buying of their products there will be no serious trouble about getting farmers together.

By Old Jim Riley

A lot of liars have bin sayin' that thars more insanity in th' rural districts than in th' towns and cities—but statistics says it aint so. Its tough enough t' have 'em say that farmers aint got sense enuff t' stand together—but when they actually insinuate that th' most of us are crazy it gits on my nerves. Id ruther be called a horse thief anytime than a fool—for a horse thief has a chance t' git over it but a fool never does.

BUCKSHOT BY THE PROFESSOR

The chief trouble with that greaser Villa seems to be that he refuses to stay dead.

* * *

That Jim Riley person went to see a picture show for the first time in his life last week and when the "pianner" started up all by itself, he thought he "had 'em."

* * *

There are a pile of people in this World whose hearts are not as big as that of a humming bird. You find them on the farm, in banks, behind the merchants counter and everywhere.

* * *

If half what the newspapers say is true, hades must be a summer resort compared to the Penetentiary at Jefferson City. Where there are so many fires there must be some reason for the smoke.

* * *

This foreign war may be good for the steel mills and the powder makers but its raising cain with the rest of us. Mighty near everything but air and sunshine has gone up in price "because of the war."

* * *

The editor showed me a letter from a farmer the other day who said, "Stop my paper 'cause I aint got no time to read it." No use trying to talk Farm Clubs to that fellow. You couldn't pound an idea into his head with a sledge hammer.

* * *

Because this paper is fighting for farmer organization, don't you ever get it into your head Brother that it expects these things to take the place of good farming methods. What we need is good farming, plus a "square deal" in the markets.

* * *

It looks to me as if, at last, farmers are going to get together and organize—and if they do, American Agriculture will come into its own and the farm will become the abode of happiness and prosperity for all who use their brains as well as their hands.

* * *

Did you hear a noise the other day over in the direction of Battle Creek, Michigan? Well, if you did, it was "Teddy" making a campaign speech—and as the bunch down at "Hez" Browns would say, it was a "ring tail tooter" that "tuck the hair off where there aint any."

* * *

The farmer who permits his self binder, mower, corn planter and cultivators to stand around in the fields all the year round is too trifling to merit serious discussion. He is not only a blamed fool but as "onery" as a yellow dog. If this hits you, put it in your pipe and smoke it.

GALLOWAY'S FREE FALL BOOKS

NOW READY

My new 100 page fall bargain book just off the press and ready to mail! Also the second edition of my big 250 page 1916 catalog. A postal gets your copies today. These books describe the famous Galloway line of Sanitary Cream Separators, the Galloway Gasoline and Kerosene Engines, the new 1917 models Galloway Manure Spreaders, our new 1917 12-20 h. p. Tractor, all kinds of farm machinery, ensilage cutters, power house accessories, grinders, buggies, wagons, harness, fencing, roofing, saddles, automobiles, stock tanks, auto accessories, sewing machines, household goods, carpets, furniture, complete line of clothing for every member of the family. I want you to have your copies! Drop a postal today. Let these two great books guide your fall buying and they will save you from $200 to $500. Remember Galloway is manufacturing headquarters for

ENGINES---SEPARATORS
SPREADERS---TRACTORS

As well as many lines of general merchandise which are sold direct from factory to you at one small profit. These books tell truth about **Galloway Sanitary Cream Separators.** They give **Gasoline Engine Secrets** and **Facts.** They tell how and why the **Galloway Manure Spreaders** are built better and sold for less money. Fully describe my **new 12-20 h. p. tractor.** A copy of each book should be in your hands even if you are not now in the market for a single thing. Printed in four colors and handsomely illustrated. **Ask for your free copies today.**

Separators $34.50 up

WM. GALLOWAY, Pres., THE WM. GALLOWAY COMPANY
BOX 597, WATERLOO, IOWA, FARM IMPLEMENT MANUFACTURING SPECIALISTS

Engines of all sizes from 1 3-4 to 16 h. p. heavy duty moguls. Prices way down. Big engines lower than ever.

These two books fully describe the 1917 models of Galloway's famous spreaders. Don't buy a spreader of any kind until you have seen these books.

GEO. A. COOK

2012 Main Street, Kansas City, Mo.

Why not line up and ask the next Legislature to put the sheep killing dogs out of business in Missouri for all time? There's many a cur dog in this state that has destroyed more sheep than the average pure bred Shorthorn or Hereford bull would sell for. Everything considered, they constitute our most costly live stock.

* * *

We employ young girls who are still in their teens to teach a rural school at $40 or $50 per month—and then we wonder why we haven't better rural schools. These immature and inexperienced teachers do the very best they can—but they can't give our boys and girls the kind of training they need to fit them for the great battle of life.

* * *

If the farmers of Missouri did nothing more than take over the handling of feed, coal, fertilizers, salt and farm seeds they could same millions of dollars annually on these items alone. Therefore, why don't you and your neighbors get together and organize a Farm Club at once? All it needs is for somebody with a little courage to take the lead.

* * *

Be sure to read the first of the new serial, The Code of the Mountains" which begins in this issue. Its a thrilling story of Breathitt County, Kentucky—the lair of the feudists. And while its full of fire and brimstone, it has a fine ending which shows that peace, after all, is the best path for all mankind to travel. This story would cost you $1.50 at any bookstore—and this paper is supplying it to you free because "all work and no play makes Jack a dull boy."

* * *

A lot of "high brows" are continually jumping onto farmers because they don't have better homes and more farm home conveniences—and if they'll pay us what our stuff is worth and put more money behind the farm game, thousands of farmers will get these things in a hurry. I want every farmer to do the best he can for his wife and children—but, after all, there is reason in all things and there is no sense in abusing men like pick pockets when they are already doing the very best they can.

* * *

The Editor tells me that THE FARMER is going to be better this winter than ever before—that not only will it have a lot in it about the great Farm Club movement but that there will be dozens of articles from the brightest and most successful farmers in Missouri who will tell how they do different things on the farm. Then we are going to have some articles from bright farm women. Altogether, the paper will be so strong and fine that you cannot afford to miss a single issue—and in order not to do so you had better send a dollar and get "marked up."

Boys, Listen Here!

Do you know that skunk and other wild animal furs are bringing a higher price to-day than ever before? There never was as fine a chance for farmer boys to make a lot of money from trapping as during the present fall and coming winter. Elsewhere in this issue you will find the advertisements of several Fur Companies. Write and ask them what they will pay you for different furs. Also ask them for their guide to trappers. Mention THE MISSOURI FARMER.

Want to Make Some Money?

On the last page of this issue appears the advertisement of a new farm tool which should be on every farm in the country because it does a lot of things that every farmer has to do. Here is a chance for any honest farmer to take an Agency in his township for an article which will almost sell itself—and thus make a lot of money during the present fall and coming winter months—and do it honestly. If you would like to get an Agency write at once to The Harrah Mfg. Co., Dept. 122, Bloomfield, Ind., for the full particulars. Don't delay because if you do someone else may nail down your territory.

A WORD TO LIVE STOCK SHIPPERS

Are you going to ship to the National Stock Yards in the near future? If you are, then you will be keenly interested in this advertisement—for of course, you will want the "high dollar" for your Live Stock and it is that "high dollar" we want to talk about for a moment.

There is a reason why the **National Live Stock Commission Co.,** does the largest business at the National Stock Yards. It is because we have built up the most powerful **Sales Force** which stands back of any Live Stock Commission firm in the United States today. From the moment the gong sounds in the morning until the last buyer has left the yards in the afternoon, these men are in the thick of the scrimmage—**fighting with might and main to get the "high dollar" for the shippers who have entrusted their welfare in our hands!** Whether you have sent us one car or a dozen makes no difference. We realize that whether your consignment is large or small, **it means everything to you!** More than that: Getting the "high dollar" for you **means everything to us**—for this is the way we built up our great business **and this is the way we hold it!**

There is an old saying that "nothing succeeds like success"—and this maxim applies vitally to our business. We realize that "Superior Service" alone is what has given us our great and ever increasing volume of business—that it is because of this "Superior Service" that we have been able to build up hundreds of warm friends among the Live Stock shippers in National Stock Yards territory—**Shippers who know from past experience that we always go the limit for them and who therefore never think of consigning to any other firm!**

Now if we can render "Superior Service" for other shippers, why shouldn't you give us a chance to render it for you? Why not give us a chance at your next consignment? **A trial is all we ask!** After that, you can be the judge. We know we will not be able to hold your business unless we "make good." But in the meantime, are we not entitled to the benefit of the doubt? Would we be doing the biggest business at the National Yards **if we were not in the habit of "making good?"** To this end, get in touch with us at once. Tell us what you are feeding and when you expect to be on the market. We will be glad to give you every helpful suggestion possible—**because we want your business from now on and we expect to earn it by giving you better service than you ever had before!**

National Live Stock Commission Co.
NATIONAL STOCK YARDS, ILLINOIS.

Marshall & Sons Offer Bargains

S. R. Marshall, Glasgow, Mo., are offering the patrons of "THE MISSOURI FARMER" real bargains in spring boars and gilts. They are offering only the tops of their crop, and are priced at such prices that make them decided bargains. Their pigs are sired by Orange Lad, The Giant, Joe Jr., Bridges' Bob Wonder and M's Wonder. Write this firm for prices and description and kindly mention this paper.

Britt's Poland Chinas

Mr. W. I. Britt, Rush Hill, Mo., has decided to reduce his herd on account of being unable to hire competent help. For this reason, he offers his prize winning herd boar, Pawnee Price 2nd, 236419, a son of the noted Pawnee Price. This boar is not only royally bred but sires the desirable kind of offspring. Among the many bargains will be found three young sows bred to Pawnee Price 2nd for October farrow. Here is an opportunity to buy open sows or they will be bred for spring farrow. Anyone in need of breeding will do well to write Mr. Britt for prices, and kindly mention THE MISSOURI FARMER.

Pike County Durocs

Cherry Chief's Pride and Disturber Chief, the great team of herd boars, are largely responsible for the great array of spring boars and gilts to be found on the farm of Wilcoxin & Porter, Bowling Green, Mo. Cherry Chief's Pride is surely a great individual, possessing extreme length and thickness, very tall and has wonderful depth, and has a back that is seldom equaled. Disturber Chief is of the same type only possesses a little more thickness. The sows found in this herd are the equal of the boars, and the pigs are just what one could expect from such mating. If in need of breeding stock visit this herd or write for information, mention this paper.

Cattle Feeders Attention

THE MISSOURI FARMER has perfected arrangements by which it is in position to save several dollars per ton to Farm Clubs on the purchase of cottonseed meal and cake and oil meal. However, in those communities where no Farm Clubs have been organized as yet, we will be blad to take this matter up with individual feeders in the hope that it will speedily lead to the perfection of such an organization. The high price of cotton this year means a high price on meal and cake and it is therefore more necessary than ever before to buy it at the bottom price. To do this, however, we must be able to ship in carload quantities and we therefore suggest to the feeders of every community that they take this matter up among themselves without delay and as soon as you are in position to order a carload of either cottonseed meal or cake or oil meal, get in immediate touch with us. We feel confident we can save you around $3.00 per ton or more—and this is thoroughly worth while.

Wouldn't You Like to Know?

Wouldn't you like to know how much it would cost you to do away with your old unsanitary heating stoves and install a farm home furnace which will give you an even heat night and day—which does away with the danger of fire and having to bild fires on cold wintry mornings? There is no greater luxury in a modern home than a modern furnace and thousands of farmers all over the Country are installing them. You don't necessarily have to build a basement or cellar under your house, as you can place it in a side room or build a small "lean to" on your house at small expense. The old fashioned heating stove which gets the house "red hot" one minute and cold the next has caused many a spell of sickness which has often led to death. Elsewhere you will find the advertisement of the American Radiator Co., and we suggest that you drop them a postal card for complete information on an early mail. Whether you are ready to buy now or not you should investigate for the future. Be sure to mention THE MISSOURI FARMER.

Hog Owners Attention

Elsewhere you will find the advertisement of the Rowe Hog Oiler Co., of Galesburg, Illinois—a device which, without any effort on your part will rid your hogs of vermin and hence render them less susceptible to disease of all kinds. These Hog Oilers are being strongly recommended by the different Agricultural Colleges and thousands of farmers are buying them because they will more than pay for themselves on the average farm in one year. Drop the Company a postal card for full information and mention THE MISSOURI FARMER.

Housewives Attention!

Did you investigate that offer of a beautiful Dinner Set for $6.45 in our last issue and notice that the Company offers to send it to you for a 30 days free trial without asking you to pay a cent in advance? After that if you want to keep it—which you surely will—you can send the Company $1.00 per month until it is paid for. A few dozen eggs will do it. If you failed to write, drop a postal card to Crofts & Reed, Dept. C-346, Chicago, Ilss., at once and ask them for full particulars. Be sure to mention THE MISSOURI FARMER.

If you like the work THE FARMER is doing, why not get each of your neighbors to give you a dollar and send us a nice club of subscriptions? We will be glad to have you keep 25c out of each dollar to cover expense of sending them in. If you are for the work we are doing this is a mighty good way to show it. The great Farm Club fight cannot be won unless hundreds of farmers all over the state give us this kind of help—and you will feel better for having done your part. All of us can help if we will.

CHERRY CHIEF'S PRIDE 187003

KING OF THE BREED

We have the best lot of spring boars and gilts to be offered for sale. They are royally bred and great individuals. All immune. Special sale on boars.

S. R. MARSHALL & SONS,
GLASGOW, - - - MISSOURI

SHADY GLEN POLAND CHINAS

Am reducing my herd. Will sell my great herd boar, Pawnee Price 2nd. Choice herd sows, either bred or open, spring boars, spring and fall gilts. Write for prices.

WM. I. BRITT, RUSH HILL, MO.

Build Your WORN OUT SOIL SWEET CLOVER

The great crop for soil fertility and animal feed. Exceptionally rich in nitrogen and humus. Higher protein content than alfalfa. Sow in spring, summer or winter. Write for prices.
Bokhara Seed Co., Box F, Falmouth, Ky.

A Splendid Opportunity

For some farmer who wants to retire. I will exchange a No. 1 piece of income property in Kansas City, netting better than 8% on the investment for a farm that is or can be made a comfortable Country home. Address Box, 41, Rfd. 3, Higginsville, Mo.

Do you need a good feed grinder? Grinding your feed makes it go farther—and saves every bit of it. Elsewhere you will find the advertisement of the T. B. Bowsher Co. Drop them a postal card for full information.

THE MISSOURI STATE FAIR

Reported by Bob Hill

The sixteenth annual Missouri State Fair just closed did not show much change from fairs of the past few years. There were 1471 head of live stock on the grounds of all classes, not including light horses and ponies. In most departments the live stock exhibits were about normal, while the showing of fruits, grains and grasses was about on a par with other years. The attendance for the week was not up to standard, due perhaps to cold, rainy weather. The threatening weather kept many automobiles away, but even after considering the great number that did come, it was hard to realize that so many cars would ever crowd on the fair grounds. During the first of the week a heavy rain and hail fell, which was followed by two real cool days.

The most important exhibit of the week was the showing of dairy cattle, the greatest dairy cattle show ever held at any Missouri State Fair. The good showing in this department is explained by the fact that the southwestern dairy show preceded the state fair at Kansas City. It is to be hoped that the dairy cattle show at the Missouri State Fair will never be any smaller than it was this year, even though there is no dairy show at Kansas City. Missouri should have one of the best dairy cattle and dairy produce shows of any state in the corn belt. There were 53 head of Jerseys, 71 Guernseys, 75 Ayrshires and 58 Holsteins, all from first class herds. One of the prettiest sights of the week was the parades of all dairy breeds on exhibit on Wednesday night, the first thing on the night program in the live stock pavillion. This parade was a topic for discussion the entire week.

It is to be regretted that there is not a better showing made of heavy horses at the Missouri State Fair, especially since almost every effort has been made by the men interested in this department to make it successful. There are always a few of the faithful to show up with their stables, but this year there was but one out-state exhibitor. Six Missourians exhibited Percherons, numbering in all, 41 head, there were three Missouri exhibitors in the grade draft horse classes with 13 head, and but one exhibitor of Clydesdales and Belgians. There were but 68 head of draft horses shown in all classes.

The mule show was one of the outstanding exhibits of the fair, in fact one of the best mule shows ever held at the Missouri State Fair. There were 44 head of mules shown, of all ages, and some of the best individuals ever fitted were put up for awards. The aged mule class was exceptionally attractive, and was won by a big heavy boned, thick bodied animal with a world of quality, and as many old mule buyers put it, she was a feast for a mule buyers' eyes. There were 12 head shown in the two-year-old class and 19 yearlings. The mule show was a big feature of the week. There were six exhibitors of jacks and jennets, totalling 30 head.

The Shorthorns and Herefords furnished the big part of the beef cattle show, there being but three exhibitors of Angus and two of Gallowoys 48 and 32 head respectively. There were 107 head of Shorthorns exhibited by ten breeders, and 90 head of Herefords by eight exhibitors. The competition in these two breeds was spirited always, the classes were well filled with a good lot of well grown, well-fitted, quality cattle. The championship classes in both breeds brought out individuals of excellent merit, and the men who exhibited beef cattle at the state fair this year are to be commended for the good showing made. There were 283 head of breeding beef cattle shown by 23 exhibitors.

For the first time in a number of years the Chester White Breeders had the greatest number of hogs on exhibit, there being 138 head of them, compared with 131 head of Poland-Chinas, 83 head of Berkshires, 76 head of Duroc Jerseys, 30 Hampshires, and 22 Yorkshires. The Poland China and Duroc shows were light this year, particularly the showing of Durocs, this being the poorest showing of numbers for a number of years, and this is appreciated most by comparing the number shown this year, 76, with the number shown last year, 174. The poor showing of this breed was brought about by the failure of the Missouri State Fair Board to appoint one of the six judges recommended by the Missouri Duroc Jersey Swine Breeders' Association, inc., to judge the open classes. As a consequence of this trouble, the Missouri Duroc Jersey Futurity was called off, which very materially affected the showing of Missouri herds of Duroc Jerseys, for a greater number of the Missouri Duroc exhibitors are members of the Missouri Duroc Jersey Swine Breeders Ass'n, inc. Over twenty herds had been nominated to show in the Duroc Futurity of Missouri this year. It is hoped that this matter will be straightened out another year. The Chester White showing was one of quality, and a credit to the breed. The Poland China pig classes were the best in the whole Poland show, and some extra good pigs were brought out. The Berkshire men held up the old standard and had a show of much quality. The Hampshire classes were poorly filled, the pig classes being the most important show of this breed. There was but one herd of Yorkshires exhibited.

There was an increased number of sheep in the barns, and the pens were practically all filled, with ten different breeds represented. The competition was strongest in the Shropshire and Hampshire classes, and the men divided honors pretty evenly. Awards were unusually equally distributed in the Missouri classes, and as much could be said for the open classes in all breeds.

As usual, the poultry building was filled with every known variety, the Missouri exhibitors winning their share of the ribbons. Missouri can always be depended upon to put out a creditable exhibit of her poultry and poultry products.

Despite the dry weather the past summer, there was a showing of grains and grasses that would lead one to believe that Missouri had had an ideal season for 1916. There are always a few favored spots in the state were good crops are raised, and this statement was verified by the attractive display of corn, oats, wheat, rye, etc. In the same building with the grains and grasses Missouri demonstrated beyond a doubt that 1916 was a good apple year in many sections of the state, for the apple show was an outstanding one.

The exhibit of automobiles attracted more attention than ever, and space for exhibits was taken up to the very inch, for automobile dealers realize that farmers are buying cars, are close observers and thinkers, and there was always a crowd in the automobile department. There were the usual number of acres of machinery exhibits and as much interest in them as heretofore. The company with a late patent on some labor-saving device drew the largest attendance.

The University of Missouri building was filled with a most practical and appealing lot of material, which the visitors appreciated. The building was crowded during the entire week. Just in the rear of the University building the Veterinary Department of the College of Agriculture had prepared a hog cholera exhibit which called for as much comment and interest as anything on the ground. The exhibit consisted of six farms, each farm illustrating some method of inviting or controlling cholera, and the exhibit was educational in every respect. This is the kind of an exhibit which the College of Agriculture should send around to the county fairs of Missouri in 1917, for this exhibit will take, it appeals to the farmers and will bring out more information than any other method. The College should prepare two sets of this exhibit so that most all the fairs that want this exhibit can have it, and without any charge on the part of the fair. The hog breeders and feeders who really understand what a calamity it is to have hog cholera in a herd were loud in their praise of this exhibit and these men know full well what an exhibit of this kind would mean at the Missouri county fairs.

Send us a 2c stamp for our splendid pamphlet on Farm Clubs. It will tell you how you and your neighbors can save a lot of money on coal, feed, salt and other commodities. Get your Farm Club started before winter sets in.

POLAND CHINA SALE NOVEMBER 1

NO CAUSE FOR WORRY

During the 25 years in which the tuberculin test has been in use it has been applied to hundreds of thousands of animals, according to E. G. Hastings, bacteriologist, agricultural Experiment Station, Madison.

"But in spite of its fairly general and very satisfactory use not all of the opposition to the test has been overcome. Even now there are those who insist that the injection of tuberculin may produce tuberculosis in healthy animals," writes Dr. Hastings.

"Such statements are wholly without foundation. It is impossible for any tubercle bacilli to remain alive after the prolonged heating required to produce the tuberculin, and thus the production of tuberculosis by its use is impossible. The addition of carbolic acid destroys other forms of organisms that may be introduced during the filtering and bottling of the tuberculin, making it all the more impossible for the extract to carry germs of the disease.

"It is not proper to apply such terms as 'serum' or 'virus' to tuberculin for it is simply an extract of the bacillus.

"The firms making tuberculin are under the supervision of the department of agriculture if their product is sold in any state other than the one in which it is made. This supervision extends not only to methods and equipment, but determinations are also made as to the value of the product by testing samples purchased on the open market. Reports of recent examinations have shown all samples examined to be satisfactory. Without such control it is conceivable that methods might be so altered as to reduce the potency of the product, but presence of living tubercle bacilli in tuberculin is inconceivable.

"The appearance of abscesses may sometimes follow the injection of tuberculin. Such a result is due to careless and dirty methods employed by the person applying the test. If the syringe has not been cleaned and sterilized since it was previously used, or if a bottle has been opened and then allowed to stand some days before the tuberculin is injected, trouble from ordinary types of infection may follow.

"It is often asserted that tuberculosis has been transferred from animal to animal by the syringe and the thermometers used in the test. Such a thing is most improbable. Before beginning a test, the syringe should be sterilized by boiling or by the use of a disinfectant. The thermometers should be cleaned and placed in a distinfectant."

The dairy cow requires an ounce or more of salt a day, and while she should be given all she needs, she should not be forced to take more than she wants. It is best, therefore, to give only a small quantity on the feed, and to place rock salt in boxes in the yard. —Farmers' Bulletin 743.

A Great Poland Sale

Elsewhere in this issue will be found notice of Hedges Bros. Poland Sale at Slater, Mo., on Nov. 3rd. This firm is so well known that it needs no special introduction to our readers and those who are in the market for high grade Poland Boars or Gilts should make it a point to attend this sale without fail —for there will be no finer offering in Central Missouri this fall. Bids sent in care of THE MISSOURI FARMER, Columbia, Mo., will receive the best of attention.

Splendid Duroc Boar for Sale

R. L. Hill, of Columbia, Mo., offers his splendid Duroc boar, "The Exponent" for sale at a close price. Write for full pedigree and particulars. He is a fine animal and worthy thorough investigation. Mr. Hill is also offering some splendid spring boars, ready for service. Also some fine fall pigs sired by Col. Wonder II and Rexall Col., son of Select Col. II. Write him your needs when he will give you full particulars on an early mail.

Prettyman's Poland Sale

Elsewhere in this issue will be found the advertisement of Obadiah Prettyman & Sons' sale of Poland China hogs at Fairfax, Mo., on November 1st. Mr. Prettyman has a splendid herd of hogs and here is a chance to get what you want at a reasonable price. Look the advertisement up and read it carefully. It will be one of the best fall offerings in that part of the state.

Worm Remedies

If hogs are to make the greatest profit, they must be kept free from worms, says the veterinary department of the Nebraska Agricultural College.

Hogs become infested with worms by taking them up with food and drink. Hence well-drained, clean lots reduce opportunity for them to become infested. It is best to keep a good worm preventative before them at all times. Any tested commercial remedy may be used, but the following preparation is very successful: air-slaked lime, 2 parts; salt, 2 parts; charcoal, 2 parts; and pulverized copperas, 1 part.

Where the herd is badly infested, use for each 100 pounds of shoat, 8 grains santonin and 6 grains calomel thoroughly mixed with a thin slop. Let the shoats miss the evening feed, and give them a treatment in place of the morning feed. If necessary, repeat in one week.

Young Farmers, Attention

If you would like to make some extra money during the coming winter months by selling a tool which every farmer needs and which he is almost certain to buy the moment he sees it work, read the advertisement on the last page of this issue carefully. It is an opportunity to make a lot of money and to make it honestly. Why not earn $300 or $400 during the coming winter? Be sure to mention THE MISSOURI FARMER.

WHERE TO BUY JERSEYS

Old Fred Chandler Ranch, -
Rt. 7. - - Chariton, Iowa.

I Am Developing Money Makers—Want to Be One?

FORGET everything else and think. What do you want most for the year ahead? It is going to be a year of stiff prices. You have got to have more money.

Am I right? Then listen. I've got a big story for you. Last year I advertised for live men to come with me and make money and I got lots of answers. Say, I had almost forgotten how many men there are who never had the right chance.

Neighbors, I had forgotten my own hard years of struggle. The letters jolted me. I took off my coat and went to work. Today hundreds of those same discouraged fellows are with me, making money, feeling good, facing the future with their heads up.

Get Your Head Up—Write To Me

I am not sentimental. I like to make money. I am running this advertisement to make money. But when I slam down my desk at night and ride home under the maple trees of my Indiana town I like to think I have shown a dozen or more other men the way to make money. It warms the cockles of my heart, makes me eat a heartier supper. Don't you want to write and find out what I mean and how I do it?

See What Neighbor Runyon Says

"A man just can't help making good money with the A. C. T., unless he goes to sleep on the job and even then he is liable to have someone wake him up to buy one. I expect to average eight sales a day, and that in a territory none too good."

G. H. RUNYON.

That is the talk and G. H. Runyon isn't in the best kind of territory either. Still it is like he says. "You can't help making money" with my proposition and the help I give you.

Read This Part Carefully

My Automatic Combination Tool is a Mechanical Marvel

I could get a hundred thousand of a certain kind of men to work for me tomorrow. You know the kind I mean. The tool is such a wonder, it does so many things and does them so well that any man can sell two or three a day and make $5 or $10.

I want fellows who will make $40 to $50 a day. I want to save the best territory for such men, train them, help them. I want the big money makers. Now think. One man, without training—just my instructions—made $45.50 in one day. Another man $1000 in one month. If I had room here I could give the names of dozens of men like this.

That's the kind of fellows I'm after. You don't know whether you are one or not, eh? Of course you don't. That rich fellow who owns the big house and the touring car didn't know, once. He had to find it out. I want to show you.

First of All—Write

No long letter necessary at all. Just your name and address on a postal card if you are in a hurry. That puts it up to me. I've got to show you and I will.

What the Tool Does

I'll tell you more about that later. But just to give you an idea—it does all the work of the old-fashioned jack, that costs almost as much, and eleven other tools besides—*single wire* stretcher, woven wire stretcher, wire mender, post puller, rail fence repairer, wheel repairer, press, hoist, vice and clamp, stump rooter and alligator wrench. It's a tool that *farmers, teamsters,* auto owners, contractors and builders have simply got to have. Once they know its merits they want it.

But Let's Get Together

I'll tell you the whole story in all its details as soon as I get your name. That's what I want now. I want you to put it up to me. Just address me or the company. I'll get the letter or the card. And please don't put it off.

How About You Boy?

How about you, my boy? Are you planning for the future? Have you made up your mind about what you are going to make of yourself? Have you mapped out your plan of campaign and is your heart on fire with a grim purpose to win? As you go about your daily tasks, do you dream of the great things you hope to accomplish in the years to come? Have you tied your rope to a star and do you, each day, fasten the knot a little more firmly? Or are you merely drifting with the current and do your thoughts dwell on the fleeting pleasures of the hour? Don't think that because you are still in your teens that this decision can be put off to some dim and distant time in the the future. I know there are those who say that youth must have its "fling" and that it is alright to sow a crop of "wild oats" first —but have a care my boy for no more subtle or dangerous lie was ever uttered and many there are who never emerge from the brambles and briars of a misspent youth.

On the contrary, the men who have left great names behind them are the men who laid the foundation for their careers while they were still in their teens—and a glance at history will confirm this fact. Not a solitary one of them sowed "wild oats" first—and yet I have no doubt that the last mothers' son of them got more true enjoyment out of life than those who take their "fling" as they say. So, whether you know it or not, you are deciding right now what manner of man you are to be in the days to come. At this very moment Destiny is sizing you up. Like shrewd old David Harum on the eve of purchasing a horse, it is taking careful account of the clearness of your eyes and your moral fibre. It is noting every blemish as well as every strong point—figuring out with unerring certainty just how far it will be able to depend upon you in the years to come. With this data jotted down in the notebook of fate, it will hurry on to the next young fellow in the line. But if what it jotted down about you is favorable it will return some day—and then it will give you your chance. Have no fear on this score for Destiny is continually looking for real men and Destiny never makes a mistake, nor does it forget. But remember also that Destiny never looks for young men in a saloon or a poolroom—for it doesn't like the popping of pool balls or the clinking of wine glasses. Likewise as I said on a former occassion, it rarely ever knocks on the door which a butler opens but prefers to choose from the ranks of the lowly—for here it finds the keenest minds, the strongest hearts and the biggest souls and without these qualities no man can rise above the common ebb tide of the crowd.

And here's another thought: The first thing to aim at is to be a real man, for this foundation you must have whatever you expect to make of yourself. Do you remember that sometime ago I quoted a great New York banker as saying that he wasn't looking for "brilliant" or "clever" young men? That message would have meant much to me in my teens—for I couldn't have qualified under either head and yet in those days I thought these qualities were essential to success. Isn't it fine to know that just every day common sense, honesty, a clean body and a willingness to "spell up from the foot of the class" are the qualities the World is looking for? And here is another thought: Don't get it into your head that the only victories worth while are to be won in the business or professional field. This great Country needs great farmers a thousand times more today than it needs great lawyers—for the first is a creator while the latter deals with musty facts which are as old as the hills. So in making your plans, don't overlook the farm which, during the next 25 years is going to need a race of giants—for from the farm came the strength which has made the Republic truly great and from this source will spring its future glory. But in any case, plan boy, plan.

There isn't a minute to lose. Never was the World more beautiful or bristling with opportunity than today. But it wants "staying qualities"—young men who are not afraid—who can stand the "gaff"—who come again with a smile when adversity topples them over.

THE PLEA OF BOB WHITE

Please, farmer friend, may I speak before you shoot?

I am Bob White. It is my cheery whistle that comes to you through the ghost-gray mist of the morning, my

covey call that echoes o'er hill and dale as dies the day.

In early springtime when nature writes in pink her proclamations of plenty I, in orchards, fields, and pastures, begin my battle against insect pests. Then when comes the wondrous white of winter, lulling into peace the plains and crowning with heavenly whiteness the hills, I still am here—still working to increase the next harvest. All winter long I labor, eating the seeds of noxious weeds.

How many bugs and beetles and weed seeds do I eat? Well, I wonder! I cannot say, but here is what science says:

"Eighty-five different weed seeds make up in part Bob White's bill of fare. Crops have been found packed with ragweed seeds and as many as 1,000 seeds of the crabgrass have been taken from one bird. A single specimen contained about 10,000 pigweed seeds. Crops and gizzards examined in government laboratories have yielded fifty-seven kinds of beetles, twenty-seven varieties of bugs, nine grasshoppers and locusts, and thirteen different sorts of caterpillars, besides ants, flies, wasps and spiders. A teaspoonful of chinch bugs has been taken from one quail, and an adult bird has been known to eat 5,000 plant lice in two hours. Bob White feeds upon the boll-weevil, cabbage worms, cucumber beetles, squash bugs, grasshoppers, chinch bugs, the army worm, Hessian fly and many other insect pests."

What pay do I demand for thus helping you in your fight against weeds and in reducing the annual insect bill of $800,000,000? Why I ask only that I be let to live. Dead, I am only a small morsel of meat; alive, I make it easier for you and yours to live. Spare me and I will serve you.

I speak not in opposition to true sportsmanship but against unrestrained slaughter. Today our numbers are few. Tomorrow we may be no more. —W. L. Nelson, Assistant Secretary Missouri State board of Agriculture, Columbia, Missouri.

WHEN TO SELECT SEED CORN

By C. O. Cromer, Associate in Crops, Purdue Experiment Station.

The season of the year is now at hand when the practical farmer should provide for his seed corn for the coming year. A great deal has been said about the advantages of going through the field early in order to select the earliest ears, those growing on the best stalks, and those attached at the proper place on the stalk. These reasons, important as they are, however, have not convinced enough people of the necessity of making seed corn selection an important work to be done before the time to begin cribbing their corn. It has been argued many times by some people that corn selected at husking time is the best because a long time for the full development of the germ is possible. On the other hand, frosts prior to the general husking have injured otherwise good looking ears.

With a view to determining the effect of the degree of maturity on the condition of the ears at the time the germination test is made, the Department of Soils and Crops began in 1909, to select corn of different degrees of maturity, store the same in the most favorable location and when dry make germination tests of the different lots.

Fifty ears each of the following different degrees of maturity were selected:

1. Just before the corn was dented.
2. When just nicely dented.
3. The ripest obtainable when the corn was ready to cut for the shock.
4. Ripest obtainable at husking time.

These selections have been made for five years and the average germination tests of the different lots for the five years are as follows:

1. Just before denting, 78.1.
2. Just nicely dented, 93.0.
3. Ripest obtainable when ready to cut and shock, 92.7.
4. Ripest obtainable at husking time, 88.9.

Judging from the above figures one may see that, while there is not much difference between the germinator performance of the second and third selections, there is a noticable drop in the per cent. of germination of the first selection and somewhat less marked fall in the germinator performance of the corn selected at the time the corn crop was cribbed. In short, one may conclude that the corn may be selected too early as well as too late. Further observations on the condition of the corn at the time of germinating it showed that the ears of the first and second selections had a large number of diseased grains on them. In addition, the kernels were not fully developed and frequently the grain was not solid on the cob and quite often the ears were chaffy. The third selection, or the ripest obtainable at shocking time, was solid, the grain well formed and almost entirely free from mouldy or diseased kernels. The fourth selection, or the ripest obtainable at husking time, was always quite good in quality. No mouldy or diseased ears were selected. However, the five-year-average germination of this fourth selection made at husking time is not as good as that of the second and third selections. The yearly germination records show that when the fall is favorable for the maturing of the grain before the first killing frost, the germination of the corn selected at husking time is not as high as the germination of that selected earlier. For instance, in 1915, with an abundance of rain in September and the fore part of October, the corn did not mature properly and the frost, about October 25, reduced the germination of the corn about 26 per cent. In other seasons, with a dry September and October the germination percentage of the late selection goes up to that of the selection made at the time the corn was ready to shock.

The results of the experiment seem to warrant the following conclusions:

1. Seed selected before the corn has become dented does not produce a fully developed kernel. Its germination is low also.
2. The perecentage of diseased kernels is highest in ears selected before denting.
3. The best time to select seed corn is after the corn has become well dented and before the first hard freeze comes.
4. One is liable to select some of the too late maturing ears, that have been injured by frost, if seed selection is delayed until corn husking starts.
5. Since no one knows how soon the first killing frost will come, it is acting one's faith in preparedness to select the ripest seed obtainable early in the season.

Any Gullies on Your Farm?

Are there not a lot of ditches and gullies on your farm that need attention while other farm work isn't crowding? Look up the Owensboro Ditcher advertisement in this issue and then drop hem a postal card for full information.

Want to Make Some Money?

Wouldn't you like to earn some money during the coming winer while things are quiet on the farm? If so look up the advertisement of the Harrah Mfg. Co. Dept. 122 Bloomfield, Ind. and write them for full details.

International Harvester Wagons—Weber and Columbus

YOU can be sure of one thing when you buy a **Weber** or **Columbus** wagon—You get more service for your money. The good service they give is one of the strongest features of **Weber** and **Columbus** wagons. This service is the result of careful design and construction, such as is shown in the **International fifth wheel.**

Look between the front axle and bolster, where the king bolt goes through. There you will find the fifth wheel (an exclusive feature). Note the wide circular wearing surface of the two substantial fifth wheel plates. Those plates relieve the owner of a lot of trouble. They prevent breaking or bending of circle irons. They prevent the pitching of the bolster that breaks or bends king bolts. They take strain off the reach and keep the lower part of the front axle from sagging.

This one feature adds years to the life of the wagon, but, better even than that, it indicates the care and thought that have been given to every **Columbus** and **Weber** feature, and they are many.

Look over the **Weber** or **Columbus** wagon carefully, either at the local dealer's place or in the illustrated wagon folders we will send you on request. Then you will see why, if you want more for your money, your next wagon should be a **Weber** or **Columbus.**

The Missouri Farmer

VOLUME VIII NOVEMBER 1, 1916 NUMBER 21

Controlling Soil Erosion

By Roy L. Furry

Conservation of the soil is a problem that is confronting the farmer today on rolling land. Every rain that we have carries off much of our fertile soil—never to be regained again, unless it be deposited on the bottom lands.

It is difficult to estimate just how much of our soil we are losing. The gulley washing can be plainly seen to be a great loss in many sections. The sheet washing which is not so easily discernable is probably more destructive. Do you know how much of your soil is being lost by this means? We have no definite way of measuring this loss. To give some idea as to what this loss may be in a few years the writer will cite a case that came to his attention the past season. When plowing for wheat this fall the plow turned up a tiling that had been laid 30 years ago. This tile was only three to four inches from the surface in places. How deep this tile had been lain it cannot be stated as no one possibly knows, but considering that it had been lain at a moderate depth it is evident that the surface washing had indeed been great in the past 30 years.

It takes nature centuries to form a very small amount of soil and a single rainy season or a single torrential rain will undo what it has taken nature centuries to form. This soil cannot be readily replaced, and we must protect it if we are to have a fertile soil. The cream of our soil is the surface and if it is allowed to pass away the succeeding generations will have the unproductive subsoil left to them as a heritage from their careless forefathers.

Terracing Saves the Loss

What are we to do to save the soil from this endless erosion? The gullies may be stopped to a certain extent by various methods now in use; but this does not account for the sheet washing which goes on the same as ever. The only successful method that has been in practice is the system of Mangum terracing. This system has been in use in certain southern states for several years and has proven a success. The system was installed on a Carroll County farm about a year ago, and has demonstrated in its short existence, that it is filling its purpose. It has since been taken up by a few farmers in other places in the state and installed on their farms since the one installed in Carroll County.

The principle of the terrace is to reduce the rate and the volume of the flow of water over the surface. Where water flows in force and volume it will pick up the soil particles and carry them away, while if it flows slowly and is not allowed to get volume it will not carry much soil. Geologists tell us that where the rate of the flow of water is doubled that the carrying capacity for soil is increased sixty-four times. It is this reducing in the volume of the water that makes the Mangum terrace a control on erosion.

Terracing Not Suited to Steep Hillsides

The terracing system is adapted to land that has a fall from 4 to 15 feet to the hundred. Any land that has a fall of over 15 feet in a hundred is not suitable for cultivation and is not suitable to terrace. The majority of the cultivated farm lands of Missouri will fall in the limits that permit terracing.

This picture shows the top of terrace ridge where the four men are standing. The man at the left is standing in the ditch above the ridge. Last year being unusually wet for a time from one to two rows of corn were drowned out. In places the corn is good in the ditch and in ordinary years no difference will be seen.—Photograph furnished by O. R. Johnson, University of Missouri.

The terrace consists of a low broad mound from 8 to 10 feet in width with a broad shallow ditch on the upper side, 8 to 10 feet wide. This terrace follows the contour of the hillside, having a fall of 6 inches to every hundred feet, which will allow the water to flow off at a low velocity with little soil and will not cut out a ditch. The distance the terraces will be placed apart will depend on the slope of the field, being so spaced that there is a fall of 3 to 6 feet between each terrace.

The course of the first terrace is staked out near the summit of the hill. A farm level or a surveyors level must be used to get the proper fall. Starting from a definite point, stakes are set every 16 to 50 feet with the proper amount of fall between each stake to make 6 inches fall to the hundred feet. If the hillside is irregular they must be closer so that the terrace will have an even fall, otherwise there may be low places in it when completed. Continue this line to the place it is to empty. Then go back where the first terrace was started and get down the hill to a point 3 to 6 feet lower and start the line for the next errace, and so on till the field is staked out.

After the terrace line is determined, follow it with a plow and throw up a back furrow about six feet wide on each side, which will result in a terrace about 12 feet wide. This done, run a road grader or a A drag over it, throwing the dirt to the center, forming a bank and a ditch on the upper side. Add two furrows on each side and drag this to the center. This will result in a ditch about 8 feet wide and a bank of the same width, which is enough for the first year. The second year plow two or four more rounds and draw them to the center. This will result in a terrace with a broad shallow ditch about ten feet wide and eighteen inches high. This mound will not interfere with tillage or any other farm operations, as any farm tool will pass over it without being hampered, and all of the ground can be used as there is no loss. The ditch may not have a full crop if there is a wet spell at seeding time but the bank will grow crops the same as any other part of the field.

The proper time to install the terraces is in the fall when farm work is slack and there are no crops on the field. These terraces are permanent in character and will require little attention after the first year. Where the terrace crosses a gulley it should be well filled and closely watched as it is more liable to break at these points at first.

Terraces Must Not Be Too Long

No terrace should be over 1500 feet long, for if longer it may not be able to carry all of the water off during a heavy rain. Each terrace must carry away all water that runs off between it and the terrace above it. Before planning the courses of the terraces be sure that there is a suitable outlet, either in the main ditch of the field, or in a roadside if the field is near the road.

The cost of this work is indeed small when its value is considered. The expense to install this system on the Carroll County farm was $14 per mile of terrace, which was about $1 per acre. This expense was counted as the labor of the men and the teams at normal prices.

As the farmer can do his own work, he will be out of no money in installing this system, unless it would be in having the courses of the terraces laid out by one who understood.

Consider the time that you may spend on filling gullies, the loss of grain and tillable land caused by these gullies, how long would it take to pay to install this erosion control system on your farm?

The above picture shows a terrace in the process of making. The plow has been used and one round has been made with the road grader to widen the ditch. In the back ground may be seen other terraces on the opposite slope the outlet for the water being outside the margin of the picture.

SALINE COUNTY TO HOLD IMMENSE CORN SHOW

By Chester Matheny

Just read that headline again,—it means something out of the ordinary this year. If there could be a season when weather conditions were more unfavorable for a big Corn Show and Seed Corn Auction Sale than this season has been, we hope that it will never materialize,—this one has been bad enough.

In spite of a cold, wet spring and a dry, scorching summer and winds which blew down and actually uprooted much corn, in spite of all these things, Saline County comes up tranquil and agriculturally smiling with a good corn crop. It is not up to her average crop by a long way but numbers of fields are showing up with prospects of considerably over seventy bushels of corn. The best fields in the county were planted last spring with pure, carefully selected seed bought at Saline County's Annual Seed Corn Auction Sale last year. The seed sold at that sale was also grown from pure seed, one thousand bushels of which were brought in during the spring of 1915 to start Saline County on the road to becoming known as the Seed Corn Center of the Corn Belt.

The County has set as her standard, the making famous her name as a seed corn county and considerable progress in that direction has been made. The greatest advance each year is the Annual Seed Corn Auction Sale, which is the big agricultural event of the county and concludes the One Thousand Dollar Corn Contest conducted yearly by the Farm Bureau, working through its County Agent. This Show and Sale is held at Marshall, Mo.

The Seed Corn Auction of 1915 was a great success in every respect. Sam Jordan, the famous Corn Man, said he never before had seen so much excellent corn in any one show. Matthew W. Hall, who had charge of the corn exhibits at the World's Fair in St. Louis, said that the World's Fair Corn Show was as big but there wasn't as much real quality corn there as at Saline County's Show. The last day of the Show all that fine corn, a total of 534 bushels, was sold at auction for seed purposes. It sold in less than three hours for $1902.75, or an average of $3.54 per bushel. Some buyers were unable to get all they wanted and placed orders to be filled later.

Since the Auction Sale, Saline County Seed Corn has been shipped out in the county's standard bushel crate of ear corn, to the states of Kansas, Oklahoma, Florida, California, Oregon, Indiana, Iowa, Arkansas and many counties in Missouri. That is a business-like trade territory for the first year, but greater things are expected this year.

County Agent R. J. Howat, who is carrying on the work of the Contest, Show and Auction Sale, recently said, "The Show and Sale last year were wonderful, but only a start. It is a real accomplishment for the county to have another one even better during this miserable corn year, but that is what is going to happen on the first two days of December. The Seed Corn Auction at Marshall this fall should be attended by buyers from every state in the corn belt, and they will have an opportunity to buy the choicest seed corn that can be found anywhere this year. We're not going to wait and see, but we are going to work and see, and if every man in the Contest does his part, we'll see a Show and Sale that will astonish even the optimists."

The Show is the culminating event of the One Thousand Dollar Corn Contest, in which every means is employed to encourage the production of high yielding corn of superior quality. Prizes totaling $1,500 are given away in about seventy-five premiums. The awards will be made on the standing of the different contestants' corn. The yield on a measured acre of dry, shelled corn determines sixty per cent of their standing and the quality of the corn brought to the Show determines the remaining forty per cent. On account of such a system of judging, every man in the contest brings in the very choicest five bushels of his entire crop.

One hundred and eighty-six men, including the best corn-raisers in the county, have agreed to compete in the Contest this year, to measure their best acre and bring in five bushels of corn to the Show and Sale. In the neighborhood of a thousand bushels of the county's best corn, including Boone County White, Reid's Yellow Dent, White Dent, Silvermine, St. Charles White and Cartner, will be there and the entire display will be sold bushel by bushel to the highest bidder on the last day of the show, December the second.

Before it is sold or even exhibited, it will be carefully gone over by a committee of expert corn judges, who will score every bushel in the Show. Any corn which fails to come up to a set standard will be excluded. This must be done for the protection of the buyer and in order to maintain the good name of Saline County Seed Corn. All corn passed by the committee and sold at the Auction will bear the county's copyrighted trade label and be guaranteed by the Farm Bureau.

Last year farmers in localities too far distant to allow them to go to the Show and Sale, chose a representative to attend and buy for a group of men. A large shipment from the last Auction Sale went to Oklahoma and another to Iowa, bought for different parties by one representative. Orders and bids were also received by mail. All communications of that nature were attended to in a satisfactory manner by the county agent and it is his expectation that this fall quite a number of mail orders will be received. It is also likely that several communities will send buyers with a good many orders to fill for neighbors who want good corn.

In addition to the Corn Show and Auction Sale on the first two days of December the crowds of visitors will be furnished with a good program of talks and demonstrations,—or rather two programs, one for the men and another for the women. Band music will also make the occasion more enjoyable.

The Saline County Poultry Association is to hold its Fall Poultry Show on the same dates as the Corn Show, thus making two days completely full of education, instruction and entertainment.

A big crowd is expected and wanted, and everyone will be welcomed at the Corn Show and Seed Corn Auction Sale on December the first and second at Marshall, Missouri, in "Saline County, the Seed Corn Center of the Corn Belt."

FARMERS' ELEVATOR MAKES GOOD

The Missouri Farmer:

I greatly admire the splendid fight you are making for the farmers of Missouri and other states. The trouble with the American farmer is he is either working himself to death for the dollar which some other man gets, or he has no desire to get somewhere. Fortunately there are more progressive farmers than the latter class. If the progressive farmer would spend one-fiftieth of his time in organizing he would have to work less and get more for his labors. I wish we had more men who would uphold the cause of the farmers like THE MISSOURI FARMER has done and is doing. You have thousands of admirers that you know not of. My only wish is that I were a man of means so I could help you, and spend the rest of my days organizing the farmers of this state.

The object of this letter is to learn from you of any corn for sale as we did not raise sufficient corn in Henry County to feed our stock. I am writing this for the benefit of the La Due Grain & Supply Co., of which I am president. Our manager is kept pretty busy so I thought I would help him out with the correspondence. We, the farmers, have a small elevator in La Due, which has saved us quite a sum of money. We had a hard time when we first started, caused by our competitor actually paying more for grain than market price, less freight and other expenses, in order to try to knock out our elevator, but thanks to the loyalty of the farmers we have made this enterprise a success.

In the face of two of the poorest small grain crops in our history we have accomplished our desire which was to maintain a fair market price. Some few looked with disfavor on our undertaking and called our elevator the "White Elephant" but those few have now become tame and want to feed what they thought was a "White Elephant." In conclusion will say to brother farmers, organize and do it quick as every day counts. Pay no attention to kickers as they will fall in line when the procession goes by. I am sending you a report from our manager for the year ending September 9, 1916. If you can give us any quotations on shelled corn F. O. B. either end of line would be very much obliged to you. Address all quotations to, La Due Grain & Supply Co., La Due, Missouri. Following is the report of the La Due Grain & Supply Co.

"The company is a year old today. On the 9th of September, 1915, John Henny dumped the first two loads of corn in our cribs for which you paid him 65 cents per bushel and Frank Calvird sold you the first load of wheat tested 52 pounds and he received 70 cents per bushel. This completed the day's business. Since then with two of the poorest consecutive small grain crops in the history of the county you have bought and sold 13,695 bushels of wheat, 20,945 bushels of corn and 9,065 bushels of oats for which you have paid the farmer full market value and at least 1 cent per bushel more than he would have received had the elevator not existed. You have bought and sold 4,900 sacks of flour, ship and bran and every sack has cost the consumer at least 5 cents less on account of your enterprise. You have bought over a million pounds of chat every bushel of which would have cost the people at least 1 cent more had you not ventured to build an elevator. You have bought and sold 12,000 bushels of coal and homes have been warmed for at least 2 cents per bushel less than in the chilly days before the elevator.

You have ground and sold 222,515 pounds of chops and meal and every hundred has gone to the consumer for at least 10 cents less on account of the elevator that has proven more than a dream.

No serious accidents have occurred, no bones have been broken nor blood drawn and every piece of machinery is working nicely.

Financially, physically, morally and spiritually you are as well off as a year ago yet there is always room for improvement.

No man has been robbed, snubbed nor ignored. Those who traded with you have saved at least $1,000. The elevator has cleared above all expenses $1,000 and those who traded elsewhere made perhaps $1,000 and therefore no matter what one thinks or where he trades the elevator has been a success and will help him in spite of anything he can do.

In addition to above figures you have dealt extensively in farm seeds, cotton and oil meal, salt, brick, cement and other articles. The business of the year amounted to $50,000 or $4,160 per month. The business capital of $2,500 with which we started has been turned 20 times, or on an average of one and two-third times each month.

Wm. Lee Pinkston, Mgr.

If you see fit to publish the foregoing report and if any Farm Club or organization wishes to build an elevator I will gladly furnish them with

The above picture shows samples from the two ten-bushel exhibits at the first Saline County Corn Show which divided the honors for first place by a tie score. The top lot is Boone County White from a field grown by J. E. Matheny, and yielded 94.5 bushels per acre. The bottom row is Reid's Yellow Dent from a field raised by W. L. Smith and yielded 86.65 bushels per acre.

all the information which I possess. Wish to say that Farmers Elevators have come to stay if they are started right and managed right. There are now four farmers elevators within a radius of 20 miles of La Due which are all doing well and making money.

Now Brother Farmers get busy and start something, demand your rights and demand them till you get them, then, and not until then will you come into your own.

Otto Volkmann,
Rt. No. 5. Clinton, Mo.

A NEW WHEAT PEST

During the past month inquiries have been received from certain parts of the state relative to a small dark colored beetle that has been ruining the winter wheat quite extensively. Upon examination of the specimens submitted, the insect pest has been identified as one which has never before been known to attack wheat in damaging numbers. The insect is most likely to the so-called Western Cabbage Flea Beetle (Phyllotreta pusilla, Horn). It gets the name of "flea beetle" due to its habits of jumping like a flea when it is disturbed. There are many kinds of these minute insects, some being striped, others being mottled in color, while still others are uniform in color. Some are known to attack cabbage and allied cruciferous plants, such as radish, wild mustard, turnip, kale, etc., while others feed upon potato, tobacco, tomato, bull nettle, and still others attack certain grasses and many of our garden vegetables. The Western Cabbage Flea Beetle, as its name implies, is almost always a cruciferous plant feeder and is quite common from the Dakotas, southward to Mexico and westward to California. Due to certain climatic conditions, the pest may, however, feed upon other plants; more than likely the recent heavy frosts, having wilted the leaves of the common food plants, have caused many of the flea beetles to forsake their most desired food plants and to subsist upon any green succulent food, such as growing wheat, grasses, etc. Undoubtedly this is the cause for the new habits seemingly acquired by this insignificant little beetle. The small bettles are a deep olive green or metalic black color with the wing-covers irregularly punctate, and measure about two millimeters or about 7-100 inch long. The larvae of all these flea bettles mine the roots or in certain cases, the leaves of the host plants. The damage done in this way is not very great, for most of them in their larval or immature stage work on the roots of weeds and grasses. In the adult or beetle stage, however, they do great damage at times as recently exemplified in a number of letters of inquiry. The following quotation from a letter shows the insidiousness of the attack. "These insects are destroying my wheat and I doubt if I can save one field of thirty acres. The insect started on the side of the wheat field next to the corn, after the frost destroyed the corn and they have entirely destroyed the wheat in a strip about fifty feet wide, extending entirely across the field. They do not leave a stalk of wheat standing, the blades dying and the roots soon disappeared. From this can be easily seen that the farmers have in this little insect, a very formidable enemy, and one which is quite abundant just now.

The general practice used against the adult insects is to spray the cabbage, potato, etc., with a Bordeaux mixture, using the formula, 5—5—50 and about 100 gallons per acre. The Bordeaux mixture acts as a repellant toward the flea beetles, causing them to seek unsprayed plants which would be weeds, grasses, etc. In cases where garden flea beetles are abundant, adding about one-half pound of Paris green or two pounds of arsenate of lead to fifty gallons of water, will make the spray not only a repellant but a destroyer. In the present case, however, it is a question whether such procedure should be advocated before certain other measures are tried.

The first thing for the farmer to do, is to inspect the wheat fields to see if this new pest is present. If so, and the bettles are injuring the plants, purchase some air slacked lime and dust this on the wheat plants, especially well around the borders of the infested area. This is done preferably after a rain or when the dew is still on the leaves. This will do much toward preventing the insects from attacking the remaining wheat plants and will drive them onto grasses and weeds around the borders of the field. If the acreage is not too large, by all means dust the entire field with the lime to which may be added poison at the rate of about one-half pound of Paris green or one pound of aresnate of lead to a bushel of air-slacked lime. Apply by sif ting through a coarse gunny sack. During the winter and early spring, clean cluture which consists of the destruction of weeds, grass in fence corners and around the field and the proper disposal of waste material, will aid materially in reducing the number of hibernating adults with subsequent fewer individuals to start the next season. Act at once to prevent further loss.—A. H. Hollinger, Assistant Entomologist, Missouri Agricultural Experiment Station.

(Editorial comment: This is a new proposition for Missouri farmers as well as for the entomologists for so far as we know this is the first time these bettles have attacked the wheat in a large enough way to cause any trouble. If the lime treatment proves an efficient remedy the slaked lime could be spread over the field with a lime spreader or in small areas with a fertilizer drill. The lime would pay for itself in benefits to the soil and the only cost then would be in the application.)

THE MISSOURI FARMER needs the active help of every farmer who believes in the great fight we are making for farm organization. Suppose 1000 farmers were to help us organize a school house Farm Club in their districts? And suppose each of these Clubs had an average membership of 15? This would mean 15,000 new farmers brought within the fold—and if each Farm Club saved $500 during the coming year it would mean a saving of a half million dollars. Don't you see what it all means and why we need your active help?

WOOD ASHES VALUABLE AS FERTILIZER

Wood ashes, which when unleached contain about five per cent potash and 30 per cent lime, are one means the farmer has for preparing against the shortage of potash salts which formerly came from Germany. The amount of potash varies somewhat, being higher in hard woods.

The potash is readily soluble in water and will be largely leached out if the ashes are not protected from rains. Farmers burning wood should store the ashes during the winter and thus furnish themselves with at least a small supply of this fertilizer that the war has made so high in price.

The Ohio Experiment Station advises the use of 400 to 500 pounds per acre of a mixture of two parts of wood ashes and one part of either acid phosphate or bonemeal. Such a fertilizer may be used to advantage on the spring crops, while the lime contained in the ashes will have a beneficial effect on acid soils. Experiments at the station show that potash does not produce its full effect except when reinforced with phosphorus.

Concrete Road near Oswego, Kendall County, Illinois

Haul in Wet Weather—on Concrete

WHEN wet weather keeps you from working in the fields you can make profitable use of your time by hauling farm products to market—IF THE ROADS ARE GOOD.

Why put up with roads which are bad—sometimes impassable—in wet weather? Rainy days are just as good as clear days on a concrete road. If your roads were built of concrete, neither season nor weather would hinder your getting to market.

CONCRETE FOR PERMANENCE

There are many advantages in concrete roads. They save the wear and tear on your wagons and harness. You can haul three or four times the load with the same number of horses. Perishable products can be hauled more quickly and with less injury over the even concrete surface.

Concrete roads will increase the number of your markets, will widen your marketing territory. Ten miles on a concrete road is not as far as five miles on an unimproved road. If you use a motor truck, twenty, thirty, even forty miles can be covered in from two to three hours. Concrete roads produce no dust. Their surface is even but not slippery.

There is nothing mysterious about concrete roads. Clean sand and pebbles, or broken stone, mixed with water and Portland cement are all the materials needed. These can be had within a reasonable distance of any community. Concrete roads can be built by local labor under the supervision of a good contractor or road engineer. Permanent concrete roads cost little more than the best waterbound macadam, which soon goes to pieces under modern motor traffic. A well-built concrete road will last indefinitely under any kind or amount of traffic. The upkeep averages very low.

Let us tell you more about concrete roads, how they reduce hauling costs, and improve social, educational, and all other community interests. Write for a free copy of "Concrete Facts About Concrete Roads." With this information you can convince your road officials.

Perfection
SMOKELESS
OIL
HEATERS

NEVER smoke—a patented lock flame-spreader automatically prevents the flame from creeping up.

There is no odor—the drum of this heater acts the same as the "Long Blue Chimney"—no dust, no ashes.

Regulator on top of drum sends heat straight up or outward into the room as desired.

Window in front makes it easy to see and regulate flame—no easy-to-break mica in window but substantial fine brass gauze.

The Perfection Smokeless Oil Heater is simple to re-wick; besides a wick with reasonable care lasts a season.

Holds one gallon of kerosene. Indicator shows how much is in the reservoir.

Any good kerosene will give satisfaction, but for best results use Perfection Oil.

Perfection Smokeless Heater is 25 inches high and 12 inches in diameter, finished in polished steel or blue enamel, with trimmings of black Japan or nickel.

Price varies from $4.00 to $7.25, according to finish. Look for the triangle trade mark.

Sold by all reliable dealers.

Rayo Lamps give that soft, mellow light which enables you to read without eye strain. Get one.

Hog Raisers Attention

Every raiser of hogs should drop a postal card to the Rowe Hog Oiler Co., 103 Liberty St., Galesburg, Ill., and ask them for literature describing this device which is now in use on hundreds of farms and by means of which hogs can easily rid themselves of vermin. A postal card will bring full information.

"TOM" AT THE UNIVERSITY

By Tom

Dear Dad: I was glad to get your letter and to learn that everybody is well and that the wheat sowing and silo filling are over in good shape. Talking about silos, the more I learn about them the more I wonder why more farmers don't build them because during the bad crop seasons we have had in recent years they have certainly been a blessing—making the corn go about a third farther in its feeding value than it will go when the stalks and blades are wasted as is true where they are not chopped up into silage. Some of these days I hope farmers will realize that there is just as much wisdom in "canning corn" as in canning tomatoes, apples, beans or anything else.

But now I am going to get down to brass tacks and tell you why I switched over from Law to Agriculture—and you don't know how glad I was when I had finished reading your last letter and found that, after all, you were not downright angry with me as I had feared you would be. In the first place, when I entered up for the Freshman Law Course, I sized up the bunch and while they were all fine boys, I realized that not one in twenty was cut out to become a great lawyer. Then I tried to size myself up in the same way. I asked myself, "Why have you any right to think that you would make a better lawyer than the average of these other boys?" Then too, I went over the list of the lawyers in our county—and, as you know, outside of Jim Lovelace they eke out a pretty meagre existence and nearly all of them have to write fire insurance on the side to "get by." There is old Judge Smith for instance who used to be considered a fine criminal lawyer—but crime is becoming more and more unpopular these days and so, about all the business the judge gets these times is an occasional divorce case and other petty things of that kind. The more I thought of it the more I hated the idea of sitting around in a little stuffy office waiting for somebody to bring me a case. Again, this view which had never occurred to me before came into my mind—that nine-tenths of the money that a lawyer makes comes from other peoples quarrels and troubles. It dosen't make any difference whether a mans cause is just or unjust, when he goes to a lawyer, the lawyer usually advises him to sue—for that is the way he makes his living. If every lawyer advised his client as he really believes in his heart, 90% of the disputes which people have would be settled out of court. Mind you, I am not blaming the lawyers for all of this—for often the client is mad and wants a run for his money and if the lawyer gave him honest advice he would say that he was "no good" and would go off and hire somebody else.

In the meantime, my roommate had entered up for the Freshman Course in Agriculture—and he was so enthusiastic about it and kept on telling me how interesting and fine it all was that before long he had me almost as wild as he was. So, in desparation, I went to Mr. ————, perhaps the strongest man in the Law Faculty. He is a middle aged man, undoubtedly deeply learned in the law but as cold as an iceberg, until you get to know him at closer range. I told him about my quandary simply and frankly. For quite a while he listened without saying a word. Then he asked, "Do you love the law?" "Would you rather be a lawyer rather than anything else in the World?" "Are you willing to dig and fight for years if necessary in order to climb to the top?" And after some mumbling I finally blurted out, "If I was as crazy about it as all that, I wouldn't be coming to you in this way. I do want to make a real success at something"—and as quick as a flash came his answer, "Well if you are not crazy about it, then find something else that you can get crazy over—and then go to it with every ounce of enthusiasm and ability there is in you." In that brief second I decided and thanking him, I made a bee line for the Agricultural College, entered up, got the necessary books—and by now I have about caught up with my classes. The other morning I ran across the Law Faculty man on the campus. He greeted me with a smile and asked, "Well, how do you like Agriculture? Are you crazy about it?" And I answered, "You bet I am"—and I meant it as I ever meant anything before.

I am satisfied that many young men want to become lawyers because it sounds big. It has always been considered a dignified profession—but not one in a hundred are "crazy" about it. They are simply looking for a "place to light"—and that is the reason why the Country is full of "bum lawyers" who either have to write fire insurance, sell real estate or get hold of some political job to make a living—and the same is true of many who study medicine, engineering or some other profession. Of course the Country will always need great lawyers, doctors and engineers but before a boy tackles one of these careers he should be mighty certain that he has heard the thin, small voice of Destiny calling to him—not once but during every waking hour in the day and in his dreams by night. On the other hand, the more I think of it, the more I am convinced that there is a splendid future ahead for any young man on the farm for, after all, it is the World's greatest business. Before long I feel sure farmers will organize and work together more than they ever have before—and once we do this we will soon compel a fair price for our products and with this assured there will be no finer, broader life than farm life. Again, the farm needs big men just as much as the business, banking or professional world and I have made up my mind to be one of them. I know you have often wondered what to do with the farm when you get too old to work anymore—but if you will rent or sell it to me you needn't worry over this problem any longer. I am going to work like the Dickens here at the Agricultural College and when I get through I'll make a bee line for home and I'll be ready to "talk Turkey" to you. In my next letter I am going to tell you about some of the things I am learning. With love to all, Tom.

THE LESSON OF THE FAIRS

Missouri is one of the few states having two great live stock shows—but, then, Missouri is one of the few states capable of supporting two such shows as the State Fair at Sedalia and the American Royal at Kansas City.

This year at the Missouri State Fair 1,471 head of live stock, exclusive of light horses and ponies, were on exhibition, while at the American Royal, now—but perhaps temporarily—an exclusive cattle show, more than 1,000 head of Shorthorns, Herefords, Angus and Galloways were entered. At both shows the quality of the live stock was uniformly good, bespeaking the best of breeding and care. In fact, it is perhaps not too much to say that never before has Missouri seen, in a single year, two live stock shows made up of animals of such outstanding excellence. The very superior quality of the animals entered is ample proof of the progress that is each year being made by breeders. Higher standards of individual worth have been established and a nearer approach to the goal is each year being made by an ever-increasing number of men who are engaged in that greatest of all branches of agriculture—the breeding and feeding of live stock. Standards are also more stable. Fads are less a factor. The breeder now has pretty firmly fixed in his mind the type of animal which he is trying to produce. Just how important this is only the scientist and the experienced stockman can realize. The Missouri State Fair and the American Royal are more than "style shows." They are, in fact, great demonstrations and schools. Each year they serve as inspiration to the thousands of visitors and indirectly add to the value of the live stock on every farm represented.

We have referred to the high quality of the live stock at both these shows as exemplified in the breeding. It is also true that the animals were never exhibited in better "bloom." They were, generally speaking, a finely fitted lot, not overdone, yet presenting an appearance in keeping with quality. This is as might be expected at a time when practically all meat animals are commanding record prices and when the "spread" between the scrub and the prime steer was never wider. With market cattle and hogs on the hoof, both commanding $10 per hundred and better and with an unprecedented demand for choice breeding stock, it is natural that, even with the high prices for corn and other feed, show animals should be presented in good form.

The character of the crowds at both shows was corespondingly high. Men who breed and feed live stock are community leaders and at this time their very appearances bespeak prosperity. But not only are these men prosperous farmers: they are students—hence their success. It is not idle curiosity, not the mere seeking of pleasure, the chance to meet and mingle with old friends and to make new acquaintances, that takes these men to such shows. They go to study. And what business is it that requires more careful study and thought than does farming?

The difference between farming in the yesterday of $1.25 land and the today of $125 land was amply illustrated in the great show animals exhibited in Convention Hall in Kansas City during the day and the "long horns" lassoed and "bulldogged" by cowboys as part of a wild west show in the same hall at night. Here in the heart of the world's greatest corn and bluegras belt must be, and is, the home of the world's best beeves. On the farms of this territory successful men long ago learned that they cannot afford to put good feed into poor cow skins. So here, today, are being bred and fed live stock as good as the world knows. This is no idle boast. The truth of this statement is borne out by the records of live stock markets, of sales of registered stock and of the country's leading shows.

One of the most encouraging features of both these meetings was the increased attention given to both the

production and market sides of live stock production. As one mingled with visitors and exhibitors and listened to the conversations this fact was contstanly impressed upon him. How best to profitably grow and finish the good ones—the kind the market demands—was the problem constantly discussed. Individual practices must always differ somewhat, but there are certain well-established rules the value of which one sees demonstrated at every such show. This, in the end, is the greatest good of going. Top market prices and championship honors do not represent luck but come as a result of approved practices.

What has been said of live stock production applies with almost equal emphasis to all other branches of agriculture. The men who won highest honors and who helped make possible the really great corn show at Sedalia were corn breeders. They got the right type in mind, put the right kind of seed in the right kind of soil, gave it the right kind of cultivation —and won. In no other way can one consistently, year after year, go on producing good corn—best by the score card or the barrel. The apples that won at Sedalia were from orchards cared for, propelry spayed, pruned and cultivated. Otherwise, they would not have won. So goes the story.

Now, reader, did you go to these two great shows and did you get the story? If so, it should be reflected in your own farm. W. L. Nelson.

GRASS AND CLOVER SEEDING

I attribute a good measure of our success in keeping up soil fertility, to our heavy seeding of grass and clover, something we have never neglected, even though seed prices were high and money scarce. On our rolling lands it is absolutely necessary to protect the soil with some kind of a growing crop, and we have never found a better combination than timothy and clover, for this purpose, as well as for a hay and pasture crop.

An eastern farm paper, some twenty years ago, offered prizes for the best letters on the topic, "What is the best combination for hay, pasture and soil protection" getting several hundred answers, a large majority favoring timothy-clover. I have not succeeded well, as a rule, in seeding timothy alone for either hay or pasture, always having better success by adding the clover, neither have I had the best results by seeding either without a nurse crop.

Our grain seeding is done from October 5 to November 5, and it is at this time that most of the timothy seed is sown, but I have done well by sowing up to the first of December.

Some years ago I was half a bushel of timothy seed short, and my dealers supply was exhausted, but the day after Thanksgiving I found that I could get that much from a neighbor. It was sown about December 1, and if there was any difference between the crop grown from this half bushel and what was sown in early October, I could not see it.

A gallon of timothy seed per acre, evenly distributed, makes a fair stand, especially when three quarts of medium red, or half a gallon of alsike clover seed is to be sown in spring.

We have long practiced adding nearly an equal amount of timothy seed to the clover seed in winter or spring seeding, and think that it pays us to do so.

As to seeding clover, my favorite season is early April when the soil is dry, and following the seeder with steel harrow setting the teeth very slanting. It is not easy to lay down a rule as to the best time for clover seeding, as this varies in different localities.

I have been in two or three sections where fall seeding of clover was successfully practiced, especially with alsike, the seed being sown so late there was no danger of its germinating until spring, the seeding being done from November 25 up to December 20. A single trial of this on my own farm gave me an excellent stand.

A neighbor, and he is a very good grass grower, says that he sows almost any time in the year, and I know him to be in the habit of doing this when he has failed to get a stand at the usual time of seeding. C. D. Lyon.

FARM LOANS AND THE RENTER

The question has been frequently asked, "How can a renter who has not saved 50 per cent of the purchase price of land make use of the Federal Farm Loan Act to get land of his own?"

This question has been answered by P. W. Goebel, of Kansas City, Kansas, president of the American Bankers' Association, before the hearing of the Federal Farm Loan Board at Topeka, Kansas. Mr. Goebel's verbatim statement covering this matter follows:

I heard several gentlemen say this morning, "But how are you going to advance the interests of the tenant farmer that has not got the 50 per cent saved up to buy his land?" Why, if the tenant is the right kind of man there will be no trouble whatever. And here the personal equation comes in. The Government must require absolutely the same maximum requirements from everybody that does business with these banks, and the local banker will take into consideration the personal equation of a man wanting to buy the land; and, as a banker, I would not hesitate to say that I would loan freely on second mortgages. I would not in a commercial bank; but in a trust company or investment bank I would lend freely on second mortgages so long as I could see that the interest and the amortized payment on the first mortgage and the interest on the second mortgage and taxes and upkeep of the land would still be less than the rental value of the land.

"We will say a young man who has worked for a farmer for a number of years, or a man of middle age whom I have known for years who has rented a place, comes to me and he says, 'I have $1,000, and I have two span of horses and some cows and some sows—enough reasonably to stock 60 acres of land. I have got to pay $50 an acre for the land. I can get a loan through the National Farm Loan Association of Staunton township for $2,000. Will you loan me the otehr $1,000?'

"Now it is a very easy proposition to figure it out. I will figure that on the first mortgage of $2,000 he will pay $120 interest at 6 per cent. I am figuring now on the maximum. He will pay $20 on the amortization fund. Now, I loan him the $1,000 at 7 per cent, if you please. He will pay me $70, and I will figure that his taxes cost him $50, which makes a total of $290.

"Now, that 80 acres of land if he rented it would cost him anywhere from $325 to $400 a year rental. It goes without saying that he will take more interest in that piece of land as an owner than as a renter. He will take better care of it and improve it. It will be improved rather than deteriorated. It does not take a great stretch of imagination to see this man with the $1,000 I loaned him can pay on an average of $100 a year on the principal. In other words, he can retire the $1,000 I am loaning him in 10 years. Then, he will simply have a proposition that with any intelligent work at all he will absolutely make a living, and the small sum he pays yearly to retire his loan finally will hardly be taken into consideration. In fact, it is my opinion, and what I am saying to you, gentlemen, is simply based on years and years of observation of the farmer and continuous financial and other business I have had with him, with any intelligent work he will have something that will make him an absolutely sure living for a good sized family.

"The result of these long-time loans will also be that more of the income from the farm can be placed into equipment for the farm; equipment not only to bring larger returns in dollars to the farmer, but that will make the family feel like they want to stay there. To my notion the greatest lure of the city is the fact that these farmers' wives and daughters come into the city to visit friends perhaps who have modern equipment in their houses. It appeals to them more strongly than anything elese, and makes them more dissatisfied with farm life than anything else. Now, with the bugaboo that the mortgage is going to come due in two or three years 'I don't know how I am going to be able to renew it, or I don't know what I have to pay; there may be stagnation in land values,'—with that bugaboo removed, why, anyone who has the welfare of the farmer at heart can readily advise him, "Now, put some money into your house and make it modern so you can make your family feel that they have the same chances for comfort and pleasure as the average laborer has in the city."

Doing "the Impossible"

The Gordian knot is the ages-old symbol of the seemingly impossible. Alexander the Great gave it a place in legendary history when, unable to untie it, he cut it in twain with his sword.

This famous incident of antiquity has its modern counterpart in the real work of the men whose vision and unrestricted initiative brought forth the great Bell System.

In the development of the telephone, one Gordian knot after another has been met with. Yet each new obstacle yielded to the enterprise of the telephone pioneers. Every difficulty was handled with a will and a courage which knew not failure.

Man's words have been given wings and carried wherever his will directs. Electrical handicaps have been overcome one by one.

The feeble current of telephone speech has had a way hewn for its passage through all physical impediments, until the entire country, from the Atlantic to the Pacific, is within hearing of a child's faint cry.

This record of the Bell System for past achievements is an earnest of future accomplishment. New problems are being met with the same indomitable spirit, which guarantees a more comprehensive as well as a more perfect service.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

THE COMMUNITY SPIRIT

No individual can accomplish much for himself without more or less enthusiasm for his work. The man who loves his work and has some aim ahead of him will accomplish something worth while in spite of heavy handicaps that may possibly get in his way. What is true of the individual in this respect is true of the community whether we apply it to the small neighborhood community, the county or the state.

The community spirit that accomplishes things of worth is the spirit of co-operation and unselfishness. But if the individual should consider his own welfare of first importance his own good will be taken care of in a much better way by working with his neighbors in those things which can be done better by the community than the individual can do them alone.

A pure bred animal or a bushel of high quality seed will have more buyers and ordinarily sell for a better price if it is produced in a community having a reputation for producing good live stock or good crops. The article has the good name of the community added to the reputation of the individual to help find buyers and to make a sale.

If this be true then why should any man fail to join with his neighbors to make a neighborhood reputation for producing high class live stock, poultry, seeds, fruits or something for which the community is adapted? In most any township in Missouri we can find two or three and possibly a half dozen breed of cattle, horses or hogs and none of them, or at most few of them of any particular merit. If instead of this condition we could have a community or better a whole county where but one breed was produced and every body working with his neighbor to make that breed better how long would it take to give that county a reputation that would spread over the entire state, and beyond the borders of the state?

This is a work that can be taken up to advantage by the many farm clubs of the state and we would suggest this as one of the things farm clubs should do this winter. In order to do this every man and every club must join in with the true co-operative and unselfish spirit.

An example of the value of the community spirit is shown in the success of the effort to make a seed corn center in Saline County, Missouri, which was inaugurated by the County Farm Bureau and largely directed by the County Agent. More than 100 farmers joined in the first year's work and actually paid something to get to do it. Think of it dear readers of THE MISSOURI FARMER, you who may happen to live in a community where there is no effort to do things in a co-operative way, that here in Saline County one of the old conservative counties of the state more than 100 farmers actually paid something to get into a co-operative movement to help the whole county. The County Farm Bureau put on a County Corn Contest and offered prizes amounting to $1,000 but the fine spirit of the movement is shown in the fact that the money for the prizes was furnished by the contestants themselves. Each contestant agreed to give to the Farm Bureau ten bushels of selected seed corn and in the event that this corn was not considered of good enough quality to be offered for seed the contestant agreed to pay $10 in cash to the prize fund.

As a result of this splendid movement 534 bushels of fine selected seed corn was sold at last year's corn show for an average of $3.54 a bushel and this represented only a small part of the good work, for hundreds of bushels were sold privately as a result of the advertising given Saline County by the contest.

On another page will be found the announcement of the second contest to be held at Marshall on December 1 and 2 with 186 contestants entered. Last year the corn sold went to eight different states besides a number of counties in Missouri and this year ought to prove even greater than that. There is not a county or a community in Missouri but what could make a reputation for producing something of superior merit and bring prosperity to the farmers if they would only get together and show the same enthusiasm and good judgment that the farmers of Saline County have manifested in this seed corn contest.

SAVE THE TOWN

We hear a lot of tommy-rot these days about saving the town but I think it is about as important that we try to save the country. As soon as we start a more efficient way of buying or selling the things we need and what we produce on the farm some interested party raises the cry "save the town." I know a small town of about 1000 people typical of many other towns in Missouri located in good agricultural sections and in this town there are three cream buyers buying cream and shipping to centralized creameries. When some one suggested a co-operative creamery for that community these three men held up their hands and said "why, a co-operative creamery will put us out of business" and through their selfish influence the movement for a co-operative creamery was killed. Now these men are entitled to consideration but shall we let the interests of three men outweigh that of 1000 people? Why not adjust the business of the town so that it will best serve the 1000 together with three or four thousand more who live about the town and help to make it?

In the above instance a co-operative creamery would kill the business of three men but the building of a creamery would furnish several weeks employment for masons, carpenters, painters and others who need to be considered when we talk about "saving the town." A co-operative creamery carefully managed should be able to pay 5 cents a pound more for butter fat than the creamery agents can pay and in a community where 500 cows are milked this should amount to an increased income of $3,000 to $4,000 a year. Would not this be a good way to "save the town" even though you must destroy the business of those men whose business is destroyed?

There are some pretty cold facts staring us in the face and the sooner business men as well as farmers realize the trend of events the better it will be for both town and country. The truth is that very few farmers are making any money and it is for this reason that the brightest of our farm boys are leaving the country. It is for this reason that farm mortgages are yearly growing in both size and number and that each year we see that more of our farm lands are owned by landlords who live in the city. In today's mail we received a letter from one of the best 240-acre farmers in Western Missouri lamenting the fact that his son had been lured from the farm by a $100-a-month job with a mining company. Talk about the beauty, health and pleasure of farm life all you please to that young man, it would not keep him on the farm for he knows that not one young farmer in a hundred can get a labor income of $1,200 a year out of the farm with a $10,000 or $15,000 investment to work with.

Some farmers blame the bad crop years for present conditions but it is our opinion that poor crops are not half so much the result of drouth as they are of a worn out soil. The worn out soil is not so much the result of poor farming as it is the effect of a system that compels the farmer to work his land hard and to draw on the natural fertility in order to make a living out of it.

I want to "save the town" but I do not want to see it done at the sacrifice of the country. Most men who have studied this matter agree that there is now too much waste between the producer and consumer and this is true whether the producer is a manufacturer or a farmer. We can use more men in the factories of this country and more men on the farms but we now have a surplus of retailers and their number ought to be reduced. The large number of retailers and the credit system are two of the principal causes of high prices today and the sooner they are both reduced the better it will be for both town and country. Those who would "save the town" had better begin within than without to find the remedy.

CATCHING THE SPIRIT

Eevery mail brings us letters from dozens of farmers who have caught the spirit of the fight which THE MISSOURI FARMER is making and we believe we are safe in saying that there well be at least a thousand Farm Clubs in Missouri by the first of the year. Scores of these letters wind up by saying that the writer appreciates the "splendid farm information" which each issue of the paper contains—and this is a point I want to touch upon briefly. It is true that THE MISSOURI FARMER believes the question of farmer organization to be the overshadowing farm problem of the hour. We believe that only by this means will farmers ever be able to rescue themselves from an idiotic situation where they are compelled to pay what the other fellow asks and accept what he offers for the fruits of the farmers toil—that only through organization will farmers ever be able to free themselves from the throat clutch of the Big Packers and the grain gamblers who manipulate grain prices—that only in this way will we be able to shorten the route from producer to consumer which, under existing conditions shames the intelligence of the entire Nation. Nor do we believe for a single moment that we have over-estimated the gravity of the situation. The two last census decades reveal an increase of over 100% in farm mortgages. Likewise they show that approximately 40% of the farms of the Nation are in the hands of tenants—with rural population growing constantly less. And these alarming conditions offer overwhelming proof of the fact that the hour has come when farmers must organize and, like the manufacturer, merchant, Organized Labor and other classes demand the production cost, together with a reasonable profit on the things produced upon the farm.

But this does not mean for a single moment that we propose to relax our interest in better farming or that we expect farmer organization to take the place of thrift and intelligence. On the contrary, what we are trying to do is to give thrift and intelligence a fair show—to reward them as they are rewarded in other fields—to so intrench them that they will no longer be at the mercy of the "stuffed club" of the Packers or other manipulators who can, under present conditions, destroy within the space of a few hours or days, the years' profits for millions of farmers.

And now, my good Brother Farmer, won't you put your "shoulder to the wheel" and help? Won't you try try to get a half dozen of your neighbors to give you a dollar for two years subscription to the paper so they may become enlisted in this great fight? If you would like to see a Farm Club organized in your district, this is the quickest way to bring it about. We are fighting not merely for you alone. We are fighting for a "square deal" for your children in the years to come. With a good fighting friend in every school district we could soon make THE MISSOURI FARMER the greatest power in the state—and won't you help do it? I will be glad to send you a bunch of sample copies and full information about organizing a Farm Club if you will send a 2c stamp to cover postage. This is **your** fight.

WILLIAM HIRTH, Publisher.

Ownership of The Missouri Farmer

In accordance with the law enacted by Congress which requires newspapers and magazines to file a statement showing the name of the editor, business manager, the owners of the publication and the names of any bond holedhs, mortgagees and other security holders, The Missouri Farmer has filed the following statement with the Potsoffice Department: The managing editor is Geo. B. Ellis. The business manager is William Hirth. The Hirth Publishing Company, which owns The Missouri Farmer, is incorporated for $20,000 divided into 200 shares, 189 of which are owned by William Hirth and 10 shares by Lillian Hirth.

COME LET US REASON TOGETEHR

A Boone County subscriber writes the following letter to THE MISSOURI FARMER which probably shows why it is some farmers are not in favor of the Missouri Land Bank.

Mr. William Hirth, Publisher:

I am a reader of your paper and I want to thank you for the many good things you advocate in the interest of farmers. However I can't see that Land Bank Bill like you put it up. I have read and re-read everything you said about it. There are several features about the measure I do not like and I will only speak of a few of them.

It provides for a number of expert land appraisers at a salary of $2,000 and expenses. Can you show me a man who is careful about his expenses when the other fellow foots the bill? In the next place it takes so much money to run the state as the matter now stands when both the lender and the borrower are supposed to pay taxes but if I borrow $1,000 and bu a piece of land and you have the $1,000 and buy bonds with it then where wil the taxes which are released from the bonds come from? Will not the land have to make it up?

If I borrow $1,000 I can elect to pay it in five annual payments of $240. Then I would pay $200 of the principal the first year and so on for the five years. Now at the end of four years I have paid all the principal but $200 and have just as much interest to pa at the end of the fifth year as I did the first year. Now did you stop to think the interest would be $200? I can borrow $1,000 at 7 per cent and pay $200 on the principal each year, the interest would only be $210 so I have only gained $10. Do you think that would pay? You can pay only on any interest paying date. When you tie a farmer down to a certain day it will catch him sooner or later and then he can get only half of the worth of the land.

This is a little of my own experience. In 1899 I bought a piece of land borrowed four-fifths of the money at 6 per cent and could make a payment on it any day in the year when I the money. As I now see it I can't support the Bill. J. B. Hendrix.

Editor al Comment:

Your discussion of the Land Bank has been referred to me by Mr. Hirth and I am going to talk it over with you through THE MISSOURI FARMER in a neighborly fashion. In the first place the printer made an error in Mr. Hirth's article. The annual payment on $1,000 under the Missouri Land Bank will be only $224 for a five year loan instead of $240 as the printer had it. I also note some mistakes in your figures but let us try to get at this matter so we will both understand it. So I will take up your objections in their order. But before we begin to answer your criticisms let us first ask if you have any prejudices or self interest in this question? If so you must try to put them aside or it will be of no use to discuss the matter. This question of better credit facilities for borrowing farmers must be considered from the standpoint of the general good and not from that of any individual. I find some men opposing the Gardner Land Bank because they are opposed to any change—think the present order of things is good enough—these men are controlled by prejudices and of course they are not going to be convinced. I find other men who have a little money to loan and they are against any plan of rural credits because they fear it may cut down their interest, forgetting, of course, the help it will be to those who are most in need of help—the mortgage-ridden farmers. In the same class, I find men who are stockholders in banks and trust companies opposing the Missouri Land Bank and the reason is apparent, it is self-interest, and selfishness is about as hard to overcome as prejudice. You know the good Book says "Ephraim is joined to idols, let him alone" and I am not expecting the above classes or others I might mention to favor the Land Bank Bill. But all men who will study this measure carefully and who can understand the inevitable trend of conditions in this country and who will divest their minds of prejudices and selfish interests I am sure will be for any practicable scheme of better farm loans.

In 1910 nearly three-fifths of all the farm land of the United Sstates was owned by less than one-fifth of the land owners. One-half the farms of the country, approximately, are now mortgaged and more than one-third are run by tenants. Suppose these tendencies keep on, how long will it be before the land will be in the hands of a few men and the rest will be tenants? Do you want to see that condition in this country as it now exists in England or do you want to see the land well distributed among the many who will own and operate it just as the farmers of France and Germany do today? We are at the forks of the road on this question and we must take our choice which way we will go.

Your first objection to the measure is that it provides for expert appraisers who will value the land. Now lets be fair. How otherwise would you get at this? Would you take the borrowers word for it? That would be idiotic would it not? These appraisers will get their salaries out of the reserve fund and the one-half per cent all borrowers pay on their loans to that fund will pay all the appraisers and create a nice surplus besides. The appraisers are not appointed by the Governor at all, but they are appointed by the manager of the bank and must be approved by the board. This is just about as safe as it can be made. Who pays the expense of appraisement now? The borrower of course. One insurance company which has twenty million dollars loaned in Missouri pays their chief appraiser $6,000 a year and expenses—just three times what the Land Bank will pay.

The reason these bonds are exempt from taxation is to make them sell readily at par, drawing a low rate of interest. They are exempt because double taxation is wrong. Now, suppose on the first day of June you own an 80-acre farm worth $4,000 on which you are assessed for taxes and I have $2,000 in money on which I am assesed. The state then gets taxes on a $6,000 valuation from both of us. But suppose that on May 31 you sold me the land for $4,000 taking my note and mortgage for $2,000 and the $2,000 in cash. Now what happens? There is no more wealth or property than before but the assessor will get you for $2,000 cash, the $2,000 note and will get me for the $4,000 on the lanc. On the same property we will now pay taxes on $8,000 instead of $6,000 as before. Do you see anything fair about that? No, the present system is more like the single tax because it places more tax on the land and the Land Bank will take it off by giving the borrowers a lower rate of interest. But most of the money loaned on our farms comes from outside the state, is loaned by insurance companies and other corporations or individuals and these bonds and mortgages are not assessed now. If we should require a small registration fee for all these mortgages we would make the man outside the state pay the same as the one inside and without the double taxation would get a great deal more money into the state treasury than we do now.

Now as to comparison of the cost of a loan from the Land Bank and from a private source, let me give you this illustration which I think will make it plain to you. You can get a 5-year loan of $1,000 from the Land Bank and pay it off, principal and interest with five payments of $224 each. If you borrow $1,000 at 7 per cent in the ordinary way and make the same payment, $224 a year, you will still owe after making the five payments $114.39. That is quite a saving on a small loan don't you think? But there is a much greater difference if you make the time 20 years, and few land loans are really paid off these days in mucn shorter time. If you borrow $1,000 from the Land Bank for 20 years you will make twenty payments of $75 each and the debt is wiped off the slate. But if you borrow $1,000 in the ordinary way at 7 per cent for 20 years and make the same twenty payments of $75 you will still owe $795.07. Would not $795.07 look pretty good to a man after he had struggled along for 20 years with a $1,000 mortgage on his farm?

Your last objection is that the Land Bank allows payments to be made only on interest paying dates. While there may be a few loans made by individuals who will take payments at any time, we think it safe to say tat more than ine-tenths of the money loaned on Missouri farms can be paid only on interest paying dates and so this is only following the ordinary rule in this matter.

I hope I have made this plain to you. We should study these questions apart from our own personal interests. Perhaps you nor the writer will ever negotiate a loan from the Land Bank if it is authorized but there are more than 128,000 mortgaged farmers in this state who will be benefitted by it and for one I am ready to help them. Geo. B. Ellis.

Our crop yields may not have been all that we would have had them, but with hogs and cattle prices "away up in the tree tops" there's much for which to be thankful.

GALLOWAY'S 1917 MODEL NO. 8 SPREADER

NOW READY

JUST READ THESE IMPROVEMENTS S-24

They mean that every Galloway Spreader is BUILT STRONGER AND BETTER THAN BEFORE. The beater bolts are 1-16 in. larger with lock nuts. Beater bar bolts increased in size and stength. Beater teeth longer and stronger than ever which means they now tear the toughest manure finer than ever and spread it easier. Heavier bolts hold the beater bars in the beater head. Rear shaft is increased in strength—higher carbon steel used. Additional bolts strengthen (beyond actual necessity) the beater bracket. Larger drive sprockets, which mean LIGHTER DRAFT THAN EVER. The fifth wheel castings are larger and increased in strength; spreader box STREADER in turnings. Rear conveyor shaft now made of No. 40 carbon steel. All steel tongue. All metal parts thoroughly coated with asphaltum weather-proof paint. Spreader box better finished and painted. Galloway WIDE SPREADING V-RAKE on every machine WORTH $15 on any spreader, COSTS YOU NOTHING EXTRA. INVINCIBLE, IRRESISTIBLE, PATENTED ROLLER FEED—an EXCLUSIVE GALLOWAY FEATURE, makes it SUPERIOR to all other feeds on all other machines—the SECRET OF OUR LIGHT DRAFT. The mechanical principle is the same as MOVING A HOUSE ON ROLLERS. THIS FEATURE ALONE WORTH $25 on any spreader. EXCLUSIVE AGAIN on the Galloway, costs you NOTHING EXTRA. PATENTED AUTOMATIC STOP uniform clean cut push board WORTH $10 EXTRA on any spreader. EXCLUSIVE on the Galloway, costs you NOTHING EXTRA. These are a few of the features you will find on the Galloway, which are PROTECTED BY GALLOWAY PATENTS. Don't buy a spreader of any make or kind until you have tried a genuine GALLOWAY 1917 MODEL No. 5, No. 1A or No. 8 at our risk, without obligating yourself in any way. Thirty days' field trial and returnable to us within one year if not perfectly satisfactory. Remember, we manufacture this spreader in our own factories and sell it direct from factory to farm. Do not confuse the Galloway spreader with lower priced machines made to sell for a price, which are all cheap, worthless imitations. Over 60,000 Galloway Spreaders in use. These and other features make the Galloway Spreader more invincible than ever in actual field work. No big, cumbersome, four-horse or three-horse team needed to handle a Galloway. Two average horses can spread with the Galloway anywhere. Complete particulars and details of this 1917 model spreader now ready. Ask for my BIG 250-PAGE CATALOG, also my FALL BARGAIN BOOK. A postal get's them.

The Code of the Mountains

By CHARLES NEVILLE BUCK

A STORY OF A MOUNTAINEER WHO BECAME CIVILIZED

The town of Winchester, like all the county seats of central Kentucky, breaks from its drowsy somnolence into a brief activity on court-day. On one Monday in each month the roads fill with an unaccustomed caravan of trade. Then under the hammer of the street autioneer farm gear and live stock change hands; saloons and eating-houses do a banner business; politicians often harangue in the court-house square; friends renew old acquaintanceships and sometimes enemies renew old quarrels. But Winchester differs in one respect from its sister towns. The savor of a soil rich in chilvaric traditions hangs here as it does over neighboring counties, and yet there is a difference. For Winchester is the nearest town of consequence to that foothilled borderland where the opulent bluegrass ends and the illiterate Cumberlands pile their grim ramparts. Here come the farther-wandering traders from the mountains; gaunt men with steady-gazing eyes and lean sinews and noiseless tread, to mingle with the louder-spoken and fuller-nourished brothers of the lowlands. It is on court-day that they come in greatest numbers. Here, too, live some of their own kin whom the menace of feudal reprisal has driven from their native slopes and "coves." With the montaineer's strong yearning to remain as near as possible to his birthplace, these refugees have made new homes and new lives at the edge of the bluegrass where on occasion they can again see familiar faces. From Frankfort to Wincehster is a matter of almost fifty miles, and Newt Spooner, who had taken up his homeward journey on a Saturday morning, saw its court-house cupola and church spires pierce the screen of foliage on the forenoon of Monday, which chanced to be the Monday allotted to Clark County for its court.

Newt was very tired and very hungry. His rebuff at the farmhouse had festered and rankled in his mind, and he had refused to ask hospitality again or to speak to any man, save for the curt asking of necessary directions. In Lexington he had bought himself a "snack," but because he was penuriously hoarding his small capital, he spent with a stingy hand and pushed onward unsatisfied.

Now, as he trudged wearily, he saw a figure by the roadside at his front. The figure was that of a negro, who sat on a rock pile in the sun, hammering limestone chunks into road metal. As the boy came nearer, he saw another detail. The black man, though unguarded, was a prisoner and he sat safe against the chance of escape by reason of the huge iron ball fastened to one ankle by a padlocked chain. The white man, himself so lately released from the penitentiary, halted. He had the mountaineer's chronic aversion to "niggers," but here was someone whom he could question and who was in no position to insult him.

"How fur mout hit be ter Winchester?" he demanded.

The negro, welcoming interruption and conversation, turned with his granite-headed hammer poised over a piece of limestone.

"It's a right-smart piece, if a man's leg-weary. It's about a mile, boss," he said.

A mile to the hills-man is nothing; a mere "whoop and a holler," yet now it seemed to the ex-convict as his informant said, "a right-smart piece." The glow which spotted his pallid face at the cheekbones told of a temperature. Through his limbs went a dull ache. From time to time he coughed. Finally the negro laid aside his rock-hammer, and gazed long and inquiringly at his silent visitor. He, too, recognized the state-bestowed clothing and its meaning.

"'Scuse me, boss," he suggested, "but yer done come from Frankfort, ain't yer?"

Newt Spooner nodded, but his eyes narrowed, discouraging interrogation.

"Was yer—was yer in de pen'tenshery, boss?"

The man chained to his rock pile doubted the wisdom of his question but African inquisitiveness had mastered his better judgment.

Instantly he recognized his mistake. The boy from Troublesome was at once on his feet and his sallow face was distorted with anger. From his lips came profane volleys of abuse. Transported by rage, he took a step forward with clenched fists. The negro clambered to his feet, and, since he was anchored against flight, backed away defensively, waving his rock hammer.

Newt Spooner selected a huge fragment of the scaly limestone, and withdrew just beyond the range of hammer and chain; but as the negro, in a paroxysm of terror, fell pleadingly to his knees, he dropped the missile at his side.

"I hain't a-goin' ter bust in yore black head," he said in slow wrath, "because I got another job ter do. Thet's ther only reason why I hain't a-goin' ter kill ye." Then he turned into the road and took up his joruney again.

* * * * * * *

Back there in the fastnesses of the hills, toward which he was making his way, the leaven of change was beginning to work, yeast-like. When he reached his destination he was to learn with surprise that he could not take up without interruption the story of his life; the story out of which pages standing for two years had been torn. Births and deaths and the giving in marriage were not the only things that had happened. Quietly a new agent had entered in; the agent of a patient spirit of education. This spirit came burning in the hearts of men and women from below, who realized that they must breast stubborn opposition and that they must adapt their methods to the life they sought to change. They must plant and nourish the new idea in the younger minds and they must not seek to alter in a twinkling a regime that had long been immutable.

But buried deep in the forestry of the tangled hills, far back from a railroad stood a group of buildings that seemed miracle-reared. They were stanch buildings of square-hewn logs, which in contrast to the ramshackle huts about them appeared to have been lifted from another world and transported on the winds of some benevolent cyclone. It was difficult to think of these houses as having been raised from solid foundation to level ridgepole so far from the facilities of transportation. Yet here in the wildersness stood the "college."

It was no vaunting boastfulness that had inspired the almost fanatical men and women who stood as sponsors for the enterprise to give so high-sounding a name to the institution which taught kindergarten and primary classes. Some day, they hoped, it might grow up to its title, and meanwhile there were gray-beards and wrinkled women who sought to study primer and multiplication-table, but whose pride would bar them from advantages undignified by the name of college.

On the spring morning when Newt Spooner was trudging homeward, Doctor Murray, who had slowly and courageously turned his dream into a reality, sat in the study of the college. There was a smile on his lips, and the square-jawed face, which escaped all trace of the pedagogic, was contented. The sun streamed in through his windows and lighted a room finished in wainscoting of oak and maple—sawed at the mill, which was part of the instituition and which he could see from his window, when he looked down.

Above, when he cast his eyes in that direction through another window, nestled the small hospital, where barbaric methods of local surgery were being altered. But, best of all, there came to his ears laughter and shouts from the trim campus where boys and girls were at play; boys and girls who until they had come here, had known little about laughter and much about drudgery. And every peal of mirth was a challenge to the old order of hatred and the ancient thraldom of sullenness.

A girl came into the room and laid some papers on his desk, and the doctor nodded at her with a smile.

"Minerva," he said, "I'm afraid you are working too hard. One doesn't have to learn everything at once, you know."

The pupil flushed and stood for a moment silent. She was straight and lithe, and under the blue calico dress that was turned down at her neck, her throat was brown with a tan through which a petal-like color glowed. Her brown hair glistened with the glint of polished mahogany, and her eyes struck the doctor as eyes meant for mirth, though they had hardly learned to laugh. The deadly seriousness of the hills and the Calvinistic seriousness that makes martyrs, seemed to hold in bondage a spirit that nature had intended to radiate gaiety. Her fingers drew themselves together into fists, and after a moment she spoke slowly, and her speech was a strange blending of the illiterate argot of the hills and a conscious effort to speak in the phrases dictated by the education which she coveted.

"I reckon ye don't hardly know how much I've got to learn," she said. "I reckon ye don't realize how plumb ign'rant I am."

Suddenly her voice became passionate.

"Maybe ye don't know how I hate it all—how I want to get away from ign'rance an dirt an' wickedness. I've been wonderin' if I didn't err in comin' here. It's just makin' me hate that cabin over yon—I mean over there—on Troublesome. Sometimes I think it can't hardly do nothin'—do anything—but make me dissatisfied."

The head of the school looked up, and his face grew grave.

"There are times," he said, "when that thought comes to me, too. I don't mean as to you, Minerva, alone, but as to all hose we take here and teach. At first it was all a dream of bringing a light to a place that was dark. That was the only phase I saw. But later I saw more. One can't make a dream a reality without struggle. Dissatisfaction is the price we must pay for regeneration—and people like you and myself must be among the first to pay it."

"Over there," she went on, as though talking to herself, "they only hates me for it. They says I'm stuck on myself an' that what's been good enough for my folks for all time ain't good enough for me no more—I mean any more."

"It takes time," the man reassured her. "In the place of ignorance, we offer education. In the place of lawlessness, we offer law. In the place of squalor, we offer thrift. Are those things not worth what they cost?"

The girl stood silent for a moment, then nodded her head.

"I reckon so," she answered simply, and turned to leave the library. After she had gone, the teacher sat for a time with his book open before him, but his eyes were contemplative, and it was from memory and not from the printed page that he was reading.

He was thinking back and seeing over again a day shortly after his school had opened. In those times there had been fewer buildings, and of the many pupils who came, hungry to learn, only a few could be taken in. Among the first had been Minerva.

She had come exhausted and tired because she had come on foot, and her mean calico dress had been briar-torn, and her feet, which were bare, had been bruised. But in her eyes was gleaming a passion of hunger and resolve for the food which the school offered the mind. She had presented herself, a ragged little medicant asking the alms of education, carrying what belonging she had in such a bundle as tramps carry.

Back in her unlighted and windowless cabin, she had heard of this "new-fangled" institution where was to be dispensed the pabulum of "larnin'"—and she had made her pilgrimage. Now Doctor Murray was recalling that day. He had been down by the stile which gave entrance from the creek-bed road, when he had seen the slight figure trudging along, and the girl had stopped and eyed him shyly.

"Air ye the feller frum down below what aims ter give folks larnin'?" she had demanded, as her large eyes held his with a tense directness, untinged by any humor.

"To give folks learning is a large contract," he had answered with a quizzical smile; "but we hope to give to as many as we can, at least its rudiments."

"What's them?"

"The start. Have you ever been to school at all?"

"I've done been ter the blab-school. I kin read an' write an' figger."

Dr. Murray had stood there looking at her, and it had come to him that she made a very pathetic picture, with the yearning in her eyes and the dust of travel on her calico, so he denied her with a heavy heart.

"Just now," he said regretfully, "we can only take in a few pupils and we are already overcrowded. I'm afraid we can't make room for you." Suddenly he added, "How far have you come?"

"The rise of twenty mile, sence sun-up," she informed him simply, then tears welled rebelliously into her eyes. Her voice broke from her lips with a fierce passionateness.

"Ye've got ter take me," she cried out. "Ye've jest simply got ter take me. I've done been prayin' ter God Almighty ter give me a chanst. I've done heerd that ye war a preacher of ther Gospel, an' I reckon God hain't a-goin' ter suffer ye ter turn me away."

Doctor Murray had then been new to the hills. The storm-like intensity of the mountain character was bringing him its revelations. He stood there by the road, watching the ox-teams that were bringing logs in to his saw-mill and made rapid calculations and as he did so he heard the new candidate for matriculation rushing on:

"There Scripters says thet God's servant won't tern away sich as comes to him seeking light—an' I've done come."

"At all events," he answered gently, "come up and have something to eat, and I'll talk it over with my wife."

Mrs. Murray had spent a half-hour with the girl, and then had come back to her husband.

"She is as wild as a squirrel," was her announcement, "but I have never seen such a starving heart or brain. I don't know what we shall do with her, but we must let her stay." And so Minerva had stayed.

Now she went out of the library, and made her way to a favorite spot up on the hillside. It was a study hour, and she carried a book with her. The time she had spent here had wrought a transformation. The brain had unfolded and the heart had become unplaced. The terms of this school adapted themselves to the needs of the environment. They did not conflict with the nearer demands of farm work, but accommodated themselves to necessity. When the frequent vacations came, Minerva went back to the cbain which she called her home. Each of these visits she dreaded.

Mountain reserve is hard to break. Even in her tempestuous appeal to the head of the school, she had not told her full story. Now she was thinking of it.

Mountain women grow old while they are yet young, but her mother had seemed to her different. Mountain women are grave with a gravity which is more than half sullen, but she remembered a mother who had laughed and whose voice had been often raised in song. Then when she was still very small, she remembered one of those rude mountain funerals where those who come raise their voices in a weird incantation of "mourning," which they leave off for gossip as soon as the period set aside for the clamor comes to its end. After that she had been motherless and had kept house for a shiftless and surly father. That house-keeping had been simple enough in the shack of one room, but it had been unrelieved drudgery, and because she was one of those human beings who are less near of kinship to the members of the family with whom they live than with some far-off ancestor whose nature is strangely duplicated, Minerva had al-

ways had longings for things which were to her undefined dreams. Her nature had always been in insurrection against the squalid facts of her life. Her inclinations and thoughts struck back, by one of Nature's practical jokes, to some woman who had been a lady in the courtly life of Virginia a century, or maybe two centuries, ago, before her ancestors became stranded pioneers and lapsed into illiteracy, degeneracy and venal sloth here in the hard hills. What this all meant she had not known, but she knew that one memory alone was sweet to her thoughts, and that was the memory of her mother. She knew, too, that even before they had taught her at the college how perverted it all was, this whole scheme of mountain feudalism and black ignorance and bitterness had seemed to her wrong and repugnant. Something had told her that somewhere there must be something different and that somehow she must find it and weave it into the pattern of her life. Of these things she had thought as she sat in the summer evenings on the slab bench before the cabin door. In summer there was a great pine, which, just after twilight had faded into velvet blackness in the sky, pointed an index upward beyond the valley; and over it, before the other stars came out there always appeared a tiny point of light, which she chose to call her star. Somehow, it seemed that in some vague future day that star would lead her.

She was often alone, for her father would leave her there and go his own ways, but a day came when he returned and began throwing his few possessions into a bundle.

"M'nervy," he said with a sullen sort of embarrassment, "I reckon thar's times when ye gits right-smart lonesome way up hyar, hain't thar?"

A catch had come into her voice as she said:

"Right often, Pappy."

He nodded, then added abruptly:

"Waal, we're ergwine ter nail up thet door ter-night an' quit this-hyar place."

"Whar air we a-goin' ter?"

"I done got myarried terday," he announced. "I reckon we'll go down an' dwell with my wife's folks."

The sun was nearing the western peaks and the afternoon was well spent. The girl had had no intimation in advance of this contemplated change of order. She stood there stunned. Life had been empty enough, but here at least she had been in a fashion mistress of the wretched house, and here she had had her pine tree and her star, which were the emblems of her dreams.

A long, low moan escaped her, and her father's face reddened in anger. He turned away and left her, going into the house, and she fled precipitately to the heights above and sobbed out her misery at the roots of the pine to which she was bidding farewell.

Then they had moved, and life had meant fitting herself into a new family, no member of which liked her, and submitting to the shrewish heckling of a step-mother, who seemed to her a hideous libel upon the memory of the woman who had been lucky enough to die young.

Now, as she sat with her book in her lap, because in a few days she must go back to that cabin, the past was parading in review before her eyes, and though she was very hungry for "larnin'" she was neglecting her books.

CHAPTER III

The late convict had wasted his strength. His violent paroxysm of anger had exhausted him more than his laborious tramp. It had sent his temperature up and brought a sickening weakness to his muscles. He wavered as he plodded and once or twice even stumbled to his knees, until at last, with only three-quarters of a mile left, he turned aside to the bank of the roadside and sat down with the sweat of weakness dripping from his face.

It was such a day as must have set poets to making jeweled phrases out of words. The air and skies held that radiance which can make of a Kentucky June morning a miracle of beauty. The horizons were dreamily soft and warm. In the field at Newt Spooner's back a meadow-lark was madly trying to burst his pulsating throat with the flood of golden joy. In Newt Spooner's mind was a somber picture; a picture of the mountains which a few days more would throw across the eastern sky-line, and of a man who lived there and who was to die. He was to die without opportunity to defend himself and without benefit of clergy. It was not to be a fight, but an execution. In the entire mental range of the young man panting by the roadside was no reflex of any other thing than brute bitterness and "pizen meanness."

A buggy and horse rose into view over the crest of the hill. It had only one occupant and the occupant was a girl. She was unlike any woman Newt Spooner had ever known; unlike any of the "gals" back in the mountains. Her lithe figure had all the spirited quality of the thoroughbred. And just as to Newt Spooner the world held only gall, so to her it held only fragrance and music and sunshine—and an abiding faith in men and women.

She was happy because she had not yet discovered any unhappiness and because she was young * * * and because to-day she would see in Winchester a certain member of the opposite sex in whom her interest was direct and personal. Meantime, June was softly glowing around the whole circle of the sky's embrace and the trees were rustling their fresh greenery and the birds were singing.

She was singing, too, but suddenly she stopped as her eyes fell on the young man by the roadside. Her quick gaze discerned that he was desperately thin and that the color in his face burned only in hectic spots against a chalky pallor. She saw, too, that as he wiped his forehead on his sleeve his forearm and hand trembled. His clothes proclaimed him lately released from the penitentiary, but her ideas on the subject of prisons were vaguely confined to a compassionate regret that they existed. Quite probably had she found him there looking weak and sick even had he worn stripes, she would still have offered him help. She drew the horse to a standstill, and called out cheerfully in a voice as tuneful as the lark over yonder in the field:

"Good-morning. Can't I give you a lift?"

Newt Spooner gazed back at her sullenly and definnatly. The dog that has only been kicked distrusts the hand thrust out in kindness. It is unknown to his experience.

"Naw," he declined, with as surly an utterance as possible.

The girl flushed and her lips tightened. She flung back her head with a gesture that set truant curls tantalizingly astir and flapped the reins on the horse's back, but in quick afterthought she drew him down again. This boy's rudeness did not alter the fact that he was sick. He looked like a mountaineer and could hardly be expected to measure up to the bluegrass requirements of courtesy.

"You're about as polite as—as a mud-turtle," she calmly informed the traveler, holding his eyes with an unflinching gaze, before which they shamefacedly drooped; "but that doesn't make any difference. I'm going into Winchester, and you don't look very well. Hadn't you better get in and ride to town?"

The boy from Troublesome stared his incredulity. She seemed to him a marvelous sort of being. Her simple dress was to his eyes extravagantly elegant and her patrician delicacy of feature belonged to an order which neither the drudgery of the hills nor that of the state prison had given him opportunity to study.

"I reckon," he said slowly and diffidently, but no longer with a note of bitterness, "hit hain't wuth while to pester ye."

"That's all right," she commanded. "Climb in." Slowly he rose and obeyed, and when they had gone a quarter of a mile. Newt made his sole voluntary contribution to the conversation.

"I'm obleeged ter ye," he said.

She did not question him unduly nor ply him with conversation, but she smiled, and in some subtle fashion there broke through the storm-wreck of the boy's bitterness a thin ray of light and glow of graciousness. She let him out at the court-house square, where buggies stood in rows and traders jostled and the auctioneer's shout resounded, and there he lost himself in the crowd; but first he stood looking after her until her buggy turned a corner, and then he remembered that she had nodded with a freindly smile of farewell. It was rather wonderful to be treated like a human being.

Newt Spooner wanted food and he wanted it to be cheap, so he foraged up and down Main Street until he came upon that lower section where several shabby eating-houses were sandwiched between equally shabby saloons.

And while he stood on the pavement undecided which way to turn, a hand was laid on his shoulder, and he wheeled, startled, to find himself gazing into the face of his kinsman, Red Newton.

"Come hyar," commanded the older man. "I done heered thet ye was pardoned out, an' I sorter 'lowed ye'd be making tracks fer ther mountings. I wants ter have talk with ye afore ye goes back."

"I aims ter git a snack ter eat," demurred Newt. "I hain't a-goin' ter talk ter no man afore I eats."

The other nodded.

I knows a place whar we kin eat an' talk, too. Fult Cawsler hes done moved hyar from over on Squabble Creek, an' opened a resteraw. All our folks eats thar.

(To be continued.)

I Like To Make Money—Do You?

OF course you do. You want to know how. You want to be honest and square and you are willing to work, but want the right start. All right—let's get together. You write me and let me show you what others are doing. If you have energy and punch, I'll furnish the way.

Just Follow My Plan—I'll Show You and Back You

Just the same as I have thousands of other men—just like yourself. And there's no trick to this. It is simple and straightforward. It shows a man how to best use his ability.

My Big Page Ad Which Preceded This

has brought me thousands of inquiries from men in all walks of life. No doubt you saw this ad but neglected to answer. Now, don't do that. Think! This means money to you and it won't cost you a cent to find out. I have been making money myself and for other men for years. And I want men who want to make from $100 to $200 a week. My men are doing it every day. You can do it, too.

Answer This Advertisement Now

Sit down now and write me a letter—not necessarily a long one, just tell me you are interested and that you want to know more about the proposition. Your name and address will bring you everything.

My Automatic Combination Tool is a Mechanical Marvel

It's a tool that farmers, teamsters, auto owners, contractors and builders have simply got to have. Once they know its merits they want it.

Write Me Now—Don't Lose a Moment's Time!

I'll tell you the whole story, in all its details as soon as I get your name. That's what I want now. I want you to put it up to me. Just address me or the company. I'll get the letter or card. And please don't put it off. Address

P. J. Harrah, President

The Harrah Manufacturing Co.

122 Main St. Bloomfield, Indiana

ORCHARD AND GARDEN

Celery may be banked with earth or boards to cause it to bleach well.

Follow up the premium won at the state or county fair with a little judicious advertising. It will help make sales.

If you don't want a lot of seedling asparagus plants coming up wild in your patch, remove the fruiting canes before the seed shells.

Have you laid in a supply of walnuts, butternuts, and hazel nuts for winter use? There may be a few on the trees yet, although the squirrels have been busy.

One of the pretty sights at this time of year along a few of our country roads are flocks of quail. They are protected by law and have some chance of increasing if the winter is not too severe.

Now is a good time to get together the horticultural books, bulletins, and papers for use this winter.

Have you saved seed of fruiting-shrubs and nut plants to plant next spring? Put them in sand until spring and then plant.

Some vegetable growers have found that it pays to put produce in packages that are easily salable. This saves recounting and handling. Thus, one-third bushel baskets are used for perishable crops like tomatoes; corn is put in sacks holding six dozen.

Be sure the shrubs and trees go into winter with plenty of water at the roots. Remember considerable moisture is lost from the tree from the time the ground freezes until it thaws in spring. Don't water the top of the ground only, but the soil clear to the roots. This means many heavy rains or watering by hand. Mulching later will help to save water, but it must be in the ground to be saved.—LeRoy Cady, associate horticulturist, University Farm, St. Paul, Minnesota.

Federal Farm Loan System

No subject is of greater importance to farmers just now than that of farm loans or as it is usually referred to as rural credits. About half the farms of Missouri are mortgaged and the relative number is increasing every year as well as the amount of the loans.

The new Federal System now being organized will premit farmers to borrow money at the lowest rate of interest and on long time with easy payments and every farmer should acquaint himself with the system and be ready to get its benefits.

The fullest and best explanation of the Federal Farm Loan System that we have seen is in a new book just off the press written by Herbert Myrick, author of co-operative finance, every question concerning the subject is explained. Price, $1.00 net.—Orange Judd Company, Publishers, New York.

THE PUBLISHER'S CORNER

Do you know my good friend that if the Farm Clubs of Missouri will take over the complete buying of corn, hay bran, shorts, cottonseed meal and cake, oil meal, tankage, flour, coal and salt that it will mean the saving of several hundred thousand dollars this winter? —and that if we had a Farm Club in every school district in the state it would mean the saving of several millions? And why in heavens name shouldn't we do this? THE MISSOURI FARMER is in position to furnish you the lowest wholesale price on all these commodities—and all in the World you need to do is to send us a 2c stamp for literature, Constiution, By-Laws, etc., call a school house meeting, perfect an organization and then get in touch with us when we will do the rest.

Scores of farmers have done this within the last few weeks—but the wonder to me is that we haven't heard from some aggressive, wide awake farmer in every school district in which THE MISSOURI FARMER circulates. The other day in the same mail, we heard from one Farm Club which has recently saved $300 on mill feed. Another had saved $75 on coal. Now isn't this just like finding money in the middle of the road—and isn't it a serious reflection against the common sense and thrift of farmers when they do not place themselves in position to pick up this money?

Especially should this appeal to farmers in the drouth stricken sections of the state where much feed will have to be shipped in—and where, beyond the slightest question, we will be able to save farmers many thousands of dollars if they will only give us the chance. To this end, won't you, my good brother, take the lead in your school district?

* * *

The market on cottonseed meal, cake and linseed oil meal has been climbing so steadily during the last 30 days that it has been impossible for us to quote prices which would hold good for 48 hours. However, we expect the market to find its level in the next week or ten days and I feel sure we will be able to affect a saving of several dollars per ton to the cattle feeders of the state on these items and if you and your neighbors can use a carload of either of the above commodities, get in touch with me at once. We will be willing to help you out in this matter whether there is a Farm Club in your district at the present time or not, for fear that the perfecting of an organization might delay matters too long. But after we have helped you I will expect you to perfect a Farm Club as soon as possible—for you owe this much to this great movement which can never be made a real success until every school district in the state has been organized.

* * *

We are trying to locate a lot of corn in Iowa where a fairly good crop has been raised in order that we may move it direct from Iowa farmers to Missouri farmers who will have to buy—but should we not succeed in locating enough to supply our Farm Club friends, we will put you in position to order direct from a big commission company and in this way save you considerable money in any event.

* * *

I heard a farmer compliment the Packers the other day on the prices they are paying for prime hogs and cattle. I asked him whether he remembered the prices they paid a year ago and whether, if hogs and cattle are worth what they are bringing today, they were not worth a great deal more than they brought last fall and winter? He answered, "Yes it looks like it." As explained in a recent article in THE MISSOURI FARMER, the Canadian Packers and the independent buyers are giving the "Big Bunch" the greatest "run for their money" they have had in years. These little fellows have captured a lot of foreign meat orders and as a result there has been a battle royal for the available supply. The moment these independent fellows cease to be a fighting factor however, the big fellows will smash the market within 24 hours. It isn't because they have had a "change of heart"—and today, just as a year ago, they constitute a "sword of Damocles" which hangs suspended over the head of every live stock producer in the land. And we will never be safe until the power of this giant monopoly has been permanently destroyed—and nothing short of the most powerful farmers organization the Country has ever known will accomplish this herculean task. There isn't a live stock producer in Missouri who isn't destined to feel the clutch of the Packers Combine many times upon his throat during the next ten years unless we destroy its present power—and I hate to see a farmer who goes to sleep the moment he gets one square meal in his stomach and thus forgets the wrongs of other days or the wrongs that are certain to be perpetrated in the future. Again, is there any "philanthropy" in present prices when the cost of feed is considered?

* * *

We have made arrangements to buy Alfalfa Hay direct from the farmers of Kansas and undoubtedly will be able to affect a big saving for our readers. Therefore try to make up a carload order and then get in touch with THE MISSOURI FARMER at once. In a little while this hay will be in the hands of dealers and then it will be too late. Don't forget to let us know whether you will have corn to sell.

William Hirth, Publisher.

SAM JORDAN'S SENSE AND NONSENSE

Are you worshiping $'s or manhood?

* * *

But what's the use to growl about every thing?

* * *

Approach every duty bravely, even the woodpile.

* * *

If your neighborhood is up-to-date, who has made it so?

* * *

If farmers had their way, the dirty booze traffic would soon be a relic.

* * *

A sure cure for corns.—Get six feet under the ground, cover up well, and stay there.

* * *

Did you ever think that a wrong act bravely done, may not be much worse than a cowardly shirking of an evident duty?

* * *

By the way, I saw in the paper something about a foot ball "squab," although I do not know what that is. The paper did not state.

* * *

And for that matter if there is "something you don't know," and are afraid to say you don't, is that cowardise, or is it ignorance?

* * *

Your uselessness usually determines your social position. The social "lion" is just about as useless as a fat pup, and almost as interesting.

* * *

If all the town loafers were made to work just two hours each day on the walks, parkings, streets and alleys, what fine towns some towns would be?

* * *

Do you put the "best on top"? Or your finest in the show window? Or do your goods come up to the sample? If not are you not a business coward?

* * *

Farmers should know more about politics,for if farmers do not look after their own interests, it should be very evident that other people will not do it for them.

* * *

Don't farmers have gumption enough to go to Congress? I scarcely think such is the case but politicians have made us think the farmers haven't got sense enough.

* * *

If all the boozers did not booze, what a fine lot of men they would be? Most all boozers are at heart "good fellows," and a "good fellow" is a man who loves men.

* * *

Thirty men out of every 31 can give but two real reasons why they are Democrats or why they are Republicans. The first and best one is that they were born that way and the other one is that most every man thinks he may some day want to run for office and if he ever scratched his ticket, his "party" will knife him as a candidate. All men at some time hear the buzz of the run-for-office bug.

* * *

Why so few farmers in Congress? and why so many lawyers in Congress? I have no fight on the lawyer up to his fair share of representation, and after that I do have a kick. The lawyer can represent you alright in your divorce suit or some other tangle, but what he does not know about farming would make a good large joke book. He cannot get the farmer's viewpoint any better than the farmer can get the lawyer's viewpoint, hence proportionate representation would at least be square.

* * *

A good thought well said should be passed along. For the above reason, I am "handing in" my son's letter, written to his Grandmother on the event of her 74th birthday. George and his Grandmother have always been "chummy," and great favorites with each other.

George may "put me on the carpet" for publishing his private correspondence, when he is so far away and cannot defend himself, but I am always likely to do the imprudent thing. So will take my chances on results since a fine sentiment well expressed may do good to some one else along the line of life.

* * *

My Dear Grandma:—

I have just received a letter from Father, and in it was a clipping containing a lot of information about that reception which so many of your friends gave you on the 74th anniversary of your birth. The story was well written, but all the words of all the editors, all the space on paper which could be devoted to this one happening, and all the good wishes of the friends gathered to wish you well and many, many more years of life, cannot in even the smallest way, tell of the good, the love, and kindly influence of which your stay on this old Earth has been so full.

You had passed almost half a century when my advent into this world took place. What happened before that is not clear in my mind. No doubt you were much like other girls, —full of life, fun, pranks and the joy of living. Then too, you may have had a dozen beaux, more or less; and then growing into womanhood, you met the man with whom the more than fifty years of married life bespeaks the truest love that could be found. By and by, children came to bless your home. Since this all the joys as well as the sorrows of motherhood have come to you. The hand of death left its mark; the road which all have had to travel maybe has been rough; but when you have lived to that age that you can look back over the past with all its trials and still possess those qualities which make you friends, which cause you to be loved, and allow you to love others, the acid test has failed to leave the slightest blemish on your character; and the greatest commendation that anyone can give are those two words,—"Well Done."

As far back as I can remember, to those days of my toddling steps, your influence has been felt. It may have been a great deal through the bringing-up of that baby girl who was to some day become my mother, that those principles of love and uprightness were so firmly taught me, and with the aid of Dad and a few good spankings, I learned very quickly of right and wrong. I also remember when I used to run to you when trouble threatened, and there is no doubt but that my "nether end" escaped some healthy slaps because of your protecting lap and protecting arms around me.

Then again, were the days with Grandpa. How we used to live at the farm and batch, cut wood, hoe (a little)) fish, and hunt. How carefree those times were for me, and how they never grew old. No boy could have wished for more. With true boy instinct I love that life, because there were no ear-washings, no shoes, pants (usually ripped), a piece of bed ticking for a "gallus", and the customary rag around some sore toe accompanied by the smell of that medicine Grandpa used to use. But the other side, the home coming, was just about as fine. Grandpa was a pretty good cook, but its needless for me to say that your fried chicken, potato salad and pancakes were the best ever.

All too soon these days have passed. Your children are grown, your grandchildren are to manhood and womanhood, with another "sweetest baby" in this world just starting the fourth generation. These things are a lot to crowd into one life, and some there are who might feel the weight of years. But thats not for you. The body may grow old, but the spirit never, the "business of growing old" is not your sphere. With your always cheerful self the thought of age will never be tolerated, and this in itself is the one big assurance that all of your loved ones will have many more years of your kindly influence.

It may often seem that some of us are neglectful. I know myself that I should write you oftener, but Grandma, all the love that any man can feel is what I have for you. No other lap was ever softer, except maybe mothers', and no other hand could soothe me as could yours. So in these days, though I am almost across the continent from you, the boyish love for mother is for you as well; and I want you to know that always when I think of home my thoughts are on you too.

With heartiest congratulations, my very best wishes, and all my love, I am, your grandson, Geo. P. Jordan.

LYON'S PRACTICAL FARM PAPERS

Last week I went to Cincinnati, and while there attended a meeting of the Audubon Society, the society that is doing so much for bird protection.

I find that sportsmen are trying to get some of our game laws repealed, and are seeking an open season on quail again, something we have not had in Ohio for several years.

The representatives from the rural counties will nearly all stand with the farmers who elected them, but nearly all the city members will vote to repeal the law and allow quail to be shot.

We have Cleveland, Cincinnati, Columbus, Dayton, Toledo and Youngstown, all cities of the first class, and about a dozen more in the 30,000—70,000 class, these casting enough votes to override anything that the farmers of the state want.

When engaged in our tobacco war some years ago, the city press uniformly denounced the farmers as "night riders," "barn burners" and the like, when 90 per cent of all the disorder in the tobacco district was actuated by the very tobacco trust that we were fighting, this being done to bring discredit upon us.

In the milk war that is now on, we see in the city press headlines telling of suffering babies in the cities, but only in the farm and local papers do we see the truth stated, this truth being, the milk companies buy the milk from the farmers at 2 to 4 cents a quart, and sell it for city babies, etc. at 7 to 12 cents a quart.

Who cares if the milk producers' baby has to sleep under an old horse blanket, if the city milk company's magnates want to transport their babies over the boulevards in $5,000 limousine?

Writing this on the morning of October 21, a cold wind has been blowing since day before yesterday, but as yet none but the tenderest vegetation has been cut down by frost.

Corn is all in the shock and seeding all done, with some early seeding damaged by fly. Potatoes a short half crop for early ones, and a full crop of those planted in late July with prices getting close to the $2 mark.

A coal famine is on with coal selling at 25 cents per bushel or $5.75 per ton. Just double what we are accustomed to paying.

When we organized, as farmers, for better prices in tobacco, a federal examination was made, to see if we were not restraining trade, and one is talked of in connection with the organization of milk producers, but there will not be any investigation made of coal men's methods.

Farmers are not organized, and when they do attempt something of the kind it is looked upon by our rulers as something near akin to treason, but million dollar corporations are organized, and the same rulers

only consider this good business sense.

Although I have never been a prohibitionist, I will vote for the candidate of that party for president, as the candidates of the two great parties are not in sympathy with me or my avocation, and, I will vote for two democrats and two republicans on the state ticket, but for neither candidate for governor or U. S. senator.

Never again will I cast a vote for a man whose record I do not believe to be clean, or who is not in sympathy with the men who have to feed the world. C. D. Lyon.

By Old Jim Riley

Every 90 days my banker sends me a postal card and asts me t' drop around t' th' bank t' renew my note. When I come in he asts me whether my mule is still livin'. Th' mule went on my note y' know. Then when I say th' mule's still kickin" he gits out a little book, turns to th' 8% Department and I get stung for whatever th' book says. When it comes t' brain work, th' feller that runs th' peanut roaster down on th' corner has got my banker skinned t' death. So far nobody ain't even sed Bevo to me about th' election.

BUCKSHOT BY THE PROFESSOR

Thank the good Lord the election will soon be over and then the politicians will quit chasing around after my little vote.

Be mighty careful about the kind of young men that keep company with that sweet daughter of yours—for her life's happiness is at stake.

* * *

Where there is real companionship between a father and his boys, the boys rarely ever go wrong—that is, if the father has the right kind of stuff in him.

* * *

When you get up in the morning, make up your mind not to say an ugly or unkind thing to anybody during the entire day. It's a mighty fine recipe for happiness.

* * *

Remember my boy that neither profanity nor vulgarity will help you in the great struggle of life—that, on the contrary, they will close a pile of doors in your face.

* * *

It is up to every one of us to be necessary in the sphere in which we move—and there are some mules who can give a better account of themselves in this respect than some men.

* * *

That Jim Riley person told a friend of mine the other day that I ought to trap polecats for a living instead of trying to write for the papers. Well, if I did and if I landed a half dozen good pelts they would be worth more to society than he is.

* * *

You know I think the average woman gets the worst of it when she marries—but on the other hand, a pile of homes would be happier if the wife tried to make herself more agreeable to the fellow she's hooked up with Even a bear or a mule likes kindness you know.

* * *

Honest Injun now, don't you think this is a mighty clean, fine farm paper—and do you know of any other paper that is making such a hard fight for the farmer? Why not contribute your mite by making up a Club of subscriptions among your neighbors? Don't you realize that there is a great work for this paper to do in Missouri during the next few years and that what it will be able to accomplish depends on the kind of support you and your neighbors give it?

SALESMEN TO STUDY AGRICULTURE

So that their representatives may be of greater service to the farmers of America with whom they come in daily contact the 3,000 salesmen, blockmen and general agents of the International Harvester Company in the United States will study improved farming methods at movable agricultural extension schools to be conducted during the fall and winter in thirty-five cities in all parts of the country. These schools have just closed a two days session in Kansas City, salesmen from many other places being present.

Today, more than ever before, world conditions demand that every acre of American farm land should be made to yield its utmost and that the fertility of the soil be preserved and built up. We must understand the need of crop rotation. We must know how to fight weeds and insect pests, smut and black rust. We must be familiar with the diseases of the farm animals and how to prevent them. We must be made to realize that diversified farming and the raising of live stock are necessary for profitable agriculture.

Given a practical working knowledge of these matters, these 3,000 salesmen will be able to render a greater and lasting service to the people. They meet the farmers every day. They visit them at their homes. They are familiar with the problems which are constantly confronting the farmer and his wife and children. They will have many opportunities to give advice and assistance—to show by actual demonstrations how better crops or more profitable results in dairying or live stock raising may be obtained.

Because of these opportunities for service; because of the need of giving the farmers every assistance possible; because of a desire to be of practical help to the people, to make farm life and community life better, the sales and agricultural extension departments of the Harvester Company are co-operating in this line of extension work.

The movable schools will be conducted by Professor P. G. Holden, director of the Agricultural Extension Department. Professor Holden will be assisted by several members of his staff and the instruction will be thorough on all agricultural subjects of importance in those communities where the schools are held. In addition, many insect enemies of plant life will be exhibited that the salesmen may become familiar with them; with their work of destruction and with the best methods of combating them.

In each city where those Agricultural Schools are held the sessions will last two days and salesmen from neighboring cities, as well as local salesmen, will attend. As soon as the school closes in one selling district it will move on to another district, until each of the four selling districts has been covered.

The schools were conducted in the southwestern territory during September, in the eastern territory during February and in the northwestern territory during March.

INSECT PESTS EASILY KILLED IN FALL

Take advantage of the bugs in their winter quarters, the remnants of old plants, the trash and litter about the garden and orchard. Burn out the fence rows, destroy the trash and litter wherever it has accumulated by burning it or plowing it under. Cut out the dead trees and limbs in the orchard and make them into fire wood.

This cleaning up about the orchard and garden will destroy a dozen or more of our most destructive pests. For example, the plum curculio is now wintering as a full grown beetle in the trash and littler along the fence rows or about the trees; the codling moth will be found in the worm stage within a silken cocoon tucked away under the shelly bark of dead trees and dead limbs; and the fruit tree bark beetles or shot hole borers will also be found wintering mostly as adult beetles in dead or dying trees.

Under the old stalks and rubbish in the garden and about the borders will be found the adult asparagus bettle, bean leaf beetle, harlequin cabbage bug, flea bettles, the striped cucumber beetle, and the chrysalis of the cabbage worm. If you want to kill these pests, pile and burn dead tomato and pea vines and other remains of vegetation in the garden and along the border.

Deep fall or early winter plowing will also destroy many insects. This is especially true of the cut worms, potato beetles, white grubs, and wire worms which are now hibernating in the soil. Late fall or early winter plowing will turn these insects up near the surface and expose them to an attack of birds, poultry and other animals. At this season of the year the insects are in a dormant or semi-dormant condition and when brought up near the surface of the ground they are unable to go deeper in the soil or to construct new cases or cocoons and they are killed by being subjected to excessive weather conditions and to the alternate freezing and thawing.

Fall plowing and cultivation will also enable you to have vegetables a week or ten days earlier next spring because you will be able to plant earlier on fall plowed ground. Early, thrifty, healthy plants are also less liable to injury from insects.—T. J. Talbert, Missouri Agricultural Experiment Station.

A MISTAKE TO SELL ALL YOUR POULTRY

The Missouri Farmer:

No doubt you have already noticed the tendency to market poultry. Presumably this may be on account of the high price of grain. I have been making some investigation both locally and in surrounding markets. One buyer, that gathers from house to house using an auto truck of four decks, tells me that in some cases he is buying all the poultry that there is on the farm. He says too often this is not always stock that the farmer is selling off preparatory to leaving the country or taking up other business but that the farmer feels it is profitable for him to sell, rather than feed it at the present price of grain.

I am sure you will agree with me that it is an unwise move the farmers are making in selling off their poultry too closely, because though grain prices are high they are receiving more for their poultry products than ever. I contend that the poultry raiser cannot afford to disorganize his poultry plans for the little saved in the price of grain. At times the above plan might be logical with most farm animals, but, at the most, cheickens are not heavy feeders and the few dollars saved in the price of grain would not make up for the many dollars that would be made in poultry products.

This last year egg producers, including both market and pure bred had big demands and at higher prices than usual. To the poultry raisers who are selling off too closely with the expectations of buying eggs in the spring and hatching their chicks, there is a possibility that they will be badly disappointed, even though eggs should not continue to be so high priced. A scarcity of poultry would mean a scarcity of eggs. They would be hard to get and in turn many would have to hatch late or not at all.

H. H. Johnson.

STANDARD BRED HORSE SALE!

MARSHALL, MO., NOVEMBER 11, 1916

On the above date we will offer at public sale 25 head of Standard bred horses at the Fair Grounds in Marshall. The offering consists of mares and geldings ranging in age from yearlings to six years old. They are being driven now and are all good individuals. Here is a fine opportunity for anyone in the market.

BEN HUR STOCK FARM

Per L. H. ELMORE, - - - - MARSHALL, MISSOURI

New Corn and Hog Cholera

Hogs often take cholera soon after being put on a ration of new corn, and its use is often condemned on this account. New corn alone is not the cause of hog cholera, but it may be a factor, along with other conditions, that helps weaken the vitality and renders the animal less resistant to disease. In order that new corn may be fed with safety, the animals should be put in a healthy, vigorous condition before time to begin feeding.

When the animals are in a thrifty growing condition, there should be much less danger but the herd should be gotten on full feed gradually. It is well to give them about a stalk of corn per hog the first day, gradually increasing it by one stalk a head every other day so that it is getting two stalks the third day, three stalks the fifth day, and so on until they are on full feed.

This gives the stomach time to adjust itself to the new ration and is a specially good thing to do before turning old hogs into the field to hog down corn. It is less necessary in case of the shoats which are not so likely to overfed because they do not have the weight and experience which enable them to break down the stalks very rapidly.—E. R. Spence, University of Missouri, College of Agriculture.

Shorthorn Breeders Attention

Shorthorn breeders, or breeders who are contemplating of founding a Shorthorn herd will be interested in a good roan Shorthorn heifer calf I have for sale, calved May 18, 1916. This calf is a good one, roan in color, and decidedly well bred. She is out of a big roan cow weighing 1300 pounds sired by Modern Marshall, and this calf is sired by College Knight, the good roan bull recently at the head of the University of Missouri Shorthorn herd. This bull, College Knight, topped the Shorthorn sale at the American Royal Live Stock Show at Kansas City last week, selling for $1,065. This heifer calf will make a good cow, and she is an excellent prospect. I have her priced reasonably. R. L. (Bob) Hill, Columbia, Mo.

Hill's Durocs

R. L. Hill of Columbia, Mo., is offering a lot of splendid Duroc boars that have grown out well, have good bone, splendid color, strong backs, deep sides and are the easy feeding, quick maturing kind that should get good big litters of pigs. If a farmer buys a boar or gilt from Mr. Hill and is not pleased with his bargain, he will let you ship the hog back without expense to you and refund your money. Surely this is as much as any one could ask. Mr. Hill's prices are also very liberal. He is one of the best hog authorities in the state and those who are in the market for Durocs will do well to get in touch with him.

Indian Runner Ducks for Sale

For sale fawn and white Indian Runners. For prices write Mrs. C. E. Alford, Box 333, Columbia, Mo. 1t

Live Stock Notes

Taylor's Champion Durocs

Chas. L. Taylor, Olean, Mo., is again before the readers of "THE MISSOURI FARMER" with an unusually attractive lot of Durocs. Mr. Taylor and his Durocs are so widely known that it is needless to dwell upon the reputation they have justly won.

Mr. Taylor not only breeds and develops his champions but keeps them in his herd, and it is from these matings that he furnishes his customers with breeding stock. The show records of this herd afford ample proof as to the class of stock Mr. Taylor breeds and develops.

With such boars as the Grand Champion, Col. Wonder, and the Junior Champion, Show Me, mated with the champion sows in this herd, the explanation of "why, such size, uniformity, richness of quality," is very simple. Mr. Taylor offers breeding stock for every need at prices within reach of all. Write or go see this herd. Mention THE MISSOURI FARMER.

Petty's Polands Please

G. E. Petty, Versailles, Mo., has decided not to hold a fall sale, and in offering the reserved tops at private treaty. Mr. Petty held one of the top sales last fall, and would have again equaled or surpassed his former record. The Grand Champion, Mo. State Fair, 1916, is a good sample of the kind Mr. Petty raises, as this boar was purchased in his fall sale last year.

All interested in Poland Chinas know that Mr. Petty buys only top stuff regardless of price for his breeding stock. The boars and gilts which he offers, afford you an opportunity to select superb individuals of almost any popular blood lines. Everything is immune and ready for shipment. Write Mr. Petty, mentioning THE MISSOURI FARMER.

Frank's Poland Chinas

Anyone in the market for good breeding stock at prices hard to duplicate will do well to write Ben Frank, Jefferson City, Mo. The list of his satisfied customers throughout the country is conclusive evidence that you not only get high class stock, but that you are dealing with a man thoroughly dependable and fair in his dealings.

Mr. Frank is making special prices on boars sired by Charter's Best, Mogul and Golden Gate King 2nd out sows by A Wonder, Big Orange, Mo. King, etc. Everything is immune and ready for shipment. Write Mr. Frank and mention this paper.

SELECTION OF BREEDING HOGS

In choosing a sow, one of the first things to look for is lots of size and capacity for a large litter of pigs. Extreme quality at the expense of size will give poor results, a thing which breeders are beginning to realize more than ever before. The sow must have good length and depth, a strong back, strong feet and pasterns, and a feminine head. Although judges differ as to what constitutes a good head for a breeding sow, yet there are some essentials which must not be overlooked. The head must be of a medium size, with a nose that is a little long and slightly dished. The eyes should be prominent and not sunken. Experience shows that a fairsized ear with plenty of quality is better than either an ear that is too large or too small, just so it does not flop over and bother the sight.

It is very important that the eyes be in good condition. A sow must be able to see where she is going and what she is doing. A sow with poor eyesight will often permanently injure her pigs while they are small or may even kill the whole litter. Another particular point in selecting the brood sow is the udder and teats. If the sow has borne several litters you can generally tell from the number of developed teats how large her litter usually is, thus indicating what her value will be to your herd. Be certain that the udder is not caked and that the teats have not spoiled. If the sow is young and has had no pigs yet, look out for blind teats; these never develop. As a rule the sow should have a least twelve teats which are sound and capable of development.

Temperament is another important thing to consider, a thing which cannot always be determined by one passing judgment. If the sow is going to be mean and hard to handle, then she is not the animal for your herd. If she is cross and irritable she will often injure her pigs, though she is trying to protect them. Often, too, her pigs will show the same crossness and irritability.

Taking the whole into consideration, then, the sow should be feminine, large, with plenty of quality, and, if pure-bred, a good representative of her breed type.

In selecting the boar, some of the things to look for will be the same as in the sow, while others will be different. He must at first sight show plainly that he is a boar; his masculinity must be pronounced. The head should be broad with the nose broad and perhaps a little shorter than that of the sow. The eyes should be large and prominent. The neck may be shorter and thicker than that of the sow, denoting masculinity. The bone should be strong and of good quality. If the bone is of good quality, then the pasterns will be upright and the toes will be strong and straight. Do not neglect the back: It is just as important for the boar to have a strong back, nicely arched as it is for the sow. Do not select a boar having a weak back thinking that because the sows you are using have good strong backs the pigs will be all right. It is hard enough to keep up the strength of the backs without having the breeding on either side deficient in this respect.

The ham is an important part to consider in any hog; it should be thick, long, broad and deep, extending well down to the hock. If possible get a boar that is as broad in the hams as he is in the shoulders.

We cannot get eight or ten pigs from a sow if she does not farrow that many. In selecting breeding animals of either sex to place in a herd, ascertain the size of the litter for two or three generations back. The size of the litter from which the animals come is a good indication of their prolificacy.

In passing on an animal to be placed in the herd, make a careful study of the pedigree and give it about as much importance as the individual. By pedigree we mean that the history of the animal must show good animals for three or four generations, not that it may trace to some noted sire or dam five or ten generations back. Do not be misled into thinking that an animal necessarily has a good pedigree because it has won a blue ribbon at some of the shows. Experience and careful study are necessary in order to know a good pedigree. Very valuable information also may be secured from old and experienced breeders about what are and have been the best lines of breeding.

Care of Brood Sows

The way a sow is handled before farrowing has much to do with the value of her litter, according to the Nebraska Agricultural College.

The sow does best when she is kept in healthy condition but is not allowed to become too fat. Heavy corn feeding makes sows fat, and they are not likely to produce large, healthy pigs. For this reason, breeding stock must be separated from fattening pigs if best results are secured. Feeds that produce bone and muscle are best. Any one of the following rations supplemented by alfalfa hay in the rack will give good results:

(1) Corn, 1 part; shorts, 1 part. (2) Corn, 5 parts; shorts, 3 parts; oil meal, 1 part. (3) Corn, 3 parts; shorts, 4 parts; tankage, 1 part. (4) Corn, 8 parts; tankage, 1 part. (5) Corn, 1 part; ground oats, 1 part; shorts, 1 part. (6) Ground barley, 1 part; ground oats, 1 part.

You can help THE MISSOURI FARMER by studying our advertisements carefully and then mentioning this paper when you write.

POLAND CHINAS

Spring Boars by the Grand Champion

A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.

WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

Poland Chinas & Shorthorns

Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.

H. S. Williamson, Route 6 Centralia, Mo.

BAKER'S REAL BIG-TYPE POLANDS

We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.

W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands

I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.

H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.

EDGAR DOOLEY, - Ettervile, Mo.

SPOTTED POLAND BOAR

My fine herd boar, Spotted Lad, No. 74030 for sale. He's a fine one. Write for full particulars. Also some fine spring gilts bred or open, for sale.

E. J. YODER, - - LA TOUR, MO.

POLAND CHINA BOARS

I have a few extra good Boars for sale at Farmers prices. March farrow. The big boned type. Immune and well grown. Also any thing you want in Jersey Cattle.

J. B. SMITH, - Platte City, Mo.

CHERRY CHIEF'S PRIDE 187003

KING OF THE BREED

We have the best lot of spring boars and gilts to be offered for sale. They are royally bred and great individuals. All immune. Special sale on boars.

WILCOXIN & PORTER,
BOWLING GREEN, - - MISSOURI

MARSHALL'S POLAND CHINAS

We are offering exceptional values in early spring pigs. Also booking orders for fall pigs. Strictly big type breeding. Satisfaction guaranteed.

S. R. MARSHALL & SONS,
GLASGOW, - - - MISSOURI

SHADY GLEN POLAND CHINAS

Am reducing my herd. Will sell my great herd boar, Pawnee Price 2nd. Choice herd sows, either bred or open, spring boars, spring and fall gilts. Write for prices.

WM. I. BRITT, RUSH HILL, MO.

POLAND CHINA

Am offering you an opportunity to buy boars and gilts of outstanding individual merit and most popular blood lines. Sired by Big Bone Leader, Big Bob, Bridges' Bob Wonder, Crow's Extra, Big Black Orange, etc. Prices reasonable. Everything immune. Satisfaction guaranteed.

G. E. PETTY, - VERSAILLES, MO.

REGISTERED PERCHERONS,
39 heavy 3 and 4 year stallions, 68 rugged 2 yr. olds. Can spare 25 reg. mares, 24 reg. Belgian stallons. Priced worth the money. Near Kansas City.

OLD FRED CHANDLER RANCH,
Route 7 - - CHARITON, IOWA.

POLAND CHINAS

Am offering rare bargains in spring boars and gilts of strictly Big Type Breeding, everything immune. Write for information.

BEN FRANK, - Jefferson City, Mo.

DUROC JERSEYS

D. C. Thomson's Early Spring Duroc Boars!

We are now offering the trade a Select lot of early spring Duroc boars. Sired by Col. Wonder II, and T's Cherry Chief. The big kind with quality. Everyone buaranteed.

W. H. & GEO. E. THOMSON, - - COLUMBIA, MO.

Durocs With Size and Bone

I am offering a choice lot of early spring pigs with unusual size, bone and quality. Bred right and priced right. Visitors welcome.

A. C. BROCKMAN, R. F. D. 2, Centralia, Mo.

Adenhill Duroc Boar and Gilt Bargains

I can supply readers of this paper with choice yearling gilts bred for fall farrow. Also extra good spring boars. My Durocs are noted for size and quality. Satisfaction guaranteed. Inquiries gladly answered.

R. L. (BOB) HILL, ADENHILL FARM, - - COLUMBIA, MO.

Top Notch Durocs

I have 100 late spring pigs weighing from 90 to 100 lbs. All good color and quality. No better Durocs anywhere. Write me what you want.

GARRARD & SON, - McBAINE, MO.

Taylor's Grand Champion Durocs!

Am offering choice boars and gilts, same breeding that won 6 champions, 26 Firsts, and a total of 63 prizes at Mo. State Fair and St. Louis Agricultural Show, at reasonable prices. Write for prices and descriptions.

CHAS. L. TAYLOR, - OLEAN, MO.

REGISTER OF MERIT JERSEYS!

Anticipate your needs—If you will be needing a bull next year, buy a calf now. Price less—transportation less and danger less—than in buying a mature dairy bull. Bull calves from 2 months to 2 yrs. old—out of heavy producing—good type—officially tested dams.

J. A. BUFFUM,
Jersey Place, Rt. 3. Columbia, Mo.

ANGUS CATTLE

ANGUS CATTLE

Herd founded 1904

Young stock sired by Dean's Eric 139686. Also offer splendid herd bull for sale. Every one the right kind and priced to sell.

V. E. LAWRENCE, SALISBURY, MO.

RED POLLED

RED POLLED CATTLE

Herd established 16 Years

Young stock for sale. Young bulls sired by LOGAN 13500; Calves sired by KNOCKER 28791. Bred for milk and beef. Also offer spotted Poland China hogs and Rieds Yellow Dent seed corn.

M. L. SNYDER, - - POLO, MO.

Aberdeen-Angus

I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.

J. D. Blackwell - Fayette, Mo.

SUGGESTIONS ON FEEDING CORN ENSILAGE

Corn ensilage is a food which may be termed "grass like." For this reason it can be used very much as pasture in the feeding of domestic animals. The analysis of good corn silage however, will show that it is richer than a great many of the pasture grasses and therefore will go farther in feeding.

As soon as the silo is filled the feeding operation may start and though it be in the heating process, it will be just as good food and will be relished by the animals quite as much as old silage. It is generally conceded, however, that silage which is several months old is better than newer silage. Some feeders prefer silage that is six months to a year old. However, it may be safely said that silage can be fed from the time the blower pipe is taken out of the silo until the feeder desires to open his silo and this may be after it has stood for several years.

Silage is strong in carbohydrates, the principal food requirement for all animals but needs protein to balance it. Alfalfa hay is perhaps the cheapest and best for this purpose. Throughout the alfalfa belt it should form a part of the ration where silage is used. This is not necessary but simply makes it possible for the feeder to gain a greater economy in his operations and at the same time give the animal a wholesome balanced ration.

Corn silage may be fed out of doors in bunks, in the stall, or in fact any place where animals can eat it without waste. In very severe weather it is best to feed silage inside, as some will freeze and this will be hard for the stock to masticate, although the feeder need not be alarmed over feeding freezing ensilage. It will not injure the animals, but frozen food is not easy for them to consume.

In feeding milch cows it is a very good plan to give the hay in rack outside or some place where the animals will not waste it, and feed the ensilage in the barn after milking. It may be given twice a day in rations from 10 to 15 pounds at a feeding or 20 to 30 pounds per day. Some large animals will take as high as 40 to 50 pounds of silage per day and make good use of it. In feeding fattening stock or steers silage may be fed twice a day in smaller rations ranging from 10 to 15 pounds at a feed for grown stock and for young animals from 6 to 12 pounds. Sheep will consume from 2 to 4 pounds daily and horses from 4 to 12 pounds when not working. It is not advisable to feed work horses large quantities of silage no more than to give them large quantities of new grass.

Feed the ensilage so that the animals will eat it up clean as it spoils or freezes when exposed to the air for several days.

SILAGE AS A SHEEP FEED

The experience of every successful sheep feeder and breeder has been that some succulence is necessary in a ration to insure the greatest gain and thrift in the flock. Everyone knows that mutton in Great Britain has a world's reputation for its flavor and quality. All sheepmen of the British Isles realize the value of succulence in a ration for their sheep. They rely upon roots as a source of succulence. In America the average farmer will not raise roots as a feed for live stock even though he knows they are good, because he feels that the labor involved is too great. But why should he not resort to the use of another feed which will supply succulence and can be produced with less labor and expense than roots? This crop is corn silage and has proven iteslef as essential to economical feeding of sheep as it has with beef cattle.

Results show that when judiciously fed it can replace roots in a ration for the breeding stock. By judicious feeding is meant the feeding of silage which is free from mold, acid and rot. Also, that the amount of silage fed to breeding ewes should be limited to two pounds daily per head. At the Pennsylvania State College an experiment on this point showed that feeding corn silage as a sole roughage is fatal to pregnant ewes in a high percentage of cases. For that reason it should be fed in conjunction with other roughages, as alfalfa or clover hay, allowing two pounds as the maximum amount of corn silage to be fed to the pregnant ewe. Spoiled or rotten silage is apt to be fed in the spring of the year when the warm days come on and fermentation takes place at a more rapid rate. Feeding of spoiled silage often causes death, especially with lambs.

Silage gives thrift to sheep because it has a desirable effect upon the digestive system, keeping the bowels in good condition. It increases the appetite and saves on the amount of grain required to keep the breeding stock in good condition. Silage, when used as a portion of the ration, has been found for fattening lambs to be the most profitable method of feeding.

At the Illinois Station in 1912-1913 it was found when they compared alfalfa hay, corn silage, corn stover and oat straw, shelled corn being fed as the concentrate in all the rations, that the most profitable ration was one composed of shelled corn, corn silage and corn stover. Corn silage tends to have a beneficial effect upon the fleeces of sheep. This fact was noted at the Pennsylvania State College and also by the Purdue University on bredeing ewes that they had under investigation. Corn silage should be fed to give succulence, cheapness and palatability to feed rations for sheep.—B. O. Severson, Penn'a, State College.

USE OF BETTER SIRES WOULD NET MILLIONS

Good, indifferent, and poor, there are over 20,000,000 dairy cows in the United States.

The good cows under most any conditions of environment return more or less profit to the owners; the indifferent cows return a profit or loss according to the conditions of their environment; while the poor cows, under like conditions, show only less or more of loss.

The key to the whole betterment problem is the education of the cow owner along dairy lines, coupled with the betterment of the dairy stock of the country.

As soon as any farmer-dairyman sees the need of better stock and begins to take pride in such stock as he has, he will also begin to give thought to the bettering of the environment; and, as his dairy education progresses, he will begin to give attention and support to intelligent efforts toward betterment of the distribution of product, which means higher prices for milk and milk products.

The great bulk of the common stock of the country is mongrel. In calling it mongrel, I mean that it is so mixed in blood that nearly all desirable characteristics resulting from any infusion of improved blood have been either lost or neutralized.

If each of the 20,000,000 or more dairy cows in the United States could today wear a card showing her production during the year 1915, together with the cost of food consumed, I have not the slightest doubt that one-fourth of these cows would be found wholly unprofitable.

There is but one practical way to better this mongrel stock situation, and that is by either replacing with pure bred stock, or by grading up the herds through the use of pure bred bulls of the established dairy breeds, at the same time eliminating the unprofitable cows from the herds.

Suppose for a moment, that it were possible to cut out and save the care and feeding expenses on 5,000,000 unprofitable cows; the saving would be at least $100,000,000 per year. And again suppose it were possible to add 600 pounds of milk, worth at least $9, during the present year to the production of each of the remaining 15,000,000 cows in the country; in that case the yearly gain would amount to $135,000,000 more.

Such an immediate saving and gain is of course impossible, because improvement takes time; but it is not only a possible accomplishment for the future but may be far surpassed.

But one out of 20 of the pure bred dairy bulls born in the herds of the country is needed for use within his breed, leaving 19 out of the 20 available for use in the improvement of grade or common herds.

What is wanted is the bringing together of the one who needs and the one who breeds the surplus bull; and thanks to the progressive spirit abroad in the land, this is fast being accomplished.—By Malcolm H. Gardner, Walworth County, Wis.

State Herd Registration

The dairy interests of Missouri are working on a legislative bill for the registration of all state-owned herds of cattle.

Thirty years ago pure bred Holstein cattle were bought for the Fulton Asylum, but no pedigrees were kept and none filed for the stock raised on the asylum farm. The result is that Superintendent M. O. Biggs, who is anxious to record the herd, is unable to make satisfactory filings for any of the two hundred fine Holsteins.

It is proposed to create, without expense to the state, an Institutional Registry Board composed of the Professor of Dairying of the Universit the State Dairy Commissioner and the State Veterinarian, to oversee the selection of pure bred sires and the registration of all cattle eligible for pedigrees.

Crude Oil Kills Lice

Hog oilers are the cheapest and most efficient means of ridding the hog of lice, says the veterinary department of the college of agriculture.

One application of crude oil kills both lice and nits. The most convenient method of applying the oil is by means of a hog oiler, of which there are several good types. They are always ready and require little attention. The best oiler allows the pig to rub the oil on any part of the body.

The oiler can also be applied with a sprinkler, spray pump, broom, or brush. If there is any indication of skin disease, the parts may be scrubbed with a broom or brush so as to get the oil well into the skin. When crude oil is used, the appearance of skin and hair is greatly improved.—University Farm, Nebraska.

A Sanitary Necessity

Elsewhere in this issue the reader will find the advertisement of the Rowe Sanitary Mfg. Co. of 1138B Rowe Bldg., Detroit, Mich. You should read it carefully and then drop the company a postal card for full information.

Does the label on your paper show that you are "way behind?" If so, send us a check for $1.00 for two years renewal and thus show your appreciation for what we are trying to do for the farmers of this great state.

SPECIAL JERSEY BARGAINS!

Due to poor crops and to reduce my herd to winter accommodations I will sell about 20 cows; 20 heifers from 10 months to two years old; and 15 bulls from calves to yearlings. The famous Blue Belle-Golden Rosebay breeding. Send for circular. No reasonable offer will be refused for this stock. All registered.

THE ENNIS STOCK AND DAIRY FARM,
(Just south of St. Louis.) HORINE, MISSOURI.

JERSEY CATTLE

REG. JERSEY BULLS

Choice Registered Jersey bulls at bargain prices. Grandsons of Noble of Oaklands and out of heavy producing dams. Yearlins, $50; Calves, $20.
BLUE CLIFF FARM,
BLUE SPRINGS, - - MISSOURI

JERSEY CATTLE

Bulls ready for service. They are sired by the Owl's Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.
Wm. H. Bruns & Son, Concordia, Mo.

SUNSET CORRECT TYPE JERSEYS

To keep our herd within 100 head we will offer at private sale fifty Jerseys, consisting of cows, bred and open heifers, young bulls, heifer and bull calves. Can fit out small herds for beginners. 125 head to select from. The famous Blue Belle-Golden Rosebays. Send for special circular before buying elsewhere. Bargains. Mention your wants.

A WORD TO LIVE STOCK SHIPPERS

Are you going to ship to the National Stock Yards in the near future? If you are, then you will be keenly interested in this advertisement—for of course, you will want the "high dollar" for your Live Stock and it is that "high dollar" we want to talk about for a moment.

There is a reason why the **National Live Stock Commission Co.,** does the largest business at the National Stock Yards. It is because we have built up the most powerful **Sales Force** which stands back of any Live Stock Commission firm in the United States today. From the moment the gong sounds in the morning until the last buyer has left the yards in the afternoon, these men are in the thick of the scrimmage—**fighting with might and main to get the "high dollar" for the shippers who have entrusted their welfare in our hands!** Whether you have sent us one car or a dozen makes no difference. We realize that whether your consignment is large or small, **it means everything to you!** More than that: Getting the "high dollar" for you **means everything to us**—for this is the way we built up our great business **and this is the way we hold it!**

There is an old saying that "nothing succeeds like success"—and this maxim applies vitally to our business. We realize that "Superior Service" alone is what has given us our great and ever increasing volume of business—that it is because of this "Superior Service" that we have been able to build up hundreds of warm friends among the Live Stock shippers in National Stock Yards territory—**Shippers who know from past experience that we always go the limit for them and who therefore never think of consigning to any other firm!**

Now if we can render "Superior Service" for other shippers, why shouldn't you give us a chance to render it for you? Why not give us a chance at your next consignment? **A trial is all we ask!** After that, you can be the judge. We know we will not be able to hold your business unless we "make good." But in the meantime, are we not entitled to the benefit of the doubt? Would we be doing the biggest business at the National Yards **if we were not in the habit of "making good?"** To this end, get in touch with us at once. Tell us what you are feeding and when you expect to be on the market. We will be glad to give you every helpful suggestion possible—**because we want your business from now on and we expect to earn it by giving you better service than you ever had before!**

A STATEMENT FROM SENATOR REED

"To the readers of
The Missouri Farmer:

Standing on the eve of the election, there are certain things which I wish to say to the readers of THE MISSOURI FARMER. I know that many of you are republicans but when I was elected to the Senate of the United States six years ago, I became the senator of all the people of our splendid commonwealth—and I therefore desire to render a brief account of my stewardship in so far as it directly touches the interests of the farmer and in which I believe every farmer in the state will be interested, regardless of his political affiliations. However sharply we may differ on the great fundamental policies which divide the two dominant political parties, all of us are agreed that Agriculture constitutes the great basic industry of the Nation and that, as it has been the real source of our greatness in the past, so it must ever remain the true basis of our National wellbeing and prosperity in the years to come. And never in any other administration has this great truth been so profoundly recognized as during the present one which, as the record will show, has done more for the farmer than any other in the history of the Republic.

As is more or less generally known, I took an active part in writing the Federal Reserve Act which has admittedly given us the greatest banking system in the World and made it impossible for us to ever again become the victims of panics as we were in years gone by. I was instrumental in placing in this Act the provision which makes our National Banks an open market for $450,000,000 of farm mortgages—this being the first time that National Banks have ever had authority to loan money on collateral of this kind.

Largely at my instance, we made cattle paper eligible for rediscount by Federal Reserve Banks, the same as ordinary commercial paper—and thus we placed millions of dollars of cattle paper on an equal footing with the regular commercial paper of the Country. In other words, National Banks are now permitted to make cattle paper the basis for the issuance of Federal Reserve notes the same as any other high grade commercial paper—and that it will mean much to the cattle feeders of the Nation as the Federal Reserve System becomes better understood, there is not the slightest question in my mind.

I heartily supported the Agricultural Bill which, among other things, contained the following provisions: Ist, It increased the appropriations for the Federal Department of Agriculture by 50%; 2nd, It increased the appropriation for eradicating the cattle tick from $100,000 to $360,000; 3rd, It established a Division of Markets and Rural Organization to disseminate information regarding transportation, storage and marketing; 4th, It appropriated $8,600,000 for Agricultural extension work which, through the cooperation of the states will carry the fight for better farming to every cross roads in the land; 5th, It provides for the issuance of negotiable warehouse receipts which will enable farmers to store their grain and obtain the necessary funds to tide them over until more favorable prices justify them in selling; 6th, It appropriated $75,000,000 for good roads to be expended in connection with the co-operation of the states and this will insure an investment of $150,000,000 in better public highways during the next five years. Beyond question this marks the greatest stride in the building of good roads in the history of the Nation—and best of all, it compels the general public to share this heavy burden with the farmer. Under this provision, the farmers of Missouri will receive approximately $1,250,000 of Government road building aid.

I supported the River and Navigation Bill which insures an expenditure of approximately $8,000,000 on the Missouri and Mississippi Rivers this year—a fact in which not merely all who live in the Mississippi Valley are keenly interested from the standpoint of navigation but which means much to thousands of bottom land farmers. It is this bill which Mr. Hughes states he would have vetoed—although while his party was in power the rivers in the great republican states were always lavishly provided for while the Missouri and Mississippi Rivers were shamefully neglected.

As a member of the Banking and Currency Committee of the Senate, I helped to write the Federal Farm Loan Bill which, in my humble judgment, constitutes the greatest single piece of legislation in the interest of the farmer ever enacted in the history of the American Congress—and which means, once it gets into full operation, that the day of excessive interest rates and embarrassing short time loans for the farmers of this Country are at an end. By the passage of this great Act, the present Administration marks a milestone in the history of American Agriculture—and partisan as we may be upon other matters, it seems to me there should not be a single farmer in the Country who will not feel profoundly grateful for this great and long needed service. However, the passage of the Federal Land Bank Bill does not mean that we no longer need a Missouri Land Bank. On the contrary the capacity of both will be taxed for sometime to come—and the two can be co-ordinated just as state banks and trust companies supplment the National Banking System.

In conclusion, if I am re-elected to the Senate I pledge myself here and now that I will make every effort in my power to see that a thorough inquiry is made into the conditions which surround the Live Stock markets and the great Packing Houses of the Country. A resolution demanding such an inquiry at the hands of the Federal Trade Commission was introduced in the House of Representatives last winter—but it failed to reach the Senate and hence I had no opportunity to get actively into the matter. But a soon as Congress reconvenes I shall inquire into the situation at once. I do not mean to say at this time that these great interests are robbing the live stock producer but what I do say is that if I am returned to the Senate I will make it my business to find out—for it is a situation in which not merely the man who raises cattle, hogs and sheep is vitally interested but the scores of millions of meat consumers as well. This, in brief, is my record as a senator wherever the interests of the farmers of Missouri were involved in Congressional action—and if it meets with the approval of the readers of THE MISSOURI FARMER, I will feel deeply grateful for your support on election day. Respectfully Submitted, James A. Reed, Democratic Candidate for re-election to the U. S. Senate."—(Political Advertisement.)

For Sale

280-acre farm belonging to the estate of Samuel Morton, located 10 miles west of Columbia, Mo., and 2 miles north of Huntsdale, consisting of 280 acres of good hill and creek bottom land all in splendid state of cultivation and mostly in grass, plenty of stock water the year around furnished by living springs. Improvements consist of good 4 room frame dwelling, 2 tenant houses, 2 barns and other necessary outbuildings. This is one of the best stock farms in Boone County and must be sold in order to make a division of the estate. I also have for sale splendid 80-acre farm near Columbia. Very respectfully, L. T. Proctor, Adm'r, Columbia, Mo.

We need a good friend to solicit subscriptions for us in every school district in Missouri—men who believe in THE MISSOURI FARMER and who want their neighbors to learn of the gospel it is preaching. In no other way can you do better service for the cause—for once a majority of the farmers of your district read the paper it will be easy to form a Farm Club.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Time to Sound the "War Whoop"

Don't you realize my good farmer friend that the hour has come when, to use a slang phrase, you ought to "cut more ice" as a man and citizen? They say you feed the World and it is true—as indeed it has been true of the farmer since long before the great Shepherd herded His flocks upon the Gallilean hillsides. There isn't a towering sky scraper, a great factory or a great mercantile establishment in the Country which does not owe its existence at least indirectly to the victories which you have won in your fields and feed lots in days gone by. And even so the fact that we are rapidly becoming the creditor Nation of the World is due, not to the gun makers and the powder kings, but to the never ending fruitage which annually comes forth from your golden harvest fields and from the cattle which browse in indolent content upon your thousand verdant hills.

Now don't get the idea that I am trying to make a martyr out of you or that I want you to hate anybody. I am merely trying to get you to realize that, as a farmer, you are tremendously necessary and vital to your Country—and, being thus necessary, that you should insist upon a seat close to the head of the table. For instance we held a great National election the other day and, as the big party chiefs gathered around the council table for the last time, they asked three questions: First, "What will Organized Labor do?" Second, "Where will the Captains of Industry line up?" Third, "How will the Germans vote?" They didn't ask, "What will the farmer do?" They knew that you men were unorganized —and hence they figured that, as usual, you would "scatter your fire." Had farmers been organized as Labor is organized for instance, some of them might have wondered about that stifled investigation of the Packers Combine. But they didn't—and yet collectively you farmers have the power to tell all of them where to "head in."

And now let's look at a few other things: When you go to market to buy a suit of clothes, a bolt of calico or a pair of shoes, the merchant tells you what you must pay—and there is no appeal from his decision and this price represents a profit for the merchant and for the manufacturer who produced it. Nor is there anything wrong about this if his figures are honest. But when you go to market with your hogs, cattle, sheep, grain, butter, eggs or poultry, you have nothing to say about what they shall bring. Unlike the merchant, you are in no position to demand production cost together with a reasonable profit—and that you and your neighbors should consent to stand for this idiotic condtion of affairs, year after year, is one of the marvels of our time.

In the meantime, your farm mortgages are rapidly increasing. Already nearly 40% of our farms are in the hands of tenants while our soil fertility is rapidly declining. Tiring of the fruitless toil and hardship your boys and girls are flocking to the already overcrowded cities. Our public highways are in a sad state because the present profits of farming don't justify building good ones. The little rural school house is little better then it was 40 years ago—and hence your children are tremendously handicapped in the great battle of life. Your farm home is without many of the comforts for which you justly yearn and the house and barn are sadly in need of a new coat of paint—and all because you and your neighbors haven't been playing the game like the other fellows play it. And now don't hang your head or jump in the creek—for what we need is not a funeral but a "war whoop" which will echo from Plmouth Rock to the Golden Gate—a sort of Rebel Yell which roars in lusty cheerfulness. , "I want a square deal and by the eternal I am going to have it!" And as that yell goes reverberating through the hills and valleys, the millions who toil in the cities will shout "Amen!"—while the fellows who have been skinning you will look at each other and grin and say, "Well, the jig is up." In hundreds of little school houses all over Missouri tonight this war whoop is already being sounded—and its time for you and your neigbors to wake up and join the procession.

—By the Author of After-Thoughts.

WILLIAM HIRTH
PUBLISHER

THE FARM CLUB MOVEMENT

We believe we are safe in saying that there will be no less than One Thousand Farm Clubs in existence in Missouri by the first of the year and that they will represent a membership of at least 20,000 farmers—and considering that the movement is less than one year old, it strikes us that this will be a pretty good showing. If we were to reproduce the scores of enthusiastic letters which are reaching us daily, they would fill a paper twice the regular size of THE MISSOURI FARMER. Again, every mail brings us many requests for literature, a suitable Constitution and By-Laws, etc.—and these requests are constantly increasing.

And now that we stand upon the threshold of the long winter months, when farmers will have the spare time to give to this great question—and since the election is out of the way—I want to make a personal appeal to every reader of THE MISSOURI FARMER to get into this great fight without further delay and see to it that a Farm Club is organized in his school district. As has often been stated before, the purpose of the present movement is, that through the organization of School House Farm Clubs, farmers shall take over the complete handling of such commodities as corn, hay, bran, shorts, flour, cotton seed meal and cake, oil meal, coal, tankage, farm seeds, fertilizers and other similar commodities—for once the farmers of the state are compactly organized, a saving of a number of millions of dollars will be involved in these items alone.

To show how foolish the present disorganized condition of the farmer is, six weeks ago THE MISSOURI FARMER had the refusal of several hundred carloads of Northern potatoes at 85c per bushel F. O. B. Dakota and Minnesota shipping points—and at that price, which we had obtained direct from the farmers in the above states, these potatoes could have been laid down, freight paid, in the average Missouri town at from $1.10 to $1.15 per bushel. At that time we sent out an urgent appeal to the Farm Clubs of the state—suggesting to them to make up a car load order without delaf and warning them that the price would soon go much higher. Only in those communities, however, where a half dozen or so Farm Clubs had been formed was it possible to get prompt action—for too often one or two Clubs found it impossible to use an entire car. In the meantime, although we asked these Northern farmers to hold their supply for us until we could get wider action, they got tired of waiting and sold to the dealers who were on the ground early and late. As a result, the opportunity passed—and before the present winter is over the retail price of potatoes is apt to go close to $3.00 per bushel, for the country has a short crop and, as usual, the commission men will have things in their own hands and will receive a good deal more for giving the people a chance to buy these potatoes than the Northern farmers got for growing them.

United Action Vital

In the meantime, enough new clubs have been formed in many communities over the state so that now a car load shipment could be handled—and during the last three weeks we have had requests for perhaps 100 cars. We have recently sent new inquiries into the Dakotas, Colorado and Minnesota in the hope of locating farmers who have not as yet sold their crop and trust we will still be able to supply these Clubs at a substantial saving—but the real opportunity for this year is gone and all because so few farmers were organized or because those who were, were isolated in scattered Clubs. It is conservative to say that the farmers of Missouri could have used 500 cars of these Northern potatoes—and a saving of 50c per bushel on that quantity—500 bushels to the car—would meant the saving of $125,000.

Likewise, through arrangements made by THE MISSOURI FARMER with a big Illinois coal concern last summer, many Farm Clubs have been saving from 50c to $1.35 per ton on coal—and where all the farmers at a given shipping point act together, it is easy for them to save from $500 to $750 on their winters' coal bill. Again, since the above contract was made, coal has advanced considerably at the mines—but our agreement holds good until next March and hence we are in position to protect our Farm Club friends.

The shortage of cars has greatly interfered with the movement of coal and hence many Clubs have had to wait—but this is a Nation-wide condition which cannot be helped and local coal dealers are up against it just as badly as the Farm Clubs. Already this arrangement has grown to such proportions that the above coal company is not taking on any new business—and by next year I am satisfied we will be able to buy the entire output of a number of big Illinois mines. That this will put us in position to demand as low prices as those made to the most powerful manufacturing concern in the Country, is apparent at a glance.

The chaotic condition which reigns in the general feed market also prevails on cotton seed meal and cake. The mills are paying from $55 to $60 per ton for cotton seed—an unprecedented price and hence the meal and cake market has been climbing steadily and it has been impossible to obtain prices which would hold good for 48 hours. We are in touch with a number of big mills in Arkansas and Oklahoma and as this article is being written these products, containing 38½% protein, can be lain down at the average point in Missouri at around $42.50 per ton—and it will be well for the interested reader to compare these figures with local prices and then get in touch with us. In any case however we can get you the lowest wholesale price at the mills, plus the freight. That the prices of meal and cake are exceedingly high goes without saying—and yet the amount of protein in these, as against other feeds, must be considered.

But here once more the necessity of a powerful state-wide farmers organization is illustrated, for once such an organization has been perfected we will be in position to submit our cotton seed meal and cake requirements to the lowest bidder—and if we could contract for 1000 cars at a time there is no sort of question but what we could affect an enormous saving. In other words, if the farmers of 50 or 60 of the leading live stock producing counties of Missouri were solidly organized, I have no doubt that a million dollars could easily be saved on cotton seed meal and cake and linseed oil meal.

A Movement With Vision

We merely mention the above items to show the scope and vision of this great Farm Club movement which, unlike the other farm organizations in the past is planned on a strictly business basis and which already, although it has hardly gotten started, is saving a lot of money for Farm Club members. Besides the above, many Clubs are ordering bran, shorts and flour by the car, while many others have arranged to buy these commodities at the wholesale price from the local flour mills—and wherever this can be done we heartily approve of this idea, for the prime motive back of the Farm Clubs should be to save money on these things and not to destroy or punish anybody who is willing to cooperate. Likewise, the buying of Alfalfa hay direct from the farmers of Kansas and other Western states is rapidly being worked out and is destined to become an item of great importance for the future.

What I want every farmer who reads THE MISSOURI FARMER to realize is that this Farm Club movement is unlike any other movement of the kind ever inaugurated among farmers—that it is based upon the idea of taking over the complete handling of the commodities mentioned above and that this alone will mean the saving of millions of dollars—that the movement has come to stay and that it is up to you and your neighbors to decide whether you want to place yourselves in position to reap your share of the benefits. For years farmers have been talking organization—and now that the opportunity is knocking at your door, why keep on drifting along in the same "devil take the hindmost" fashion?

(Continued on page 7)

Wherever THE MISSOURI FARMER has a good circulation, there you will find the Farm Clubs flourishing. If you want them to flourish in your neighborhood, get a dozen of your neighbors to give you a dollar for two years subscription. The paper will do the rest.

FREE THIS WONDERFUL LAND BOOK

CONTAINING intensely interesting facts and pictures about that remarkable section of mild climate and perpetual growth:

The Highlands of Louisiana

Every farmer in America interested in good land and *greater* opportunity should have this new *Free Book*. Tells all about climate, soil, crops and health, what is being accomplished there, why the present remarkably low price of the land is possible, with **Small Down Payment, Easy Terms.** With Map of Louisiana.

Its a wonderful book, profusely illustrated, and it is absolutely **FREE.** Nor will there be the slightest obligation in sending for it. Simply write your name and address on a postal and send it to

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat near $2 a bushel offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

The Missouri Farmer

VOLUME VIII NOVEMBER 15, 1916 NUMBER 22

Butchering on the Farm

By T. B. Ingwersen

Hardly without exception, the prices for hogs are lowest during the winter-time. Nine years out of ten the unfortunate farmer who has raised and fed hogs is compelled to turn them over for a good deal less than the cost of production to the only buyer we have in this great and free country of ours—the Beef and Grain Trust. Is it any wonder then that the mortgages on farm lands have increased 50% during the past ten years? If a man sells below the cost of production, he diminishes his capital; if he has no capital, he increases his debts or mortgage; if he does this just once too often it spells ruin for him and his family and possibly it means a sheriff's sale of the old homestead and his personal property.

The Farmer Supports the Trust

It is true his property then has gone to make up a part of the immense profits which this great Trust is making every year, and this past year, the saddest of all for the farmers, this Trust is counting its annual profits by the tens of millions of dollars, and is boasting of "The Greatest Prosperity" this country ever had. How many Sheriff's sales did it take and how many farmers and their families had to be ruined to create this so much praised "prosperity" of the Trusts no one knows but anyone who has taken only so much as a look into our newspapers could not help but noticing the endless advertising of farms to be sold under deeds of trust. Everybody will remember the year of the financial panic, 1907, and every farmer will recall how the Beef Trust that winter stole our cattle and hogs—hogs taken from us at $4 to $5 a hundred were really worth $8 and more and it was so proven later.

This was not the first time that I had been "trimmed" and "skinned" properly according to the rules of "Big Business" but this time it got me to a point where I would not stand for this highway-robbery any longer. I got busy, converted a machine-shed into a small slaughter-house, provided it with a cutting room, a smoke-room and a storage room, bought the necessary tools, including a small power meat grinder, a sausage stuffer, lard press and a lot of lard cans neatly painted with my name and the name of the farm. On a trip to my native land in the old country (Denmark) I made it a point to get acquainted with the methods over there and especially learned the preparation of the high class hams and sausages as well as the examination of hogs for Trichinosis for which purpose I had to buy a microscope.

Now at last I was ready to begin. Realizing that I knew as yet but little and had no experience, with no place to go for advice or help, I began on a very small scale—learning the business as I went along. Luck enabled me to run across an old butcher who was looking for work. He was an elderly man who had worked in packing-houses and butcher-shops and in every branch of this business he was an expert and knew every detail of it. He has worked for me two winters and from him I have learned the practical part of the business. Since, I have visited The Farmers Week in Columbia, Missouri, where Prof. P. F. Trowbridge is teaching this particular branch and it is now comparatively an easy matter to learn these things. Considering the short time that I am able to pack—only a little over three months in the winter—my total inexperience, and my poor location, I have done fairly well. Some years I have done better than in others—but in no one year have I lost any money at it. Therefore I believe every farmer should put up at least enough meat for his own use and some could make a nice little profit by supplying the home demand in their little town or village.

What Every Farmer Should Do

In order to do this, the farmer must know something about this business and he must also be prepared for it. By this I do not mean that he should have an expensive plant with modern machinery, which, although I prefer it, would be unpractical for, and not within the means of the average farmer. But small and inexpensive devices can be provided. A tackle-block saves a good deal of hard lifting. The ancient barrel can be replaced by a regular scalding vat which every village blacksmith can make at a small cost. Instead of scraping the hogs on a few boards, just laid on the ground, as is usually done, a table can be used or the boards can be laid on a pair of saw-horses—and this will make the work much easier and saves the back. A few good tools will do better work and facilitate it. A few hog scrapers, the proper knives, a meat-saw, a cleaver, a lard-kettle, a lard-press, and a meat-grinder are indispensible and should be procured, but these, as well as the scalding vat, can be owned and used by different parties in common. For cutting the hogs up, a clean and well lighted room is very desirable.

The day before killing, the hogs should be brought to a pen next to the scalding vat where they are kept quietly and comfortably with good dry bedding but without feed or water. The next morning when the water is hot enough, about 140 degrees Fahrenheit, one hog is caught by a hind leg and by means of the tackle-block hoisted so high that its nose is about two feet above the ground; then it is stuck and left to bleed. In this way all the blood will run out and there will be no bloody shoulders and heads as is usually the case if the hog is knocked down and stuck on the ground. When the blood is all out and life has gone, the hog is let down into the scalding-vat where it is moved about and turned until the hair come loose; then it is pulled out and placed on the table where it is quickly scraped, then hung by the hind-legs in the usual way, only with the help of the tackle-block. Then the carcass is thoroughly washed and cleaned, the last hair are now removed with a sharp knife and then the hog is dressed. While this is going on a second hog may be caught, hoisted, stuck, and left to bleed to follow the first one or as soon as time and help permit.

Discloses His "Secrets"

The carcasses are left to cool until the next morning when they are taken into the cutting-room where they are cut, trimmed and prepared according to the uses to be made of the meat. I receive a good many letters from parties desiring to put up fancy meats, begging for the secret of my recipes, promising to keep it to themselves, etc. As a matter of fact I have no secrets except a few which however I am going to reveal in this article. The first secret is CLEANLINESS in dressing the carcass, in keeping the tools, tables, blocks, the meat-grinder, the cutting-room and everything else absolutely spick and span and sanitary.

T. B. Ingwersen.

The second is the proper selection of the animal. Out of an old stag or male hog, fancy meat cannot be made, nor can good hams be made out of a hog that is too poor or over fat. As far as the recipes go, they are in my opinion of minor importance. They are largely a matter of taste. Thousands of them exist and can be bought in small books and in large books. Below I give a few recipes:

DRY CURE:—For 100 lbs. of meat; 4 lbs. salt, 1 lb. sugar, ¼ lb. pepper, 2 ounces saltpeter.

BRINE CURE:—For 100 lbs. meat; 7 lbs. salt, 5 lbs. sugar, 1½ ounces saltpeter, 4 gallons water.

It is advisable to use only the best of ingredients and it is especially the salt that I desire to call the readers attention to; only the very best of it is good enough for the good and expensive meats. A specially prepared salt like that which is used for butter making should be bought. We use the Wor-

The splendid farm home of Mr. T. B. Ingwersen, Pike County, Missouri.

cester Salt exclusively and the result is satisfactory. The time of curing depends on the kind of meat and the size of it. Small hams about 14 days, with large hams up to 30 days. Bacon never longer than four days. When taken out of the cure, all meats must be washed in warm water, in order to remove any salt adhering to it. Then the smoking begins: About the lenghth of time to smoke the different pieces of meat, I am not able to give any rules; good judgment alone must govern here. The only thing I have to say is that I prefer a frost-free smoke-room or smoke-house (We understand Mr. Ingwersen kills about 200 hogs a year and if this number were handled in this way by every community it would save a great many thousands of dollars annually to Missouri farmers.) that I am very partial to hickory wood and like frequent short, and not too hot smokes.

Prize bacon Missouri Ham and Bacon show, 1915.

To dispose of the ribs and bones is still an unsolved problem. As these must be sold fresh, I have so far only sold them at home, which as the demand here is rather slim, has limited my packing operations to such a comparatively small business; however I intend to give this problem my serious attention this winter and I hope to solve it by establishing connections in St. Louis and there dispose of these meats by means of Parcel-Post and Express. Another way to solve this problem is to scrape all the meat off these bones and use it in the sausage and grind the bones for chicken-feed. In the same manner can the heads be disposed of. The jowls must be taken off first and these can be cured and smoked; if there is, however, no demand for jowls they can be cut up and rendered in the lard kettle as they make good lard. There is a little very good lean meat on the head which can be used for some kind of a sausage; the greatest part however is bone and will have to be ground into chicken-feed.

The profits of this business naturally vary. This last winter because of the low market price was very favorable for it. I have cleared above all expenses about two dollars a hundred. However what could be done at the basis of the present market would be fortelling the future—but it is very seldom that less than one dollar per hundred can be made.

A good deal has been said about the big packers making use of every bit of offal and having in this respect a great advantage over the farmer-packer. This may be so, yet most of this offal consists of tankage and fertilizer —all of which should go back to the farm. In my packing operations but little has been wasted and what the hogs and chickens will not eat makes good fertilizer. This winter we are going to install a Bone-Cutter which will help to reduce the waste still more. Green bone is an egg-producing feed and is of great value to the flock.

While it is my wish that the farmer may get some relief from the tyrannical rule of the Beef Trust through his home butchering, I believe that the real solution of this problem will have to be solved by co-operative packing companies owned and controlled by the farmers themselves, like they do it in Denmark so successfully. Then it will be possible to make use of all the labor saving machinery and utilize even the smallest item—including possibly the "squeal and the scent" as they say the big Packers do.

My business is still so small that it has not justified my doing any advertising—but somehow my meats have always found a ready sale. I have a good many friends in different states and through them I have found many new customers.

If the weeds on our farms could be turned into feed, wouldn't we have a lot of feed to sell? It is not necessary, neither is it good business, nor good farm sense to grow so many weeds as we do grow. You can draw your own conclusions as to whether it is carelessness, laziness, ignorance or just pure cussedness. Sam Jordan.

First, second and third prize hams at the 1915 Ham and Bacon show held by the Missouri State Board of Agriculture. The lower cut shows the fine texture of the meat after the hams were cut.

DRAINING LAND IN CARROL COUNTY

It does not always take a lot of money to drain land. During the Farm Management survey last summer in Carroll County a farmer was found who had some drains in successful operation that had cost him nothing but his labor. This was on land that had plenty of slope so that the question of fall in laying his drain did not enter in. The reason this did not cost him anything but his labor was because he used poles instead of tile. He had a large grove of maples that furnished the poles. He dug a ditch as though he were going to put in tile. Instead of tile he laid two poles in the bottom of the ditch with a third pole on top of these poles and plowed in the ditch. Some of this work was done twenty-five years ago,—seventeen years ago he did some more—today this drain is running a good stream of water and draining some bad seepy places on the hillside in his fields.

It is true these poles rotted out in a few years, but this did not stop the drain by any means. When these drains work satisfactorily for twenty-five years, they ought to be worth while.

A great many farmers who do not have the money to buy tile have lots of poles on their farms that might be used in this way. This farmer had a grove that was worth mighty little to him as it stood. By utilizing the poles in this grove he was able to make them worth a great deal to him.—O. R. Johnson, Missouri College of Agriculture.

A SEED LAW FOR MISSOURI

By Sam Jordan

We have been misled much too long by depending on the percentage of purity of seed as advertised by those selling seeds. A sample of seed may be 99½ per cent pure, yet be wholly unfit to use for seed. What the impurity consists of is of the most vital importance. A sample of seed might contain a large per cent of some sorts of weeds, and yet not be very objectionable. Fox tail, crab grass, smart weed, and such are not considered as bad by any means as buck horn, and other plantains, willow-leafed dock, red topped sorrel, quack grass, or Canada thistle.

To show that even one-half of one per cent is by far too much, a little calculation will make it clear. Suppose the seed to be considered is red clover. There are about 375,000 seeds in a pound of red clover seed, and one-half of one per cent is 1875. If the impurity is buckhorn this will mean that about 11 of these seeds would be sown per square rod, by sowing one pound to the acre. If six pounds be sown it would mean 66 buck horn seed per square rod.

Suppose that we are considering Alsyke clover. A pound of this has about 700,000 seeds. Suppose the one-half per cent be red sorrel or Canada thistle. By sowing five pounds of this seed that is 99½ per cent pure would mean that we would sow at the rate of 100 of these weeds per square rod.

It has been claimed that the farmers have "protection" against the use of bad seed, by the College of Agriculture. Protection is hardly the right word in this case. The farmers can get "information" as to purity or viability of seed from the College of Agriculture, but not protection. The College can also give us information as to whether or not a dealer is giving us oleo when he claimed that he was selling us butter, but that is not sufficient. A law requires that he let us know what he sells, or that it be true in name, and the goods be what they are represented to be.

Many of the worst weeds in the world are becoming scattered more and more over the farms of Missouri from year to year, and as long as the present situation exists there is little hope of improvement.

How long are Missouri farmers going to stand for this condition? How long are we going to allow seeds to be sown on our farms that are a great damage not to us only, but to our community as well?

How will your member vote on this law at the coming session of the legislature? Why not ask him and see what he says? By so doing you may find out how he stands on matters vital to the farmers.

THAT STORY OF AN OLD FARM

I have four letters and three postal cards in regard to the series of articles written on that subject. Two writers want to get into a useless discussion of the merits of deep and shallow plowing, one critises our method of handling manure, one, who evidently knew nothing about the nature of our soil, thinks that we ought to break more land every year while the other three thank me for writing the articles, saying that they will be of great benefit to many readers.

As a dozen farmers stood in the hardware store one stormy morning last week, they held a sort of a farmers institute with manure as the main topic. They were all good farmers, and they agreed to a man, that, while perhaps the ideal plan for handling manure was to get it on the fields as fast as made, that the ideal was not always the most practical plan, and that the use of a large amount of bedding and litter under the stock, with the cleaning of the stables often enough to prevent their interfering with the comfort of the stock, was the plan most nearly satisfactory to a majority of farmers.

Three of these men were enthusiastic advocates of shredding fodder, and claim that the waste from this fodder makes the best bedding, two or three silo owners said that they would buy damaged shredded fodder at half price to use as bedding, while the majority were satisfied, as we are, with straw.

There was one dissenting voice to the proposition, that as a rule we would get more benefit from our manures by spreading them at a lighter rate per acre than is the usual custom, and one man thought that extra heavy bedding cut down the value of the manure, this man not being willing to concede the value of humus in the soil.

He is an extra good farmer, and presented some good arguments on his side of the question, and I may also say that he has some good authority on his side, but most of us are going to stick to the old theory that humus not only assists us in making the soil work better, but that it is a solvent and container of actual plant food.

In regard to breaking more than one-fourth of our land per year, such a plan certainly would have delayed our building up the soil from its depleted condition, especially during the years 1868-1882, that we were unable to secure clover stands.

If there was an absolute certainty

that we would never miss a stand of clover, I am not sure that soil improvement could not be carried on as rapidly under a three year rotation of plow crop, small grain-clover, as under our four years rotation of plow crops, small grain, clover timothy, timothy-clover, but when we miss a stand of clover, as we do yet, we would either have to break two-thirds of the farm, or permit one-third to lay in weeds.

As we practice, in case of a failure in clover, we have the timothy to fall back on as a cover and pasture crop, and oftentimes we conclude to let some field, already in good grass and clover, stand a year or two out of its turn, and break the field where the failure was made.

Another thing I have not drawn out at length, is, the fact that our special crop, tobacco, has stood in the way of rapid soil improvement, not that tobacco draws any more heavily on the soil than a 200 bushel potato crop, but for years we disregarded this fact, and used our manures too heavily on the tobacco crop.

Again, the time the tobacco demands every man and every hour, August 25, October 5, is the time we could be making a few tons of cowpea hay, getting a double reward from the cowpea crop, but an impossibility with tobacco in the field.

We have never, to any extent, practiced the scraping up and saving of the manure that always accumulates about the milking yard, or at the corners of fields where stock congregates.

Some of the men who held that hardware store institute, had done this, and one man said that he got three to five good loads of manure per year in this way, certainly an amount of manure well worth considering.

In the summer, and up to the time when the milk stock is stabled every night, our cows each has a place to which she comes and is tied up for milking night and morning.

It is not much trouble to go over this place every morning, with shovel and wheelbarrow, take up the droppings and dump them in a pen, and if this is done regularly, enough manure to grow thirty or forty bushels of corn can be saved.

We have increased our milk herd to seven cows, and want to get up to ten within a year. When this is done, the tobacco crop is to be cut from six to four acres, then, by 1918 at the latest, the silo is to be built, and it is going to take less labor to run the farm.

For seven years we kept up a few acres of alfalfa, but one year made the serious mistake of cutting a fourth crop late in the season, damaging the stand, and have had a failure in seeding since.

We got a good stand of sweet clover last spring by seeding with oats, after having failed to do so several times by other methods.

As a rule I only favor seeding sweet clover on rough, stony, or steep lands, those not easy to cultivate, but we had the seed, and so we put it, ten pounds per acre on the less fertile end of a twelve acre field, and are glad we did so.

This answers a query as to what time I would sow sweet clover, as it is the first time I ever got a good stand, and I have seeded at several other seasons, and in several ways.

C. D. Lyon.

There are a pile of little school house Farm Clubs which have already saved $300 or $400 for their members. Why shouldn't you and your neighbors do likewise?

SHIPPING LIVE STOCK DIRECT

We have been watching the direct shipment and selling of Live Stock to the big Packers for sometime and believe that the practice is fraught with grave danger to Live Stock producers throughout the Country. Beyond question, it is of vital importance to the Live Stock industry that the open market shall be maintained, if a fair degree of competition in the selling is to remain—and the more cattle, hogs and sheep that are sold direct to the Packers in the feed lot or through local buyers who sell direct, the more the open market will become weakened. If it is a good thing for a half dozen feeders to sell direct to the Packers, then it should be an equally good thing for 1000 or 5000 feeders to do likewise—and thus, in a little while, the open competitive market would become a thing of the past and then indeed would the last vestige of control be delivered over to those powerful concerns which, in latter years, have so often found themselves in position to smash prices at will.

A splendid case in point is the history of the last twelve months: A year ago, as if by an agreed signal, the big Packers pounded down the price of hogs over one dollar per hundred within the short space of 48 hours—and the hog and cattle prices which thereafter obtained until in January of the present year, lost tens of millions of dollars for the Live Stock feeders and producers of the Country. Then suddenly something happened. The Canadian Packers had succeeded in landing some big foreign meat contracts and no sooner had they tucked these contracts away in their pockets when they appeared in the American markets as fighting competitors for cattle and hogs—and it has been a battle royal between them and the Big Fellows ever since.

To these 'invaders" from the North and to the activity of the independent buyers in general during recent months is due entirely the fact that cattle and hogs have been and are selling at $10 per cwt. at the present time—for the man who thinks that the Packers have had a "change of heart," or that they are throwing out a little "sop" because of fear for a Congressional investigation has another guess coming. Now suppose that during the last ten years feeders had sold enough of their cattle and hogs direct so as to have destroyed these big open markets—or at least have materially enfeebled them? Where would the Canadian crowd and our own independent order buyers be going today for their cattle, hogs and sheep? Again, if today you should sell a carload of cattle direct and get $10.50 per cwt. for them on your farm, remember that the pace for this price was set in the big open markets—not in your feed lot, for there the representative of the big Packer is the sole bidder and therefore without competition. Therefore, if he consents to pay you a good price it is only because the standard for that price has been fought out in the big competitive markets which, regardless of all other considerations, must be maintained at all hazards.

The good Lord knows the Packers have their own way often enough as it is—for the moment the independent factors in the market get out of the fight, prices begin to tumble like a house of cards. But at least let us hold to what independence remains to us. Let us preserve the open market—and perhaps someday if farmers use enough foresight to organize we will be able to dominate the selling end completely, so that the law of supply and demand may become a living fact—for not until this goal is realized will the Live Stock industry rest upon a solid foundation.

I know there are those who sell direct to the Packers because in this way they can avoid the payment of commissions to a Live Stock Commission Co.—but here again, if we are correct in the conclusions voiced above, the feeder is merely "selling his birthright for a mess of pottage." As matters stand, the commission man stands as an effective barrier between the Live Stock producer and a closed market—and therefore, for the present at least, their interests are mutual and they should fight side by side. The saving of the commission is the "bait" on the hook. At first glance, like all other "bait," it looks like a "good thing"—but, as usual, it is wise to look carefully into what the felllow who put the bait on the hook has up his sleeve. If the big Packers have made a single move during the last 25 years which was not calculated to tighten their grip on the Live Stock producer it has escaped our attention—and hence, from our view of the matter at this time, we would advise feeders to ship to the open market and sell only to buyers who consign to the open market.

William Hirth.

Year-after-year Comfort with Ideal Heating

It's a mistake to think that you too cannot have IDEAL Heating. Just read these reasons, then send for our free book "IDEAL Heating" and you will see how easy it will be for you to have these comforts and conveniences.

"Come right in, folks, where it's warm all over—radiators make a heap of difference"

Reason 1. IDEAL heating can be put in a house, new or old, without tearing out partitions, walls, or floors, or disturbing present heating arrangements. No dirt, fuss, or confusion.

Reason 2. Not necessary to have water pressure because IDEAL boilers use the same water for years. The outfit may the first time be filled with a bucket.

Reason 3. Not necessary to have a cellar because IDEAL boiler may be placed in side room or "lean-to." Thousands of boilers are so placed.

Reason 4. The savings in fuel (IDEAL boilers burn any local fuel) soon pay the original cost of the outfit and the absence of labor and attention, and repairs of IDEAL heating, repay many times the cost.

Reason 5. The cost, as illustrated below, is not large. Consider that you buy an IDEAL outfit for a lifetime of service with no further upkeep expense, and when you are through with it, it's just as good as when first bought. It's the only equipment you can buy which is never worth less than you pay for it. In the meantime, it gives you unequaled heating service with less fuel bill per season and it increases the value of your property more than any one thing will do.

Reason 6. Because your wife wants it and ought to have it. The outfit changes a house into a home.

AMERICAN RADIATORS & IDEAL BOILERS

Write today for Free Book

A No. 4-19-W IDEAL Boiler and 270 ft. of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Our book, "IDEAL Heating" is the best one published, giving illustrations and description of Radiator Heating—you can't make the best choice until you read it.

A Great Sale of Jerseys

Elsewhere in this issue appears the announcement of the sale of the great herd of Jerseys owned by the late Col. W. H. Phleps, at Carthage, Mo. This is one of the finest herds of Jerseys in this section of the Country and those who are interested should not fail to attend. It is a great opportunity and one which does not come often.

"The Road to Somewhere"

This is the title of an inspiring, illustrated lecture for boys and girls which Chas. F. Alt, Principal of the Robidoux High School, at St. Joseph, Mo., delivers to rural school audiences and our friends will do well to get in touch with him and arrange for this lecture. Teachers and school boards should write to him for his terms.

TOM AT THE UNIVERSITY

By "Tom."

Dear Dad: I am getting along fine in my school work and like it better every day. You said that you would like to hear more about the University and what we learn here. I am going to tell you what I am learning about modern agriculture in my letters now so that you may think over them during the long winter evenings and see if you can be able to apply some of them on the farm. I do not want you to get the idea that many farmers and other people have, that a study of modern agriculture is based on "theories" and "book larnin'", for such is not the case.

No business could ever be a success if not based on a substantial foundation, and agriculture is a real business, and a complicated one at that if properly conducted. To base it on theories would be placing the nation's greatest industry on the sands.

When grandfather came upon good old Missouri's soil it was cheap and fertile. He farmed it according to the standard of his day and was able to make it pay for itself after so long a time. He had no serious marketing problems to face then as we have today and the fertile soil produced all that was required to make a living at that time. It was useless for him to form a Farmer's Club to aid in selling or buying, and an agricultural education would have been out of the question as there was no need for it. Yet today, many of the older farmers will look upon an agricultural education with an unfavorable eye and say it is unnecessary, and cite their own case where they have a small fortune in owning the land that they obtained when they were young. But look at it this way. Was this fortune made by farming of a high degree? No, excellent farming methods may have been used, but in many cases the fortune was brought about by an increase in value of the land and the farming methods had little to do with it. It is impossible for the young farmer of today to get land like his father obtained when he was young, because it is all taken up now. Instead, he must pay four or five times as much for the land as grandfather, accepting it after much of the fertility has been destroyed; face fluctuating market conditions that usually allow him to get barely enough to pay for the work of production, to say nothing of having any left to pay down on the farm.

It is up to the young man of today to learn more of the fundamentals of agriculture to fit him to meet these new conditions, and I feel that here in the College of Agriculture I am learning a few things that will fit me to run the farm on a more intelligent and better paying basis than we have been able to before and help make farm life the best of all to live.

But now I will tell you a point that I have learned since I have been here that may be of interest to you. For several years we have been trying to grow cowpeas in our corn but have never been able to get a real sucess out of them. Cowpeas are alright in the corn in the southern part of the state but in the northern part it has been found that the soybeans are better. I had never heard so very much about the soybeans until lately and as far as I can see they are a worthwhile proposition, as a "side line" to the corn crop. They are planted the same time as the corn with a cowpea attachment, putting two or three beans in each hill of corn. From experiments and the results of practical farmers it has been found that a normal season will produce six or seven bushels to the acre. These are worth about $1.50 per bushel as a feed which would mean about $10 per acre if they were fed. Where the corn is hogged down as is now a more or less common practice, the hogs will eat these seeds, and here is where their value comes in. As you well know, tankage or some other high protein feed must be fed to fattening hogs if they are to make the most economical gains and the seed of the soybean is high in protein and will replace a part of the tankage that is necessary to feed and save this expense to a certain extent.

In cutting corn for silage the soybeans will go in the bundle with the corn as they stand erect. Silage in itself does not make a "balanced ration" and must have clover, alfalfa or some other feed which has a high protein content to balance it up. The soybean has a protein content as high as alfalfa and will help replace these other feeds.

Where sheep are turned in the corn in the fall they will clean up some of the weeds and get a large amount of feed from the soybeans as they will cut the leaves and the pods also. This is a good feature and I think more farmers should keep sheep around their farms to act as scavengers and they could be turned in and allowed to get the good of the soybeans. Young sheep are easily finished out where they have these soybeans to feed upon and the farmer has no expense of feeding them as they do the harvesting for him.

Another feature of this crop combination is that it adds fertility to the soil. The soybeans are what we call legumes and have the ability, when inoculated, of taking the nitrogen from the air and placing it in the soil in such a form that it may be used as a food for the following crops. Nitrogen is one of our most needed plant foods in the soil and must be well taken care of. The roots of the soybean go deeper than the roots of our grass crops and bring up fertility that would not be used by our other crops.

Now I do not want you to think that I am trying to exaggerate the good of this one little feature for I am not; these little things if added to our greater ones will help make our crops pay out better and may be enough to make a profit that is paying rather than one that is not and any added gain, even if small, should always be taken into consideration. It is getting late and I must be going to bed. In my next letter I will tell you about some other point that I have learned. Love to all, Tom.

DO SOMETHING—YOU!

For weal or for woe, the Farm Club is here. It is being "cussed" and discussed. It is well. Both courses help to advertise. If you are a farmer and are not in touch with this movement, I say "look around you." Wake up! The band wagon is coming. Don't wait till it runs over your toes before you wake up to the fact that it is here. Come down the road and meet us half way. The hand of co-operation is extended. Get aboard. Bring your horn. "He that tooteth not his own horn, the same shall not be tooted." If we get a square deal in the halls of the law makers and in the markets of the land, we must toot our own horn. This is the great game of life. Play your best hand. Clubs are trumps. If you haven't a trump, get one. Organize a school house Farm Club. If you need help, call for it. Don't sit back and howl at your fate. Do something! Do it now! You have it all to win and nothing to lose.

We will soon have at Centralia, Boone County, an example for you to pattern after. We have 12 local clubs federated into a Central Club. A business manager is to be employed to handle the co-operative business of all the local clubs. He is to have charge of co-operative grain and live stock shipments, the co-operative buying of supplies, and the co-operative plans for educational and social betterment.

Success will crown honest, earnest, intelligent efforts at co-operation. Are you in? Are you "ready to go," or are you to sit back and "Let George do it?" Too busy, are you? The peasant farmers of Europe and Asia are busy too. They work from dawn till after dark just for a mere existence. Does that problem please you? When the pages of history unfold their final story of our country, shall the story be told of a peasant farmer people who heeded not the fate that befell the farmers of the great nations of the past: or shall the story be told of a farmer folk who fought the good fight and won?

The call today is for leaders. Two thousand years ago, the Apostle Paul stood on the shore at Troas and heard the Macedonian call from across the waves. Today the Macedonian call comes up from every school district in the land. We want men—"men to match the mountains;" not men to slink along like whipped curs down the rut that leads to poverty and peasantry. "He who is not for us is against us." What are you going to do? B. P. Smoot.

HOW ONE FARMER BEAT THE PACKERS

With the time of butchering near at hand, let us prepare to keep some of this season's meat out of the packer's hand and save paying them an enormous profit, freight, both to and from the market, commissions and other middlemens profits.

Too many farmers practice feeding their hogs in the fall of the year and sacrifice them to the packers when they are harvesting their products to sell the following summer at a handsome profit. The same is done by the grain dealers every season, and especially did they do this in 1916. When at threshing time wheat was bought around the dollar mark, and now selling around the two dollar mark, with no visible reason, only, to accumulate millions of dollars at the expense of the farmer and consumer.

Why not esablish a little packing house and granary of your own?

I have been trying the packing house plan the past few years with very satisfactory results. The average farmer feeds from fifteen to twenty-five hogs in the fall, butchers about five or six, and turns the rest over to the packers. Some not butchering any, turning all of them to the packers, and buy them back the following summer at from fifty to one hundred per cent profit.

My plan is to butcher all the hogs I feed in the fall. I butchered twenty-seven hogs last season at three butcherings. I sold all my sausage, bones, livers, heads and feet at time of butchering at a good price. Bringing from forty to forty-five per cent of what the hogs were worth on foot. The jowls were taken off the heads, leaving the lower jaw bone on the head. The jowls I salted down the same as bacon, and sold early in the spring at a good price. The rest of the head being made into hog's head cheese which will sell almost as high as sausage.

My last butchering was done the 20th of February when hogs had advanced from about 6 cents per pound at home in December (when most of the farmers were turning hogs loose), to 8 cents per pound at this time. I butchered nine head weighing thirteen hundred and ninety-six pounds, worth $111.68 at current price. I sold the parts mentioned before for forty-five dollars and forty-seven cents on the local market. The rest being salted down and taken up about the first of April and smoked with green hickory wood five or six days, and sold on the 10th of April for $84.86. Making $130.23 for the nine hogs, or nine dollars and thirty-three cents per hundred at time of butchering. I made quite a good deal more profit off of the first two butcherings (one being made Dec. 20th when the hogs were selling at 6c at home, and the other Jan. 22nd when hogs were selling at 7c at home), from the fact the packers were forcing the retail dealers to sell their meat at the same price, or about the same, at these two times, that they were when the last butchering was done. Consequently I got same price for sausage, bones, etc., making the profit greater.

Four or Five men can easily butcher ten or twelve hogs in one day and finish everything—using the ordinary methods commonly used by farmers, and which could easily be improved upon. So one can see the cost of butchering would be small, and yet smaller by co-operating with his neighbors and not hire any help.

So let us organize these Farm Clubs all over the state, as THE MISSOURI FARMER is trying so hard to get us do, and solve this problem as well as many others.

The farmers of my school district organized about ten months ago with twenty members, and we now have eighty members from this and adjoining districts. We are saving ourselves a great deal of money on the buying proposition and the same in regard to selling. We have just bought 19,000 lbs. of flour at a saving of one dollar and forty cents per bbl. under the local retail price.

If we farmers don't paddle our own canoe, no one else is going to paddle it for us. So let us get together and get in and paddle. Ezra T. Palmer, Boone County.

BALANCING THE FEED FOR PROFIT

Mr. R. W. G., Garden City, Mo., makes inquiry as follows: "I have 3 litters of September pigs, 27 in all, which will be weaned about last of November. Now I would like to feed these shoats out, making medium weight hogs of them some time next spring. I will be obliged to buy every pound of feed they eat from weaning time on, outside of the red clover and blue grass I will have for them next spring. I would like for you to help me outline a ration and a plan for handling these shoats, always remembering it is profit I want. I have an excellent hog house, warm and dry, also a concrete feeding floor 12x30."

Owing to the general character of the inquiry it is rather hard to furnish definite advice regarding the matter. Assuming, however, that your

correspondent's pigs will average 35 to 40 pounds at weaning time and that he desires to market them in the spring at the weight of 200—225 pounds it would mean that they are to be fed 4 or 5 months.

In order to reach the desired weight in the time alloted it will be necessary to feed practically a full feed from weaning time on. Since the hogs are to be marketed in the spring this feed must necessarily be principally grain. Now the best grain ration to use would depend, among other things, upon the relative prices of the different feeds in the locality where they are to be purchased. Ordinarily, however, corn and tankage will make the most economical ration with perhaps some shorts added to the ration of young pigs. The Missouri Agricultural Experiment Station fed some pigs, averaging 49 pounds in weight for 60 days on a self feeder. The feeds used were corn, shorts and tankage; each of these feeds being placed in a separate feeder so that the pigs could eat as much of each feed as they wished. The ratio of feeds consumed when fed in this was:

Corn	9.2 pounds.
Shorts	3.5 pounds.
Tankage	1 pound.

The average daily feed per hog was 5.17 pounds which produced an average daily gain of 1.27 pounds so that at the end of the 60 day feeding period the pigs weighed 125.7 pounds, having gained on the average 76.7 pounds per head. With corn at 80c per bushel, shorts $1.40 per hundred weight and tankage $2.50 per hundred weight the cost per hundred pounds gain was $6.07.

After the pigs have been fed for 60 days or thereabouts, the shorts may be dropped from the ration if desired. At the Missouri Station hogs weighing 122.2 pounds self fed on corn and tankage in the manner already indicated gained an average of 1.61 pounds per day for 60 days, making their final weight 219.2 pounds. During this feeding period the average daily feed was 7.45 pounds in the proportion of 17.1 pounds of corn to 1 pound tankage. With the price of feeds the same as in the former trial the cost of the gain would still be less than $7.00 per hundred pounds.

With good, thrifty, well bred pigs your correspondent should be able to duplicate the above results.

L. A. Weaver,
Mo. Agricultural Expt. Station.

DEVELOPMENT OF THE HEREFORD BUSINESS IN ST. FRANCOIS COUNTY

By Bert L. France, County Agent

The St. Francois County Hereford Association was organized in the spring of 1915. The object of this association was to develop the Hereford industry in that county. At that time there were about 20 men breeding purebred Herefords. The first event of especial significance was a Hereford tour conducted in August of that same year. Mr. R. J. Kinzer secretary of the American Hereford Association was invited to the county to inspect the cattle there. All of the Hereford breeders and many of the business men of the county met on Friday morning in Farmington where automobiles were provided for a tour of the county. About 100 men made this trip. On the first day twelve herds were visited. A picnic dinner was held on the first day at one of the farms. On that same evening a banquet was held in the hotel in Farmington at which about 60 plates were laid. The trip was concluded the following day with lunch in one of the outlying towns.

There were several results of this trip. The farmers and business men of the county had never before realized that there were so many purebred Herefords in the county and especially had not known that there was so much exceptional quality to be found. The breeders themselves had not realized that there were so many good cattle. The herds visited that day represented about 500 pure-bred cattle.

On December 20 the association sold 41 head at public auction at Jackson, Tennessee. These cattle sold well but the great value of this sale is to be found in the splendid advertising which it gave to the St. Francois County product.

The second association sale was held at home this year in Farmington on the 28th day of October, 1916. There were about 45 head in this offering.

The most interesting feature in this connection indicating the reputation that those breeders have already made, was the sale this fall of 83 head of spring calves for November 1 delivery when they will average not over seven months of age, at an average of $80.00 per head.

The demand for breeding stock greatly exceeds the supply and incidentally there are about thirty breeders in the county now raising purebred Herefords. The big thing that has been accomplished there is the getting together on one breed and boosting for that breed.

WON HIGHEST AWARD AT SAN FRANCISCO EXPOSITION

International Harvester Wagons—Weber—Columbus

WHEN your old wagon is just about gone and you're thinking of buying a new one, sit down and do a little figuring. What kind of service has that wagon given you? How many delays have you had because of accident and breakdowns? Could you always get repairs easily? How long has it lasted? You have to add all unnecessary expense to the price you paid at first, to find out what your wagon really cost you.

When you have these figures you will see at once the advantage of buying a **Columbus** or **Weber** wagon. They give you steady service, with no delays. You can get repairs any day you need them. The folding endgate and link end rods make them easy to load and unload. The fifth wheel—an exclusive feature on these wagons—adds years to their life.

When you are ready to buy a new wagon and want the one that costs the least per year of service, drop us a line. We will direct you to the nearest **Columbus** or **Weber** wagon dealer and give you information that will make it easy for you to buy one of the best wagons you ever owned.

THE FARM CLUB MOVEMENT

(Continued from page 2)

As I have said several times before, the "big farmers" are taking a hand in this Farm Club fight—the men who are big live stock producers and feeders and who heretofore have largely stood aloof from movements of this kind. As Mr. Earl Rea, a progressive Saline County farmer remarked to me the other day, "As long as our land kept on increasing in value we didn't feel things so keenly—but now its quit doing that and our backs are up against the wall along with the tenant farmer or the farmer who owns only a little 40." And this expresses the situation in a nut shell. Up in the Dakotas, in Minnesota, Iowa and everywhere farmers are "milling" as never before and all signs go to show that we are on the eve of the greatest farmer awakening the Country has ever known. But thus far the movement in Missouri is more practical and on a firmer foundation than in any of these states. We are in position to lead and set the pace for farmers throughout the Country—if only you and your neighbors will wake up and take your place in the procession.

What They Are Doing

The County Farmers Ass'n which was formed in Lafayette County some weeks ago is pushing the organization of Farm Clubs in every direction and I believe I am safe in saying that nearly 100 school house Clubs will have been formed by January 1st. In a few days the Township Committees will meet for a conference and at that time the project of building several Farmers Elevators will be taken in hand—and the idea of a big Co-Operative Creamery will also be discussed. At Centralia, Mo., more than a dozen new Farm Clubs have been organized during the last 30 days and a Live Stock Shippers Ass'n with a regular paid Manager is now in the process of completion—Centralia being one of the biggest live stock shipping points in Missouri. Up around Richmond in Ray County a dozen new Clubs have been formed during the last three weeks and soon a County Ass'n will be perfected. Down in Vernon County more than 20 Clubs have been formed and a County Ass'n will be organized soon. In Saline County the movement is growing daily and the big mass meeting which was planned several weeks ago and which was postponed because of the election will soon be held for the purpose of perfecting a County Ass'n. Up at Meadville a number of Clubs have formed a Live Stock Shippers Ass'n while at Triplett in Chariton County a Farmers Elevator is being organized. At Brunswick Messrs. Bachtel, Smutz, Heisel and other Farm Club leaders are planning a big "Love Feast" and supper for their Farm Club members and wives in the near future. They have been saving money on coal, salt and mill feed and report farmers as being greatly enthused. Down at Warrenton, Gust Polster, Pres't of the Warren Co. Farmers Ass'n is planning a big "round up" of the Farm Clubs of that County in the near future—and so it goes all over the state—and mind you, as I said a little while ago, we have hardly more than started. Even down at Branson in the heart of the Ozarks, Mr. Renshaw and a few courageous souls are trying to start the ball rolling among the crags where Harold Bell Wright found the characters and setting for his beautiful story, "The Shepherd of the Hills."

A New Opportunity

With the defeat of the Missouri Land Bank amendment, which means that the farmers of this state who desire to escape from heavy interest rates and long time loans will have to avail themselves of the new Federal Farm Loan Act—this suddenly has created a new reason for the formation of a Farm Club in every school district. In order for farmers to avail themselves of loans under this law, 10 or more farmers in the same general community must form a Nat'l Farm Loan Ass'n and these farmers must ask for loans aggregating not less than $20,000. Within 10 days our new pamphlet explaining the law fully will be ready for distribution to those who send us a 2c stamp to cover cost of mailing. But the point in a nut shell is this: If farmers will see to it that a dozen or so Farm Clubs are formed in their neighborhood, it will then be easy to discuss the new law so that every member fully understands it. Then those farmers who desire to make application for loans in each Club can get together and form a National Farm Loan Ass'n. In other words, through the discussions in the Farm Clubs farmers will be much more able to understand the working of the law—and more vital than all else, the Farm Clubs will become the clearing house through which those who desire to borrow can be brought together for the formation of a Nat'l Loan Ass'n and thus, another powerful incentive has been placed back of the crying necessity for farm organization.

In conclusion, let me say as I have often said before—that there is no phase of this great new movement which I value more highly than the fact that it is bringing farmers together for the discussion of their problems in the little school house. If the farmer is to become a really vital force in the Nation—which he is not at this time; if we are ever to shake loose the grip of the Packers Combine, the grain gamblers and others who levy tribute upon the farmers sweat and toil—then the farmer must get together with his neighbors and prepare for this fight as never before. We can't win this battle by sitting around the kitchen fire or by merely yelling "Howdy" to the neighbor across the fence—or chatting for a few moments on the street corner when we go to town to trade on Saturday. We must touch elbows and plan this great coming struggle in the little school house meetings—and furthermore, it will put a new zest and enthusiasm into farm life and relieve it of the monotony which makes it so dull and listless at this time. For a 2c stamp to cover cost of mailing we will be glad to send you literature, Constitution, By-Laws, etc., for a Club in your district.

William Hirth.

Farmer Boys Attention!

Never before have farmer boys had such a fine opportunity to make a lot of money out of polecat and other wild animal skins as this winter—and you ought to get out your steel traps and get busy. In the meantime, write to the fur companies whose advertisements you will find in this issue and ask them to send you their price lists and "Trappers Guide." Be sure to mention this paper when you write.

THE MISSOURI FARMER
Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VIII November 15, 1916 No. 22

William Hirth, - - - Publisher
Geo. B. Ellis, - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 75c Cents a Year in Advance or two years for One Dollar.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

DESERVING SUCCESS

The different Record Associations of purebred live stock have done this country incalculable good and their work will not be finished when the last scrub is eliminated. One association which is winning success and which deserves it, is the National Duroc Jersey Record Association with headquarters at Peoria, Illinois.

The annual meeting of the stock holders will be held on December 2nd at which time one of the most magnificent buildings owned by any live stock association will be dedicated. The building has just been completed at a cost of $60,000 with a balance left in the treasury for other purposes.

We acknowledge the courtesy of an invitation to be present at the dedication and annual banquet and our toast delivered in advance is "Long live and prosper the National Duroc-Jersey Record Association."

CO-OPERATIVE EFFORT

There is so much that can be done in any community by earnest co-operative effort and so little that can be accomplished without it that it is beyond our understanding to explain why there is not more co-operation among farmers generally. The big farmer will find many things helpful in co-operation but with the small farmer it is absolutely impossible to do much without it. In pioneer days the farmers of a settlement found it necessary to co-operate pretty closely in house and barn raisings log rollings, wheat thrashing, etc., but with the advent of machinery farmers have drifted too much to individualism in doing their work and that has gradually had the effect of destroying the necessary co-operation in social, educational and other community projects.

The swamp lands of this state are being made into fertile fields by co-operation and this improvement could not have been done in a thousand years without a co-operative drainage law which empowered a majority to unite and compel the minority to pay their proportional part. The Farmer, a farm paper of St. Paul, suggests that land clearing associations should be formed by the farmers of the timbered sections of the Northern states so that capital can be secured to buy stump pullers, pilers, etc., and by 6 to 10 men working together each man will become expert in doing some part of the work and the land can be cleared without the outlay of very much money and without the back breaking work that is necessary to do clearing without the necessary machinery.

We offer this suggestion for the benefit of our readers who may yet have some timber lands to clear. We have much to learn about the different ways of helping our work along by co-operative effort and every successful enterprise of this kind will lead the way to something better.

DEFEAT OF THE LAND BANK

Our readers are all aware by this time of the defeat of the Land Bank amendment which was voted on at the general election. We are not in possession of the official figures but according to the published figures the amendment carried a very complimentary vote and it is no great surprise that a proposition so new and so little understood should be defeated the first time it was voted on.

Those who believe there is a real demand for a rural credits system need not be discouraged by this temporary defeat for we can now turn to the Federal Farm Loan Act which will soon be put into operation. It is not necessary to discuss the relative merits of the two plans now but every man who wants to get a loan on his land at a lower rate of interest than he is paying now or who wants to get a loan that he can pay off a little at a time will do well to investigate the Federal Farm Loan plan.

FARMERS SHOULD BE ON GUARD

This is a pretty good time for farmers to look after their interests that are likely to come up in the Legislature this winter. All other interests are busy now trying to organize their forces so as to get what they want in legislation and appropriations and unless the farmers get busy they are sure to find their own wants overshadowed by other things.

One important matter that concerns every farmer in the state which will come before the Legislature this winter is the acceptance of Federal aid for road building. A few people who believe in building national roads and state roads out of Federal and State appropriations are already well organized and it would seem from recent speeches of Secretary of Agriculture Houston, that they now have that gentleman converted to their way of thinking. A few months ago Mr. Houston was emphasizing the need of the farmer's market road, the road over which must go all the surplus grain and produce of the farm and taking a common sense view of the matter it would seem these are the roads of the greatest importance to the whole country but this idea is being ridiculed by the "silk stocking tourist" and unless farmers wake up the former plan will be adopted.

Another matter of importance to the state and to thousands of farmers is the enactment of an adequate sheep protection law. There are now more than 40,000 farmers interested in the sheep business and there is room for as many more but the greatest handicap to the business is the annual loss from the depredations of prowling dogs. It matters not whether any individual farmer wants to engage in the sheep business or not but he will readily understand that if $10,000,000 or $15,000,000 of new wealth were added to the present resources of the state he would be indirectly benefitted by it. We now have in Missouri about 1,000,000 sheep and an equal number of dogs and if we could get rid of half of the dogs and increase the sheep to double the present number it would be a fine thing for Missouri.

There are many other matters that will come before the Legislature that farmers are vitally interested in including questions of taxation and appropriations but it makes little difference what the questions are unless the farmers make their wishes known they are likely to come out with the short end of the deal.

There are already several hundred Farm Clubs organized in Missouri and still room for many times more and if these clubs will take up the discussion of these legislative questions and forward their protest or indorsement to the members of the Legislature they will find less cause to complain after the Legislature adjourns next March.

INTERNATIONAL LIVE STOCK EXPOSITION

We agree with Dean Curtis of the Iowa State College when he says, 'There has' been something of vital importance lacking in the live stock industry of the United States since 1913. Nothing can take the place of the International Live Stock Exposition. The end of a season without an International seems like a great drama with the principal character omitted. The International will be of unusual interest and of special service and value to the live stock interests this season. Never before in the history of American agriculture have the live stock interests occupied a position of such commanding importance and general interest as they do today. The International Live Stock Exposition is the culminating event of supreme importance in the animal husbandry affairs of North America."

The holding of the International for 1914 and 1915 was suspended because of the outbreak of foot and mouth disease and this great show ought to prove a greater success this year than ever before. It is the crowning event of all live stock expositions in America and a week spent at the International ought to be more profitable to any farmer interested in better live stock than any week during the year spent in productive work on the farm. The show will be held this year December 2 to 9, at Chicago, and a large attendance is anticipated by the management.

CALF AND PIG CLUBS

There is no better way to get a boy or girl permanently interested in some good work than to give them something to do that will bring them a profit. In fact profit has a whole lot to do in holding the interest of grown-ups in most undertakings. A very commendable effort for community betterment has been called to our attention by Mr. E. G. Bennett, State Dairy Commissioner of Missouri. The Union Trust Company of Carthage, has very generously offered to finance two boys and girls calf clubs and two pig clubs and to do this without interest for one year.

The plan, as we understand it is that 40 boys and girls must join the club to make it complete. After the club is formed the members together with the officials of the bank will select some one to go into the dairy districts to buy 40 pure bred Holstein heifer calves and one bull calf. The price of the male will be added to the price of the 40 heifers and each boy or girl who is a member takes one calf giving his or her note without interest for one year for the purchase price. At the end of the year the calves are to be sold at public auction and each member will get the profit over the amount of his or her note. In addition to the profit, prizes are offered to the three members who put the greatest gain on the calves. If 80 boys can be interested in the handling and breeding of better live stock in any community it is impossible to estimate the future benefits to that community

A SPLENDID FREE LIBRARY

We have thought out a Free Library plan which we feel sure will prove of keen interest to the thousands of readers of THE MISSOURI FARMER—and here it is: If you and eleven other friends in your neighborhood will put up a dollar each for two years subscription to the paper, we will make you a present of a dozen of the standard Classics. We will send you a list of 100 books and you and the other members of the Club can select any dozen which you like best. In the list will be such great books as Les Miserables, Quo Vadis, The Little Minister and dozens of others like them—books which every man and woman, boy and girl should read and without which their education is incomplete. Some of the later books of splendid fiction will also be included—but, in any case, you may depend upon it that every book in the list will be worth while. As soon as you have completed your first book you can exchange it with another Club member—and thus the books will keep moving around the circle until each member has read the entire dozen. After that, lots can be drawn and each member will become the permanent owner of whichever book falls to his or her lot. Therefore, your dollar will have provided you with a winters fine reading and you will have two years subscription to the paper and a good book—a book which would cost you 75c or one dollar at any book store.

Now isn't this a fine offer? Did you ever have so splendid an opportunity before? When the supper dishes have been cleared away, can't you see yourself tucked down in a chair where the light is good, getting keen enjoyment and value out of the long winter evenings which are ahead? Now the thing to do is to sit right down and plan who among your neighbors you want to have join this Club. As soon as the list is made up, call them up over the telephone and explain this fine proposal to them—and I'll venture to say that in 30 minutes your Club will be made up. Then send us the dozen subscriptions as soon as you can collect them up, when we will at once send you the list of 100 books to choose from. And here is another thing: The Club can be continually enlarged. Thus, if there are a half dozen other books you want, all you need to do is to get a half dozen new members. I am especially anxious for country boys and girls as well as the older folks to take advantage of this fine offer. Now lets not lose any time—for already winter is here. So get busy right away, make up your Club, write us—and we will do the rest.

WILLIAM HIRTH, Publisher.

and while this banking institution is pulling off a splendid advertising stunt it is at the same time rendering a great service to these boys and girls, to their parents and to the whole state.

What if every rural bank in the state should put on something of this kind? Don't you think it would make Missouri the greatest dairy and live stock state in the Union? That is just what we think about it and we hope to see this club work spread to every county in Missouri.

SAM JORDAN'S SENSE AND NONSENSE

What is your recommendation? I read some time ago where my very dear friend, A. N. Lindsey, of Clinton, said in a political speech that he was born in Kentucky, is a Campbellite, and a Democrat.

Now, I love every pound of Lindsey, and there are several pounds of him. But not because he was born in Kentucky, for no doubt, there have been several men hung who were born in that fine old state. It is not because he is a Campbellite, for there may have been some members of that fine old church that have proven themselves to be scallawags of the worst sort. Neither is my admiration of him based on the fact that he is a Democrat, for in that fine old party, without doubt, there have been some pretty nasty folks. But the reason that I love him is on account of the brand of citizenship he hands out by his daily deeds.

It is not always safe to depend on our breeding to give out the impression of our citizenship, as there are many well bred scrubs. Neither is the world hunting for ancestry in this tolerably free country of ours, but it is on the hunt of the citizen, measured by the service he renders as such. I saw an old man the other day, who may have had "illustrious" ancestry, but had that fine ancestry seen him in the plight in whichI I saw him, they would surely have turned over in their graves. In boasting of your "sturdy old stock" do you not know that you may be related to that fellow that the mob hanged for stealing horses? Are you sure you are not remotely, at least, related to all the thugs, highwaymen, murderers, bloats, slobs, sane and insane, crooks, vagabonds, and (Democrats,—and Republicans) since our first parents, in the Garden of Eden? If you are not, when and where did your ancestry begin? Just go back to that time and see what a mean trick Eve played on Adam, then remember how weak that old boy was. Then you may remember that it was not very far down that first family until there was a murderer,—one who did not consider himself his brother's keeper. Do not get blue, now, over what I have said, for while you are so badly related, you have other relatives, who are presidents, kings, princes, Democrats, and Republicans, Campbellites, yes,—mayhap a Methodist, or even a Baptist.

Yes, your ancestry is a jumbled up lot, some of whom you should be proud, and on account of the deeds of others you feel that you should hide your face in shame.

My dear friend, the world is taking your measure every day of your life, and it wants you, or does not want you, just as your citizenship measures up the standards of a man. Your recommendation is your daily life, and the world is taking you at your face value.

* * *

Have you ever thought of the fact that all the good, and bad characters of your ancestry were born in you? And that much depends on you which ones predominate? Environment, then, may make you an angel or a demon, just as you permit those characters to predominate.

* * *

The penalty for violated law must be paid, some day, by somebody, some where, some how, no matter where, when, or by whom the law was violated.

It is just as true of the soil as of the soul. I often see soil so bady used that it is, no longer productive, and the cause is bad methods, that should amount to a crime. It is a crime, but human law does not forbid it, but society in general is paying the penalty just the same. "The limiting factor of a nation is its agriculture." Yet our nation is permitting soil destruction at a rapid rate. When our soil is destroyed the human race is at the last end of the last "quarter."

* * *

Flies and Some Hotels

One morning not so long ago on going into the dining room of the "leading hotel," we seated ourselves at the table for the "ordeal" of eating breakfast. No other guests had been at the same table that morning I presume, for when we saw the pitcher presumed to hold the "cream" ? ? ? for our coffee only six flies were swimming in it, cool for a morning bath, too. We made up our minds that we did not like "cream" ? ? ? any way. A look at and around the back door and dooryard we saw the cause that attracted the flies, and cats. It was dirt of many sorts including "details" of many a murdered chicken that had been served up in the dinning room "a la gravy."

We at once "fell to," discussing the state hotel inspector, and we found his certificate on the wall, and we wondered what the duties of this person are. We made up our minds that his duty is but one, and that one is to see if the bed sheets are nine feet long, hems included. We have sometimes wondered whether or not any hotel "keeper" has ever been refused a certificate.

It does not seem fair nor right when men whose life is "on the road" must some times have to endure such filth, bred of ignorance, or laziness or both. In the main, the hotels are good and clean. The food wholesome and well prepared and served, but some times we cannot avoid the dirty ones.

"Life on the road" is tough at best 'and we are at the mercy of conditions as we find them and in a few instances we have had to ask for private entertainment, or we would leave the place.

A hotel is perhaps a town's greatest advertiser, and the advertising is "good reading" or bad as the case may be, but it advertises just the same. The good hotels are not always in the big towns by any means, nor are the bad ones confined to the small towns. Some that are first class in every way are found in small places, but it does not make much difference, the price is always asked.

At some places there will be tables for the local patrons and the price is 35 cents a meal, but a table for the "knight of the grip" that costs a half a dollar, all because there is a bowl with a bannana or two, a minted apple, or a little orange that a fellow would have to be desperately hungry to get away with.

We gladly pay the price when the service is renderd, but do kick on some deals we get.

THE WORLD AS WE SEE IT

We know a fellow who never will have "brain fag."

* * *

Speaking of the election—"and the next day it rained."

* * *

Fortunate the farmer who is filling granaries in America instead of graveyards in Europe.

* * *

A lot of folks with no real troubles can't be content without trumping up some imaginary ones.

* * *

The political straw vote was so valueless that it wasn't worth baling. Might as well burn it.

* * *

There are some folks in the world who are big enough to grow great without growing greedy.

* * *

And now they are testing tobacco by the use of machinery—just as if there was no better way.

* * *

A thief who entered a Kansas City home stole a pumpkin pie. Evidently he was a man of good taste.

* * *

Old iron is bringing a good price, but not enough to pay for new farming machinery. So why not a shelter?

* * *

Who says this is not the day of the farmer? Didn't Missouri have a Lamb and a Gardner running for governor?

* * *

If the price of Boston's favorite dish continues to advance there will be lots of folks who "don't know beans."

* * *

The Salt River of political tradition may have had its origin in a salt lick. At least, there was some licking somewhere.

* * *

Some theoretical reformers who would "uplift" the farmer and revolutionize country life still have a little to learn.

* * *

The weather is the auto crank of conversation yet, when it comes to talk, lots of folks are sure enough self-starters.

* * *

A newspaper, in telling of the high prices for potatoes, refers to African potatoes. Is this a new name for sweet potatoes, with 'possum as a side dish?

It isn't always the fellow with the biggest foot that boots the football the best—nor the man with the most muscle who is the best farmer.

* * *

Half of the candidates are now thoroughly convinced that it's impossible to "rope" the voters with campaign cigars—near ropes though they be.

* * *

We have no patience with that individual who refers to his father as "the old man," who speaks of his old home town as "that berg" and who talks of the country as "back in the sticks."

W. L. Nelson.

And also, does your inner life come up to the sample you hand out? If not, is not that moral cowardise?

10 DAYS' FREE TRIAL

We will send you this big

Upholstered ROCKER

At Our Introductory Price of Only $5.45

If you would like to have this big, comfortable, Upholstered Rocker in your home, just fill out the coupon below and we will send it to you *without a cent of money in advance.* This offer is open to any responsible person. When you receive the Rocker, put it in your parlor and use it for 10 days—use it just as if you had paid for it, and if at the end of 10 days you decide it is a real bargain—if you decide you would not part with it for twice the price we ask, then send us $1.00 and pay $1.00 each month until you have paid our Bargain Introductory Price of..... $5.45

Satisfaction Guaranteed Our Liberal Easy-Payment Plan enables you to have this splendid Rocker for your home without feeling the cost. You take absolutely no risk in sending for this Rocker—we are an old established firm having been in business since 1888. You do not have to send a cent of money with the order, and if you don't want to keep the Rocker, just send it back at our expense. Fill out and mail Coupon today.

CROFTS & REED CO., Installment Dept. C-381 CHICAGO, ILL.

SEND ORDER ON THIS COUPON

CROFTS & REED CO., Dept. C-381 Chicago, Ill.

You may send me Upholstered Rocker No. 90305. I agree to pay the freight charges, and if I decide to keep it, will send you $1.00 at the end of 10 days, and $1.00 each month until I have paid your Introductory Price of $6.45. It is understood that the title to the Rocker shall remain in the name of CROFTS & REED CO., until the bill is paid.

JUST THE COUPON

(507)

Description of Rocker No. 90305 We do not believe you have ever seen a Rocker equal to this one sold at so low a price. The strongly constructed frame is made entirely of Oak with a fine Golden Oak finish; pretty embossing on front and back; spring seat is 19½ inches wide and 18 inches deep; upholstered over strong steel springs. Back is 25 inches high from seat and 18 inches wide. Arms are 3¾ inches wide. Rocker is upholstered with a splendid quality of imitation Spanish leather which harmonizes perfectly with the beautiful Golden Oak finished frame.

GALLOWAY

ENGINES SEPARATORS, SPREADERS, TRACTORS

My 250-page free catalog tells you why I sell direct to user, at wholesale, these and other implements, built in my own factories at Waterloo, at prices one-third to one-half LESS than you usually pay for first-class goods. All sizes, styles and prices of separators, engines and spreaders. My Farmobile (tractor) has no equal for simplicity and efficiency. State what you need. 250,000 customers testify to quality of the Galloway line of goods. Write today for your free copy of this wonderful book of bargains for farm and household.

$34.50 Spreaders $34.75 up

WM. GALLOWAY, Pres., WM. GALLOWAY CO. Galloway Station Waterloo, Iowa.

Engines $26.75 up

$995

Drainage

Solve the problem. Make every acre pay. Try a Martin 10 days' at our risk.

Farm Ditcher and Road Grader

Cuts ditches, makes terraces and levees. Levels land, grades roads. All-steel, reversible and adjustable. Ask about trial offer. Write for free books.

Owensboro Ditcher & Grader Co., Inc. Box 311, Owensboro, Ky. Branch: Traders Bldg. Kansas City, Mo.

KEROSENE ENGINES

OTTAWA LATEST DESIGN

Durable, Powerful, Reliable, Massive. Built to last; to do hard, heavy work. Uses Cheapest Fuel. Pull ¼ to ½ horse-power more than rated. *3 Months Trial. Easy Terms.* Sizes 1½ to 22 H-P. Easy to start. No Cranking. No batteries. 10 Year Guarantee. Most practical engine ever built. Engine book free. A Postal brings it.

THE OTTAWA MANUFACTURING CO., 1821 King Street, OTTAWA, KANSAS.

The Code of the Mountains

By CHARLES NEVILLE BUCK

A STORY OF A MOUNTAINEER WHO BECAME CIVILIZED

The youth, who had three days before been Number 813, permitted himself to be led through an uninviting doorway around which stood several gaunt men in mud-spattered clothes. But Red Newton did not suffer him to halt at any of those tables, covered with red oilcloth, where several taciturn pilgrims from the hills were feeding themselves from the blades of their knives. Instead he whispered something to Fult Cawsler himself, and was permitted to climb a narrow stairway at the back. At its head they traversed a narrow hall and came into a separate room where around a private table were seated a group of men whom the boy knew. Old Jason Dode was, as usual, tipsy and, even as the newcomers entered, was tilting the bottle of "red licker" which he unwillingly substituted for the white and sweetish moonshine of his native stills. But the important thing was that Black Peter Spooner stood gazing out of the open window, though he stood back far enough to escape the eyes of passers-by below. His hands were thrust deep in his pockets and on his face was the same expression that always sat there. Few people passed Black Pete by without turning to look again. He stood somewhat upward of six feet and his broad shoulders tapered to a gauntness of waist and leg which gave him the suggestion of a timber wedge. He was as tough as that lumberman's implement and wedgelike, too, in his power of disrupting the dividing elements which, but for him, might have hung together in harmony.

His dark head he carried high-flung with a swing of independence, and that head, even more than the physique, caught and challenged attention.

Black Pete's face was rather narrow and rather long, but its brow was high, its nose strong and regular, and its chin had that square-blocked declaration of resoluteness which commands respect. Under brows black and bushy gazed out eyes that were the dominating feature. They were clear and penetrating as crystal lenses, and in them dwelt a sober, almost sad contemplativeness as though the brain behind them were habitually gazing off beyond horizons that limited other visions. They were eyes that seemed able to pierce the opaque things of life. The hair curled crisply in glistening black, about the forehead and neck, and over the firm mouth a black mustache fell drooping in long ends. It was a face that hinted at no violence, though at great strength and determination. Rather was it suggestive of melancholy thought, and it had won for him the satiric title of the "Deacon."

As Red Newton and Newt Spooner came into the room, Black Pete turned his glance for a moment upon them, then wheeled again to the window with no apparent interest in their presence or existence. His face remained as wistfully distracted as though he were a minister preparing a discourse, on a text which lay very near his heart. But Newt, having seen him, continued to stare. His eyes narrowed. He knew that several years ago, before he had himself become a felon, the Deacon had gone West—where he did not know. But he did know that only so long as this man remained away from the county could there be hope of even comparative peace between the Spooners and the Falkinses. So dreaded was the quiet-visaged intriguer, so unalterably given to violence and the taking of lives, that his exile had been the condition precedent to all negotiations for truces and peace. Now Black Pete was back. Obviously, the meeting in Cawsler's "resteraw," seventy miles from home, held some portent beyond the casual.

They brought the newest prodigal food, and, while he devoured it, bolting it with wolfish hunger, he also picked up the loose ends of talk and began to understand the situation. There had been an election down in his section since Newt's conviction—an election and some other things, which Red Newton briefly summarized as "merry cane." The "penitentiarying" of Newt himself had been only the inaugural of more sweeping and hateful innovations. Three times the old blood-feud had broken into sporadic outbursts, and three men had been shot. But what most galled was the fact that the commonwealth's attorney had shown a hound-like nose for evidence and that all of the accused clansmen had been viciously prosecuted.

A truce had been patched, by the terms of which Jake Falerin, a cousin of McAllister Falkins and the leader of the militant Falkinses, had agreed to leave the hills and remove the menace of his disturbing influence. He had gone only as far as Winchester, and, from councils held there with visiting Falkinses, was as dangerous as though he had remained at home, even while his own life was safer. The Spooners had decided that this half-compliance was a practical breach of the truce, and in accordance with that theory the Deacon had come home. At least, he had come this far. In the meanwhile, the Honorable Cale Floyd, commonwealth's attorney, had reaped the gratitude of his constituency. Because he had waged relentless war on lawlessness and had begun to show incipient symptoms of victory he was defeated for re-election. Sick of the futility of such endeavor, he had closed the bare law-office before which his shingle had swung in Jackson, and had come to Winchester, where the field was larger and v men were more appreciative of the qualities and principles for which he stood. He was the man who had put stripes on Newt, and who, had he remained in office long enough, would have made the pattern a family apparel for other Spooners.

"That's how things stands, Newt," summarized Red, turning to the new arrival, "an' that's what I 'lowed ye'd better know about afore ye went back home."

"An' them fellers, Jake Falerin an' Cale Floyd, is a settin' over thar somewhars in this-hyar town right now, a-brewin' of more deviltry," enlightened old Jason Dode in a hiccupy voice, "an' because they hain't in the mountings, they 'lows they kin go right on with hit. We don't 'low they kin."

The "Deacon" turned from the window, and strolled toward the table. Newt, having appeased his hunger, was wiping his mouth on the spotted tablecloth. The dark giant fixed him with thoughtful eyes. When he spoke, his voice was in contrast with those of his fellows, for his life in the West had almost freed it from drawl and vernacular, and he spoke with a quiet graveness.

"Son, this Cale Floyd is the same lawyer that sent you to prison."

Newt's eyes flashed.

"I reckon I hain't fergot thet," he said shortly.

Black Pete nodded sympathetically and went on with the same grave intonation.

"I reckon you wouldn't mind much if he got his dues?"

"He's ergwine ter git his'n," asserted old Jason, his bloodshot eyes wickedl aflare. "He's ergwine ter git his'n this day afore sundown. An' Jake Falerin's ergwine ter git his'n, too. Them two fellers 'll be dead ternight."

"Shut the old fool up," suggested the Deacon passively; "he'll be shouting that out in the street after on more swig of liquor." Then he turned to Newt again.

"If Floyd isn't taken care of, son, the next commonwealth's attorney will follow right after him. We've got to give a lesson an' a warning. Do you understand?"

"I reckon I do," replied the ex-convict, but he spoke without ardor.

"This evenin' about half-past four o'clock," proceeded Black Pete, "Mister Lawyer Floyd is going to make speech in front of the court-house. There'll be a crowd, and we figure that Falerin will be there, too. Our boys will get up close. Some of them will start a fight amongst themselves, and I reckon they'll pull guns. Mr. Floyd an' Mr. Falerin are apt to get accidentally shot."

Newt Spooner rose, and stretched his arms. His food and rest had refreshed him, and the red spots had gone out of his cheeks.

"What for," he inquired cooly, "air ye a-tellin' me all this-hyar business?"

The Deacon's grave eyes clouded, but otherwise his expression did not change.

"We figured you'd be interested, son. You were the first Spooner they ever put behind penitentiary bars. They did it. We figured that when we came to punish these fellers—" He broke off with a shrug of his shoulders.

"Ye 'lowed ye mout git me ter kill 'em?" Newt spoke with absolutely no betrayal of interest.

"Jest the lawyer, Newt," interpolated Red Newton ingratiatingly. "He's your'n. Hit's your right ter punish him."

The late convict wheeled on the speaker, and his face blackened and lowered.

"No hit isn't!" he screamed. "I hain't a-holden nothin' 'g'inst ther lawyer. He didn't do nothin' but what he had a license ter do. I knows who I'm atter. You folks wants two men killed, an' you wants me ter be ther feller ter go ter the penitentiary fer doin' hit. What did any of ye do fer me last time? What do I owe any of ye, wuth goin' back thar fer?"

For a moment, a general silence of dazed astonishment followed the outburst. It was the Deacon who broke it at last.

"All right, son," he said almost gently. Every man accordin' to his lights. I reckon you ain't goin' to tell anybody what you've heard?"

Newt snorted contemptuously.

"I reckon ye knows thar hain't no danger of thet."

"Hit 'pears like," interposed Red Newton with an apologetic shrug to the others, "hit 'pears like the penitenshery hes done broke ther boy's sperit. Some folks is thet-away, but hit don't hardly seem like no Spooner."

Newt wheeled on him.

"Thet's a low-down lie," he stormed. "Nothin' hain't broke my sperit. I hain't scairt of them, ner of you. I knows what I'm atter. Thar's a feller I'm ergwine ter kill, but hit hain't this one. I'm tendin' ter my own business—not your'n. You-all got me inter one killin', an' not a blame one of ye stood by me atterwards.

He glared around the group for a moment and left the house, and no one made an effort to stop him. Newt meant to take up his journey within an hour or two. He, too, had a vengeance planned, but the man he sought was back there in the mountains, and there was no use in "foolin' away time an' money here."

Yet an hour later he walked past the court-house and the large hotel just beyond it, and abruptly, opposite the hotel door, he halted. He had seen a buggy drive up and stop, and in the buggy was the girl who had brought him to town. He had forgotten her, but now he paused across the street and stood gazing. He gazed simply because she was the first living soul who had ever been kind or gracious to him, and, precisely as the blind man may feel the sunlight and know that it is pleasant, he glowed dumbly under the remembrance of her smile.

Then as he stood looking, a young man came out of the hotel with his hat lifted and his face smiling. In his eyes was an expression easy to read, an eager, glad welcome as he crossed the pavement with extended hand and climbed into the buggy beside the girl. The young man was well dressed and bore himself like a gentleman, yet he was a mountaineer by parentage and birth.

Newt's posture stiffened into rigidity. The color left his face and his eyes began to burn balefully. * * * He had just recognized Henry Falkins.

For an instant, the erstwhile convict stood paralyzed with astonishment, then the blood in his arteries began pounding a fanfare of triumph. Wheeling, he went rapidly toward the restaurant of Mr. Cawsler. There he would find some of the clansmen, and one of them would lend him a pistal. If they refused, he would ravish a weapon from them with his bare hands. After that, if they let him have ten minutes for his own, he would join them in any schemes, conspiracies or crimes that interested them. For him, ten minutes would be sufficient. His walk broke into a trot at which the passers-by laughed. A yokel in a hurry is always amusing.

CHAPTER IV

A group of shabby men lounging in front of Fult Cawsler's restaurant paid scant attention to a wild-eyed youth who came down the street at a run and dashed into the door. Newt found the dining-room on the main floor empty save for a weary and untidy woman who was clearing away the china of the mid-day trade, and Fult Cawsler himself, whose bulky figure was just then disappearing up the stairs. The boy stood for a moment anxiously gazing about the place with its oil-cloth table-covers and its gaudy wall calendars, then dashed pell-mell after the climbing restauranteur. The woman called to him in high-pitched and raucous prohibition, but Newt Spooner went heedlessly on his way. At the head of the stairs in the murky hallway Cawsler turned, and without at once recognizing the on-rushing invader wheeled belligerently to face him.

The plans which had been hatched in his place that day were not such as would enhance his reputation as a law-abiding tradesman should they come to general knowledge. As the proprietor blocked the way, his voice carried the ring of asperity.

"What air ye makin' such a fuss about?"

"Hit's me, hit's Newt Spooner," volleyed the unarmed avenger. "Whar's Red? Whar's the Deacon? I hain't got no time ter fool round. I'm in a hurry!"

"They've done gone—all of 'em," responded Cawsler calmly, as he recognized the ex-convict. I don't know whar they're at." He paused, and then admonished coldly, 'Y'e'd better set down and calm yoreself. Ef ye runs around town so distracted-like, they'll put ye in the jail-house fer shore."

Newt only snarled. Here was a situation upon which he had not counted. He had unexpectedly found his quarry, and he was unarmed. By the time he remedied his deficiency his victim might have escaped. For an instant he stood in a futile and silent transport of rage, his entire body in a tremor of anger and excitement. Then with an oath he pushed Cawsler aside and entered the room where he had left his clansmen. It, too, was empty, except for a figure breathing with heavy and stentorous stupor in a chair at one corner.

The one man was old Jason Dode. Newt rushed across, and unceremoniously catching him by the shoulders, twisted his sagging figure until it lay chest upward. The old drunkard mumbled and raised balky hands against the indignity, but consciousness flitted only spasmodically across his face, and he sank back again with an incoherent murmur. Newt tore open his coat and vest, and ran his hand under the left armpit, but he found there only an empty holster. Old Jason was drunk and ineffective, and lest in his maudlin condition he might wander out and disturb the equilibrium of their plans, the clan had disarmed him. Newt rose and faced Cawsler.

"I've got ter have a gun," he exploded. "Git me a gun!"

But Cawsler, gazing into the wild face and burning eyes, judged that Newt, too, had been "hittin' up the red licker," and that a gun was just what he least needed. Accordingly he shrugged the fat shoulders under his dirty shirt, and shook his head in negation.

"I hain't got no gun," he lied; "I done loaned mine out." With another wild oath, the would-be assassin dashed down the steps and out into the street. He would search the town until he found a kinsman, and incidentally he would try to keep an eye of sufficient watchfulness on Henry Falkins to remain familiar with his

movements. It did not occur to him that Henry Falkins might be unsuspicious. To his mind Henry Falkins must know, if he had heard of the pardon, that, straight as a homing pigeon, Newt would come to him for reprisal. Such was the code of the Cumberlands. So his task was threefold: to arm himself; to find Henry Falkins; and to conceal himself from Henry Falkins.

The Spooner aggregation meant to make its appearance at the psychological moment, and until that moment to remain as invisible as a covey of quail in close brush. Newt, no longer excited of guise, but quiet, almost feline in his alert movements, slunk from saloon to saloon, and scanned the length of the streets with a purposeful glitter in his eye—and his search for a kinsman was vain.

The afternoon was well advanced when the boy, lurking in a side stre saw a buggy pass at a rapid trot, and recognized its occupants. The vehicle was going out on Main Street, and in it were a girl and a man. For the second time that day, he had sighted his quarry, and, turning into Main Street, he began to follow. It was merely reconnaissance, but, if he could hold the vehicle in sight long enough, he might know where later to take up his watch. A man on foot is poorly equipped to follow a standard-bred trotter between the shafts of a light buggy, but the streets of Winchester lie over gradual and rolling hills, and the girl who held the reins was a humane driver. A square ahead, she drew her horse to a walk for the climb, so the man could keep them in sight as far as the next ridge, an he strode along at a rapid distance-devouring walk, forgetting his weariness as a hunter forgets it when a covey rises whirring from the stubble

Then for a while he lost them, and so, losing and regaining his view, he followed them up and down hill till the town dwindled into outskirts and the street became a smooth turnpike between farms and woodlands. But at last, the difference in speed to and the boy reluctantly abandoned the chase. Not, however, until he had glimpsed through stretches of velvet woodland a thing which he did not understand, and which he paused in perplexity to study. Back in the patriarchal grove of oaks and walnuts and hickories was a frame platform, and men were working on their hands and knees, polishing its floors. About it were strung long lines of paper lanterns of bright and varied colors and fantastic shapes. Still farther back, but close of access to the platform, rose the front of an ancient and vine-covered mansion with its little village of barns and servants' quarters, peeping out between lilac bushes and cedars. But it was the platform that puzzled the mountain traveler, and he perched himself on the fence to "study" about it.

A negro boy, riding a colt and carrying an empty basket, came jogging down the avenue and into the pike, where he drew rein in response to Newt Spooner's signal.

"What mout thet contraption be over yon?" demanded the mountaineer in a surly voice, as he indicated with a jerk of his head the object of his curiosity.

The servant laughed long and loud. He was a young negro and mounted. By putting spurs to his steed he could escape any penalty of insolence, and if the mountaineer dislikes the negro it is with no greater scorn than that which the negro feels for the poor white. When he had finished laughing his white teeth continued to gleam in a wide grin.

"Thet-thar contraption," he mimicked with an excellent impersonation of the nasal drawl in which he had been questioned, "is a platfawm. It's shorely an' p'intedly a platfawm. Our folks is gwine ter have a platfawm dance ternight. Saxton's band's coming frum Lexin'ton ter play de music, and all de quality folks'll be hyar."

At the sneer of the servant's manner, Newt Spooner had slipped down from the place he had assumed on the fence, and stalked menacingly out into the road. The negro had moved his horse a little to the side and waited. But, at the information received, Newt forgot his wrath in the engrossment of a sudden idea. A dance! The young people would be there in force. Perhaps among them would be the one he sought. In his country where round dances are unknown, special invitations are not required. Word goes out that so-and-so is giving a dance at such-and-such a point, and the countryside troops thither for shuffle and jig and wassail.

"I reckon," said Newt slowly, "I reckon I'll be thar."

The black boy let out a loud guffaw He leaned back with one hand supporting his weight on the haunches of his mount, and whooped his mirthful derision to the open heavens. Newt gazed at him, first in astonishment; then in passion.

"What air ye a-laughin' at, nigger?" he inquired with low-pitched ferocity of voice.

The boy gathered up his reins, and, under the pressure of his spurred heel the colt was away in a gallop.

"I may be a nigger," he flung back over his shoulder, "but I ain't no po' white trash. The likes of you comin' to our dance!" A roar of ironical laughter followed in the wake of clattering hoofs, while Newt Spooner, his thin face working with a positive mania of fury, hurled rock after rock at the retreating figure.

Slowly the mountain boy walked back toward town, his black suit already whitened with a fine coating turnpike dust.

As he neared the court-house, he quickened his step, for a dense crow was gathered at its front, and he knew that the speaking must be in progres His people would be in the throng and they would be armed. If he were going to the dance to-night, he needed a gun, and yet his craftiness automatically set a restraint on his impatient haste. Should he rush headlong into that crowd just on the verge of trouble, he might rush also into arrest. The applause and laughter with which the crowd just now jostled shoulders told him that nothing had yet occurred to break the peace or equipoise of the occasion; but that something was to happen he knew, and the knowledge made him cautious. A distinguished-looking gentleman with white hair was speaking from an improvised stand, and, as the ex-convict drew near the outskirts of the crowd, he found himself standing near a man who wore a blue coat, and leaned on a stout hickory staff. The partial uniform of this individual proclaimed a town marshal, and the badge on the breast corroborated the proclamation. It occurred to Newt that to be talking with an officer of the law when the shooting began would constitute an excellent alibi. So he stopped, and touching the officer on the elbow, inquired:

"Stranger, who mout thet man be thet's a-talking?"

The policeman turned and regarded him out of a broad, good-humored face, in which shrewd, but merry eyes twinkled.

Newt wanted that officer to know him the next time they met, and to remember him definitely, so he returned the gaze with one frank and unblinking.

"That's General Braden, sonny," the town marshal amiably enlightened; "he's just introducin' the Honorable Cale Floyd. That's Floyd now."

"I hain't in yore way, am I, stranger?" questioned Newt humbly by way of further emphasizing his presence. "I 'low ef I hain't, I'll jest stay right hyar an' listen at his speak."

The officer laughed.

"Stay right where you are, sonny," he invited; "I expect it's as good a place as any." And then, to the boy's delight, the other laid a hand lightly on his shoulder.

The young man from the waters of Troublesome wore a blank face, although it was difficult. He had told himself that he felt no hostility for this prosecutor who had convicted him. Yet, now, as he saw the tall man step forward to take his place on the platform, remove his felt hat and shake back the black hair which fell, mane-like, over his forehead, Newt acknowledged a sense of gladness that he was to be killed.

The Honorable Cale Floyd had fought a bitter battle back there in the lawless hills for the vindication of law. He had walked in the shadow of death and had been deprived of office; ostracized like Aristides because he was "too just a man."

Now, he had come down here to the cultured blue-grass, and was being pointed out as something of a hero.

The Best Fur House On Earth
For Fur Shippers

Nothing is more important to the Fur Shipper than doing business with an Honest—Reliable—Responsible—Safe Fur House.

Safety First—"Ship To Shubert"

the largest House in the World dealing exclusively in American Raw Furs, where you will always receive an Accurate and Liberal Assortment, the Highest Market Prices and the usual "Shubert" Efficient, Speedy, Courteous service.

Write for the latest edition of "The Shubert Shipper," containing valuable Market information you must have.

A. B. SHUBERT, Inc. 25-27 WEST AUSTIN AVE. Dept. 58 CHICAGO, U.S.A.

$1,000,000 for Furs!

We have a million in cash ready to pay you for your furs. This means safe, prompt returns. We pay full prices shown on our price list. No deductions made on pretext of commission, transportation or anything else. **No one pays more.** If higher prices are quoted beware of deductions. Thousands of hunters and trappers make sure living by depending on our fair dealings. Farmers who quit others stay with us. Why run risks of losing a whole season's work by sending furs to someone you are not sure of? Remember, $1,000,000 in cash and a thirty-year reputation are behind our offer. Write today for price list. Then we will keep you posted on every turn in the fur market, so no one can mislead you. Originators of Classified Price List.

Becker Bros. & Co. Dept. C5 416 N. Dearborn St., Chicago Dept. C5, 129 W. 29th St., New York

Clients with well-filled purses brought their litigation to his office. And it came to pass that in the glow of unwonted recognition, the simplicity with which he had faced peril back there in his own country was slipping from him. He felt the theatric quality of the moment, and struck something of a pose as the crowd took in his tall figure and broad shoulders and country lawyer's make-up of frock coat and black string tie. He had recognized that it was more effective to appear the backwoods lawyer than the well-groomed attorney. His mentality would flash more startlingly from six feet of rugged mountaineer, and his attainments would limn themselves forth in a more impressive forcefulness. In short, the Honorable Cale Floyd was not now averse to capitalizing his past vicissitudes.

So he shook back his hair, and stood smiling with the June sun touching them like a face cast in bronze. Then he began to talk. He warmed into his subject, gathering a wine-like thrill from the interested attention of the upturned faces; faces which long jury experience made as readable to him as clear type, and he threw more and more fire into his utterance, until he was borne out of himself and into a realm of eloquence. With a characteristic gesture, he leaned far outward and stretched his hand, index-like, toward the edge of the crowd. Thus had he turned often from the jury-box and scourged with figure and invective the man in the prisoner's dock. It chanced that all unconsciously the finger went like an aimed weapon to the face of Newt Spooner, and straightway the boy saw red. From his mind passed the white brick facade of the blue-grass court-house, the sea of hats and the field of shoulders, and in their stead there rose again before him the dingy interior in Jackson, where he sat beside his counsel, while this same man, with this same gesture, loosed on his head all the bolts of the law's castigation. And at that same moment, playing with hypnotic intensity on his audience, the Honorable Cale Floyd fell instantly and suddenly silent, holding his bronze-like pose of outstretched arm and hand. It was only for a momentary pause; an oratorical trick of contrast and emphasis, out of which his voice would presently ring again in compelling tones. But in that instant of quiet there rose from the center of the crowd a sudden shuffle and muffled outcry accompanied by a swaying of bodies. It was so close to the stand that the speaker, looking off more widely, was conscious of it only with annoyance for a marred effect. But, as he drew himself erect once more, to the undefined disturbance was added an outbreak of oaths, and, before they had died away, several close pistol reports came spitting sharply from the front, and little wisps of blue smoke twisted upward above the hats. At once there followed a general pandemonium, shoving, shouting, the shrill screams of women; an effort among the panic-stricken to get away by climbing over those who obstructed them. With an oath, and an eloquent sweep of the hand to his pistol-pocket, the town marshal left Newt, who stood with an enigmatical smile on his lips, and went ploughing through the scattering mob toward the center of the disturbance. For a breathing space, the speaker stood leaning on the rail of the platform and looking out with no expression on his face save one of chagrined interruption.

Newt Spooner suppressed a snarl of contempt.

"By God," he muttered to himself, "ef they didn't go an' plumb miss him!"

But, as he was still growling inwardly with disgust, the attorney started to step back, reeled and crumpled limply to the floor of the platform.

(To be continued.)

RAW FURS

I HAVE BEEN BUYING Raw Furs for 40 years, and have always paid the very highest cash prices. Write for my price list.

GROWING OLDER

"A little more tired at the close of day;
A little less anxious to have our way;
A little less ready to scold and blame;
A little more care for a brother's name;
And so we are nearing the journy's end,
Where time and eternity meet and blend.

"A little less care for bonds and gold;
A little more zest in the days of old;
A broader view and a saner mind
And a little more love for all mankind;
A little more careful of what we say;
And so we are faring a-down the way.

"A little more love for the friends of youth;
A little more zeal for established truth;
A little more charity in our views;
A little less thirst for the daily news;
And so we are folding our tents away
And passing in silence at close of day.

"A little more leisure to sit and dream;
A little more real the things unseen;
A little bit nearer to those ahead;
With visions of those long-loved and dead;
And so we are going where all must go,
To the place the living may never know.

"A little more laughter, a few more tears.
And we shall have told our increasing years;
The book is closed and the prayers are said,
And we are a part of the countless dead.
Thrice happy, then, if some soul can say:
'I live because he has passed my way.'"

—Selected.

TIME TO BE A FRIEND

When a feller's down an' out,
Then's the time he needs a friend;
When his heart ain't over stout
An' his nerve is at an end;
When he don't know where to turn;
When he don't know what to do,
Then's the time he'd like to learn
That he's got a friend in you.

When he's plumb fagged out an' worn,
An' his cheeks are pale an' white;
When his clothes are old an'torn
An' he's lost his grit to fight;
When he's lagging far behind,
An' he hasn't got a sou;
Then's the time he'll like to find
That he's got a friend in you.

—Detroit Free Press.

OUR BOYS AND GIRLS

During the summer the boys and girls were too busy with their work we imagine to keep up their letter writing to THE MISSOURI FARMER but now that the work is over and the schools are in session we will give them a chance to renew this department. The letters must be original and we prefer that you write about something you have done or are doing. If you had a good time during the summer either at work or pleasure tell us about it. If you have a better school than the surrounding districts we would like to know why it is better and how you come to have a better school. If you are doing something to make some money or to get started in the poultry business or the live stock business it might help some others if you would tell us how you are doing it. We do not want very long letters but if you have any thing of interest to write about we would like to hear from you.

Stands Up for the Farmer

In times past the farmer was called "Old Hayseed" by his city cousins but now the tables have turned and he is no longer looked upon in that disrespectful way. There are just as many ways of finding pleasure on the farm as in the city if the farmers will only find them. The farm clubs are a help for this purpose and many of them are being organized. Many farmers have automobiles and if a fair or other entertainment is going on within 50 or 75 miles the farmer can take his family in his car and after an hour or two pleasant driving arrives at his destination. The farmer and his sons look forward to fair time with a lot of pleasure if they have some good grain or live stock they are expecting to show for a premium.

Farmers are more independent than others because it is on the farm that most of our food is grown—fruits, vegetables, grain and meats. The horse is the pride of most farm boys and you will find from 4 to 20 horses or mules on the average farm.

Cattle is about the most profitable class of farm animals and the dairy cow is getting to be more popular every year. It is estimated that a farmer can make as much money from 10 or 12 good dairy cows as he can from raising grain on 80 or 100 acres of land. We have also found that hogs, sheep and poultry all make money for the farmer.

The principal crops in Henry County are corn, oats, hay and wheat.

Del Erhart.

Pleasures of Farm Life

I am going to tell you some of the interesting things that a little girl sees on the farm. In the spring time I love to go to the pasture and gather the early flowers when they come peeping through the grass. A ltitle later I sometimes go and gather wild strawberries and then mamma will make us a nice, big short-cake. So I think it a lot of fun to gather the berries and more to eat the cake.

I like to go to the field to take papa a drink of water and I sometimes stay a little while to watch him plow. In the summer time I get up early in the morning and ride my pony, Daisy, after the cows while mamma is getting breakfast.

Often I have a pleasant time when some of my little friends come to visit me. We make play-houses and play with our dolls.

I go to Sunday school every Sunday and I like to go too. In the fall we have many happy times. We go to the woods to gather nuts, grapes and persimmons and we can see the squirrels playing in the trees and hear all kinds of birds singing. I like to watch the birds because I see so many different kinds.

In the winter time I enjoy the snow because I can go coasting and I have a pair of skates and when the ice is thick I go skating and oh! what fun.

I help my mamma with the house work too and also help to care for the poultry. I like to raise chickens and I think the little downy chicks in the spring are pretty. Mamma sometimes gives me chickens to sell, then I put the money in the bank where I have a savings account. Georgia.

Our Farm

Let me tell you about our farm which is in Henry County, Missouri. There are 80 acres in the farm, with 30 acres in corn, 10 acres in clover and timothy, 15 acres in timber and the balance devoted to grazing. We have cattle, sheep, hogs, horses and chickens. I have a pony and his name is Midget and I think it a good name because the pony is so little.

We have a pond and in the summer we go there to bathe and in the winter we go to skate. We have many nice times when we go to the timber for a picnic or to gather wild flowers.

There are many things I like on our farm, but I like none better than my baby sister. Ruth Erhart.

By Old Jim Riley

Well, it was some hoss race. How did it happen? Search me. When th' fellers in Ohio and Kansas go hog wild fur Woodrow and Indianny and Illinoy think their souls salvation rests with Charley and Teddy, I ain't goin' t' give myself a headache by tryin' t' figger it out. I'd ruther play checkers and laugh at th' fellers in N' York gettin' landed plum outside th' breastworks. After all, it didn't make much difference t' me. It just means that old "Hez" Brown will read my postal cards for th' next four years instead of Old Jim Smith—so there ain't much local difference. But I've got a sneakin' idea that th' "kept us out of war" stuff is what saved Woodrow and I hope he'll remember this—and not get het up durin' th' next four years 'thout hes got a mighty good reason. And here's another hunch—by th' way th' fellers voted on that No. 3 thing I think we'll soon be in fur th' durndest drouth this Country ever saw.

BUCKSHOT BY THE PROFESSOR

Anyhow we can go back to the Mexican question and taking it all in all, I believe I like it the best anyway.

* * *

Old Jim Riley, had a bath the other day—that is, he fell in the pond. So you see the election did some good after all.

* * *

One trouble with the most of us is that we are inherently lazy. That's why we follow the "line of least resistance" on so many things.

* * *

I've been carrying a club ever since the election—and the first fellow who tries to tell me how and why it happened is going to get lammed over the head with it.

The freest and cheapest thing in this World outside of air and sunshine is information. It is also one of the most valuable—and yet many of us flee from it as from a pestilence.

* * *

Some people have so many of the characteristics of a polecat that you imagine almost you can see the white streak down their backs—but even at that maybe its better than a yellow one.

* * *

Beauty may be only skin deep but its a powerful sight easier for a fellow to love a woman who looks sweet and neat than one who goes around with her shoes unlaced and her hair looking like a last years birds nest.

* * *

Where is the self binder, the mower, the grain drill, the hay rake and the old plow tonight? Are they out there in the field where you used them last? You know there are few things more ornery in this World than a shiftless farmer.

* * *

I'd rather have a million fleas than to have a woman come to me and let out a long wail about women being "Disfranchised." I have no objection to their voting if they want to, but heaven deliver me from that word "disfranchised."

* * *

An American who lives in Mexico told me the other day that about the time of the Columbus raid he saw a mob of "greasers" hooting and driving a donkey through the streets of Mexico City with an American flag tied to his tail. Now you know I am about the most peaceable cuss that ever walked but speaking conservatively, I am in favor of licking the everlasting daylights out of them the next time they even crook their fingers at us.

* * *

It may not be what they call "Americanism," but if I had the power, do you know what I'd do? I'd pass a law instanter forbidding any passenger ship which carries powder and shells from carrying American citizens—thereby lessing the chance of the aforesaid American citizens from running amuck of a torpedo and therefore greatly reducing the chance of our becoming involved in that fool European war. Then I'd put a permanent embargo on selling American guns and ammunition to the "greasers." No doubt this would be a rank violation of "Americanism" but it strikes me nevertheless that it would be good horse sense.

LYON'S PRACTICAL FARM PAPERS

The other day a neighbor who had torn down the last old style rail fence on his farm, told me to bring up the wagon and get a load of old rails for wood.

I have known this farm since 1860, and excepting for perhaps two or three hundred rails made about 1875 no rails had been made on the farm in all that time, yet fully half of the stuff in that fence was sound enough to make good fire wood, and some was good enough to be used to make hog pens and the like.

These rails were of blue ash, oak, walnut and a few of poplar, the former owner who had known the farm since 1833, once having told me, that he had never known a poplar rail made there, so that these must have been 100 years old at least.

About twenty years ago, I tore away the last of our rail fence, finding a few perfectly sound wild cherry rails, which father said that an old man told him were made in 1804-06, and a few of these may be lying about the farm yet.

I have a mile or more of woven wire fencing on the farm, the first built in 1900, and it is all servicable yet, although some strands show more corrosion than others do, and I think that perhaps the first built is corroded less than any; due to the fact that the manufacturer's had not then learned how to put on a light coat of zinc.

Last year a neighbor took down thirty rods of a woven wire fence put up in 1875. It was light wire, woven in four inch mesh chicken fence style and while it had never been a first class fence it still served to turn cattle.

In 1882, people here began to build wire and paling fence and we thought that it would solve the fence problem by lasting at least twenty-five years, but the palings, even though made of the best oak, became brittle after ten or twelve years, and hogs soon found out that they could go right through it. The last of this was put up in the late 90s, and very little of this doing duty as a fence against all kind of stock, its term of usefulness not being more than twelve years on an average.

We had company from Cincinnati this week, the chief of the City Detective Bureau, one of his men, a U. S. Marine Inspector, and our county Prosecutor, the party bent on killing rabbits and having a good time.

Our gasoline engine balked just as they came with a big pile of wood to saw, and I do want to say, that being a criminal chaser does not keep a man from doing stunts with an engine, as that big fellow dug the insides out of the engine and put them to rights quickly.

The boys say they had a big time in the fields and took some 50 rabbits home, and they all said that they were ashamed to think of the dinner they ate, as harvest hands are no good alongside that crowd at the table.

I like to have such men come to see me once in awhile, as it is a pleasure to them, while it costs us nothing more than a few meals, and I think that it would be better, for both city and country dwellers if they mixed up more and got better acquainted.

The chief, a cultured Christian gentleman, told the boys to call on him at the city hall some morning at 9 o'clock and sit through a session of police court, as he thought that such a glimpse of city wickedness as they would get there would cure them of any yearning they might have for city life.

As for myself, I have seen all such sights, and I am like Chief Wimms, I think that if country boys could all see them, there would be fewer men walking the streets in search of work.

I am reading the first page articles in THE MISSOURI FARMER, and want to compliment the writer on them. Today the country offers greater opportunities to young men than any city in the world does, and if I do not err in my judgment the next ten years is going to show greater development than the last ten has done.

No matter who is elected President November 7, no matter what policy the new Congress pursues, the time has come when the farmer will take his rightful place among men.

Speak a good word for THE MISSOURI FARMER to your neighbors. It takes a lot of strong friends to build up a powerful farm paper.

Writing this, November 6th, A. M. Thermometer 70. In 1881, we had our first freeze November 14, and that year the leaves on the forest trees were green at this date. This year the leaves were frosted ten days ago, but our lawn and yard is bright with roses and other flowers.

We have green beans, and green and ripe tomatoes in the store house, enough to last until December.

Last week we shipped three small calves, a pair of twins from a heifer, and the other a Jersey calf, with two small coops of chickens, one of these coops being of very old and little brown Leghorns.

The shipment brought $59.50, and we did not get as good prices as better stuff would have brought.

I do not know what we will do about our concentrates for feeding dairy cows this winter, as bran is $33 per ton and oil meal out of sight.

Ten tons of clover hay will help us out some, and I suppose that after that we will use corn chop.

Still, with corn at 80 cents for 68 pounds in the ear, and bran at $33, perhaps it will pay to sell part of the corn and buy bran.

All over the country the boys—and men—are cutting bee trees and getting lots of honey too.

My boys have cut three, averaging about 50 pounds each, but as high as 200 pounds is reported from one tree.

Some years ago, my boys and a neighbor, cut a small bush on his farm, taking 175 pounds actual weight, of honey, as white as ever came from a hive.

I bought some mill end roofing, at a dollar for 108 square feet, and am lining the hen houses with it, as our houses were made of rough plank and are full of cracks. C. D. Lyon.

THE PUBLISHER'S CORNER

I want every reader to read carefully the "Free Library" offer which I have described elsewhere—for it presents a splendid opportunity for a fine winters reading.

* * *

The great Farm Club movement is here to stay and the sooner you folks get in the "band wagon" the better. It means the saving of a lot of money—and makes farm life more worth living.

* * *

We are in position to supply our Farm Club friends with fine Alfalfa seed direct from Kansas farmers—cheaper and better seed than you can obtain from the seed dealers. Those who are in the market should get in touch with us at once.

* * *

We have located 100 cars of fine No. 2 Alfalfa hay which can be bought at from $11.50 to $12 per ton f. o. b. Kansas shipping points. A great many people are under the impression that hay will increase sharply in price and there is therefore no time to lose. In a little while this hay will be in the hands of dealers.

* * *

In a few days we trust to have some good news for the Farm Clubs on Potatoes. If we succeed in driving that deal we now have in hand we will still be able to save you considerable money. The same is true of cotton seed meal and cake—the prices of which have been in such chaotic condition for the last 60 days.

* * *

Many Farm Clubs are saving $150 per car on mixed cars of bran, shorts and flour through THE MISSOURI FARMER—and why the farmers of every school district in which we have a single subscriber don't jump at this opportunity I can't understand. Hundreds of them are—but why should there not be thousands? The same is true of corn and oats.

* * *

Don't forget the social feature in your Farm Club. Once in a while invite the women folks and the children—for they too deserve all the sunshine we can put into their lives. And here's a live suggestion: Why not plan a little Christmas tree and have the time of your lives on Christmas Eve? Lets put a little more joy into farm life. We can if we will. All it needs is a few enthusiastic souls to lead out.

* * *

Our Managing Editor, Mr. Ellis welcomes interesting articles from any reader of the paper. Help us to make the paper more valuable by giving our readers the benefit of your farm experiences. There are hundreds of farmers who have a message of interest if only they would take time to write it up for us. THE MISSOURI FARMER is your paper. Help us to make it finer and better this winter than ever before.

* * *

We have just completed a pamphlet on the Federal Farm Loan Act which will be mailed to any reader who sends us 4c in stamps to cover cost of mailing. The reason we ask for 4c instead of 2c is because we wish to also send you our splendid pamphlet on Farm Club organization—for, with the defeat of the Missouri Land Bank Law the formation of Farm Clubs is more important than ever for, before you will be able to form a Nat'l Farm Loan Ass'n in your community you will need a half dozen Farm Clubs first. Surely never before were there so many reasons why farmers should get together.

* * *

Every Farm Club in the state should immediately take advantage of our great series of Farm Club Discussions. Just think of 20 pamphlets on 20 of the burning farm problems of the day—so plain and so minutely explained that a bunch of school children can understand them—intimate facts and information which not one farmer in 20 posses at this time. If your Club hasn't made arrangements for these Discussions yet it should do so without delay. Lets make this winter a great feast of reason in your Club. Lets make every meeting night a treat for every member. Lets have something to do—for we can't solve the great questions which confront the farmer by sitting around the kitchen stove.

* * *

Almost in every mail I open a letter from some farmer who incloses a dollar on subscription and asks for Farm Club literature. Invariably they speak words of cheer for the great fight the paper is making and often they say "I didn't subscribe for the paper in the first place but I am for you because you are really trying to help us." And both these kind words and the dollars are mighty welcome—for THE MISSOURI FARMER is a young paper and needs fighting friends. If it is to succeed in the great work it has undertaken it must have this support from every thinking farmer in the state. Still other of our friends are making up Clubs of subscriptions among their more and more convinced that the things for which we are fighting are going to win.

William Hirth, Publisher.

THE TREND OF BEEF CATTLE VALUES

The records show that public sales of beef cattle in the fall usually result in somewhat lower prices than in the spring and late winter season. Yet it would appear from the public sales held so far this season that Shorthorn values will hold to a higher level than during the spring sale season. The fact that the present season is an exception, so far as the breed is concerned, indicates an increasing demand.

The sale of imported Shorthorns, held at Chicago November 1 by Carpenter & Ross, of Ohio, resulted in an average of $911 on 72 head, all of the calves with two exceptions being sold separate from their dams. Had they been sold together, as is the prevailing custom, the average would have been considerably higher. The cattle were widely distributed, going into eleven Central states.

It was in the Anoka Farms sale in Wisconsin that the most positive evidence of demand for Shorthorn seed stock was manifested. The year's calf crop, 40 odd head in number, sold for an average of $1,016. At the opening of the sale, ten of the most desirable were displayed in the ring, and when sold the average on these ten stood at $1,900 per head. The Anoka Farms' exhibit in the get-of-sire class in the leading shows was included in this sale and the quartet sold for an average of approximately $2,400 each.

At the point McDermott, Weaver & Garden sale at Chicago an average of $677 was made.

It is a significant fact that in these sales, no efforts were made to create unusual enthusiasm. The bidding represented the sober judgment of the farmers and breeders and the settlements were practically all made in cash. The purchases were made for foundation breeding material and the discrimination in these selections clearly indicates the broad purpose of breeders in all sections to improve the standards of their herds in keeping with the general tendency toward higher achievement in American livestock husbandry. Frank D. Tomson.

Prize Winning Polands

Elsewhere we call attention to the advertisement of Boyd's Poland Chinas which merit the attention of any of our readers who are in the market for this great breed. Mr. Boyd won first at the State Fair in the aged class on The A Wonder. He also won first at St. Louis which speaks for itself. Mr. Boyd is one of the best hog men in Central Missouri and guarantees satisfaction to every buyer.

Want to Make Some Money?

Those who would like to earn some extra money during the coming winter months will do well to read carefully the advertisement of the Harrah Mfg. Co. which appears elsewhere in this issue and which presents a splendid opportunity. Anyway, it won't do any harm to investigate. Be sure to mention this paper when you write.

The farmer who raises his own live stock is playing a much safer game than that played by the fellow who raises the other sport's "ante."

Forget Everything Else Think of Money-Making for a Minute!

Here is a Secret

ARE you making money? No? What's the matter? You want to, don't you? But wait. I know. I've been discouraged a thousand times. I've walked around with my hands in my pockets, thinking and thinking and getting nowhere.

Now things are different with me. I'm making money and I'm organizing the greatest crowd of money-makers the world has ever known. Want to get in? Listen. One man without training, just my instructions, made $45.00 in one day—another $1000 in one month.

You and Your Family Can Have the GOOD Things of Life

I am not sentimental. I like to make money. I am running this ad to make money. But when I slam down my desk at night and ride home under the maple trees of my Indiana town I like to think that I have helped a dozen or more fellows to make more money that day. Helped them to a happier life and to the good things we all want. Don't you want to write and find out what I mean and how I do it?

Did You See My Big Ad? It appeared in farm papers a little while ago. Probably you did. If you didn't read it—all right—but don't pass this up. Read it—read every word—think about it and first of all write and get the facts.

My Automatic Combination Tool is a Mechanical Marvel

I could get a hundred thousand of a certain kind of men to work for me tomorrow. You know the kind I mean. The tool is such a wonder, it does so many things and does them so well that any man can sell two or three a day and make $5 or $10. I want fellows who will make $100 to $200 a week. I want the big money-makers. Now think. You don't know whether you are one or not eh? Of course you don't. That rich fellow who owns the big house and the touring car didn't know, once. He had to find it out. I want to show you.

First of All—Write No long letter necessary at all. Just your name and address on a postal card if you are in a hurry. That puts it up to me. I've got to show you and I will.

What the Tool Does I'll tell you more about that later. But just to give you an idea—it does all the work of the old-fashioned jack, that costs almost as much, and eleven other tools besides—single wire stretcher, woven wire stretcher, wire mender, post puller, rail fence repairer, wheel repairer, press, hoist, vice and clamp, stump rooter and alligator wrench. It's a tool that farmers, teamsters, auto owners, contractors and builders have simply got to have. Once they know its merits they want it.

Let's Get Together I'll tell you the whole story in all its details as soon as I get your name. That's what I want now. I want you to put it up to me. Just address me or the company. I'll get the letter or the card. And please don't put it off.

Address P. J. HARRAH, Pres.
The Harrah Mfg. Company
122 Main Street
Bloomfield, Ind.

Live Stock Notes

On the St. Louis market, a few days ago, a carload of hogs sold for $2,576.21.

* * *

W. P. Wells, who owns a Missouri farm, has a herd of 79 Shorthorn cows. These cows have saved 80 calves this season.

* * *

A Cass County, Mo., farmer recently sold yearling steers, of his own raising and feeding, on the Kansas City market at $110.22 per head.

* * *

In the Escher & Ryan sale of Angus held at Harlan, Iowa, 51 head averaged $593. One heifer sold for $1,575, and six head brought $1,000 or more.

* * *

John P. Lynn, of Tarkio, Mo., recently sold 406 head of Herefords, listed as 281 lots, in a two days' sale, for $89,690, an average of $319.18 per head.

* * *

Just as a matter of history it is interesting to note that on General Election day, 1916, cattle, hogs and sheep on the St. Louis market all sold at $10 per hundredweight or better.

* * *

When we remember that 1,617 cars of cattle were received on the Kansas City market one day we appreciate somewhat the importance of the live stock industry here in the center of the Corn Belt.

* * *

In Callaway County good roads enthusiasm has reached such a high pitch that one district has found it necessary to keep its road grader locked up at night in order to prevent another district from borrowing it.

* * *

C. D. & E. F. Caldwell, of Burlington Junction, Mo., held a sale of Angus the first week in November. Forty-six head brought $19,750, an average of $429.34 per head. The 38 females averaged $410, and the eight bulls, $521.25.

* * *

Shorthorns to the number of 37 head averaged $509 in the American Royal sale at Kansas City. Twenty-eight females averaged $500, and nine bulls $539. The top price of the sale was $1,075, paid for the 2-year-old bull, Sultan Mine 2d, sold by Carpenter & Carpenter, of Wisconsin.

* * *

In the American Royal sale held in Kansas City 50 Herefords averaged $854. The 17 females averaged $901, and 33 bulls $830. The top price of the sale was $3,000, paid by Bowman & Co., of Kansas, for the imported 2-year-old bull, Shucknall Monarch. The top cow of the sale sold for $2,500.

W. L. Nelson.

Clover and Alfalfa Best in Lamb Feeding

"When the same grain ration was fed, no matter whether the grain consisted of corn alone or of corn and linseed meal, the lambs fed clover or alfalfa made larger gains, required less feed per pound of gain and produced gains at a lower cost for feed than did those given either oat straw or corn stover," said J. W. Hammond of the Ohio Experiment Station in discussing the results secured in his lamb-feeding tests with various roughages.

"The' value of leguminous roughages is generally appreciated by lamb feeders; and most of them know that so far as efficiency is concerned clover and alfalfa hay are unsurpassed for finishing lambs. On most farms, however, there are always such roughages as oat straw or corn stover that it is desirable to utilize in the feeding operations. There are years when legumes are a partial or total failure, or not enough legumes may be raised to feed as many lambs as desired. In such cases timothy hay, oat straw or corn stover are fed.

"These non-leguminous feeds, however, did not prove satisfactory as sole roughages for fattening lambs in the feeding tests conducted at the Experiment Station. They may be used in the earlier part of a long feeding period, provided the lambs are finished on a more efficient roughage like clover or alfalfa, or they may be used as a part of the rougage.

"Such feeds as timothy hay, oat straw and corn stover are low in protein, and should be supplemented with a high-protein feed like linseed meal. In the feeding trials mentioned above the addition of linseed meal to corn and either oat straw or corn stover resulted in larger and cheaper gains and higher finish on the lambs. Still, the gains made by these lambs were more costly than those produced by clover or alfalfa."

When both roughages were of equal quality, clover and alfalfa had about equal values for fattening lambs. Alfalfa usually is harvested in better condition than clover, and commands a higher price on the market. The results of these feeding tests justify a warning to feeders not to overvalue alfalfa to the extent of feeding an inferior grade of this hay when good clover may be had at a lower price.

Dairy Cows Suffer From Lack of Shelter

The dairy cow often suffers the most from exposure to the weather before real winter has begun. After steady cold comes the cow is generally stabled. Exposure to cold rains in November is often more injurious to the animal than the colder but dry weather later in the winter.

The dairy cow is not the fat steer, protected from cold by a layer of fat. As a result bad weather causes a big drop in milk production. So long as the weather is dry it is just as well to leave the cow outside nights for some time yet but every cold rain should find her protected.

It is not necessary in the climate of Missouri to go to any great expense on most farms in order that the barn may be warm. The main thing is to have tight walls so there is no draft or wind and a good roof. Care should be taken in arranging the walls in the form of a platform of the right length and a gutter of sufficient depth to hold the manure. The cleanliness of milk depends to a considerable extent upon having the barn built so the cow will keep herself clean.—C. H. Eckles Missouri College of Agriculture.

Country is Unloading Cattle

The country is striving desparately to get rid of all surplus cattle before cold weather forces feeding. This fact is clearly emphasized by the magnitude of October receipts at St. Louis and other markets as well. The October cattle run at St. Louis showed an increase of 47,600 head or 35 per cent over receipts the same period last year.

Five principal western markets combined (St. Louis, Chicago, Kansas City, Omaha and St. Joseph) rolled up a total of 1,166,000 cattle during the month just closed. This is an increase of 335,000 head, or 29 per cent over the October run in 1915.

Even granting the fact of some increase in cattle production throughout the west the enormous gain in receipts over last October is clear evidence that the scarcity and high price of feed are forcing everything to market that can well be spared; in ordinary years a certain percentage of farmers and stockmen hold back their cattle during breaks in October but this year there has been a general and continuous unloading. Dollar corn and other feeds in proportion constitute a barrier that few cattlemen have the nerve to go up against.—Live Stock Reporter.

A Wonderful Sale Record

From Sept. 1, 1916, to and including Oct. 25, 1916, 18 public sales of Herefords were held in the United States in which 1,431 head of registered Herefords were sold for an aggregate of $510,157, or an average of $356 per head. Between Sept. 1 and the American Royal sale, Oct. 7, not including the latter, seven sales were held in which 385 head brought $92,917, an average of $241. Beginning with the American Royal sale and ending with the Bowman & Co. sale, Oct. 25, 11 sales were held in which 1,046 head sold for $417,240, an average of $399. From this it appears that as the season advances the demand increases

POLAND CHINAS

Poland Chinas & Shorthorns
Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.
H. S. Williamson, Route 6 Centralia, Mo.

Spring Boars by the Grand Champion
A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.
WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

BAKER'S REAL BIG-TYPE POLANDS
We have a number of extra good spring boars sired by Big Look that we are offering worth the money. Need the room and must sell.
W. A. BAKER & SONS, BUTLER, MO.

Linhardt's Polands
I have a choice lot of extra good fall gilts sired by outstanding boars. Customers in 26 states. GIANT MAMMOTH 68375 and CHIEF BIG BONE 75856 in service. Priced for farm trade.
H. O. LINHARDT, LOHMAN, MO.

DOOLEY'S SPOTTED POLANDS
Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pair and trios no relation. Also registry furnished. Send check with first letter.
EDGAR DOOLEY, - Etterville, Mo.

Am offering choice boars and gilts, same breeding that won 6 champions, 26 Firsts, and a total of 63 prizes at Mo. State Fair and St. Louis Agricultural Show, at reasonable prices. Write for prices and descriptions.
CHAS. L. TAYLOR, - OLEAN, MO.

REGISTER OF MERIT JERSEYS!
Anticipate your needs—If you will be needing a bull next year, buy a calf now. Price less—transportation less and danger less—than in buying a mature dairy bull. Bull calves from 2 months to 2 yrs. old—out of heavy producing—good type—officially tested dams.
J. A. BUFFUM,
Jersey Place, Rt. 3. Columbia, Mo.

ANGUS CATTLE

ANGUS CATTLE
Herd founded 1904
Young stock sired by Dean's Eric 139686. Also offer splendid herd bull for sale. Every one the right kind and priced to sell.
V. E. LAWRENCE, SALISBURY, MO.

RED POLLED

RED POLLED CATTLE
Herd established 16 Years
Young stock for sale. Young bulls sired by LOGAN 13500; Calves sired by KNOCKER 28791. Bred for milk and beef. Also offer spotted Poland China hogs and Rieds Yellow Dent seed corn.
M. L. SNYDER, - - POLO, MO.

Aberdeen-Angus
I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
J. D. Blackwell - Fayette, Mo.

and prices advance. There is a moral in this for those who are waiting to buy Hereford breeding stock. Several more sales will be held before the Christmas holidays, and the wise buyer will take advantage of them, for the indications are that the spring sales will see a still greater demand and a still higher level of prices—American Hereford Journal.

Relative Value of Cotton Seed Meal

In discussing the value of cotton seed meal on the basis of present corn prices Mr. Lehman Johnson, of Memphis, Tenn., who is considered good authority on the subject is quoted as saying, "The real value of cotton seed meal as compared with corn, oats, wheat, bran and the like is not $45.00 to $50.00 a ton, but $70.00 to $75.00 a ton. Corn at $30.00 a ton and containing about 12 per cent protein makes the protein cost $2.50 per unit. This unit value of protein makes 38½ per cent cotton seed meal figure $96.25. Allowing $21.25 for the excess carbohydrates and all other feeding value in corn over cotton seed meal and we stil have $75.00 as the feeding value of cotton seed meal."

A GREAT COMMISSION FIRM

The above likeness of W. R. Hensley, Presdident of the National Live Stock Commission Co., at the National Stock Yards, Ill., is familiar to thousands of shippers to that great Live Stock market. Among the different commission firms at the National Stock Yards, the National Live Stock Commission Co. has, for several years, been easily in the lead in the annual volume of business—and this volume is constantly increasing and in no slight degree is this fact due to the fighting personality of "Rock" Hensley as he is familiarly known to his hundreds of shipper friends for whom, time after time, he has succeeded in getting the "high dollar."

Undoubtedly the National Live Stock Commission Co. has built up one of the most powerful forces of salesmen that can be found at any Live Stock Market in the Country—if indeed it is not the strongest of them all—men like Geo. P. Coy, head of the Hog Dept. and H. H. Huschle, able assistant to Mr. Hensley in the Cattle Dept.—men who know the value of a hog or steer as well as any men living and who recognize no interest except that of the shipper whose welfare has been placed in their hands. Besides these men there are more than 20 others of the highest ability that money can hire and that they "keep on making good" is evidenced by the fact that once a shipper or feeder has consigned to them, he becomes a steady customer.

Mr. Hensley was born and raised in Montgomery County, Missouri, and today owns a splendid farm in that county upon which he annually feeds many hogs and cattle—and thus he is on "both sides of the fence" and has a deep sympathy with the man who entrusts the sale of live stock into his hands. THE MISSOURI FARMER has no hesitancy in commending the services of this powerful firm to those of its friends who are in the habit of shipping to the National Stock Yards. And this we do without questioning the integrity or sincerity of any other firm. We simply believe that Mr. Hensley has built up the most powerful selling organization in this great market—and this is what the shipper is looking for. Furthermore, the ever growing volume of business of the National Live Stock Commission Co. bears out our view. If you expect to ship to the National Stock Yards in the near future and desire any particular information, write W. R. Hensley in care of the above firm freely and frankly. He will gladly give you his best counsel and advice.

Silage Recommended for Lambs by Successful Missouri Sheep Feeder

Mr. Frank McRoberts, one of the most successful lamb feeders in Missouri, in speaking of his feeding operations during the Sheep Feeders' meeting at the University of Missouri said: "For the past four years I have fed silage in connection with corn, cottonseed meal, and a little hay, and found it a great benefit. Lambs do not commence to eat silage quickly unless very hungry. I have found it much easier to start them by giving a small amount when they first arrive at the feed lot, and gradually increase it until they have all they will clean up in an hour and a half after turning them to the troughs.

"Occasionally you will find a spot of mold in the middle of your silo or it might be at the door. This should be thrown away. Usually the bad results of feeding silage to lambs is due to moldy or sour silage.

"I have had good results from the following ration: corn, 1¼ pounds; silage, 2 pounds; cottonseed meal, ¼ pound; and all the hay they would clean up. This will be from ¼ to ½ pound.

"I do not wish to leave the impression that silage is the only good feed for lambs for the largest gain I ever made was with corn, oats, wheat, and alfalfa hay, but the expense of feeding was too great. Therefore, I would recommend silage as the most economical feed."

The Department of Animal Husbandry would like to hear from more Missouri lamb feedrs.—Howard Hackedorn, Missouri College of Agriculture.

Grain Saved by Feeding-Floors

Those who have used feeding-floors for their hogs have found them to be good grain-savers, and concrete feeding-floors are coming into favor.

Such a floor should be 6 inches thick, and, if not laid against the barnyard pavement, should have a curb extending from 12 to 18 inches below the surface of the ground. This will prevent the hogs from rooting under the floor. The floor should slope slightly toward one corner in order to carry off rain, or water used in washing. A rim around the outside edge will prevent grain from being pushed off into the mud.

For feeding-floors concrete should be mixed in the proportion of 1 sack of Portland cement, 2 cubic feet of clean coarse sand, graded up to one-fourth of an inch, and 3 cubic feet of hard durable gravel or broken stone from one-fourth of an inch to one inch in diameter. Eleven sacks of cement will make enough concrete for 100 square feet of feeding-floor. The concrete should be thoroughly mixed and should contain enough water to make the mass quaky so that the concrete will flatten out of its own weight. It should be lightly tamped, however, then leveled off with a straight edge, and finished off with a wooden float. The floor may be laid in slabs each 6 feet square, 2 inch lumber being used for forms. Feeding-floors should be large enough to give each hog 18 square feet of space.—Minnesota Experiment Station.

Why not scrape around and send us a dollar and have us mark you up for a couple of years? It will make both of us feel better.

Personality Counts in the Stock Yards!

W. R. Hensley, President National Live Stock Commission Co.

THE REASON the National Live Stock Commission Co. does an ever increasing business is because of the **Personality** back of this great organization—because it has built up the most powerful force of salesmen that can be found at any Live Stock market in the Country—men who know the value of a hog, steer or sheep as well as any men living and who fight for the "high dollar" from the minute the gong sounds in the morning until the curtain is rung down in the afternoon.

These men realize that they must "get the limit" for you if they are going to be able to hold your business. They know they **can** get the "high dollar" for you because they have been getting it for hundreds of other shippers who never think of consigning to any other firm. So give them a chance at your next shipment. Let them show you what they can do for you. They will realize that "its up to them" to "make good"—for there is no love lost in the stock yards and **results are the only things that count!** All they ask is a trial. If you expect to ship to the Nat'l Stock Yards soon, write us for any information you may want. **We are at your service.**

The National Live Stock Commission Co.

NATIONAL STOCK YARDS, - - ILLINOIS

THE BORROWING HABIT

Editor Missouri Farmer:

At the risk of being called narrow and selfish I am taking up the cudgel in defense of banker Lynch, in his statement that "Borrowing is already too easy for the farmer." I say the borrowing habit is a curse to the country. Personal, Municipal and National. Understand I do not condemn borrowing under all conditions, but it is carried to such deplorable extremes. I think Mr. Lynch did not mean that it was too easy for farmers to borrow to buy a home, or for improvements for the comfort of his family or stock, or that gives a reasonable assurance of a profit on the investment.

The main trouble is people live too fast. Crank? Yes, I do not deny it, but why should we be a nation of dependents? Bound by the shackles of debt, how many men I have heard say, "If I were only out of debt." The easiest way to get out of debt is to keep out. I was taught to avoid debt as a pestilence, never gave my note but once, for a small amount for 30 days, and never signed a note for any one else. Have been a director in a small bank for a number of years. There one has a good chance to observe the business methods used by farmers, as well as men in business, and it is surprising, to say the least how many men and some women that have their noses kept on the grind stone (to use a homely expression) by the borrowing habit. If a man is honest pay day is bound to come. Cash is always the best buyer, why not keep a little ahead, save that interest and the worry and vexation of having to think of that note or that interest that must be paid? I know dozens of farmers that would be better off if they had not been able to borrow at all. A natural inference would be that when prices are high and money plenty bank loans would be at the minimum but the reverse is true.

Go back to the early seventies when this state was recovering from the devastation of war. My father came here and bought the farm on which I now live (or rather a part of it), for thirty dollars per acre,—a boom price. He bought just as good land ten years later for ten. War prices still prevailed. A large issue of bonds had been voted to build a railroad across the country. The railroad was not built, but the debt was. The innocent purchasers law fastened it on us and we are still paying on that old debt at the rate of 1½% on our assessed valuation. It is costing me at least twenty-five dollars a year, because it was easy for people to borrow. Will be several years yet before we are rid of that old debt but a bond issue of a million dollars is being agitated to build rock roads. If a much needed bridge is asked for, we must wait for three to five years. A bridge near where I live was damaged so that it was condemned, and stood that way for over a year, then was patched up. How many fine steel bridges could be built with just the interest on that old debt, and how many miles of rock roads with the principal? A leading attorney told me a few days ago that 89 out of the 114 counties of the state were in the same fix as this one.

But to go back to 72 to 74 nearly every farm in the county had a plaster on it. Prices were declining, but people were saving their money and paying out. In those days every school boy at fifteen did not have his horse and buggy, a gold watch, and three or four suits. Everybody rode in the big wagon or on horse back. My first saddle was a blanket with rope stirrups, and many a time have I taken my best girl to church behind me on horse back. About 1877 father bought a spring wagon. The first spring vehicle in this part of the county, and farmers came for miles to borrow it on funeral occassions. But farmers were getting along and paying on their mortgages, with interest rates at ten, fifteen and as high as twenty per cent, with cattle, two to three cents. Hogs two and a half to three and a half. Corn fifteen to twenty cents, wheat forty to fifty cents. In 1875 came the worst drouth ever known in the state. What corn was raised was cut for fodder. In feeding out if we found an ear, we would pick it up look it all over and almost stop to count the grains, and some stock starved to death before grass came the next spring which was naer the last of June as the grasshoppers kept everything eaten off till about the 8th. Talk about hard times, but farmers were paying out. Now with such prices as we have, with time loans at 5½ to 6% farmers must have state or national aid to get cheaper money. WHY? Perhaps you will say, Yes: He is another retired farmer that sends his money to Arkansaw to escape the assessor and get 10% on it, lets see: I am a farmer and put in about 14 hours a day for 300 days out of the year at farm work. Not much retirement about that. I try to farm my land for what there is in it, but it will raise better crops than it would forty years ago. Have tried to be frugal and saving. Have a well improved farm with two good houses and two large barns, all the stock that can be kept on 300 acres, a good silo that has been used for 14 years, and other necessary out buildings. I stayed at home till of age and was given $500 out of the earnings of the farm. Then was given one-fourth of net earnings and two or three years later bought a piece of land, paid the cash. Have given two daughters a college education, with music and painting. The third an adopted one, is in high school. Have taken several trips with the family east and west. Visited with them two worlds fairs, helped to pay off a mortgage on my father-in-law's farm so they could spend their last days without the worry of trying to meet the everlasting interest. A sister-in-law neeeded a few hundred to pay off some debts (made by her husband before his death). So she could save the homestead, not at 10% but without interest. Am helping a very worthy preacher's son through medical college. Who beside helping the folks at home and putting a sister through school, is waiting table in a boarding house to pay his board. A bright young girl that helped to care for my mother-in-law in her last years, was helped through high school, and is now a successful teacher. Two brothers who have the borrowing habit have been helped several hundred each. Both had more of a cash start than I. Now I am not writing this in a boastful way, but to show that a pay as you go plan can be made to win out, to a reasonable degree at least.

Of course it took close grubbing for the first few years, but it was worth all it cost to me.

Now just a word about the Missouri Land Bank. It seems to me the state of Missouri is hardly in shape to go into the banking business when we do not have revenue enough to build a much needed normal school building, and our state university has to borrow money to keep from closing its doors. Issue bonds and tax all the people of the state to help the farmers? If that is not class legislation where will you find it? Are we so helpless? When farmers will give a mortgage on the farm or on their team, and I have known some to even sell their home to buy an automobile. It looks as if something should be done to make it easier for them to borrow money. Don't spend your dollars till you get them, say I. Uncle Rube.

LIME NOT TO BE USED DURING THE WINTER

While it is better to use lime on acid soils at any time of the year than not to apply any, soil specialists at the Ohio Experiment Station recommend that this material be used after plowing for some cultivated spring crop. The lime can then perform its full function in promoting the growth of the bacteria that grow on clover roots.

These countless bacteria, so helpful to clover crops, work only in the dark and require both water and air for their existence. Also, they can live only in soils either naturally or artificially supplied with lime.

Lime spread on the surface and not stirred into the soil can help the bacteria but little. They would die there for lack of moisture, and the lime would be dissolved and carried into the soil only after a long time. Lime plowed under is also out of reach of the bacteria, which live chiefly in the upper three or four inches of soil where air is plentiful. Hence, applying lime after plowing in the spring and mixing it by cultivation into the soil during the summer make conditions most favorable for the clover crops later.

Boyd's Poland Chinas!

A few choice spring boars sired by the A Wonder and Boyd's Big Orange. Both of these boars are state fair winners. Also some good fall pigs, both sexes. Can furnish pairs and trios not related. In addition to this I am offering a few choice bred sows, all of which have had litters and raised them.

A. O. BOYD, Rfd. 6, COLUMBIA, MO.

Why Not Look Into It?

Elsewhere in this issue you will find the advertisement of the American Radiator Co. which is putting out an ideal furnace for farm homes—a furnace which does away forever with the unsanitary and dangerous heating stove and which will keep your farm home snug and warm, day and night. Why not drop the company a card today and have them explain what it will cost to install one in your home? Remember you don't have to have a basement. It can be put in a "lean to" or an adjoining room. Be sure to mention THE MISSOURI FARMER when you write.

A Great Reading Lamp

Elsewhere in this issue the reader will find the advertisement of the Mantle Lamp Co. who send out a splendid lamp on ten days free trial. The old coal oil lamps which are used in many farm homes are responsible for much poor eyesight—saying nothing about the torture of trying to read by them. If you want to enjoy a good light during the long winter evenings which are ahead, investigate this offer.

Selfishness

Once more the day of Thanksgiving has come and gone and once more it found the most of us willing to acknowledge that with all of its trials and tribulations life is, after all, worth while. And don't you know my good friend that the view point from which we gaze out upon the sea of life has everything to do with what we get out of it? If during the last year you have striven for dollars alone and failed to gain them, then no doubt the Thanksgiving dinner didn't taste very appetizing. But, after all, was it to chase dollars alone that we came into the world? Should we not, in the last analysis, covet them chiefly as a means to an end—as the means which provide a cheerful home, free from debt and all the good and wholesome things that go with it? And if in this respect hope has been deferred, if we are well and strong, may we not live to strive another day? May not the "good ship" even now be in the offing—shrouded by thin mists which the morrows sun will chase away?

The thought I want to drive home to your heart is that the most of us take this task of dollar chasing too seriously. Well enough I know that we must have our share of them and even so I know that when the hunt for them is clean it is not without splendid and wholesome exhileration—but too often it becomes a frenzy which chills the more kindly instincts of our souls and makes love a stranger in our daily lives and acts. If I were asked to name what, in my humble judgment, is the greatest menace which confronts our great Republic at this hour I would say without hesitation—Selfishness! We measure success almost altogether by the dollar—and the man who has a million of them wants two millions. If, in acquiring the second million they sought to better the condition of scores or hundreds of their fellow men, I would have aught but praise for their aspiration—but too often this is not true. In the mad scramble the man who loses becomes soured while those who win become inflamed with a lust for more—and even as the hands of the drunkard forever clutch after the wine glass so these others, drunk with the lust for gold, cry for more and more—until at last death mocks and laughs at both of them.

"What care I so long as I am getting rich?" This is the exultant thought in the breasts of too many men in this great Country of ours today—and mind you, I am not now referring to the man who is playing the game square, for it is by no means a crime to be rich. I am striking merely at those who would climb up over the backs of others to pluck the golden apples—and their name is legion. To these, the man with the hoe is merely an unlucky fool—the woman at the wash tub a part of the scheme of life. That the little street gamins who plaintively ask, "Buy a paper mister?" may have no place to sleep or nothing to eat—this is of little concern to these smug and "successful" ones. And yet what arrant fools they are—for, in the years to come, their children are apt to reap the whirlwind which they are sowing at this very hour. As Louis XV of France remarked when the final storm clouds were gathering, "After us—the deluge." Of all the pitiful fools in the Universe there is none so pitiful as he who laughs at the holy mandate that we are "our brothers keeper."

It is when I think of these things which are grinding out the hearts of thousands of men and women in our great cities that my love for the Country is enhanced a thousand fold and as my eyes try to penetrate the dark night of the future I am convinced more than ever that the hope of our blessed Republic lies in our myriad farm homes—for here God still reigns and here today as in the past abides a manhood and womanhood which will stand the test in this hour when the whole World seems bathed in tears and hate. And if the good wife who sits across the table from you and the little ones are well and happy—why then my good brother get down on your knees and say a little prayer, for greater heritage than these no man possesses.

LYON'S PRACTICAL FARM PAPERS

This is 6 a. m., November 12, and today wife got a basket of ripe tomatoes out of the truck patch. These tomatoes came from a dry hillside, and had had no protection whatever from the frost.

The young folks went to a big dinner today, and wife and I dined alone, the main dishes being field mushrooms, bread, butter and wild honey out of a sixty pound lot the boys got from a bee tree. The mushrooms were of the variety known as the Oyster mushroom, the big white kind so often found at this season, growing in large clusters on decaying trees, usually elm, maple and hickory.

I went a mile this morning, to teach a neighbor who had found some, how to prepare them, and his wife telephoned us an hour ago, saying that they never at anything more delicious.

My fathers mother was a Virginian, born 1799, and she always objected to us using tomatoes, as she had been taught, when young, that they were poisonous. When I was a boy, few people knew anything about celery, okra, or half a dozen other vegetables now in common use. I tasted my first banana the year I was 21 years old, my first pineaple when I was 18, and my first grape fruit at 55. This fruit has only come into general use in past few years, and up to about 1905, was not used much, even where it grew wild.

Writing of mushrooms, reminds me, that some years ago I was riding on a train, and pointed out some mushrooms of the variety mentioned to a big foreign looking man who shared my seat. He wanted to shake hands with me three or four times, and he said, "You got good heart. Most times Merican man say not good eat, but poor man from way off know much better."

This man, a Lithuarian coal miner, who had only been in this country five years said that in the course of a year his little family made many a meal from the mushrooms he gathered.

Because there are four or five varieties of these strange plants which are poisonous, all of them are in disrepute among most of our people who do not try to learn the good from the bad, and my coal miner friend said, that in the schools in his country, this very thing was taught the children.

Between October 20 and November 20, tons of this very mushroom will rot away, within sight of homes in which no meat is on the table more than two or three times a week, and while some mushroom enthusiasts have set up the false claim that they are equal, pound for pound, in food value, with steak or any other meat, the real fact is that they have more than half their value, and that they come as a free gift from a beneficient Creator.

Twenty minutes time, one day in the week, would suffice for the teacher of any school to instruct the pupils as to which mushroom was edible, and which was poisonous, thus adding thousands of tons annually to the food supply of the country.

I spent three days in Cincinnati last week and I talked to lots of people of all classes. Perhaps I have mentioned in these papers, that I have friends in the city Police Department, and I walked with one of these for several hours along the streets of the tenement districts. We saw them buying food supplies and we talked with them about food and the cost of living

These people as a rule are poor buyers, and do not seem to realize that when a man is only getting $10 to $14 a week, his family cannot afford to have potatoes, at 30 cents a half peck, on the table two or three times a day.

I told one woman that I noticed that sweet potatoes were one half this price, and that rice and corn meal was still cheaper food, but she said, "Yes, I know, but our folks won't eat 'em," and she said that their family of six were living on her husbands wage of $12 per week.

Our farm work is well in hand, but we are late with our corn gathering, owing to the wet fall. Corn is selling at 85-90 cents per bushel, and we will get rid of a few hogs soon, as they are selling at near $9 per cwt., and we look to see corn $1.25 per bushel before the 1917 crop is ready to feed.

The dairy cows are paying us well now, as we have good pasture, are feeding but little grain, and $8 to $10 per week for cream looks like clear gain. We are putting in some up-to-date swing stanchions in our barn, having always used tie ropes, and find that stanchions have gone up 50 cents each in the past month "owing to the war." I put up a pair of barn doors, the pair being 12x16 feet, lumber, nails, track and hangers costing me nearly $15, $4 being "owing to the war."

It is very probable that over in Belgium, and about Verdun in France, there is a great shortage in stanchions and barn doors, also in cows to put in the stanchions, and barns to hang the doors on, so that makes the price high here?

Some of this "owing to the war" talk, reminds me of the man who shipped some corn to a commission merchant, and the charges took nearly all the corn to pay them. The returns itemized, "wharfage, drayage, storage, rathage" and two or three other "ages," and the man wrote back, "why the devil did you not put in stealage, and take it all?"

It is a fact, brother farmers, that we are getting good prices for all we have to sell, and it is also a fact that the commercial world knows this, so this commercial world is not going to allow us to retain any more, from the returns of our labor, than we have been doing.

Ponder this well, for it is of more importance to us, than who is to draw $75,000 a year as President, or which party will organize the lower house of Congress. C. D. Lyon.

TO THE FARMERS OF MISSOURI

Brother Farmers:

I wish to say that THE MISSOURI FARMER, in my opinion, is responsible for the great Farm Club movement which is taking such a firm hold on the farmers of Missouri today.

Brother farmers, I wish to impress on your minds that THE MISSOURI FARMER has set out to organize us farmers and it is up to us to organize as we owe it to ourselves and to the world. Why just think: Suppose the farmers had organized even ten years ago, today you would see better farms and more money in the hands of the farmers.

You hear the people complaining about the Land Bank. If we will organize, we won't need a land bank as there won't be so many middle men who are today making more money out of what we farmers are producing than we farmers are out of our own products.

Now, gentlemen, just think of the enormous amount of money we are piling up in the wrong place, that is, with the packers and middle men? For example, suppose the twenty-five dollars which the packer makes on every steer you or I produce was piled up in one pile, don't you think this would make a handsome sum of money? This money we are piling up with Mr. Packer doesn't do us farmers any good, neither is that we are piling up with the corn, wheat and potato kings. Farmers, let us wake up! Not one of you in this or any other state believes that we are working on the right basis.

Why are we not doing this? It is because we are not organized and so long as we are not, we are traveling on the wrong road, and are continuing to make millionaires out of the packers and grain and produce kings.

Now, fellow farmers, lets get together and organize. This is the first step to take. If we were organized do you not think we could accomplish and bring about satisfactory results? The best example of the good effects of organizing are the Orange growers of California. The world knows what they have done.

Since it takes a leader to make anything a success, I wish to say it is my opinion that THE MISSOURI FARMER is closer to the hearts of the real thinking farmers of Missouri than any other farm paper. Its editor is always willing to give his assistance and if we will all put our shoulders to the wheel we will win the fight. I believe this excellent farm paper should and soon will be in the hands of every farmer in the state. It is, undoubtedly, the only paper that has taken up this great fight for the farmers.

Lets get together without further delay. Ask your neighbors to meet at the school house and set the ball to rolling. We owe it to the future generations of farmers. If we will organize, we can place some farmers in Congress to represent us. This would certainly be a great thing—to have the farmers represented and to have a few real, brainy farmer Congressmen to look after the farmers' interests. We, the producers, who feed the world are the only unorganized class in the Nation today. Is it any wonder we keep coming out of the small end of the horn. I hope you and your neighbors will get busy at once.—John R. Dryer, President of Lafayette County Farmers' Association.

More than 500 neighborhood Farm Clubs have been organized the past year through the influence of THE MISSOURI FARMER and they are all saving their members a lot of money.

COMPARE FOR YOURSELF! HERE ARE THE FACTS!

WAIT! LEARN THE TRUTH ABOUT ENGINES

For years and years I have told you to compare the Galloway engine with any other engine! That's what my customers have done and that's why the annual sales of Galloway engines run up into the **thousands** upon **thousands!** I have told you to **compare the design** of the Galloway Masterpiece engine, the **material,** the **workmanship, finish** and the SIX 1917 SELLING PLANS—CASH OR TIME on which I sell them with **any engine on earth,** whether it costs more or less. If you pay less for an engine than for a Galloway Masterpiece you could **not possibly** be getting as good an engine. If you pay more it would only be **paying too much.** No matter what size or style engine you want **I build them** here in Waterloo in my own great chain of factories to fill every **want.** My 1¾, 2¼, 4 h. p. and other sizes are just as **scientifically designed, built, machined** and **finished** as my mogul engines from 12 to 16 h. p.

$25,000.00 LEGAL BANK BOND ABSOLUTELY PROTECTS every one of my customers and proves my willingness to have **every claim** and statement I make **fully investigated.** I want you to **try** a Galloway engine on your farm—in your own shop! That's why I prepared my new 1917 special proposition. I want a Galloway Masterpiece 1917 Model gas, kerosene or distillate engine in **every township** between **now** and **March 1st.**

GALLOWAY'S ENGINE TALK NO. 1

These monthly engine talks are to show you **why you should not buy an engine of any make** or kind until you have thoroughly investigated my new 1917 model Galloway Masterpiece engines—portable and stationary—from 1¾ to 16 h.p.

One-Piece Cylinder and Base--Note Wide Bearings

Cylinder and base of all Galloway engines from 4 to 16 h. p. cast in one piece. Cylinder, piston, connecting rod, crank shaft and flywheels always in perfect alignment. Absolute uniformity of wear. Only scientific successful method of construction for large, heavy duty, heavy weight engines. Two-piece cylinder and frame castings cannot be kept in line. Galloway engine cylinders will not score, nor will pistons become worn in short time.

Steel Drop Forged Cranks on All Masterpiece Engines up to 9 H. P.

This drop forged crank-shaft in all Galloway engines up to 9 H. P.

Highest carbon drop forged steel crank shafts up to 9 h. p. Larger engines have crank shafts cut and turned from solid steam hammered billets of high carbon steel. Every crank tested in excess of hardest power strain. Will give a lifetime of good, honest service.

Adjustable Bearings on Connecting Rods

Masterpiece connecting rods have adjustable bearings. Note this steel I-beam connecting rod on engines up to 9 h. p. Twelve and 16 h.p. connecting rods made from steam hammered billets of high carbon steel. Die castings used in connecting rod boxes equal in quality to those on high priced automobiles. Note the length of connecting rods (see catalog). A short connecting rod causes piston to cramp in cylinder and score sides of same. High speeded small bore, short stroke engines most always have short connecting rods. Crank pin bearings on connecting rods lubricated by automatic hard oil cup.

GET THIS FREE BOOK

It Tells All About Engines

I want you to have this new book about Galloway Masterpiece engines. It tells you how to pick out, size up and judge an engine. Gives you engine secrets and facts. Tells why to insist on heavy weight, large bore, long stroke and low speed. Tells why we sell direct to farm or shop at wholesale. How to install an engine and hook up machinery. How Galloway engines are built. How to lay out and build a cheap, efficient, power house. Why our prices on high-class portable and stationary engines and saw rigs are so low considering quality. Ask today. A postal gets it. Address me as below.

KEROSENE ENGINES
OTTAWA LATEST DESIGN

Durable, Powerful, Reliable, Massive. Built to last; to do hard, heavy work. Uses Cheapest Fuel. Pull ¼ to ½ horse-power more than rated. *3 Months Trial. Easy Terms.* Sizes 1½ to 22 H-P. Easy to start. No Cranking. No batteries. 10 Year Guarantee. Most practical engine ever built. Engine book free. A Postal brings it.
THE OTTAWA MANUFACTURING CO.,
1821 King Street, OTTAWA, KANSAS.

New KEROSENE LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money

We don't ask you to pay us a cent until you have used this wonderful modern white light in your own home ten days, then you may return it at our expense if not perfectly satisfied. You can't possibly lose a cent. We want to prove to you that it makes an ordinary oil lamp look like a candle; beats electric, gasoline or acetylene. Lights and is put out like old oil lamp. Tests by U. S. Government and 34 leading Universities show that it

Burns 50 Hours on One Gallon

common kerosene (coal oil), no odor, smoke or noise, simple, clean, won't explode. Three million people already enjoying this powerful, white, steady light, nearest to sunlight. **Won Gold Medal** at Panama Exposition. Greatest invention of the age. Guaranteed.

$1000 Reward will be given to the person who shows us an oil lamp equal to the new **Aladdin** in every way (details of offer given in our circular). We want **one user in each locality** to whom we can refer customers. To that person we have a special introductory offer to make, under which one lamp is **given free.** Write quick for our 10-Day Absolutely Free Trial Proposition and learn how to get **one free.** Yours FREE

MANTLE LAMP COMPANY, 283 Aladdin Building, CHICAGO, ILL.
Largest Kerosene (Coal Oil) Mantle Lamp House in the World

Men With Rigs Make $100 to $300 Per Mo. Our trial delivery plan makes it easy. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before writes: "*I sold 51 the first seven days.*" Christensen, Wis., says: "*Have never seen an article that sells so easily.*" Norring, Iowa, says: "*92 per cent of homes visited bought.*" Phillips, Ohio, says: "*Every customer becomes a friend and booster.*" Kemerling, Minn., says: "*No flowery talk necessary. Sells itself.*" Thousands who are coining money endorse the **Aladdin** just as strongly. **NO MONEY REQUIRED.** We furnish stock to reliable men to get started. Ask for our distributor's plan, and learn how to secure an appointment and make big money in unoccupied territory. State occupation, age, whether you have rig or auto; whether can work spare time or steady; when can start; townships most convenient for you to work.

The Missouri Farmer

VOLUME VIII DECEMBER 1, 1916 NUMBER 23

Farmers' Week for the Farmer and his Wife

By W. L. Nelson, Assistant Secretary Board of Agriculture.

Every one is anxious to start the New Year right. Of all men, the farmer probably best realizes the value of a good beginning. He has learned what this means in preparing the ground for his crops, getting the seed into the soil, and in harvesting in proper season.

The opening of the year 1917 brings to Missouri farmers a rare opportunity to make a profitable start in the great business of farming, a business greater and more far reaching in its effects and in its possibilities than at any other time in the history of the world. This opportunity comes not alone to the man in the field, but it is for the farm woman and for other members of the rural household.

What is this opportunity of which we speak? It is the annual Missouri Farmers' Week. The dates are January 1 to 5, 1917. Preparations, always extensive, have this year been made on a still larger scale. A feast of good things, comparing favorably with the turkey, cranberry, Christmas cakes and puddings of the holiday season, is being made ready for Missouri farmers. For weeks the State Board of Agriculture and the College of Agriculture, together with more than a dozen associations, have been planning programs and making ready for this, the most successful armers' Week in America.

As has been the custom for a number of years, the forenoons will be devoted to a short course for the men and women of the farm, those who are not yet too old to learn nor to take interest in the bigger, broader and better things of life. This forenoon school—for such it is—will embrace practically every subject in which the farm man and woman is interested. There will be practical instruction in the care and feeding of animals, the growing and harvesting of field crops, orcharding and gardening, beekeeping, poultry husbandry and other branches of farm industry. At this time, with the high cost of feed a paramount problem, considerable attention will be given to this subject and to the most economical methods of making cattle and other stock ready for market. The great market problem, itself of unusual importance just now, will have a prominent place in the Week's program.

In women's work there will be lectures, demonstrations and laboratory periods which are sure to prove profitable to every farm woman. Everyday problems of the rural household will be discussed by those who know whereof they speak. For the young folks, the boys and girls of the farm, a special program has been planned, with periods of work and play. Contests of various kinds will add interest to the work

Each afternoon, following the conclusion of the short course work, the various state agricultural associations will hold meetings. At these sessions corn growers, live stock breeders and feeders, and the various others will meet in their respective associations to discuss problems in which they are most vitally interested.

As usual, the Missouri State Corn Show, now generally conceded to be one of the best put on in any of the Corn Belt states, will be one of the big features of Farmers' Week. Entries in the Corn Show close well in advance, and for this reason interested parties should not delay making entries. The Farmers' Ham and Bacon Show, which represents a Missouri idea, will again prove how palatable may be made Missouri pork products as finished on the farm. In the meat show, prices aggregating $150 are given, and entries may be made up to the opening day of the show, or until 5 o'clock on Monday afternoon, January 1. This enables farmers who may care to do so to bring choice hams and bacon or other pork products with them on Monday morning and enter same in the show.

The visitor who attends Missouri Farmers' Week as a student and each morning selects lectures, demonstrations or discussions in which he is most interested, who carefully follows these, will receive a direct benefit such as could come to him in no other week's work. And this is the way that Farmers' Week should be followed. Daily programs are provided, and with the aid of these it is possible for each visitor to make an intelligent choice as to his course. To wander aimlessly about from place to place, spending a few minutes in one room, then going to another, getting only a smattering, is largely to lose the good of the visit. It is the wise, thoughtful visitor who plans an intelligent course and who carefully and conscientously follows it. From this it must not be understood that all of the benefit comes from class room or from demonstrations or even from association meetings. The personal contact is important. It is worth a great deal to a farmer to meet other progressive, up-to-date farmers, to talk to them of their methods and their problems, and to gain inspiration as well as instruction from such meetings.

Judging Hams at the Missouri Farmers' Ham and Bacon Show. Fifth Annual Show, January 1 to 5, 1917. Premiums of $150 in cash. No Entrance Fees.

In fact, Farmers' Week is one great clearing house for agricultural ideas. Here practice and theory meet. The men and women on the farm come in contact, not only ith others whose problems are the same as their own, but they meet with men and women whose lives are largely spent in class room and laboratory. As a result, both classes are benefited. It is a contact which brings real co-operation. The college men and women, if they are in sympathy with country folk and with the farm, get quite as much benefit from Farmers' Week as does the farmer. It is worth a great deal to get the viewpoint of the other fellow. It is important that while we may have our heads in the air, our feet should be on the ground. Science and practice must fit together like the parts of a broken saucer. If not, there is some error, the correction of which is important.

Best of all, Missouri Farmers' Week is a real country life conference, and just here it may be said that one of the helpful association meetings is the Missouri Rural Life Conference, but it is of that larger rural life conference that we would speak. No one can truthfully say that the success and welfare of the farmers rests upon the solution of any one problem, or that to bring about improvement in any one field would end all our difficulties. One man may see only the need of making more money; another thinks first of all of schools, another of roads, another concerning soil fertility. So it goes, almost without end. All these are big problems; all are farm problems; all concern the country's best crop, the men and women, the boys and girls, whose lives are lived out in the open country. It is for these that Farmers' Week is planned. It is to these that a special invitation is extended to come to Columbia on New Year' Day, 1917.

"New Methods," it has been said, "demand new measures." May not the same be said of the New Year? Farming is each year increasing in importance, and each year the problems demanding solution become more diffi-

cult. The farmer's fight is all-important. It demands fitness and preparation. Preparedness must be a part of the agricultural program. Missouri Farmers' Week, January 1 to 5, 1917, is a real preparedness program. The call is for volunteers—for men, not to fill graveyards but granaries, for those who would bring more of joy and less of sorrow into the world, for those who would build rather than destroy.

W. L. Nelson.

BEEF CATTLE PRODUCTION

This article is not written for the purpose of helping any farmer to decide whether he shoud grow beef or dairy cattle. I am conscious of the fact that all men will not, on account of their individual tastes, circumstances, or ability to secure suitable help, engage in dairying, one of the most profitable branches of all animal industries. There has been, is now, and will continue to be men in Missouri who will grow and produce beef cattle and it is of the utmost importance that they use and employ those methods that will give the largest returns for the time and money invested in this industry.

The farmer keeps beef cows and feeds and pastures their offspring to sell to the butcher and packer. The packer buys them to sell and he is interested in the killing percentage; that is, the number of pounds of edible beef the fat steer or heifer will kill out. Beef cattle must have the right breeding and feeding. The breeding will give them the correct type, or conformation, the big heart girth, the proper spring of rib, the wide back and plenty of room to lay on flesh in the region of the high priced cuts, and let me emphasize that this is the reason and the only reason the steers described below brought ten and eleven cents, and the inferior bred, but just as well fed, sold from five to seven cents. Good illustrations are always more helpful in presenting an argument, or reaching the understanding than abstract or academic presentations; therefore I will set ut what I conceive to be the marvelous advantages of a well bred animal for beef purposes over the scrub.

I wish it to be remembered that I am speaking of the raising of beef cattle. There are times when the feeder can go on the open market and buy an inferior grade of cattle, feed them out, and make more net profit than had he bought the high grade feeders. When it comes to producing them on his own farm, however, the proposition changes and he must have the very best that blood and feed will produce. They need not necessarily be pure breds, but such as come from the use of pure bred sires of individual excellence.

Now for the illustrations — Two young men start farming on adjoining farms, each containing one hundred and sixty acres, the one with low grade nondescript heifers, the other one with well bred heifers, not necessarily high priced, but of strong individual merit and possessing the good points of the ideal feeder. In an incredibly short time each will have all the cattle their quarter section will support, and in the course of time will have a carload of steers ready for the feed lot. These are put in and fed out with hogs to follow them. When the steers are fed up to weigh about 1200 pounds each, the two lots are loaded on the cars and shipped to market. They are consigned to some reputable commission firm and the young men go with them for their individual education. The freight is the same with the scrubs as with the choice steers. The yardage, inspection, commission, and all expenses are identically the same, and in the name of common sense, Mr. beef cattle man, don't lose sight of these material facts. The prime bullocks are landed in a conspicuous place and the nondescripts hustled off to some obscure corner of the yards, the good conveniently located for the inspection of the packing house buyers who are looking for that class of stuff, and the scrubs where the scalpers frequent. In the stock yards parlance the good steers are labled "Prime Bullocks," and the others "Penholders" or "Quinine" steers. The good ones will sell twenty times where the others have no chance for disposal, the former bringing ten or eleven cents per pound to the latters six or seven.

The young man who believes in breeding and feeding the market toppers, comes home with a draft for $2,000 or $2,500 in his pocket, while the breeder and feeder of the low grades has a draft for $1,200 or $1,500. The one is filled with dignity for his calling, the other is chagrined. One has the record of Twentieth Century methods of farming, the other pays the penalty for neglecting to live up to his opportunity. The inferior steers and their dams eat as much grass and corn, occupy as much room in the sheds in stormy weather, and require as much time and attention, as do the choice steers. Why will farmers spend time and money with inferior stock, when the same amount of energy expended with the better grades will give him a just recompence for his toil? There is no mystery or need of great capital in connection with the breeding of the good kinds. Only the very wealthy farmers with fat bank accounts can afford to produce the scrubs.

You must realize and believe that you can breed the type or conformation that you desire. You must have a fixed purpose, then select your breed and stay with them. There is no best breed, but select the one that you like best and you will give them better care, and they will do better for you. Exercise good judgment in the selection of your sires and use nothing but the best individuals of the breed that you are handling. It is not good policy to cross breed indiscriminately, for you can not use your cross bred heifers for breeding purposes. The cross bred steer is all right for the feed lot, but you will lose out on your heifers. When you get a sire that has strong prepotency, it is a good idea to hold on to him as long as possible without inbreeding too much. There is much to be learned by visiting the herds of reputable breeders, and attending the live stock shows, studying types, methods of breeding, and the essentials of care and management.

Men like Cruikshank, Booth and Bates, among the improvers of Short Horns, Price, Tompkins, and others among the White-faces, as well as the improvers of the Polled breeds, consecrated their entire lives to their work, and were not changing from one breed to another. There are hundreds of men that have begun with common native cows, and by using upon these cows and their heifers, sires of some of the prononuced beef breeds, pure in blood, and strong in pedigree, have in four or five crosses produced steers that for all practical purposes are as good in the feed lot as those eligible to registry. The breeder need not make hot house plants out of his cattle but should give them good shelter during storms. He should not and need not pamper his cattle, but good feed has been and is yet one of the potent factors in the improvement of cattle, hence he should see that his cattle get feed in such quantities, and of such quality as to keep them growing throughout the year.

Making Baby Beef

I never like to write an article, or make a talk without offering a remedy or suggesting what I have found to be sound in practice. I have found it to be a very satisfactory method in producing beef cattle, for profit, to allow the calves to take all of their mothers milk until the calf reaches the age of seven or eight months before weaning. Before you take the calf away from it's mother, be sure and have it eating well, if not on full feed. Now feed it liberally on clover, alfalfa hay and plenty of good sound corn and let it eat good old Kentucky blue grass and by all means never let it lose it's baby flesh or form. Good strong beef calves handled thus, should weigh by June or July fist, 1,000 pounds, and bring $100 to $120 on the market. When you consider that you have fed them your own feed, and at the same time built up your land, this is not a mean price and can not help but make you money.

Having shown the manifest advantages of breeding an dfeeding better live stock from a money standpoint, tages of breeding and feeding better tion to be considered, which is perhaps the most important. There has gone up in recent years, in this country, the slogan "Back to the land." Presidents, governors, senators, doctors, ministers, and all classes have all joined in the cry until the air is resonant, and the sound reverberates from hut to palace. This hue and cry has enlisted a multitude of earnest workers, all striving to discover the key to the situation. Some have suggested the consolidation of schools, others good roads, still others making the rural school house the center of social activity, while many advocate the resuscitation of the country church. To all these remedies we utter a hearty amen. But in my humble judgment there is no factor, or agency, that will be more effectual, in solving this problem than the propagation of good live stock on the farm, and the prosecution of all your farming operation in keeping with this high and noble standard.

W. D. McKee.

WHERE THE TROUBLE IS

When feed is scarce and high in price, and money is also hard to get and hard to hold, and the weather is adverse to good cropping and drouths are prevalent, many people find it necessary to cut down the expenses of their business. Such a course is seldom either pleasant or easy. Probably in the great majority of cases it is both disagreeable and difficult. In numerous cases it may appear to threaten heavy loss, if not absolute ruin, as the profitable management of the business seems to call for larger outlay rather than for diminished expenditure. But "necessity knows no law" and a great many farmers, as well as men in other lines of business, find themselves in circumstances which compel them to reduce business expenses.

The theory of getting business upon a better basis by cutting down the cost of conducting it is easily understood. It is plain to see that if expenses are materially reduced there will be a considerable increase in the profits, provided, however, the decrease in expense does not diminish the efficiency with which the business is conducted. Just here is where the difficulty begins and it often proves very serious. A great deal of the work of the farm is far-reaching in its effects. It cannot safely be considered by itself alone.

Nothing should be said, either in bad times or good ones, against an economical system of management. But it should be remembered that there are cases in which retrenchment is not true economy. Saving at the spigot and losing at the bung can never be made profitable. The man who stops his farm paper, or his ordinary newspaper, is very certain to lose vastly more than he saves. The same may be said of the man who feeds his animals scantily, or uses worn out tools or machines in order to save the expense of new ones. There are many other ways in which the farmer will find it possible to avoid paying the money, but which are not in the line of true economy. At one time I was employed by a firm dealing in pure-bred live stock, advertising their stock extensively in the farm papers of the corn belt, and carrying on a very good pure-bred business for new breeders. A severe drouth one summer handicapped crop production and they decided to cut down expenses, and the first item to get the knife was to discharge the stenographer. There were two members of this firm and neither of them knew how to operate a machine with any degree of rapidity, accuracy or neatness, and when the inquiries came in for their pure-bred live stock, the letters were left to accumulate on account of lack of ability to properly answer them on the typewriter, and the real mainstay of the business, the funds coming in for the pure-bred stock sales, was left to dwindle and fall off to nothing. This was decidedly poor management, and the firm later gave up the pure-bred business entirely and in the end gave up the farm.

It is easy to go to an extreme in the direction of reducing the cost of carrying on business. It is not the hoarding of capital, but its active employment that enables men to get wealth. It is not the farmer who cuts off the greatest proportion of cost, but the one who turns his expenditures into the most profitable channels, who will have the highest degree of success. If there are any who are so unfortunate as to be absolutely unable to meet the expenses which sound judgment shows are necessary to the profitable management of affairs, their best course would seem to be an immediate reduction of their business to proportions which will correspond with the amount of capital which they are able to command. If it is properly directed, perseverance is an excellent quality. It has been one of the great factors of success in many great undertakings as well as in numerous smaller ones. But it is possible to allow this trait to degenerate into mere obstinacy, and so direct it that it shall lead to failure instead of success.

The returns from any business will depend largely upon the degree of skill with which that business is managed. This fact has been demonstrated by the experience of numerous men, not a few of whom have found that hard work and close attention to details will not, of themselves alone, secure success. Many a man has

toiled early and late, denied himself and his family most of the luxuries and many of the conveniences of life, and yet, from a financial point of view, has had very little success. Multitudes of others are now doing the same way and in due time will reach the same unfortunate conclusion of their labors. Manufacturers, merchants, mechanics, farmers and men who are directing business affairs along various other lines, are freely represented in this losing struggle for competence or wealth. It is true that in many instances in which the desired reward is not secured there are other impediments than the one that has been named. But it is no less true that in countless cases the one great barrier to success is a want of skillful management. The men who are sowing much and reaping none either do not understand or else they fail to apply the principles upon which success depends. This, at least, is the general rule. There are exceptional cases in which failure results from causes which can neither be foreseen nor prevented. There are misfortunes against which no human skill can avail. But in the majority of cases the men who do not get along fairly well are not managing their business to the best advantage. What has been said involves no harsh criticism of those who do not succeed. Competition is exceedingly sharp, and it requires both skill and energy in an eminent degree to enable one to keep anywhere near the front ranks of the crowd that with feverish haste is pressing toward its goal. Even the man who is best equipped for his work may be surpassed by one whose natural abilities are less, but who makes a better use of the few talents he has received. It hardly needs to be said that the business of farming is one that requires very careful management, or to add that this is one of the weaker points in the farm economy of the present day. Our farmers work hard. Many of them work a great deal harder than they should. If they would do less in the way of manual labor and spend the time thus saved in devising better methods of managing their business, it would be a great improvement. They would save much comparatively useless toil, and would obtain better financial returns. I have taken it for granted that each and all of the farmers who will read this desire to improve. Even those who have been most successful in the past wish to do still better in the coming years, while those whose rewards have been meagre in the past are anxious to make the future more prolific of good.

Bob Hill.

A Concrete Watering Trough for Your Stock

DAIRY profits depend upon the health of your cows, and the health of your cows depends very largely upon a clean water supply. For drinking water a concrete trough should be found on every farm.

A concrete trough is easily cleaned; it does not rot nor leak. It is so simply constructed, your labor isn't worth mentioning, and as for materials, you can usually find the sand and pebbles or broken stone close at hand. The only thing you need buy is the Portland cement. A few sacks will do.

Take This Hint

When building a concrete watering trough, be sure to extend the concrete floor a few feet from the tank. This will prevent the formation of mud when water splashes over the sides, will keep the barnyard clean and the foundation from softening by stock trampling in the mud.

Let us send you a free copy of our booklet No. 142 entitled "Concrete Troughs, Tanks, Hog Wallows, Manure Pits, and Cisterns." It tells you how to build them.

CONCRETE FOR PERMANENCE

SALINE COUNTY FARMERS ORGANIZING

The first school house Farm Club was organized October 2nd and every man in the district a member. They named it—Farmer's Business Club of District No. 53. They meet the first and third Monday of each month. Through THE MISSOURI FARMER, a car of best grade Illinois coal was bought at a saving of $100, and at the last meeting an order for a car of flour, shorts, and bran was made. Large quantites of salt and seed will be purchased in car lots later. Selling has been planned in the same business way. Talks and exchange of ideas on subjects pertaining to the w lfare of the farmers has proven interesting and profitable.

At a meeting on November 6th a committee of three men were appointed to assist in organizing other school house clubs, and at this writing (November 22nd) there are about ten clubs organized in different sections of the county. These clubs are carrying the good work on in forming clubs in their adjoining districts, and by this chain method the whole county will be organized in the near future.

This great educational and financial movement is the only salvation for the farmer of all classes, and it is of vital importance that every farmer regardless of his standing financially should join the organization and assist in raising the standard of living, as he owes this to his county, state, and nation. We must wake up, as we can no longer handle the biggest business in the world single handed. Times have changed and we must change with them.

Farmers are the only class of men that have not a voice as to the financial part of their business, either in buying or selling. Why? Lack of organization.

I do not condemn the man that can put a price on what he has to sell, whatever it may be, I only admire him, as he could see long ago the results of organization, nor do I believe in crushing the towns.. But we are forced to a condition whereby we must procure better prices both in selling and buying, and car lots of such as is named above would not affect any town materially. Let the home town bid first on car lots, give them a chance with outside firms.

Organization will improve market conditions. The producer will receive more and the consumer pay less. Farmer's near a certain city in this state sold their potatoes including sacks for 60c a bushel this fall and yet these potatoes a few weeks later retailed at $2.00 a bushel in that same city. Who ate the pie in that deal? This is only a sample of the kind of business we carry on unorganized.

There are many reasons in favor of organization, while I have failed to learn one reason why we should not organize. It can be accomplished, and will before we have reached the crisis.

Some farmers have done well on the advancement in the price of their land, but if we don't beat 2% which is the average of the state, it looks like watered stock, and when the water is rung out, who is going to get wet? A better system of all kinds of farming in all its phases must be adopted as soon as possible; if not, what are our children, and their children going to do with the farm mortgages increasing, and fertility of the soil decreasing? Is it not a serious state of affairs?

Less moss, gold bricks, and hog cholera cures,
More intelligent thinking, and results, it procures,
Less envy, and suspicion of neighbors, who are yours,
More school house Farm Clubs, and the goal, it secures.

L. H. Brownfield, Saline Co.

Let the Hogs Feed Themselves

The Missouri Agricultural Experiment Station has demonstrated the fact that gains may be put on fattening hogs rapidly and economically by the use of self feeders.

Shoats weighing 121.0 pounds at the beginning of a sixty-day feeding period gained 1.79 pounds a head daily, weighing 228.9 pounds at the close of the feeding trial. During this time they were supplied corn, shorts, and tankage, each of these feeds being placed in a separate self feeder and the shoats allowed to eat as much of each as they wished. When so fed they seemed to balance their ration about as well as could be done by hand feeding. The proportion in which the feeds were eaten are: Corn, 20.66 pounds; shorts, 3.93 pounds; and tankage, 1 pound. The average daily feed consumed per hog was 8.185 pounds. The amount of feed required for each pound of gain produced was 4.55 pounds.

With corn worth 65 cents a bushel, shorts $1.35 per hundred and tankage $2.50 per hundred it cost $5.68 to produce one hundred pounds of pork.—L. A. Weaver, Missouri College of Agriculture.

TOM AT THE UNIVERSITY

By "Tom"

Dear Dad: In a previous letter I told you that I was becoming a football enthusiast and I know that you are wondering why. I know that you think of college football as a rather rough game and would like to know why I should take such a fancy to it. But really, collegiate football is not a knock-down, drag-out affair, that it is often given the name of being, but is as clean a game as baseball or any other standard sport. But why should we as students become so enthusiastic about the game? Every man who has a drop of red blood in him, has a spark of enthusiasm that can be kindled when the proper opportunity is afforded. No better means could be presented than by having a contest, mental or physical, between chosen representatives of schools. It would be a rather stupid person who could not stir up enthusiasm enough to urge his team on to victory; cheering them when they made a victorious play, or urge them on when they were being outplayed by their opponents. Many has been the time when you have urged on your team at a "log rolling" or a rope pulling contest. This "rooting" which you do in a contest is a means of giving vent to your stored up enthusiasm, and is proof to your team that you are behind them.

Did you ever notice how much happier you were after a lively contest, even when you were defeated? The excitement and interest you had in the contest, made you forget all about the serious things of life and allowed your mind to be refreshed. The student, after spending many hours over his hard studies, goes to a football game and joins in with his classmates in spending an hour in watching his team struggling for a victory over their opponents. Having his mind refreshed he is better in a better mood to resume his studies again.

To change the subject rather abruptly, I will attempt to answer a question you asked in your last letter in regard to crop rotations. I will try to tell you what advantages I have found out there are in rotating our crops.

To begin with a rotation in growing our crops in a logical order so as to increase the yields without increasing the cost of production. These ends are brought about by adding more humus to the soil to build up its fertility, the better control of weeds, insect pests and plant diseases. Where a crop rotation is followed the same acreage of each crop is grown each year. For a live stock man this means much for it affords approximately the same amount of feed each year and he can keep the same number of live stock on hand all of the time, and not many one year and a few the next, to make his feed come out even. Some years there is a failure of one crop, while there may be none among the other crops. If the farmer has one crop on which he is depending for his years income and there is a failure of that crop, he will have little for his years work. On the other hand where he has other crops of the same acreage he will have them to fall back upon to make money.

The insects that affect one crop will not always affect another and where the crops are changed each year on the field the insects will not accumulate so readily. The same is true of the plant diseases. The time that elapses between the growing of the crop on the field will be long enough to keep any particular pest of that crop from making its breeding place there. Where the same crop is grown continuously on a field its pests will accumulate to such an extent that they may destroy the crop. The weeds that grow in corn will not grow to such advantage in wheat or the clover, and they too will be handicapped.

It would probably be useless to enumerate the advantages of a rotation without giving specific instances of where these could be applied, so I will apply them to a rotation that is a good one for most Missouri conditions. It is the rotation of corn, oats, wheat, clover. This is a four year rotation and will call for four fields, or at least fields that may be so arranged that they may be operated together to have the same amount of each crop. If there are 160 acres of land in cultivation on the farm it would make 40 acres of each of the above crops each year.

Starting with the clover field, we would plow it up in the fall. The fall plowing will come at a time when there is not such a rush of work on hand as is the case in the spring. It also allows the sod to lay over winter and crumble well by spring and will settle so as to form a better seed bed. The plowed ground will also absorb more water and store it up for the crop to use than will the unplowed ground. The following spring the oats well be seeded. For the oats the ground will not need to be plowed as it is following the corn and the ground has been well worked up the year before. Experiments have shown that it is not a paying proposition to plow for oaths and that a good double disking is all that is necessary. In following the corn it saves a plowing, and there is no time lost for a growing crop on the ground. Wheat is a good crop to have following the oats. Early plowed ground has proven the best for growing good wheat. By experiment, it has been found that the yield may be increased by a third where the ground has been plowed early over the late plowing. If the plowing is allowed to go until late in the season it s hard to get a good well packed seed bed by seeding time. Also weeds will grow up and produce many seed. The oats will come off soon enough to permit the earliest time necessary for early plowing. The July plowing will permit the ground to get well packed, keep down weeds, and gather more of the water from the rains.

The clover in this rotation follows the wheat. The clover is seeded in the early spring in the wheat. The clover will get a good start in the wheat as a nurse crop and be well on its way by fall and ready for a full crop the following year, without having any time lost for the soil in getting it started. In many cases it forms a good pasture after the wheat is taken off.

The clover is to be used according to the desire of the farmer, for pasture, feeding, for seed, or probably turning a crop under to add humus to the soil and increasing the fertility of it. The following year the corn will again be on this field.

Now what are some of the advantages that are to be gained? First, the clover is a crop that will take the nitrogen from the air and put it in the soil in such a form as to build up the fertility. The roots of the clover go deeper in the soil than the small grains and the corn, and makes it more porous. It also brings up plant food from depths greater than the roots of our other crops are able to go. It also puts the ground in a looser and much better physical condition. The corn is our greatest crop and in following the clover will reap the greatest amount of good from it. There is no time lost between any of these crops as the soil is being used all of the time. There are only two plowings for each field in four years for these crops. Plowing is the most expensive single operation in cropping and to reduce it is to be saving an expense. Another big factor to keep in mind is the distribution of the work over the year. The harvesting of these crops comes so that the labor is spread out more than where a one crop system is used. The only conflict being where the oats and wheat may come so close together and the later plowings of the corn; but this cannot be avoided under any system. Where the labor is more evenly distributed through the year for the planting, tending and harvesting of the crops, it will keep the men and teams busy more of the time and will not cause periods of too much work and none at others. It will also make it unnecessary to hire extra help at such times.

Now a rotation is a good thing and as you can plainly see it is making the ground produce all that it is able to. If all of these crops are removed and none of the manure returned it would be making the soil itself poorer faster than where no rotation would be followed, although it would be increasing the crop returns for the time being. In other words I mean that these crops must be fed to live stock and all manure and straw returned to the soil to help maintain the fertility. Now I cannot go further in detail about this matter in this letter, but in a later one I will tell more about other things that may be done to keep up the fertility of the soil. These things that I have mentioned are only brief and you may be able to see other advantages to a rotation if you only think about it, as if it were in actual operation on the farm. I will close for this time hoping to hear from you soon. Love to all. Tom.

PUTTING BUSINESS INTO MARKETING

By Geo. K. Andrews, Agricultural Commissioner, Missouri Pacific Railway.

Mr. J. R. Leighty is a very busy business man. He is a civil engineer in charge of maintenance of way of all Missouri Pacific Railway Lines west of Kansas City. But years ago he began planting trees on his father's farm in Northern Indiana so that now, when it has come to him, he has an eighty acre orchard, 60% in bearing, of well selected varieties. Every year since it started this orchard has had the very best of care. The ground has been tilled, the trees sprayed and pruned, and this year, when apples are a failure thereabouts, his trees are loaded with perfect fruit. He made up his mind to supply his home market. It is a very good one, there being a population of 750,000 within 100 miles of the farm outside of larger cities. So the other day he toured nearby towns and called on the storekeepers, using the round barrel-labels of his orchard as his business card. Having so introduced himself, he told the story of the orchard and ended by saying that his purpose in calling was not to ask the man to buy apples, but to invite him to visit the orchard.

At each town he put a display advertisement in the local papers, of which there were twenty, and which have an aggregate circulation of 25,000 copies. Here again the message told about the orchard, disclaimed any present expectation that visitors would be purchasers, but invited people to come and see it; saying that the orchard was a nice place for a picnic dinner; and concluding with the suggestion that those with automobiles might bring with them a less fortunate friend. The papers went to press mostly on Thursday and Friday, but on the following Sunday over half the storekeepers and five hundred other people came there, and were met by a man who is a good talker, who ran a lot of apples through the sorter, explaining its operation and purpose. There were rings to test the apples as they came out, and the sorter had been adjusted so as to run them out in sizes to within an eighth of an inch, so that they looked as if they had been made in a mould. When a party were through here, they were taken through the orchard to inspect the ripening fruit. There are a few Ben Davis trees in this orchard and, of course, they had to be fairly crowded with beautiful (looking) apples; and one branch in particular was borne down to the ground by about a hundred perfect apples, each trying to crowd the other off the tree. Inevitably it became the cynosure of all eyes. People tried to spy around them to count them, and made little whispering sounds with their lips.

A desk was provided at which the visitors were invited to register; the cards being as follows:

BEAR CREEK FARM
Leighty Orchard
Register Card

Name .....
Town .....
Street No. or Rural Route No.....
Shall we notify you when picking and packing commences so you can s it done? .....
Are you prepared to put away and keep some apples for winter use?.....
What varieties do you prefer?.....
How many bushels can you use?.....
Shall we save them for you?.....

The price will be One Dollar per bushel at the farm without package, any variety, same quality as is packed for shipment.

By night there were orders for seven hundred bushels and the visitors expresesd themselves as being pleased, and showed a keen interest in the marvel of a fruitful orchard in the otherwheres fruitless year. Having seen it and having become interested, it is quite natural that they felt a sort of proprietary interest in its welfare and that they became partisans of the Leighty Orchard. Even the editors of the newspapers were interested. "See here," one of them said to the owner. "You say you think you are a philanthropist because you are supplying us with apples and the money we pay for them is going to stay here instead of going to some distant state; and I don't know but that you are. Anyway, it is good work, and I want you to sit right down and write an editorial about it and I'll print it." And he did so, calling attention to the $1,250,000 that will be paid out for apples by the people living within a hundred miles of this orchard, and that this money will be sent away for something that could have been produced at home of better quality and at no greater cost.

Mr. Leighty had planned to put advertisements in the women's page of the Sunday's papers published in the neighboring cities, such as Ft. Wayne, but inasmuch as they would be coming so far he postponed this invitation until picking time, as they would

not be likely to make a second trip. But on last Sunday the Orchard had a little more than one thousand visitors, with total advance sales to date of thirteen hundred bushels, and orders coming in at the rate of two hundred bushels a day. He writes as follows:

"Have sold all the remaining apples to one buyer, so will have to shut off on local sales. Scheme worked O. K. though, as far as it was permitted to go."

The moral of this story is that a lot of people raise a lot of stuff and send it off to a distant and oversupplied market, when all the time there is a good market at their very doors.

But to get this home market, to create the demand for the near-by thing instead of the far-away thing, tact, business ability and psychology are required. These three words have not appeared, spelled out in letters, until now, but they are found everywhere in Mr. Leighty's method. Thus, it will be noticed that the whole work was carried out in the belief that if the people are curious enough about a thing to visit it, they will buy it if it is a good thing to have, for they will feel that the virtue of possession is due to their own enterprise in discovering it. The same as people buy from the Venetian glassblower at the fair, because they "saw him make it."

Another inducement not allowed to be lost sight of was that this Orchard produced nothing but high grade apples that really belong in fancy packages to the city trade, but that they could be had for the home trade if spoken for in advance.

And, lastly, it pays to advertise.

THE TENANT'S CROPS

Tenant farmers crop their land harder than do owners. A study made by the Missouri College of Agriculture shows that about one-fifth of the owner's farm was in corn, while one-third of the tenant's farm grew corn. One-twelfth of the owner's farm was in wheat, while nearly one-seventh of the tenant's farm was in wheat. Three-eighths of the owner's farm was in grass, while a little more than one-fourth of the tenant's farm was in grass.

The tenant not only grows more crops on his land, but he sells twice as much of the crops he grows as does the owner. Twenty-six per cent of the owner's receipts come from crop sales, while fifty-one per cent of the tenant's receipts come from the sale of crops. Sixty-three and four-tenths per cent of the tenants get crop yields below the average for the region, while only forty-four and nine-tenths per cent of the owners get yields below the average. Tenants get five bushels less corn per acre than do owners, and ten bushels less oats. The hay yield is practically the same. The wheat yield on the tenant farm is only one bushel less per acre than on the owner's farm.

The fact that the tenant farms his land harder than does the owner is a fault of the system and not a fault of the individual. Because his arrangement with the owner of the land is purely temporary, the tenant can hardly afford to keep much live stock. He must live in addition to paying rent on his land, consequently, he grows all the cash crops he can. As he cannot afford to keep live stock, he must, of course, depend largely on the sale of crops for his income. If a tenant has any assurance that he can stay on a farm for more than one year or perhaps two, it is believed that his farming methods would be changed to quite an extent. In England tenants do some of the best farming.—O. R. Johnson, Missouri College of Agriculture.

HAWKS, SKUNKS, SNAKES AND MICE

Two years ago, our state legislature passed a law providing a bounty of one dollar each, on every hen hawk, Coopers hawk or sharp skinned hawk killed. This is paid, by a warrant on the treasurer, issued by the township clerk, upon presentation of the hawk head. While the law specified the varieties of hawks the bounty was to be paid on every kind of hawk found in Ohio, even down to the little sparrow hawk, every pair of which is worth more than $10 per year to the owner of the farm they live on.

The great fur houses flood the country with circulars, telling how farm boys can make good money trapping skunks, incidentally buying traps, and fish oil at $20 per gallon of the fur houses, and also incidentally, shipping their fur to be paid for at prices less than the market.

Every farmer, or nearly every farmer, his sons and his hired man, kill every snake they see, from the little green corn snake to the big bull snake and the black snake, and they are much more energetic at killing snakes then they are at killing weeds in the corn.

As the hawks, the skunks and the snakes disappear, or at least become much scarcer than usual, mice, moles, gophers and chipmunks increase, all due to the decrease in the number of their natural enemies.

I know every word that can be used in condemnation of the hawk tribe, and I also know that 90 per cent of what is said, is not based upon careful observation, for excepting the three varieties named by our law, our hawks do a dollars worth of good in killing farm pests, for every dimes worth of harm they do in killing an occasional chicken.

Even with this said, it is not every individual of the vicious species mentioned that are habitual frequenters of the poultry yard, only resorting there in the absence of their natural prey.

Yes, the skunk does suck eggs, but what per cent of the readers of THE MISSOURI FARMER is it that allows the hens to lay out in fence corners, and the eggs to remain in the nests two or three days and nights?

In sixty years of farm life, and all that time with skunk dens 100 yards from the hen house, yes, right under the barn, I have never known two dozen eggs eaten by skunks, nor have I ever known of a chicken being killed by them.

At my upper barn last summer, a skunk and her litter of young lived under the barn floor, and twenty feet away a hen laid her eggs and hatched her brood of chickens, unmolested.

I have known snakes to enter coops and kill young chicks, three or four times in sixty years, and I have also known of scores of rats leaving a corn crib, within a days time after a five foot blacksnake took up its abode there.

The plain house cat, the weasel and the mink, do a large part of the damage to farm poultry that is usually credited to hawks and skunks, yet we hear nothing about a bounty on these animals, however desirable such a thing might be.

Our fields are over run with the common short tailed field mouse, rats are more plentiful than in years, while scores of chipmunks will be ready to dig up corn next spring, because the hawks, skunks and snakes are gone.

C. D. Lyon.

Hogs Fed Less Grain When Out On Pasture

When corn is high priced and pasture plentiful, it will pay to feed less than a full feed of grain to hogs, says W. L. Robison in the July Monthly Bulletin of the Ohio Experiment Station. When corn alone is fed, a limited ration is much cheaper because green feed takes the place of much of the high-priced grain.

Hogs fed all the grain they will eat make more rapid but less economical gains. They can be marketed sooner, which often is an advantage to farmers.

For hog pasture alfalfa, clover, rape and soybeans are recommended. Corn is usually fed alone to hogs on such pasture. Pigs weighing less than 100 pounds should receive a small amount of protein feed, such as tankage, in addition to the corn. About one part to 15 parts of corn is reconmended. With larger hogs pork production is usually too expensive when tankage is fed.

There are so many ways you can get a dollar's worth out of THE MISSOURI FARMER we wonder why you do not send in your dollar for a two years subscription. Better send it now.

Loyal to the Service

They Uphold Each Other's Hands

The public *must* be served. This is the dominating thought of the entire Bell organization from the president down. Every employe feels the sense of responsibility that this working principle implies. The public must be served—efficiently, uninterruptedly.

In the fulfilment of this policy, the management of the Bell System realizes that every individual employe must give undivided and undistracted effort and interest to his work.

To assure this, every worker receives adequate remuneration, ample protection in case of illness and provision for old age. All these personal matters are cared for so that the employe has the least possible worry regarding his own welfare. His whole-hearted attention can be devoted to serving the public.

While each employe realizes that he is but a single factor, he understands that not only is supreme personal effort expected of him, but also a loyal support to every other telephone worker.

There is something in the telephone organization which imbues every employe with a spirit of loyalty to the public. All feel a direct responsibility for each other because each recognizes that only by mutual endeavor can they render the high standard of service which is expected of them. They uphold each other's hands so that the public may be served.

Every Farmer should have this great Land Book

This book, which costs you nothing, may be the means of making you independent for life. Complete in description and profusely illustrated, it tells the Fact about new farm lands in a region where there is no severe winter cold, droughts are unknown, and the growth of vegetation continues the year 'round—the sunny, healthful

Highlands of Louisiana

These lands are high, gently rolling, well drained, adapted to general farming, ideal for stock raising and dairying. They are being sold by a thoroughly reliable company at extremely low prices, on remarkably easy terms—**One Small Down Payment, Then Nothing but Interest for Three Years!**

Send for this book. Read it. Remember this is absolutely **FREE**; no obligation in sending for it. With it comes a map of Louisiana in full colors. Learn the details of this rare opportunity to become a prosperous, contented farm owner in the happy land "Where Soil and Climate Are Never Idle." A postal brings the book.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

FACING A HARD PROBLEM

The incoming administration of Missouri is facing a hard problem. The Legislature of 1915 appropriated more money by some four or five million dollars than the total revenues for 1915 and 1916. The governor vetoed a part of the excess but allowed somewhere from one million to three million more of appropriations than the income and the next Legislature will not only have to provide for the years 1917 and 1918 but it will have to make up this deficiency. We can lay the blame on the Legislature of 1915 if we like, for over appropriations or we can blame Governor Major for approving sums above the state auditor's estimates, but blaming some one does not pay our obligations. No state can afford to repudiate the regularly authorized debts contracted by its agents and the different state institutions have already spent most of the money authorized by borrowing money on the strength of the appropriations. What are we going to do about it?

In the first place the new administration ought to give assurance that it will practice the most rigid economy consistent with the state's welfare.

We do not believe there is a state department, board or institution but what could find leaks and useless expenditures that ought to be stopped. But in most departments and institutions these savings will be small in comparison to the necessary growth and expansion of the state and the consequent growth of the state's business.

We have often said in these columns that it is not necessarily the state which spends the least money which serves its people most efficiently but it is the state which gives the people the most service for the money expended. We can see no difference in the theory between public expenditures and private expenditures. In both cases the aim should be to get the worth of the money used.

Besides having to make up for the debts of the present administration the new one will have to find some way to make up the deficiency caused by the abolishment of contract labor in the state penitentiary and this will amount to several hundred thousands of dollars for the two years. Then the Legislature will be called upon to provide the money to duplicate National aid for roads, several thousands of dollars of which will be available for the next two years.

From the newspapers we learn that the Governor-elect suggests a general inheritance tax as one means for making up the deficiency in revenues. We now have a law providing a 5 per cent tax on what are known as collateral inheritances but this money amounting to probably a half million dollars a year goes exclusively to the State University. This law ought to be repealed and a general inheritance tax law enacted in its place. With reasonable exemptions for small inheritances from one million to two million dollars a year could be added to the state's revenues without working a hardship on any one. Most of the states have some form of the inheritance tax and some of them raise large amounts of money from this source. We believe the two most equitable forms of revenue for either the state or the national governments are the inheritance and the income taxes and if we must raise more money for the state's work we would like to see the Legislature make the start in that direction at this session.

If our readers believe that a general inheritance tax, with reasonable exemptions, is a fair and equitable system for raising some of the money that will have to be provided by the next Legislature we would like to have them write us their views on the subject.

USING BORROWED CAPITAL

In our last issue of November 15th there appeared an article under the caption "The Borrowing Habit" that contained many valuable suggestions on extravagance, living above ones means, and running in debt for other than productive purposes. The author of the article is a well-to-do farmer of Cass County who writes over the pen name of "Uncle Rube." While we endorse everything Uncle Rube says against the "habit" of going in debt we do not agree with his faulty argument against the need in this country for a better system of getting farm loans. While now and then a farm loan is secured by one who is grasping for more land or by another for speculative purposes, most farm loans are made to men who are trying to build homes for their families and to secure a competency for educating their children and provide enough to care for themselves and dependent ones in old age.

We understand Uncle Rube to advise everybody to keep out of debt. Why then does he continue in a business that depends entirely on debt for its profits. (Uncle Rube is a banker as well as a farmer.) There are credit practices in this country we believe to be disastrous, both to the one who extends the credit and to the debtor. We believe that the credit system in retail trade as it is generally practiced in most every town in this country has been a very bad thing for both the financial and the moral welfare of the people. In this line of credit we would agree with Uncle Rube that the borrowing habit is a curse. This habit has enabled the landlord to hold his tenants in a state of peonage. It has enabled the wealthy mine owner or merchant to grow rich off the misfortunes and the borrowing habit of common laborers. Other merchants have been bankrupted by extending credit where they were not able to collect their bills. And so for all this kind of credit and the profligacy and extravagance which leads to it we can not find language strong enough to condemn.

Credit is a part of the natural economic law of business. The young man starts out with energy, ambition and hope but usually without capital. The old man with the accumulation of years of industry and frugality lacks the energy and ambition necessary for a strenuous business and so it is but taking the natural course for the older man to hire his capital to the younger man that it may bring them both a profit.

Uncle Rube says that when he became of age he was given $500 capital. Hundreds of boys are started in this way but what about the thousands of boys whose parents are not able to give them even a dollar to start with? What would Uncle Rube have them do? But that was not the extent of Uncle Rubes capital if we understand his statement. What is the difference in principle of renting a farm as Uncle Rue did and paying a share of the crop for its use or of buying a farm on credit and paying a stipulated amount for interest and liquidation? Whether a man should rent a farm on shares, for a cash payment or should buy it on time and pay interest instead of rent must as a matter of course be decided upon the man's opportunity and the relative terms in each transaction but no matter which plan he chooses or is compelled to take he is a debtor just the same.

If our eyes are not closed to everything except our own preconceived notions we can learn from the experiences of other people. I think it is generally agreed by those who have studied the question of land tenancy and land credits in different countries that conditions are better where the land is well distributed and is owned by the men who till it rather than where a few own the land and operate it either by leasing or by hired labor. Unless the young men of each succeeding generation inherit their farms there is but two alternatives, either farm them as tenants or buy them on credit.

To any young man who may read this discussion we would say, consider every act of debt making as a financial transaction. If you choose farming for your occupation and do not own a farm there is not one whits difference in principle whether you rent for shares, for a cash payment or whether you buy the land on time and pay interest—the land must meet the payment. The larger the share of the crop you give or the bigger the cash rent payment or the higher the interest, in that proportion will it be harder on you to meet your payments. Believing this to be true we have favored a better and more economical system of making farm loans so that the load will be a little lighter on the thousands of hard working tillers of the soil who have a wholesome desire to own their homes.

FOOT AND MOUTH DISEASE

The country was declared free of the 1915 outbreak of foot and mouth disease only a few months ago and just as the cattle, sheep and swine owners were feeling pretty secure from any further danger we are threatened with another spread of that destructive disease of live stock.

From reliable sources we learn that a shipment of about 130 head of cattle which were received in the Kansas City stockyards on Friday, November 24, developed symptoms of foot and mouth disease. These cattle had been shipped from a place in Western Nebraska and were unloaded enroute in the St. Joseph Stock Yards for feed and water. Before the ailment was discovered a number of loads of feeder cattle had been shipped from the Kansas City Yards to different points in Missouri and several dairy cows had been driven out of the yards to farms in Jackson County. The authorities of both Missouri and Kansas, co-operating with the Federal inspectors have not decided positively whether the ailment is the European foot and mouth disease but as a precautionary measure the yards at Kansas City and St. Joseph have been quarantined and no cattle will be permitted to leave the yards except those for immediate slaughter until it is definitely ascertained what the disease is.

The state veterinarian of Missouri, Dr. D. F. Lucky, informed this office that he had by Monday, November 27, located every bunch of cattle that had been shipped from Kansas City Yards since the diseased cattle were received and they were all being held for observation by a deputy veterinarian. Every precaution possible, Dr. Lucky states, has been taken to prevent the spread of the contagion if it should develop in any of these herds. The local stock yards have been disinfected and also the cars in which these cattle were shipped.

The Stock Yards at East St. Louis, and Chicago and other places have now been closed to shipments from Kansas, Nebraska and Missouri. While these stringent measures may work a heardship on some shippers or feeders it is the imperative duty of every live stock owner to co-operate to the fullest extent with the State and Federal officers in complying with all rules that may be laid down. If foot and mouth disease should get a permanent hold in this country as it has in Europe it would cause an annual loss of millions of dollars and like hog cholera this loss would continue indefinitely. It is the opinion of some of the ablest veterinarians who are familiar with the conditions that if foot and mouth disease should ever get a foot hold on our Western ranges that it never could be eradicated. Since the above went to press we learn from Dr. Lucky that seemingly the danger is past and that the disease is not contagious foot and mouth disease.

FARMERS' NATIONAL CONGRESS

At the recent Farmers' National Congress held in Indianapolis, Indiana, Oct. 17-20, Missouri was represented by three delegates, Messrs J. A. Myers, West Plains, C. D. Nelson, Freeman, and Robert S. McIlvain, Kearney. Mr. Myers was Assistant Secretary of the Congress, Mr. Nelson, a member of the resolutions committee and author of a resolution recommending the inauguration of the Torren's system of registering land titles which was unanimously adopted. Mr. McIlvain is the author of the following resolution on Rural Education which was also adopted without opposition: That the Farmers' National Congress recommends that the National Government and the governments of the several states make necessary provision for a high school education in rural communities where parents can not afford to send their children to city high schools, after completing grade school work.

That the Congress recommends Federal and State aid to rural high schools where districts have the required number of pupils and square miles.

That this aid also be used for safe transportation of children to and from school in the rural districts.

The committee extended an urgent

invitation to the Congress to hold the next annual meeting in the Queen City of the Ozarks, Springfield, Missouri. This invitation was supported by the Governor of the State, Elliott W. Major and by W. L. Nelson of the State Board of Agriculture.

The Congress could not find a more appropriate place for its next meeting nor a city where the members would receive a more hearty welcome.

SAM JORDAN'S SENSE AND NONSENSE

Shoes to Go Up—Causes. Of course, it is blamed on to the war, the same as are many other bad things, but will it not at least, modify our conclusions some when we remember that in the last 17 years the number of beef cattle from which shoe leather comes, have decreased 13,000,000 head? The big drop began fifteen years before the war began.

To get at the "high cost of shoes" we will have to start long before the war started. To begin with, farmers b gan going out of the business of beef production for the only reason that it was becoming unprofitable to them. To indicate why it was not paying the farmer, one item of interest might be that, four of the big packing companies in 1915 declared dividends on their capital stock of an average of more than 40 per cent, and at a time when scores of farmers were losing money on their cattle.

The farmer has not only been dirven out of business, but the folks that eat cattle have been taught not to eat cattle, and the method of teaching the lesson has been to make meat so high in price that they could not afford to buy it. At this time the whole country is coming up in arms to try to put a stop to the "ravages" of the packers. "Reuben is waking up" and is going to do something to the packers, or to his Congressman at the next election.

If cattle profits could be reasonably certain, the farmer would again "embark" in cattle growing, but he fears that the fancy prices at this time is only a "sop" to let him down again. The high prices for cattle at this time should not deceive us, but we should keep up the fight for fairness. If we will not fight our own battles it is very doubtful if others will fight them for us. A square deal is all the farmer has ever asked, and we believe that much is due him.

What Is the Matter With the "Business" Men?

Reports tell us that only a short time ago there were hundreds of car loads of potatoes on the tracks in Kansas City, and that many cars had been lost on account of being allowed to freeze. Other reports indicate that the price is so high that the poor folks in Kansas City (and there seems to be a big lot of that kind) cannot afford to buy potatoes. People are also asking that an embargo be placed on food products so that the hungry thousands of Europe, cannot get them from this country. What is the matter with the business (?) men of Kansas City? Are they only sharks, or are they bone heads, or just pirates? Or is it that the people of Kansas City merely stand for it?

As usual the Kansas City papers will be begging the country at large to be a "Good Fellow" that the poor children may be made happy at the Christmas time. This is all very fine, but if the food products that are allowed to go to waste by the business men of Kansas City, were cared for, these would feed thousands of hungry poor, and it is hard to be very happy with a hungry stomach. Another fine feature of using sense enough to prevent this loss would at the same time save for the grower the loss of his year's toil.

We have in every possible way been urging greater production of farm crops, but there is little comfort in our efforts when those who by reason of their business position, should do the most to give us a fair market, are not only robbing us of our toil, but are starving the hungry at the same time. In other words, so controlling foods that great waste and loss is occasioned, and the reason of course is that the dealer makes the most out of it by the method he employs.

We believe that we grow enough if it were rightly cared for and distributed, and this should be the duty of the business man, that we could eventually pay off our mortgages, and own more of our homes, but we lose heart when we hear of such methods as are employed by what we designate as "business men."

Somebody is to blame, and those who grow and those who buy are the ones to suffer from such practices. As far as the writer has been able to investigate this country has the most inefficient system of distribution of food products of any civilized nation. Is this condition not a reflection on the business men of the country, whose business it should be to get the farmer at least a fair price for what he grows, and allow the consumer to live? It seems as though the handlers of food products care little what happens, if they can get the profits, even though great waste is the result of their methods. In the face of the facts, it appears that we will not get relief till food products are distributed through other channels, and this will not be done until the farmer demands it as he can by the impelling power if he will only arise to the emergency.

* * *

A few days ago a person asked me the price of wood in Columbia. I gave an opinion, but said that on my farm I was simply setting fire to it, as the easiest way to get rid of it. My questioner then asked me if I did not think I was committing a crime by doing as I was, to which I replied that it was surely a crime, but that I had to get the ground cleared, and that I could not even give the wood away. My farm is one hundred and fifty miles from St. Louis, yet the freight rates and the cost of hauling it one and one half miles to the railway station, would cost me more than the wood could be sold for in St. Louis.

There are, no doubt, thousands in St. Louis that will suffer this winter as usual, but I presume that if the roads would grant a concession on wood to St. Louis, that they would be subject to arrest and punishment by the Public Utilities Commission. If I could just break even on this wood, or just get out of it what it costs to put in St. Louis, I would be glad to do so, without one cent's profit. I would like to do this as my part in being a "Good Fellow" at Christmas time, yet all this must go to waste, and what would keep thousands warm must go up in smoke down on my farm. As it stands I feel convicted of this "crime" that is no fault of mine, yet no less a crime. Society, or law, or no law, or something somewhere, somehow, is radically wrong. It will at any rate have to come under the same head as the distribution of foods, Namely, BAD BUSINESS, by an inefficient people.

More for Your Money

WON HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION SAN FRANCISCO 1915

International Harvester Wagons—Weber and Columbus

YOU can be sure of one thing when you buy a **Weber** or **Columbus** wagon—You get more service for your money. The good service they give is one of the strongest features of **Weber** and **Columbus** wagons. This service is the result of careful design and construction, such as is shown in the **International fifth wheel.**

Look between the front axle and bolster, where the king bolt goes through. There you will find the fifth wheel (an exclusive feature). Note the wide circular wearing surface of the two substantial fifth wheel plates. Those plates relieve the owner of a lot of trouble. They prevent breaking or bending of circle irons. They prevent the pitching of the bolster that breaks or bends king bolts. They take strain off the reach and keep the lower part of the front axle from sagging.

This one feature adds years to the life of the wagon, but, better even than that, it indicates the care and thought that have been given to every **Columbus** and **Weber** feature, and they are many.

Look over the **Weber** or **Columbus** wagon carefully, either at the local dealer's place or in the illustrated wagon folders we will send you on request. Then you will see why, if you want more for your money, your next wagon should be a **Weber** or **Columbus.**

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her **FREE Homestead lands of 160 acres each** or secure some of the low priced lands in **Manitoba, Saskatchewan and Alberta.** This year **wheat is higher** but **Canadian land just as cheap,** so the opportunity is more attractive than ever. Canada wants you to help **feed the world** by tilling some of her fertile soil **—land similar to that** which during many years **has averaged 20 to 45 bushels of wheat to the acre.** Think of the **money you can make** with wheat around **$2 a bushel** and land so easy to get. Wonderful yields also of **Oats, Barley and Flax. Mixed farming** in Western Canada is as **profitable an industry as grain growing.**

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Canadian Government Agent.

Packing Business Control

Is government control of the meat packing business coming? Packers have surely been playing the part of the parasite, that destroy its own like, by killing its host. The packers for the last twenty years have been steadily, but surely, driving farmers out of the cattle raising industry, to the extent of a decrease of most twenty million head in the last twenty years. This is beef cattle that I refer to. The farmer has gone out of the raising of cattle for the only reason that it has not been profitable for him. This same combination that has driven and is driving thousands of farmers out of growing beef cattle, has made the price of meat so high that the consumer has been doing all he can to learn to live without meat. Thus has the parasite operated at both ends of the line, yet the same are in the meat industry. The packers now have such a hold on this industry that to get relief seems very remote, except through either strict government regu-

Dept 991 Waterloo, Iowa

Perfection
Smokeless
Oil Heater
si a regular little furnace of heating energy

The Perfection Smokeless Heater is indispensable in the home, no matter what heating facilities you have—the bathroom is too cold for baby's bath, the sewing room is chilly, the living room is not comfortable, the laundry, the basement, the attic, all have cold corners.

Get a Perfection Smokeless Heater today. It burns kerosene. Cheap and always available. Any good kerosene will give satisfaction, but for best results use Perfection Oil.

No smoke—no dust—no odor—no ashes. Just plenty of sweet, warm air that makes home, home.

Weighs 12 pounds, is only 25 inches high and 12 inches in diameter. Finished in highly polished steel or blue enamel. Trimmings are black Japan or nickel.

Easy to light—lift the drum and touch a match. Regulate flame as desired. No need to worry about flame getting too high. Automatic lock flame spreader prevents that.

Can be carried about the house easily—handle never gets hot.

Perfection Smokeless Heater varies in price from $4.00 to $7.25 according to finish. Look for triangle trade mark.

Sold by all reliable dealers.

Rayo Lamps give that soft, mellow light which enables you to read without eye strain. Get one.

FARMER BOYS ATTENTION!

Never before have farmer boys had such a fine opportunity to make a lot of money out of polecat and other wild animal skins as this winter—and you ought to get out your steel traps and get busy. In the meantime, write to the fur companies whose advertisements you will find in this issue and ask them to send you their price lists and "Trappers Guide." Be sure to mention this paper when you write.

The Code of the Mountains

By CHARLES NEVILLE BUCK

A STORY OF A MOUNTAINEER WHO BECAME CIVILIZED

CHAPTER V

After the momentary shock of sudden panic the scattered auditors began shamefacedly drifting back for inquiry and solution.

Newt Spooner saw General Braden and a companion carrying the limp figure of the mountain lawyer down the stairway of the platform and heard them cursing the lawlessness of the mountaineers who, "having made an excursion from their own shambles were waging their damnable war on the streets of a civilized town."

He saw the crowd opening to let out several men who bore another prostrate figure, and, as they passed, one glance at the face, which had fallen back, loose-jawed, between the supporting arms, told him that some one had "gotten" Jake Falerin. Then he saw the town marshal, supported by half-dozen volunteer deputies, fighting for a passage through the throng with the prisoners, whose bodies they shielded with their own. This group made its way up the stairs, and flattened itself against the court-house wall.

Behind the drawn revolvers of the guard, the late convict recognized the faces of Red Newton and his accomplice. Already the crowd, which had a moment before been in panic-stricken flight, was pressing menacingly forward, and talk of lynching ran like wildfire from mouth to mouth. The officer was brandishing his pistol, and two of the volunteers were holding aloft, in show of force, the revolvers they had taken from the captives, whom they were waiting to slip through the court-house halls to the jail. Someone had gone around to unlock the doors.

The prisoners themselves stood stoically enough with mask-like faces, and if the roar of bluegrass wrath intimidated them, their eyes and lips showed no trace.

The countenance of Red Newton even wore a satirical smile as he commented to the other Spooner, loudly enough to be heard around a wide radius:

"These-here furriners air shore hell-bent on law an' order, hain't they? They're bounden fer ter have hit, even if they has ter lynch folks ter git hit."

Then the door opened, and the officer with his prisoners backed swiftly through it and slammed it in the faces of the crowd. Newt calmly walked down the stairs, and strolled along the street. At a corner, he saw Black Pete leaning nonchalantly against the wall in conversation with a farmer, who was roundly berating the violence of the mountaineers. The Deacon was chewing a wooden toothpick and regarding his chance companion with grave and respectful attention, nodding his head in approval of the sentiments expressed, but, as Newt passed him, he fell into step, and the two walked together toward Mr. Cawsler's restaurant.

"Son," suggested the quiet giant who had arranged the little tragedy of the afternoon, "this town's going to be a right-bad place for us mountain men for a time. If I was you, I'd dig out."

"Thet's my business," retorted the other sullenly. "I've got a matter ter settle up, fust—beside I reckon I kin prove I didn't have no hand in these doin's. I was havin' speech with the policeman when hit busted loose."

The Deacon came as near smiling as he ever came. One side of his long mustache tilted up, but his eyes remained sadly grave.

"I reckon I can prove that I didn't have no part in it, either," he said easily. "But some of these Falerins have seen me around town, and I reckon they'll try to get me implicated. That Falkins crowd suspects everybody. Come in here with me a minute, son."

The Deacon turned and led the way into the inside, already noisy with excited men having recourse to drink and discussion.

They passed through the place and into the yard at the rear, where, after a look around to assure himself that they were alone, the older man drew a heavy revolver from under his coat.

"If they try to get me into it," he said calmly, "I'm going to make them search me. Keep my gun for me a while, if you don't mind. You were with the policeman, and they won't suspicion you."

For a moment Newt hesitated, then came the thought of his own affairs. A weapon was what above all other things, he needed. Accordingly, he took it silently, and slipped it inside his coat, and without a word or a nod turned and walked back through the saloon, to disappear beyond its swinging screens.

When night came a two-thirds moon rode high and paled the summer stars into pin-points. Newt Spooner knew from talk on the streets that the lawyer would recover to reap greater reputation from the affair in which, even after leaving the storm of his own country, he had fallen under a mountain hand. But Jake Falerin would reap nothing from the afternoon's doings beyond an obituary in the newspapers; an obituary which would recount a sanguinary career closed with a sanguinary climax.

These matters, however, gave Newt only minor concern. He was not to be shaken from a fixed resolve by other men's hopes or disappointments. Nightfall found him trudging out the moon-bathed turnpike between the blue and silver mists of the fields; because, though uninvited, he was going to a party. He was not going as a guest, nor yet wholly as an onlooker. If one man was not among the guests, he would turn back from the fringe of the festivity, touching it no further. If that one man was there, Newt Spooner meant to break up the party, and add a sequel to the shocking transpirings of the afternoon.

Many buggies passed him, driving slowly, for the night was gracious with the sweet fragrance of the young summer, and the occupants of the vehicles were young, too, and no part of a summer dance is better than the going thither and coming home. From this caravan came the music of much laughter, and now and then the lilting of a song; sounds as unaccustomed to Newt Spooner as grand opera. But the only impression made on him was the realization that he was too early; so, when he found a thick grove flanking the road, he climbed the fence and lay down under a hedge and rested. While he was stretched there in the dewy grass, he cocked and uncocked the revolver to make sure that, when he needed it, it would not fail him.

It was a night for lovers and lovers were availing themselves of it, but to Newt Spooner the seductive whispers through the upper branches of the oaks carried no message of peace or minstrelsy. Yet, even to him, there was a dumb sense that life here in the great "down below" was a different thing, and, as he lay there fingering the mechanism of his revolver, he could not escape a large and disturbing wonderment. The breadth of the sky made him feel small and alone in the center of vastness. At home, mountain walls rose confiningly on all sides and one looked up at at a narrowed patch of stars as if from the depth of a great well. But here one could gaze away on the level of the eyes and watch the wonderful phenomenon of a heaven coming down with its stars to meet the edge of the flattened earth. At home, one would ride the dirt roads on muleback and in silence, save where the hoofs splashed along the creek-beds. But here the horses beat a sharp rat-tat with metal shoes on a metaled road, and the rubber-tired wheels ran noiselessly. These people, too, reversed the order of things even as their country reversed them. At home, almost every one was poor; here every one seemed rich, and the women, whom every mountaineer knows should be treated as inferiors, suited only to the tasks of housework and child-rearing, were treated by the men as equals. That he knew from the chatter and laughter of those who passed in earshot, driving two and two. And what fools they all were, for surely no people who were not fools could chatter and laugh and sing!

After an hour, the buggies passed less frequently, leaving the road free of travel, except for town-faring negroes on foot and singing. Then Newt Spooner came out from behind his hedge and made his way once more along the turnpike. What his eyes had once seen his memory retained with photographic ditinctness, and as soon as he reached the beginning of the low stone fence, which he had noted that afternoon, he knew that he was drawing near the dance.

But Newt would have known that he was near his destination without the fence, for already, though blurred by the distance into an indistinct and formless spot of brightness and color, he could make out the illumination of the Chinese lanterns and there came to his ears across the softness of the night the merry strains of a band playing a two-step.

The mountain boy made a rapid survey. The house sat deeply back in the woodland, some five mundred yards from the road, but the platform, though almost directly at its front, lay nearer the farther side. The lateral fences of the woodland were lined with locust groves, giving a band of shadow along the edges. He might have crossed the fence at the nearest corner and worked his way back, but time was not an object, and so, before selecting his route, he went along the turnpike to the other side of the place for fuller reconnaissance, and found there even better and more continuous cover. Also, by taking that side, he was further from the driveway and would arrive closer to the platform without leaving the shadow. As Newt crossed into the woodland, he became invisible, thanks to the inky shade of the locusts, just now heavy with fragrance of bloom. The thickets of his own rhododendron and laurel could not have availed him more serviceably. At his left were acres of undulating bluegrass, broken generously with forest trees, and between the trees lay a silver lake of open moonlight, dotted with an island of shadow. But, by following the fence line back, he could invisibly draw near to the platform, and creep still closer under the shelter of a heavy growth of lilac bushes.

Suddenly, the mountain boy's heart began to pound in a strange way. He had never been afraid of anything and he was not afraid now, but as he crept, like a woodland animal, close enough to take in details, he felt as a man might feel who finds himself pursuing an enemy on Mars. He was in a new world and one so strange to him that its very difference brought a sense of misgiving. He had been born and reared in a windowless mountain cabin of one room. His light at night had been that of crackling logs on a stone hearth and a single lamp without a chimney. He had heard hatred of enemies preached before he could talk himself. That his present purpose was righteous, he passionately believed; that one should pay his blood-debt seemed axiomatic. Yet, as he looked out, he could not shake off that sense of strange uneasiness. Something was wrong. Perhaps it was simply the inarticulate realization that the scene was set for merry-making and not for tragedy. At home, it was different. The mountains were sterner and bred sterner emotions. The darkness there seemed grimmer, too. This was not the night or place for a murder.

Criss crossed about the platform and between the trees swayed the vivid color splashes of the lanterns, like magnified and luminous confetti. Sifting and eddying on the swaying floor went the rhythmic whirlpool of dancers. The soft colors of evening gowns, the ivory flashes of girlish shoulders and the floating of filmy scarfs dizzied the boy, who by the iron dictate of heredity and upbringing was a human rattle-snake. The strange sight of men in evening dress, their shirt-fronts gleaming like conspicuous targets, added to his bewilderment.

Between the trees passed strolling

couples whose laughter lilted musically, and, as he crept nearer in the shadow of the lilac bushes, he saw a queer little affair which was also new to him, only a few yards away. It was a rustic summer-house, over the timbers of which trailed masses of honeysuckle, and into it, as he lay there peering sharply ahead, went a man and a girl. The man was dutifully wielding a fan after the flush of the dance and talking earnestly in a low tone, and the girl was laughing up into his face with a silvery softness so unlike the nasal voices of his own kind that Newt could make nothing of it. Nowhere was the hint of hardship; the hardship which was in his country life's dominant note. Back at the rear in the moonlight, the whitewashed barns and fences gleamed like structures of ivory.

He lay there on his stomach, his elbows on the ground and his chin in his hands, trying to search the faces of the dancers. But the dancers shifted and sifted in so bewildering a maze that even had they been nearer at hand he could hardly have identified familiar features. Then the music stopped, and he drew a breath of relief, for the platform partly emptied itelf, and, as the couples came down and strolled under the lanterns, it was easier to search for the face he wanted to see.

Newt Spooner had been there perhaps an hour while waltz and two-step alternated to set the human mass he was trying to sift into fresh and maddening puzzles of rapid movement and vagueness. At the distance he had decided it was hopeless, and though the summer-house under the honeysuckle seemed a favorite retreat to which couple after couple came for a moment of rest and innocent flirtation, it had not proved a Mecca for his victim, if indeed his victim were there at all. Of this possibility he now felt a diminishing credulity. He would, nevertheless try to slip closer for a final scrutiny and then go back to town, admitting temporary defeat. Then, as with snake-like movements he was hitching himself closer to the ground and held his intaken breath in his throbbing throat.

A new couple came out of the shadow and strolled across the path of open moonlight toward the summer-house. The girl was she who had picked him up on the road, and the man was Henry Falkins. Even in evening dress, there was no mistaking the features, and that shirt-front was a target to even an amateur's taste.

The girl wore a filmy gown and about her bare shoulders was thrown some silky thing as iridescent as gossamer. But, unlike those others who had come there, she was not laughing.

Instead, she was looking up with a very direct gaze into the man's face, and her eyes and lips bore a somewhat wistful seriousness.

At the front of the summer-house, her companion stopped and broke a spray of bloom from the vine.

"It always reminds me of you," he told her in a soft voice. "There may be sweeter fragrances, but I doubt it. I guess that's why."

He lifted a drooping branch of leaf and bloom, and she passed under his arm.

Newt Spooner was lying only a few yards away, but he must be closer. The mass of vine obscured his line of vision, and he had no wish to kill the girl. Behind his ambuscade of trellised supports, he could come near enough to reach his hand through and touch his victim if he chose. It was almost too simple—too easy. Yet, after all, it was a bad arrangement, though that he could not remedy. He must announce himself to the man he meant to kill, or defeat the satisfaction of revenge. To let him die without realizing why would rob the punishment of its sting. Then the woman would doubtless make an outcry, and his chance of escape would end. Besides that there was a second objection: the girl had befriended him. He was to some extent "beholden to her." He wished now that he had refused to drive with her; but, when he had accepted her invitation, he had had no idea that his purpose could concern her, and his purpose came first.

Newt Spooner drew very near. He cautiously pulled back a branch of the honey-suckle, and looked through. The girl was sitting with her eyes downcast, and the man standing with one knee on the rough bench. He was leaning forward and his voice, though tense with earnestness, was almost a whisper. Newt might at that moment have been noisy instead of noiseless without danger of distracting the attention of that man and woman.

At home in the mountains, Henry Falkins would have been more wary, but here in the bluegrass he had laid aside all thoughts of danger, as he had laid aside his high-laced boots and corduroys. He was standing at the other side of life's gamut. Enmity, for him, did not exist. The universe was filled, he believed at that moment, to the boundary of the last sentinel star with love. The night breathed it. He was breathing it, the girl's eyes were just then raised to meet his, brimming with a light that set his pulses bounding.

"Back there in the hills," he said, "there is a place high up the mountainside that looks down on such a night as this over an ocean of silver mists in the valley. I have often gone there alone and listened to the nightingale talking about you. After this," he added joyously, "all nights will be moonlight and starlight for me, dear, if—" But there he broke off and became silent.

Newt Spooner advanced one knee a few inches, and steadied his position. He drew the vine back a little further with his left hand, and slowly thrust his right into his coat pocket. When it came back, it held the pistol, and this Newt placed at his back, that the soft click of its cocking might be muffled by his intervening body.

* * * * * * *

The stars were as bright and the moon as serene that night back in the broken ramparts of the mountains as here in the lowlands. No hint of brewing tragedy disturbed the majesty of the summits that raised their crests into the cobalt, or marred the silvery flood that bathed the valleys.

Where the college buildings nestled in a tidy village near the waters of Fist-fight Creek, the picture was a nocturne that must have brought joy to the heart of a painter whose soul responds to the beautiful.

Already, in the dormitories, most of the children were asleep, but one girl, who was half child and half woman, crept noiselessly down the stairs of the building where she had her room, and made her way to the creek-bank.

She had spent a longer time over her studies than had her fellow pupils, because in her serious little breast burned a hunger for that education which might open new ways and make for her a life beyond the imprisonment of her environment.

In years, Minerva Rawlins was a child, but the life of her people brings early maturity and into her little brain had recently been creeping the restlessness of new things—and of womanhood. To-night, the plaintive call of the whippoorwills from the deep shadows of the timber was a call to be under open skies, where the thoughts that assailed her might not feel cramped within walls. There were many things of which she must think—and it happened that the subject uppermost in her mind was Henry Falkins.

She went with lithe tread and pliant carriage down beyond the saw-mill to a spot where the sycamores hung low by the waters that swirled in a cascade over a litter of huge rocks. On the steep mountainside beyond, the flowering laurel and rhododendron were thick, and the forests hardly showed a scar from the axes that had claimed the timber for the buildings. She had discovered that here through a gap between two summits she could see the same pale star to which the single pine had pointed back there from the front door of the cabin, which, wretched as it was, had been her only idea of home. In the silvers and grays and cobalts of the picture, and in the night song of the whippoorwills and booming frogs, there was solace, and to-night she wanted solace.

She told herself that this restlessness which would not let her sleep was loneliness; but beyond that single feeling were others more complex for which she had no analysis.

There was the starving eagerness for something very different from what wares life had ever spread to her gaze, some yearning that had crept down through lapsed generations from an ancestor or ancestress who had known the courtly life of Old Virginia before the pioneer tide swept them westward to their stranding. This hunger was a fiery thing, which made the eagerness to learn blaze hotly because its attainment meant struggle.

Then there was the conflict between that loyalty which the code of the Cumberlands impresses as a cardinal duty upon its children, and an insurgent hatred for the squalid family into which her father's second marriage had thrown her.

The law of feudalism and of the clan writes at the head of its decalogue, "Kith and kin above all." Minerva would have resented an implication of wanted stanchness, and yet as she sat with her small and well-chiseled chin cradled in the hands, which drudgery must soon make hard and shapeless, her eyes filled with tears and her slender body trembled with instinctive repulsion at the thought of return to the cabin where the razor-back hogs would scratch their backs under the gaping floor timbers, and where darkness hung day-long between smoke-blackened rafters.

And though she did not admit that either, a part of the restlessness was the awakening of womanhood, and the woman's hunger for love. She thought of all the young men she know back there; of the boorish creatures whose breath reeked with moonshine whiskey, and whose thoughts were as coarse as their brogans, and once more a shiver ran through her.

It all made her feel very wicked. She had come to the college and learned a little, and she had learned above all a fastidious discontent, which was poisoning her thoughts.

She told herself she ought to be very happy. Then a smile stole across her face as she sat there in the moonlight, and she drew from the collar of her calico dress a small medal on a string. It was a medal that had a few days before been awarded her for proficiency, but to her it stood for the nearest glimpse she had ever had of romance, though of romance passing by like a caravan which she had viewed from the way-side.

There had been spelling matches and recitations and the award of small prizes at the college, and the rough folk had trooped in from the countryside, riding mules or walking from many miles about. Women had come in bright-hued calicoes and sun-bonnets, and bearded, gaunt men in hodden-gray. Through that gathering and above it, since one who is very young and very inexperienced may be pardoned for a finger-touch from the gods of romance, a figure had stood out for Minerva Rawlins, endowed with every superiority.

The guests of honor on that occasion had been Old Mack Falkin and his son Henry. Old Mack had made a speech and, in awarding the prizes, his son had followed him. The people of the countryside had listened, and their applause had rocked the rafters, with that sincerity of admiration which they accorded to his native-born eloquence. But it was the younger man who had brought to Minerva Rawlins her first stir of hero-worship; the adulation of the inexperienced young girl for the first man she had seen who seemed an exemplar and a revelation.

Comparison is the one yard-stick of life, and by comparison this young man, who had lived the life of the outer world as well as that at home, might well have loomed large to such impressionable eyes.

Minerva was seeing that scene again; the school-room with its shuffling audience, and the young speaker whose words carried no taint of dialect or inelegance, as he spoke of the torch which was being lighted here to dispel the murk of illiteracy.

What Henry Falkins had said became in a fashion Minerva's standards. She found herself hating the lawlessness of the feud and the squalor of backwoods ignorance. She found herself wishing to be a recruit in the little army that sought to raise other ideals—but most of all she found herself longing rebelliously for the chance to have in her own life the companionship of some man like that. To herself she put it that way. She did not say that man, but, when she said, "some man like that," the features and bearing and voice of young Falkins portrayed themselves, and as she sat with the medal in her fingers, listening to the whippoorwills, her fancy conjured up his image.

Engine Booze

Ontario went dry recently, but this did not spell disaster to all the distilleries in the province. One distiller made a few alterations in his plant and is now turning out fuel alcohol on a successful commercial basis.

At a convention of chemists in New York it was vigorously proclaimed that alcohol would soon be used as a supplemental fuel to gasoline in all manner of internal combustion engine. A big munitions concern has learned to make grain alcohol from sawdust at low cost. There are vast sources of wood waste from which to make it.

As prohibition continues its march and puts the whisky and gin factories out of the business of making rum, they need not close their shutters and allow their plants to fall in ruin. They can keep their equipment almost intact and make motor fuel, or, as one chemist called it, "engine booze."

The readjustment will work out automatically. Rum has ceased to be and "engine booze" is. Of course it will be a wise and necessary precaution to denature "engine booze" into a chemical something that is potently unfit for human consumption. Else appalling developments might ensue.—Country Gentleman.

SAM JORDAN'S SENSE AND NONSENSE

(Continued from page 9)

lation and control, or direct government ownership. This will be hard to accomplish when we remember the fate of the Borland Resolution. We wonder how much of Congress the packers control. Our only relief will be found in getting together with the little white ballot and electing men that we at least believe the packers do not own.

Back to "Earth".

Where, when and how will we ever get back to a reasonable level on the high cost of living? At this time this country is all out of balance.

I wonder if it will not happen about this way? The war will close, peace will be declared, but thousands will seek the "land of the free" and they must have work, and the price of work will come down. Europe will grow all they can, enough to feed what they have not killed, and what did not come to America, hence will not need our exports. Europe will manufacture all they can, sell all they can, and buy as little as they can, then we will have a surplus at home, and unless our business (?) men can be able to destroy it even more successfully than they do now, the price must inevitably come down.

This crash will make fine political argument, and may cause the present administration to go down to defeat, as it will take many of us a long time to see, or admit rather that such will be a blessing in disguise, since we are all out of reason at this time. It should, however, be kept in mind that our business world must be reformed, or we never will get back to a reasonable level, for the same waste, and destruction of food products will continue, unless business is reformed, and curbed in its "reckless riot" in bad business.

MANAGING SOILS FOR PROFIT

The great world war that has torn Europe for the past two years has inaugurated changes in modes of living and methods of thinking that is destined to usher in a new life for men and industries. The farm in common with all other industries is showing the effect of the upheaval. So many and such strange economic influences have been brought to bear upon farming during the past few years that to indicate the whole path of most successful farm management at this moment would tax even the foresight of a prophet. One thing is true:—More attention must be given to all contributory factors if farming is going to survive the test.

Opinions differ as to the efficiency of the average American farm. Some say American Farming is already efficient. They point to the rapid rise in land values, the signs of accumulated buildings, livestock and farm accessories that usually find place on the farms of successful business men who operate farms as a sideline, or invest their money in same because the farm investment is generally looked upon as safe. Yet in spite of the educational work of farmers' organizations, state colleges, the agricultural press and other agencies, the tendency of quality in corn is downward, as shown by the records in the Chicago market.

I wish to add to these two facts the record of American livestock production. Statistics show a decrease of over 10,000,000 head of meat animals in America between the years 1910 and 1913. There have been many reasons advanced for this alarming decrease, not the least of which has been the claim that the farmer could not make sufficient interest on money invested in land by growing crops and feeding livestock. One of the important reasons why he cannot make money on livestock is the fact that the American acre under present methods of farm management is capable of maintaining less than one-half as much livestock as is maintained by the European acre.

Successful soil management must rest on established facts. I wish to call your attention to four of these established facts, which appear to me to be essential to more efficient soil management.

(1) Soils must be drained in order to be most productive.

(2) The organic matter or humus of soils must be maintained.

(3) Soils must be kept sweet for maximum crop production.

(4) Plantfood must be abundant and properly balanced if best crops are to be produced.

Probably no subject has received so much attention as that of available plantfood or fertilizers. It is one of supreme importance. The plant may be provided with a perfect home. It may be the product of a strong seed, but if the food supply upon which it is to live and thrive is limited and unbalanced, the resulting crop cannot fail to be unsatisfactory. In answer to the question, "Can I make a reasonable profit by fertilizing my crops?" It is the experience of reliable experiment stations in this country and Europe and the experience of thousands of successful farmers, that great profit in increased crop yields and products of superior quality accrues to farmers when fertilizers of suitable analyses are properly used on soil in good physical condition. By good physical condition, I mean that the soils have been well drained, sufficiently supplied with organic matter, sweet in reaction, and properly tilled. Under such conditions fertilizers give maximum returns. By suitable analysis, I mean that the fertilizer has been chosen to make up for the characteristic weaknesses of the soil, and to meet the characteristic requirements of the crops. By "properly used," I mean that the available plantfood of fertilizers will do its greatest good if incorporated largely in the region of the seedbed where the tiny plant begins to feed. Frequently poor results are obtained from fertilizers because they are not worked into the soil properly, or because they are sown on sod and plowed under. Such an application places them too deep to help the young crop.

As to the profit accruing from the proper use of fertilizers, the findings of experiment stations are the best data to consult. Ohio Experiment Station found, as the result of 20 years' test of fertilizers on a three year rotation of potatoes, wheat and clover, that suitable fertilizers maintained and increased the crop yields consistently at a net gain per acre per rotation of $13.18 as an average for the first 12 years, and $20.98 per acre per rotation for the last 8 years. On the 5-year rotation of corn, oats, wheat, clover and timothy, Ohio Experiment Station obtained from an expenditure of $16.05 per rotation in fertilizer on one plot, the following net profits per rotation for each period of 5 years, 1—$5.32; 2—$15.86; 3—$21.28; and 4—$12.27. On another plot, for an expenditure in fertilizers of $17.60 per rotation, Ohio obtained for each period of 5 years a net gain of 1—$1.80; 2—$19.01; 3—$28.68; 4—$23.70.

To obtain these net gains, the produce was figured at exceedingly low prices,—prices which have in all cases ruled much higher during the last 10 years; in fact, nearly double during the past three years. The cost of fertilizer has increased also, but the balance of net profit at present valuations would be considerably larger than what has been quoted. An important point in refernce to these results is that the productive power of the soils has been not only maintained but materially increased on these plots during the 20 year test.

Now, as to the "mystery" or the difficulty of using fertilizers, there isn't such a thing. The fact has been established for nearly 100 years that crop yields can be maintained and greatly increased by adding available plantfood in connection with well tilled soil. When our farmers come to realize that it is a problem of feeding their crops, they will get an entirely different and clearer view of the subject. The secret of life processes in the plant has never been explained, but the reaction of plant life to treatment is common knowledge. True, the fertility problem is an individual one to a large extent, but the basic principles we have outlined have been established for a score of years at least.—Henry G. Bell, in an address before National Farmers' Congress.

By Old Jim Riley

One of them college professer fellers made a speech down at Possum Holler th' other day and sed if you ground up yer corn fer hogs they could digest it in half th' time. But after it was over old Zeke Smith sed he didn't think much of th' idee—that th' hogs didn't have nuthin' else t' do nohow. I heard a republican express hisself on th' election th' other day and if there had a bin a constable around he'd a got arrested.

BUCKSHOT BY THE PROFESSOR

It costs so much to live these days that a lot of people aren't worth the price.

I see where the foot and mouth disease has broken loose again—and this reminds me that that Jim Riley person has been afflicted with the last half of this disease all his life. But the only time anything gets wrong with his feet is when they get mixed up with the tanglefoot stuff.

This is a good time of year to do plowing for spring crops. Plowing now will turn up the insects hibernating in the soil and many of them will be killed by freezing. The land plowed now will become pulverized by spring and will take less work to get it ready for planting. It is a good practice to plow an inch or two deeper at this time of year than we do if plowing at planting time.

Hot Springs Waters Wonderfully Successful in the Treatment of Rheumatism

THE peculiar properties of the waters of the Hot Springs of Arkansas are due to radio activity, found in them to an exceptionally marked degree, and their equal has never been known in the treatment of rheumatism and all uric acid troubles. These springs are owned and controlled by the U. S. Government.

The cost of living at Hot Springs may be regulated to suit any purse, accommodations varying from moderate-priced boarding houses, up to the most fashionable hostelries.

THE PUBLISHER'S CORNER

If you are going to ship to the Nat'l Stock Yards in the near future and are not tied up with any other firm, we suggest you get in touch with the Nat'l Live Stock Commission Co. which has one of the most powerful forces of practical live stock salesmen that can be found in the Country.

* * *

We have a chance to buy some high grade Alfalfa seed for our Farm Club friends direct from Kansas farmers at from $6 to $8 per bushel—and those who will need some should get busy right away, for this is better seed and cheaper than you will be able to buy from the seed dealers later on.

* * *

Have you got any stump land that needs clearing up? If so, I direct your attention to the advertisement of the Hercules Stump Puller Co. which appears on the last page of this issue. I have seen this stump puller tried and it does remarkable work. I also know this firm and vouch for its honesty without qualification.

* * *

Until the car shortage lets up we will be able to move very little more Illinois coal—and it is a regretable situation because we have been saving many Clubs from $75 to $100 per car. Our coal company has orders for fully 250 carloads on the waiting list at the present time and I trust the car situation will soon improve so we can begin moving it in larger quantities again.

* * *

We have succeeded in locating some more Northern potatoes at a price which will save a good deal of money—but the danger of freezing in transit is so great that we hardly think it advisable to order at this time. Should a car run into extreme cold weather a big part of the shipment might be lost. We therefore think it best to hold up on this matter until toward spring when we believe we will still be in position to affect a big saving over local prices. If the farmers of Missouri had been solidly organized six weeks or two months ago when we were in position to lay the finest Northern potatoes down in Missouri at from $1.10 to $1.15 per bushel, a pile of money could have been saved.

* * *

The Alfalfa hay question is another illustration of the potato proposition. Thirty days ago we sent word to the Farm Clubs that we had located several hundred car loads of fine No. 2 Alfalfa hay in the hands of Kansas growers at from $11.50 to $12 per ton, f. o. b. Kansas points. But only a few of them took prompt advantage of the opportunity. During the last ten days however they have waked up and we have been deluged with appeals for this hay—but in the meantime the big commission firms in Kansas City have gobbled it up—and now those who buy will have to pay a premium of all the way from $5 to $8 per ton for this same hay. Could you ask for a finer illustration of the crying need of farmer organization?

* * *

While the Farm Club movement is forging ahead by leaps and bounds all over Missouri, nowhere is it making such fine progress as in Lafayette and Saline Counties were squads of organizers are at work, bringing several new school house Farm Clubs into existence every night in the week. Four or five farmers who have gotten thoroughly into the work will send word to a certain school district and ask two or three men to call up every farmer over the telephone and ask him to attend a meeting that night—or maybe the next night—without fail. Then in the evening the "organizing squad" piles into an automobile and each man makes a little talk, urging the necessity for organization. In the meantime, they are armed with the Farm Club literature provided by THE MISSOURI FARMER which includes a suitable Constitution and By-Laws—and once this is read it is promptly adopted and a new Farm Club has been brought into being. The next night the performance is repeated in some other district. Many communities are already almost solidly organized and thus they are getting in position where carload shipments of commodities can be handled with ease. I want to appeal to every Farm Club in the state to follow this example. We have about 500 Farm Clubs in the state at the present time. If each of these Clubs would organize only one new adjoining district each week, in one month we would be able to bring 2000 new Clubs into existence. Can't you see what it means? As one of the Farm Club leaders remarked to me in Lafayette County the other day, "We have developed a half dozen farmer speakers who can make the rafters ring—and all of us enjoy the work. We haven't failed to organize in a single district where we have held meetings. My Club has saved about $500 during the last three months—and when we tell other farmers what we are doing they are glad to fall in line and help push things along."

LOAFIN' IN THE STABLE

When the day's too wet for plowin',
And the clouds are in the sky,
You'll be apt to find me loafin'
In the stable where it's dry;
Kinda tink'rin' with the harness,
Or a-bright'nin' up the plows,
Or a'plannin' out the stanchions
So they're handier for the cows.

Or maybe I'm just a-loafin'
In a lazy kind of way
In the stable loft, a-dreamin'
In the sweet alfalfa hay,
And the tinkle, drip and dribble
Of the raindrops runnin' down
Mossy shingles on the gable
Is a mighty soothin' sound.

Prop myself up by the winder
So's to watch the broad expanse
Of the cornfields and the medders
Where the raindrops splash and dance;
Watch the wheat fields dip and billow
As the breezes come and go
Jest lay back there in the shelter
Of the eaves and watch her grow.

—Jay B. Iden in Collier's Weekly.

THE COUNTRY TOWN AND THE COUNTRY AROUND

Does the country make the town or does the town make the country? Should the country town merchants be the benefactors of the farmers, the servants of the farmers, or co-operate with the farmers?

Farmers are not getting rich, the laborers of the cities are not getting rich, the country merchants are not getting rich, yet the country as a whole is becoming wonderfuly rich. Somebody is reaping a profit on the toil of the laborers of the country. Where is the leak? The toilers of the cities and the toilers of the farm turn the wheels of industry. They are entitled to an honest reward. Something is wrong, somewhere when it costs 54 cents to carry 66 cents worth of farm products to the consumer. Be the wrong at either end or in the middle, the wrong must be righted. The time has passed when the American people can afford such an extravagant system of distributing the products of the farms, factories, mines and mills to the consumers. We farmers must learn the selling end of marketing farm products. The consumers of the cities must learn the buying end. The toilers of the land at both ends of the line must work together to shake off the leaches of modern industry who are slowly sucking the life blood from the great middle class of people. When Adam was driven from the Garden of Eden, man was condemned to a life of work, but he was promised a reward.

Are the problems of the country town to be solved by the farmers with or without the co-operation of the country merchants? It is up to the merchants. If merchants make the claim that the country merchant is entitled to the support and loyalty of farmers (even when there are too many merchants in business conducted along unbusiness like lines) then it is idle to talk about co-operation between farmers and country merchants. True co-operation can not thrive on poor business. The country merchant must learn that the mission of the purely country town is to serve the country in the most efficient way possible, for the country town depends on the country around. The farmer has already registered his opinion that the country is not dependent on the country town. The growing mail order business tells this. It is up to the merchant. If he can see that the band wagon is coming and gets on board, he has a chance. However if he gets out in front of it after it has arrived and howls at farmers for taking in hand as a last resort their own business, he will be toppled over. A country with a dead town in the center of it is a calamity; but a country town with a dead country around it is oblivion. The thinking farmer wishes for neither. However if it comes to a choice, he will choose the live country with no town rather than the dead country and dead town. He is fair minded enough to want to co-operate with local merchants to eliminate local evils, but if local merchants maintain that there are no wrongs to be righted, then the question of co-operation between farmers and country merchants is vetoed. Sound and lasting co-operation between town and country must be based on something besides social, educational, and religious betterment. It must include actual financial benefits, plowing both ways.

B. P. Smoot.

ANSWERS UNCLE RUBE

Editor Missouri Farmer:

I simply can't let Uncle Rube and his wonderful flaying of the Land Bank Bill, with its possible good to the farmers of Missouri, go without some kind of an answer. Uncle Rube, as he signs himself, has spent the greater part of his life getting together his worldly possessions and now since he has all he used to think he would want, why here he is wanting more and still more. He says he works 14 hours a day, 300 days in the year. Wish he would tell us what he does the other 65 days. There are only 52 Sundays so I for one would like to know what he does with those other 13 days.

Well, gentlemen, I don't work 14 hours a day now or never did, and to be honest I don't believe any man who has real good sense will work that way. Now in just a very few instances Rube shows fairly good judgment, but in only a very few. Now for instance he seems to take pride in the fact that he never went on anyone's bond, that is indeed one of the saddest of his acts. He says he is a director in a small bank. I don't know the size of the bank, but it surely has at least one very small director. Rube must know, if he knows anything at all about business, that most of the business of the small bank is by men that borrow money from the bank and almost invariably they go on each others bond or note. Rube would have us believe that such banks as his don't charge more than 5% or 6%. But here again he is mistaken for most of the people of Missouri have been shown along that line. And then the idea of a first class Missouri farmer making an ideal out of some city banker. Say, brother farmers, what do you think of that? I am almost ashamed to go any further, but I will try and handle his case as easy as I can. (I will be like the ventriloquist when the colored men were taking the body of a departed brother from the hearse. Just for fun he threw his voice to the casket and said, "Let me down easy boys." Of course there was a scattering of colored pallbearers and the ventriloquist paid the damages.) The help Uncle Rube gave his own daughters was only what he should naturally do and the other help that he gave was very commendable indeed. Possibly he is like me in regard to automobiles. I would get one if I was not afraid it would make me do some unusual labor stunts. But no, that surely would not bother a man that works 14 hours every day, 300 days in the year.

Now about 1875 I was here too, but we did not have any plaster on our farm, and we raised about 1000 bushels of corn to boot. But as Rube says, times were very hard, but I don't think there were nearly as many farms mortgaged then as now. Possibly Rube will say, "Of course not, there were not nearly as many farms." That is so, too, but I mean in the same ratio. He seems to have a holy horror of the mere mention of that million for rock roads. Well, Uncle Rube, if you can't stand that and more, you had better get ready to move on for it is coming as sure as night follows day. If Uncle Rube is such a public spirited gentlemen, why did not he take a few of the many dollars he says he has and go and fix that bridge so close to him? That is the way us fellows here in old Johnson County do. I am inclined to think that learned attorney Rube speaks about is about as well informed as Uncle Rube himself. Say, brother farmers, what kind of a Farmers' Club man do you think Uncle Rube would make? Possibly we can convert him, but it looks as if it would be a job that we in this day and age don't have the time to spare to try to do, but there are plenty of us that are not so narrow minded that we will not help our brothers and sisters who are less fortunate financially than we are.

Now in conclusion I will just say, I by his hard work and other ways of by his hard work and others ways of accumulating property, but who were always hard on people that are in the same situation that he was when he started. Now I was never real poor, neither have I ever been very rich, but I have always been so situated so I did not need to work 14 hours, 300 days in the year. I have never seen a time that I would not help any one that I saw needed help. I am 57 years old and if such a thing is possible I enjoy each day as it comes just a little better than the day before it. Now Uncle Rube, try and take a good look at yourself from what I have written and I do hope the next time you write for us it will be something for the farmers to be proud of you. Also the next time you write please give us your name in full and the postoffice address. I am rather glad the former generation voted those bonds on you. It gives you something to think about the 10 hours you are not working. Say Rube, some of these people that have their autos bought on time see more real enjoyment on one of their automobile rides than you have experienced in all of your life.

T. E. Repp, Centerview, Mo.

IMPROVING THE LAWN

Did the hot, dry weather hurt your lawn? September is the month for repairing lawns in Ohio. While lawn repairing often presents many difficulties, most thin sods will be improved by fertilizing and reseeding.

Patches that have died should be scratched and made fine with a steel rake for seeding. Unless the soil is rich it should be made so by the use of manure or commercial fertilizer. The latter is preferable because it is easier to apply and carries no weed seeds. For such purposes the Ohio Experiment Station recommends the use of about four pounds of steamed bonemeal to the square rod. An application of 10 to 15 pounds per square rod of hydrated lime or of 20 to 30 pounds of finely ground raw limestone is also advised for soils deficient in this constituent. The lime should be worked into the soil before any fertilizer is added.

After this treatment a mixture of equal parts of Kentucky bluegrass and redtop, with a little white clover, should be sown broadcast at the rate of one pint to the square rod. The ground should then be raked over to cover the seed and to make a smooth surface. Lack of moisture will make seedings uncertain. Hence, sprinkling of laws is advisable in dry seasons.

Even those lawns having heavy sods will be improved by occasional dressings of manure or fertilizer. Such treatment will thicken up the grasses without reseeding.

Stable manure applied in the fall or winter will cause the lawn grasses to be thicker and of a darker green color in spring. Such material should rotted and fine. Coarse, strawy manure or lumps of such matter will kill out the grass beneath.

Live Stock Notes

Bridges Bros. Second Sale of Poland China's a Big Success

One of the best sales of the season was held by Brides Bros., of Slater, Mo., on Friday, November 3. They sold 46 head for an average of $61.21. Last year their sale averaged $63 per head on bred sows. The top price for their gilts was $135 for a daughter of Long Big Bone. Their two herd boars, Bridges Bob Wonder and Long Wonder Timm, came in for a lot of deserved admiration by the visiting breeders. The feature of the sale was the purchase of the junior yearling boar, Model Big Bone 3rd, a son of the world's champion, Long Big Bone.

The high average price of the sales of these young breedrs shows that this firm is progressing in the production of high class breeding stock and is winning the esteem of their brother breeders.

Grand Champion Hampshires

The card ad of Mark Whittaker, Miami, Mo., is particularly worthy of notice to those interested in good Hampshires. The remarkable record established by the above breeder at the Missouri State Fair this year is certainly convincing evidence that he is producing the best the breed affords. Br. Whittaker offers you big husky spring boars and bred gilts of same breeding as his prize winners. If in the market for this class of breeding stock, why not write them? Kindly mention this paper when writing.

Jersey Dispersion Sale

A rare opportunity to buy some high class Jersey cows is offered in the dispersion sale of the herd of the late Col. W. H. Phelps of Carthage, Mo. The sale will be held on Monday Dec. 11 and if you are looking for something of real merit in the Jersey line either for single cows or for car lots better attend this sale. Some very fine cows are offered.

WEED OUT THE BOARDERS

Cow testing associations should command the interest of every dairyman for they help to make more money for the man who milks.

Progress and then success spring from dissatisfaction with present conditions. The 53 active cow testing associations in Wisconsin are made up of dissatisfied men.

A year ago a certain Waupaca county dairyman was dissatisfied. He wa milking eleven cows and getting a monthly cream check of $35. He joined the Waupaca and Butter Nut Ridge association. By weeding out the robber cows and replacing them with good producers and by giving the herd better feed and care he increased his monthly cream check from t cows to $110 a month. He has one cow less to milk and a cream check three times as large. Very many members of Wisconsin cow testing associations could tell somewhat similar experiences.

Oust "Robber" Cows

A cow testing association is simply a group of 25 or 30 dairymen who jointly hire a man to weigh and test the milk of each cow in their herds, to keep their production and feed records and to do whatever else he can to promote their interests. The movement is neither old nor new, yet it is old enough to have proved its worth in making dairying more interesting and profitable, but so new that your community is not getting the benefits of one.

During the past fifteen years the price of feed has increased about 50 per cent, while the price of dairy products has increased only about 30 per cent. Labor and land values have also risen, making it necessary to lower the cost of production in order to make a profit in the business. The low-producing or "robber" cow is undoubtedly the greatest factor in increasing the cost of production. To detect these "robber" cows is the first duty of the cow testing association.

"The poor ye have with ye always" is true of cows as it is of people, unless we detect and dispose of them. If we do not dispose of these poor cows, we become poor like they, and the more we have the poorer we get. The Stanley association sold 101 poor cows for one-fourth of the cows in the association before the year closed. Welcome association sold 28 unprofitable cows the first year and 92 the second year. Antigo association sold 54 "boarder" cows before the end of the year. The Sheboygan association, in one of the best dairy sections of the state, found 89 out of the 480 cows to be unprofitable and sold them during the year.

Uses Standard Tests

Last year records of 19,000 cows were kept and about 4,000 or more than one-fifth the number under test were sold as unprofitable. The time is past in Wisconsin when a man claims that he can tell, by looking at or even by milking, how much milk or fat a cow will give in a year. The Babcock test, the milk scale, and the yearly record are the only reliable judges of cow ability to convert feed into fat, and the cow testing association seems the best way to use these means for it insures the work being done accurately, promptly, impartially, and economically.

While the cow testing sssociation is locating the unprofitable cow, it is also locating the profitable cow—the cow that will return $1.50 to $3 worth of dairy products for every $1 worth of feed. To know what each cow produces during the month and the cost of the production stimulates interest in the cows as individuals and causes the whole family, and the hired man, too, to take new interest in the dairy business.—Noel Negley, Wisconsin.

PORK AND HIGH PRICED FEEDS

The higher the price of grain the more care is required in feeding operations. It is not profitable to feed corn alone. It should be supplemented with some feed like tankage or linseed oil meal.

Tankage has perhaps received more attention by Experiment Stations and by practical feeders during the last few years than any other protein supplement. Its composition makes it almost an ideal supplement to corn for hog feeding. The high protein content, derived from an animal source, along with a high mineral or ash content makes it particularly valuable when fed with corn, which is noticeably lacking in these nutrients. It would be impossible to discuss here in detail the enormous amount of experimental data upon this subject since most of the State Experiment Stations, including the Missouri Station, have published the results of trials made with tankage. The data reported, however, shows that tankage is in every way one of the best supplements to corn for hog feeding.

Experimental work shows that better results are obtained with the breeding herd when some tankage or meat meal is added to a corn ration. Not only are more pigs farrowed per litter but those farrowed are stronger. It has been found for example that gilts fed corn alone farrowed an average of 7.6 pigs per litter as compared with an average of 8.5 farrowed by the gilts fed a ration of corn 10 parts, tankage or meat meal 1 part. Sixty-eight per cent of the former were strong as compared with ninety-eight per cent of the latter.

Not only does the addition of some feed like tankage increase the efficiency of the breeding herd but it also materially decreases the time required to get the pig to a marketable weight. This is shown in a list at the Missouri Agricultural Experiment Station where one lot of hogs for 120 days on a ration of corn 10 parts, tankage 1 part gained on the average 1.15 pounds per head per day, while a similar lot fed on corn alone gained only 1.11 pounds. This would indicate that it would require about a month longer to make a 100-pound shoat weigh 250 pounds, if corn alone was used as the ration than when a ration of corn and tankage was used. In the trial mentioned above, it required 436.4 pounds of corn

POLAND CHINAS

Poland Chinas & Shorthorns
Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.
H. S. Williamson, Route 6 Centralia, Mo.

Spring Boars by the Grand Champion
A desirable lot of early spring boars by The Giant, acknowledged to be one of the greatest young Poland China boars of the breed. Prices within reach of all.

Am offering choice boars and gilts, same breeding that won 6 champions, 26 Firsts, and a total of 63 prizes at Mo. State Fair and St. Louis Agricultural Show, at reasonable prices. Write for prices and descriptions.
CHAS. L. TAYLOR, - OLEAN, MO.

ANGUS CATTLE
Herd founded 1904
Young stock sired by Dean's Eric 139686. Also offer splendid herd bull for sale. Every one the right kind and priced to sell.
V. E. LAWRENCE, - Salisbury, Mo.

Aberdeen-Angus
I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
J. D. BLACKWELL, - Fayette, Mo.

Personality Counts in the Stock Yards!

W. R. Hensley, President National Live Stock Commission Co.

THE REASON the National Live Stock Commission Co. does an ever increasing business is because of the **Personality** back of this great organization—because it has built up the most powerful force of salesmen that can be found at any Live Stock market in the Country—men who know the value of a hog, steer or sheep as well as any men living and who fight for the "high dollar" from the minute the gong sounds in the morning until the curtain is rung down in the afternoon.

These men realize that they must "get the limit" for you if they are going to be able to hold your business. They know they **can** get the "high dollar" for you because they have been getting it for hundreds of other shippers who never think of consigning to any other firm. So give them a chance at your next shipment. Let them show you what they can do for you. They will realize that "its up to them" to "make good"—for there is no love lost in the stock yards and **results are the only things that count!** All they ask is a trial. If you expect to ship to the Nat'l Stock Yards soon, write them for any information you may want. **They are at your service.**

The National Live Stock Commission Co.

NATIONAL STOCK YARDS, - - ILLINOIS

plus 43.6 pounds of tankage to produce 100 pounds gain on the one hand as compared with 580 pounds of corn where corn alone was used.—L. A. Weaver, Mo. College of Agriculture.

Marketing to Save $1 Corn

Cattle receipts at the St. Louis National Stock Yards from January 1 up to today, November 22, totaled 1,044,682 head. This is more cattle than arrived at these yards during the entire year 1915.

Up to November 22, hog receipts at this market for the year 1916 totaled 2,592,255 head. During the entire year 1915 hog receipts at this market were only 2,591,768 head.

Above figures indicate satisfactory growth of the market, but the fact must not be overlooked that farmers are "cashing in" freely this fall to "get from under" feeding dollar corn. A world of cattle and hogs are coming to market now that should be kept at home and fed out, but the man who has to buy corn that is as costly as diamonds, comparatively speaking, is apparently going on the theory that a bird in the hand in the autumn is worth two in the bush next spring.—National Live Stock Reporter.

MAKING PORK ON FORAGE

It is evident that we will never again see very cheap corn in this country. Land is too high priced and it costs too much to keep up the fertility on our corn lands to make it possible to produce corn without considerable expense. The hog raiser must then find some substitute for corn in making pork. The Missouri hog raiser is more favorably situated in this respect than the farmers of more northern states because our mild climate permits the growing of crops that will furnish good grazing for 8 to 10 months in the year.

R. C. Ashby animal husbandman in charge of swine, fed a large number of hogs different rations of grain along with their pasture, with very satisfactory gains. One group of hogs, self-fed on shelled corn and alfalfa pasture, at a cost of $6.20 for each 100 pounds of gain, returned a gross profit of $168.09—not including labor, risk, interest or other overhead—per acre of pasture.

The farmer will be interested in knowing what the results were. The rations were as follows:

1. Three per cent of live weight in shelled corn, with alfalfa pasture.
2. Four per cent of live weight in shelled corn with alfalfa pasture.
3. Shelled corn, self-fed, with alfalfa pasture.
4. Four per cent of live weight in shelled corn with two pounds of buttermilk, per pig daily, and alfalfa pasture.
5. Four per cent of shelled corn with very light tankage ration and alfalfa pasture.
6. Three per cent of ground barley with rape pasture.
7. Three per cent of shelled corn with rape pasture.
8. Four per cent of shelled corn with rape pasture.
9. Shelled corn, self-fed, with rape pasture.
10. Shelled corn, self-fed, tankage and rape pasture.

The results of feeding these various rations including cost, profit, per acre, and profit per pig, appear in the following table:

Rations fed	Feed cost of 100 pounds gain	Profit per acre of pasture	Profit per pig
1.....	$5,922	$105.85	$3,599
2.....	5,885	157.44	4,920
3.....	6,203	168.09	4,387
4.....	5,981	144.21	.....
5.....	6,010	99.80	3,164
6.....	6,136	81.79	2,590
7.....	5,780	77.164	2,443
8.....	5,177	138.84	4,338
9.....	5,534	109.60	3,425
10.....	5,638	165.52	.....

The profits shown by ration 7 and 9 were reduced because one pig in each lot proved to be unthrifty and had to be removed.

Keep Hogs Free from Lice

The female hog louse deposits the eggs (nits) on the hair. The lice hatch out in from ten to fourteen days and are ready to reproduce in a few weeks. The favorite place for the lice is a crevice of the skin as is found back of the ears and in the flanks. In the summer time they may be found on any part of the body, but in cold weather they seek out these protected places. They can also live in the usual litter of hog pens, and when dislodged by scratching, or if they leave by preference they can easily find suitable quarters until another pig comes along. This is their method of spreading. Undoubtedly, when hogs pile up in their pens in cold weather, Mr. Louse can visit a new host by a less laborious journey.

Dipping is a sure method of eradicating hog lice. The dip may be a crude oil emulsion or a kerosene oil emulsion. The hog should be dipped every ten days for three or four successive times. There are many machines on the market called hog oilers, which overcome the difficulty, inconvenience and danger of dipping animals in winter. The hog oilers take advantage of the fact that all lousy hogs scratch.—S. C. Agricultural College.

BARGAINS IN JERSEY COWS!

From one to a car load of good, young registered Jersey cows, mostly fresh or soon due; offered at sacrifice prices because short of feed and cannot winter. Also, a few open heifers and young bulls. Write your wants or come and see this stock.

Read How Fortunes Are Made Quick by Pulling Stumps

HERCULES Hand-Power Stump Puller
LOW PRICE
120,000 lbs. Pull
ASK US ABOUT IT

LET me send you my new, fine free book at once. I want to show you *proof* of how you can turn each acre of stump land into a double profit the first year, in extra crops and added value of land—by pulling stumps with the Hercules All-Steel Triple-Power Stump Puller—and how you can make *big money* in *your spare time* by pulling stumps for *your neighbors* or *by renting* your machine at a *nice fat profit.*

My book shows *actual photographs* and prints *actual letters* from many *owners*, telling of the remarkable feats of the Hercules—how it pulls *any size stump, green tree* or *hedge* in less than five minutes—how it easily pulls *an acre a day.* Read how one man increased his land value from $25.00 an acre to $125.00. Read why the Hercules is the *best investment* you can make now. The

Hercules Triple-Power Portable Stump Puller

is the puller that has the single, double and triple power features, giving you three machines in one. One man with a team can handle it and move it from place to place. No heavy lifting. The new portable is equipped with a solid steel bedplate and broad steel wheels. There isn't a stump, green tree or hedge grown that the Hercules won't pull out without straining or breaking any castings. It's the low-down constructed puller that has self-anchoring and stump-anchoring features—the one with double safety ratchets that insure the absolute safety of men and team. I want to send you a Hercules on

30 Days' Free Trial

so you can *see* how *powerful* it is and how *easy it works.* I want you to *know* for yourself that the all-steel construction means 60% less weight and 400% greater strength than cast-iron or "semi-steel." Besides that, I want to save you big money on the cost. I'm making a

Special Price Proposition

to the first buyer in 5000 different parts of the country. If I get *one* Hercules in each locality *more will surely follow* because of Hercules quality and efficiency. So I can easily afford to sacrifice my profit on the *first* machine in each locality. Take advantage of this big profit and big saving opportunity *now.* Besides my 30 days' free trial offer and money-saving price I give you a

3-Year Guaranty

that *means* something. The *all-steel construction, the triple-power* feature that saves your team and gives a tremendous increase of power, the *double safety ratchets* and the careful *turning and grinding of every part*—all these things make it *safe* for us to *guarantee the replacement of any casting of a Hercules that breaks any time within three years, whether it is the fault of the machine or your fault.*

This Free Book Tells All

Just simply send your name and address on the coupon or on a postal so I can send you the convincing facts about the superiority and efficiency and value of the Hercules Stump Puller. Only 5000 of these machines will be sold at this remarkable introductory price, so get your name in now. My new book is a beauty. See the real pictures of big stumps it has pulled out like you would pull weeds. Read the many interesting letters from farmers, lumbermen and land promoters. Stumps, stumps, stumps, pulled out quick, making fortunes for owners of Hercules Stump Pullers. I want you to know the facts. Just mail coupon or postal *now.* I'll send the book and price by return mail. I'll tell you the best crops to raise on virgin land where stumps were before. I simply want to get my free book to you at once, so that you can read the remarkable facts about the Hercules All-Steel Triple-Power Stump Puller and how it does such a splendid work making big profits for owners everywhere.

Your Friend and Mine

In a few days the blessed Christmas time will be here once more and here's hoping that it may find the Love Lamp burning brightly in he myriad farm homes in which this paper is a constant visitor and in which it tries, as best t can, to render some slight service—to contribute its mite toward making life a little more cheerful and worth while—to lend the light of its poor flickering little lantern to the end that its friends may the better see the path ahead. If we succeed in this endeavor ever so slightly we will not have labored entirely in vain. And here's hoping that when your little ones kneel in prayer on Christmas Eve, that the heartfelt petition which they will address to Old Santa Claus at the end may be answered at least in part when bright eyes seek the lit le stockings on Christmas Morn—and also that the kindly Old Fellow will not entirely overlook sweet, patient, uncomplaining mother.

It is always with a sense of overwhelming unfitness that I try to write anything about this, the most sacred occasion in all human history—a feeling that somehow this beautiful story should not be touched by rough hands such as mine—hands which had hardly ceased to reach out after the baubles of childhood when they were compelled to take up the hard and harsh struggle of life which, with each passing year, seems to grow heavier. It is only when I think of Him as the friend of the uncouth and the lowly that I can bring myself to the task without a conviction of sacrilege. And is this not true of many others who will read these lines? Have not the polished orators of the pulpit surrounded His Personality with so much mystery and carried their deification to such extremes that, through a sense of overmastering unfitness, they are driving us away from from Him rather than leading us toward Him? As I think of the beautiful words of hope and encouragement He spoke to Mary Magdelene—as I hear Him plead, "Suffer little children to come unto Me"—as I hear Him chide in kindly accents the arrogant and the mighty and ever look for an oppotrunity to give aid or cheer to the poor and miserable ones—as in those last agonizing hours upon the Cross I hear Him murmur words of hope to the dying thief who had become resigned to his fate—when I see and think of Him in this way I know that He is your friend and mine, sinners in the vinyard though, we be—a Being vastly more noble, tender hearted and forgiving than those who act as His spokesmen would have us believe.

Could He come back to Earth for these brief Yuletide days, I know where we would find Him. Even now I see Him moving about amid the bloody trenches of Belgium and Poland and taking His gentle way beside the long rows of wounded in the hospitals—patting a fevered cheek here and stopping to murmur a little prayer with a dying one yonder. Then, in the midst of His ministrations, I hear Him dispatch hurried messengers to the mighty Emperor of the Germans—to Loyd-George of England—to Poincare of France—to Nicholas of Russia—to Ferdinand of Bulgaria—and once confronted by these, the mightiest gladiators of all time, I hear Him say to them with a kindly smile, " Now let us sit down and talk for a little while"—and do you, my good friend, doubt what the outcome would be? Can you not even now see them come out of such a conference with tear stained but happy faces and even now can you not hear a million church bells ringing out the glad tidings, "Peace on Earth, good will to men?"

I know little of Theology—for I toil in a spot where the gales of life blow fiercely and where there is little time for meditation. But I do know that the Savior still lives—that He walks with us through the shadows of the valley and amid the sunshine on the mountain tops—that even as the mighty are not beyond the pale of His beautiful philosophy which is as everlasting as the crags of the sea, so the humblest and poorest of us may sit with Him at the foot of the Cross and learn of the peace which passeth all human understanding.

—By the Author of After-Thoughts.

WILLIAM HIRTH
PUBLISHER

LYONS PRACTICAL FARM PAPERS.

The Professor is hereby warned not to make any more uncomplimentary remarks about Jim Riley, for Jim has won my heart by his "It just means that old "Hez" Brown will read my postal cards for th' next four years instead of old Jim Smith."

As the old woman said, "That's all there are to it," cause if Jim Riley calls on me for a pound of tobacco to use in that cob of his why Jim is going to get it—that's all.

I know if a man who sold a good farm, and bought a "Hennery" and ten acres of land in a little town, so he could be postmaster—Ouch!!

We are getting along well with our corn and despite the damage by wind, will have a good big lot of fine corn, but in putting up seed corn, I find fewer high scoring ears than usual.

There are plenty of ears of good body and good tips, but well filled butts are very scarce.

One eleven inch ear of 24 rows of grains is lying in my desk, and if the butt half inch was a good as the rest of the ear, I would not fear to enter it in any contest I ever saw.

The shredder came into our neighborhood today, November 28, just ten days late, as it is going to rain some in the next day or two.

We are not intending to shred anyway but next year we want to shred 200-300 shocks, and I urged the purchase of a machine by a club of neighbors, six in number, offering to pay my share, even though I did not use the machine. The other men wanted to wait a year, then the custom shredder men made promises and lied a good deal, so if the weather brakes, they will not get their corn shredded, and the proposed club shredder seems to be a certainty for next year.

Butter fat has reached 39 cents per pound, and the creamery man says it will go to 45 cents.

Bran is $33 per ton, oil meal $46, cotton seed meal, not on the market and a "diary food" $37.50 per ton, 16 per cent protein claimed. Unless a man has clover or alfalfa hay, he cannot make much money out of butter fat, even at 37 to 40 cents per pound, if he has to pay such prices for concentrates and corn chop is worth $2 per cwt.

My son Arthur writes me from Kansas City, that he has just been to the beet sugar districts of Kansas and Colorado, and has bought 600 tons of beet feed, which his dairy company will furnish its patrons at cost and freight, near $23 per ton, I believe.

He is enthusiastic over the value of this feed, and says that it is the cheapest milk making concentrate on the market at this time.

So far we have not fed a pound of ground feed, excepting a few bags of bran, depending on clover hay and the sortings of corn, but as soon as the corn is all in, we will have a load or two of corn chop made.

With us, dairying has always been a side line, but when a five gallon can of cream brings $7.50, and we can sell a can every nine days from 6 cows, two of them heifers, it looks like we had better keep more cows. Just fifty years ago, one of the best agricultural authorities in the U. S. was asked, "do you not think there is grave danger of the dairy business being overdone?" and he answered, "I do not think that there is, for some years at least."

With the H. C. of L, (High Cost of Labor) as we have it now, and as it will continue to increase, there is less danger than ever of dairying becoming unprofitable

It amuses me to read about the kick beng made in Chicago and other big cities over the cost of eggs. The investigators of egg prices seem to have the idea that hens lay all the year round without any reference to weather conditions, molting or anything else.

Our 125 hen flock, is above an average one in regard to egg production, and is having above average feed and care, but the molt was later than usual, and we are getting from one to four eggs a day. We are not egg specialists, but a neighbor is, and reports from a flock of 150, ten eggs per day from November 17 to December 1.

It is costing us 50 to 65 cents per day just now to feed our flock, and the eggs are not worth ten cents per day and I wish that some of those intivestigating city folks would get a couple of dozen hens and try egg production. No, I believe that I will take that back, for I do not want to see a lot of innocent hens abused by the poor care and feed such folks would give them.

If the cold storage people are responsible for the high prices of eggs, please remember that the farmer is ot engaged in the cold storage business.

Some way I feel that there is danger of an embargo on the food stuffs of this country, and that feeling is strengthened by the fact that the officials of several National banks I know of, are selling all the live stock and grain on the farms they own or control.

If there is any danger of prices of anything going down from any cause, of course Washington would warn the banks and bankers if possible, so that these elect gentlemen could not lose money.

It would not make any difference how much money Bill and Bob and Tom, the farmers would lose, but the banker and speculator must be taken care of.

December 2. Still Indian summer weather after a good rain. Corn $1, wheat $1.75, hogs $9, eggs 40c, butter fat 40c, rabbits 12c.

Those of us who are beginning to be called "old," are apt to indulge in thoughts of the past, and, in many respects, I do not think that I can recall another year in fifty just like this one. To begin with, the winter of 1915-16, was unusually mild, little snowfall, muddy roads and wet months up to May, when we had a severe dry spell. Rain came again in June, then from perhaps June 15 to August 1, we had the most burning months it has ever been my ill fortune to see. The very last days of July rain came, and from that date until October we had rain two or three days in the week, real dry weather from that time on until November 27, when it began to rain again. On September 14 we had a sharp frost, followed by others at intervals of from a day or two to a week, none of them doing any real damage until in the first days of November when we had a hard freeze.

When the rains began the last days of July, you might have hunted the cultivated fields over for hours and not found a bucketful of weeds, but at seeding time there was a heavy crop of all fall weeds and grasses, seeding being a hard job.

The dry spell in May made the wheat crop the shortest in years, oats were a total failure, potatoes but little better and how the corn managed to make an average crop, with that May drouth, followed by another in July, is past my understanding.

A few people planted cabbage seed in the hill about July 15 after a light shower, still others, seeing that early potatoes were a failure planted late varieties, and those reaped an abundant harvest.

Our special crop, tobacco, is a peculiar one, in that if a tobacco plant is standing in rich soil and is well rooted on August 1, if the weather is seasonable for the next forty days it will make a full yield, and to this habit of the plant, is due the fact that we have one of the best tobacco crops in history.

Our first Sudan grass was grown in 1915, and this year we sowed two plats for hog pasture. A single trial of any new crop proves little if anything of the value of that crop, but we are inclined to think that the Sudan is the coming hog pasture grass.

It is not going to cost our readers much to make a test of Sudan grass for this use next year, and I wish that about 1000 of them would try a plat of say half an acre, seeding it in late May make at the rate of 8 or 10 pounds per acre.

In turning on this grass, we made a mistake, that of letting it get most too large, and unless too much stock is put on it I think that they should go in when it is about a foot high, as if eaten off it sprouts up again.

Clover and timothy sown last spring, are going into the winter in excellent condition, but the stand is irregular in many fields.

On these thin spots a light sprinkling of manure, even half rotted straw will help the coming crop.

Live stock is going into the winter in good shape, and as for roughage there is more than usual.

Perhaps 85 percent of the corn is cut here, and 75 per cent of the stover is fed without shredding, but the practice of shredding is gaining every year. The hay was practically all baled, none for sale, and one-third of the straw was baled for home use. The object in baling straw here, is to have it more convenient to use as bedding, as but few farmers have learned the bad habit of selling straw or hay.

With best wishes to all MISSOURI FARMER folks for 1917. C. D. Lyon.

BUY THE BEST AND STILL SAVE $25 TO $50!

Direct From Factory to User

I mean every word of it! You can own the best spreader built and save from $25 to $50 over prices usually paid for spreaders not as good—not as down to date in design, as light in draft, made of as fine materials nor covered by the eleven Galloway spreader patents found exclusively on the Galloway. These features and many others make the Galloway

WORTH $50 MORE THAN ANY OTHER SPREADER

Remember this spreader is **low down**—only 42 in. high to center of box. Easy to load. Lightest draft spreader of its capacity built. Two horses handle Galloway spreaders anywhere. The Galloway **wide-spreading, V-rake, worth $15 extra** on any spreader—costs you **nothing extra** on the **Galloway.** The **invincible, irresistible, patented roller-feed**—an **exclusive** Galloway feature—the secret of its **light draft,** alone **worth $25 extra** on any spreader—exclusive again on the Galloway—costs you **nothing extra. Patented automatic stop, uniform clean out, push board—worth $10 extra** on any spreader—exclusive on the Galloway—costs you nothing extra. These are only a few of the special features you will find on the Gallo way which are protected by Galloway patents. Don't buy a spreader of any make or kind until you have tried a genuine Galloway 1917 Model No. 8, No. 5. or No. 1A at our risk without obligating yourself in any way. Give my spreader

30 DAYS' ACTUAL FIELD TRIAL

and return to me within one year if not perfectly satisfactory. Remember we manufacture in our own factories and sell direct from factory to farm. Remember that no speader is as good as the Galloway that does not have these modern improvements, and remember again that other spreaders can't have them because they are patented Galloway features and can be found on no other spreader.

6 EASY SELLING PLANS

Pay for this spreader on your own terms. Buy it now, use it all winter and spring, pay for it next fall when it suits you. Complete particulars of these six easy selling plans in my new free book which tells all about Galloway spreaders, engines, separators, tractors and farm implements built in my own chain of factories right here in Waterloo.

GET THIS FREE BOOK

TELLS ALL ABOUT MANURE SPREADERS

Let This Book Save You Money

It tells you how to double your corn crop—increase your wheat crop, and by the judicious use of the manure crop on your farm grow three bushels of small grain where you grew two before. A postal gets it. 250 pages. Tells how to handle manure with least labor. How to increase your corn crop 15 to 25 bushels per acre. How a Galloway spreader will pay for itself in one year by increasing crop profits. How we save you $25 to $50 and still give you a better spreader. How and why a Galloway spreader handles easier with two horses than other spreaders with three and often four. How a run out, unproductive farm was turned into a gold mine crop producer. How to build a manure pit to preserve fertility, etc.

Note These 1917 Improvements. Look at the above picture.

A—Shows the new all steel V-shape rake which spreads manure evenly over the beater for wide, even spreading.

B—Shows adjustable automatic tension to make the comb handle load any height above the box.

C—Shows guard which throws all manure over to the beater.

D—Shows the Galloway patent roller feed lever.

E—Shows the stronger than ever beater teeth fastened in all steel beater bar with locknuts

F—Shows chain drive, pulls direct from both rear wheels. Remember—A DOUBLE chain drive.

G—Shows where feed lever operates in feed sprocket which moves the endless apron force feed direct back to the beater.

H—Shows you how strong the feed wheel is

I—Shows arrows pointing to drive sprockets on both rear wheels.

S 26

Only 42 in. High at Center of Box

All four wheels under the load. A compact, low down, modern spreader without an equal on the market today.

WM. GALLOWAY.

THE WM. GALLOWAY CO.,
Waterloo, Iowa.
Gentlemen:—
I am well satisfied in every way with spreader, and also with treatment accorded me by your Company, and must say I saved at least $40.00 by buying from you with interest figured in on the money. Yours very truly,
P. L. Watson, Randolph, Nebraska.

Made and Shipped Direct From Our Great Factories in Waterloo.

WM. GALLOWAY CO.,
Waterloo, Iowa.
Gentlemen:—
I want to thank you for your courtesy and square dealing in my purchase of a manurer No. 8 that you shipped me. It is giving me the best of satisfaction. I have been in active business more than 25 years and I wish to say I never received more kind or fairer treatment than I have from your house. Some people say, keep your money at home. I have as good a spreader as money can buy, and by buying from you I kept $35.43 in my own pocket which is the nearest home I can keep it. Some said that a 65 bushel machine was too large, but I am using mine with a team that weighs 1,800 lbs. with perfect satisfaction. Very truly yours,
Mr. Wm. H. Adams, R. 1, Pound, Wis.

BURNS 94% AIR

TWICE THE LIGHT ON HALF THE OIL

We don't ask you to pay us a cent until you have used this wonderful modern white light in your own home ten days, then you may return it at our expense if not perfectly satisfied. You can't possibly lose a cent. We want to prove to you that it makes an ordinary oil lamp look like a candle; beats electric, gasoline or acetylene. Lights and is put out like old oil lamp. Tests by U. S. Government and 84 leading Universities show that it

Burns 50 Hours on One Gallon

common kerosene (coal oil), no odor, smoke or noise, simple, clean, won't explode. Three million people already enjoying this powerful, white, steady light, nearest to sunlight. **Won Gold Medal** at Panama Exposition. Greatest invention of the age. Guaranteed.

$1000 Reward will be given to the person who shows us an oil lamp equal to the new **Aladdin** in every way (details of offer given in our circular). We want **one user in each locality** to whom we can refer customers. To that person we have a special introductory offer to make, under which one lamp is **given free.** Write quick for our 10-Day Absolutely Free Trial Proposition and learn how to get **one free.** **Yours FREE**

MANTLE LAMP COMPANY, 289 Aladdin Building, CHICAGO, ILL.
Largest Kerosene (Coal Oil) Mantle Lamp House in the World

Men With Rigs Make $100 to $300 Per Mo. Our trial delivery plan makes it easy. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before writes: "*I sold 51 the first seven days.*" Christensen, Wis., says: "*Have never seen an article that sells so easily.*" Norring, Iowa, says: "*98 per cent of homes visited bought.*" Phillips, Ohio, says: "*Every customer becomes a friend and booster.*" Kemerling, Minn., says: "*No flowery talk necessary. Sells itself.*" Thousands who are coining money endorse the **Aladdin** just as strongly. **NO MONEY REQUIRED.** We furnish stock to reliable men to get started. Ask for our distributor's plan, and learn how to secure an appointment and make big money in unoccupied territory. State occupation, age, whether you have rig or auto; whether can work spare time or steady; when can start; townships most convenient for you to work.

The Missouri Farmer

VOLUME VIII DECEMBER 15, 1916 NUMBER 24

How Business Men Can Help the Farmer

By Geo. B. Ellis, Managing Editor

The other day a man came into my office and during a conversation about present conditions he said "I have lived on the same farm in Western Missouri for 40 years and in all that time—1876 to 1916—I have never before seen the conditions quite so hard and unpromising as they are right now. Most of my neighbors are buying corn now at $1.08 a bushel and other feeds at relatively high prices. With feed at such high prices and farmers having to buy it most of them can keep only their work teams and milk cows and if we should get a good crop next year we will have nothing to feed it to and I fear we will find a poor market for what we raise. So, what are we to do? In the language of Mr. Cleveland are we not 'facing a condition instead of a theory, in the farming game for the next few years?" It happened that soon after the above interview took place another farmer from Central Missouri came into our office and when he was asked what he thought of the business outlook for farmers replied "I have never seen a better time for farmers to make money. Everything they have to sell is high. Wheat has been selling for $1.50 and up per bushel, corn is selling for 80 to 85 cents and most farmers are holding for a dollar. I had a very good crop this year and with prices so high farmers all ought to be making money. Why," he continued, "I bought and sold three teams of horses this year at a clear profit of $140 and with some other trading and what I have produced I expect to make a net profit this year above all expenses and a living for my family of one thousand dollars."

Is the Fault with the Farmer?

The above are responsible men, both good farmers, each living in one of the best counties of his section of the state but giving such radically different reports of present conditions and their hopes for the future that we quote them here for comparison and analysis. Not a reader of THE MISSOURI FARMER who could not duplicate one or the other of the above reports. If we should take individual farmers only no doubt we could duplicate both conditions in most any section of the state. Then where is the fault and what is the remedy? If the fault is with the farmers themselves in the one instance and success in the other is due altogether to the better farming methods practiced we would have no further to go to find the remedy. But when we go into these respective counties and study the progress made in a period of say twenty or thirty years and find that the farmers as a whole in the first mentioned county built as good homes, have farms as well cultivated and improved and have in all material ways made as much progress as the farmers have in the Central part of the state we must look further than the farmers themselves for the difference.

No Account Taken of Fertility

For the past several years we have not had a really all round good season for farming in Missouri. Some years have been good for some of the crops but not for all. Some years have been too wet, others too dry, and still other years with rainfall sufficient in one county and deficient in another. These conditions account for the desert here and the oasis there—for the success in one instance and the failure in another for it is under such erratic conditions that one farmer's loss is another's gain. The man who has corn to sell at a dollar a bushel ought to be making money but the man who buys the corn at one dollar a bushel to feed 9 cent hogs will certainly lose money unless he can find a cheaper feed to mix with the corn. The farmer who has wheat to sell at $1.50 to $1.75 a bushel has no right to complain but the fellow who must pay $10 a barrel for flour finds it adding very much to the family expenses.

We do not subscribe altogether to the doctrine of unlimited production so loudly and persistently proclaimed by so many writers, for the experiences of the past in corn raising, wheat raising and cotton raising as well as most other crops that under normal conditions, we can produce so much that there is much waste and no profit to the farmer. When hogs and cattle sold at 3 cents a pound or less and corn at 15 to 20 cents a bushel and wheat at 50 cents a bushel there was an overproduction and the only thing that saved farmers from bankruptcy was that they had a rich virgin soil to draw upon to produce the crops and for the plant food nature had stored up no account was taken and no charge was made. But now that we must first put water in the well before we can draw it out again, so it is equally true that we must put fertility into the soil before we can grow profitable crops. Here then we have at least one reason for the difference in crop yields in the Western and Central sections of the state. But as the system of grain farming is not confined to Western Missouri, nor live stock farming solely to any other section we would say that the primary reason for failure on so many farms is exhaustive farming because of too much grain growing and on the other hand those farms that pay even in bad years are the ones where the soil fertility has been conserved by plowing fewer acres, keeping more of the land in patures, selling less grain, feeding more live stock on the farm and returning the manure to the land. The writer can say with good grace, "I told you so" for he has for 16 years in a public capacity been sounding a warning against the inevitable disaster of too much grain farming.

All Classes Interested in the Farmer

It makes little difference to the farmer to tell him prices are high when he has nothing to sell, but this condition ought to put the man who has failed to thinking. The scarcity of food and attendant high prices have put the business men, professional men, financiers and all consuming classes to thinking as never before and we believe they see now more clearly that the future welfare of this country and possibly its very existence depends absolutely on a prosperous and profitable agriculture. The time has come for co-operative thinking and we should all join hands—producer with consumer—to find the way to a greater prosperity and a permanent stable system of farming.

The desire to find the solution of the above mentioned problems, has caused more rapid expansion in Government and State activities in the past few years than was made in all the previous history of the Nation. The Congress has doubled and trebled its appropriations to the department of agriculture and there are now more than 16,000 men in that great division of the government working in the interest of the farmer. The states have kept pace with the Government and by appropriations for extending the teaching of agricultural subjects to public schools, the development of the

A FARM CLUB CONVENTION

Farmers Week at Columbia this year will be held from January 1st to the 5th inclusive. On Tuesday Jan. 2nd and Wednesday Jan. 3rd a great state wide Farm Club Convention will be held—and we sincerely trust that not merely every Farm Club but every community in the state will be represented at this, the most important meeting of the kind ever called in Missouri. In the first place, your Farm Club should be repesented by a strong delegation so that you can go back home and tell your members just what it is this great farm organization movement is trying to accomplish. Secondly, if the Farm Club movement has not yet gotten started in your section, it will give you the necessary information and enthusiasm to go back and tell your neighbors about it. To this end, delegations should be made up in every community from the Iowa line to Arkansas and from Kansas to the Mississippi River. Already a number of the wide-awake Farm Clubs are working on a Pullman car delegation—and elsewhere the cost and terms of these cars is explained.

At this meeting you will hear talks by the Farm Club leaders of the state. They will tell you first hand what they have accomplished thus far and what they expect to accomplish in the future—and what they will have to say will be worth going miles to hear. I want every reader of THE FARMER to realize that this great organization movement is different from any similar movement ever inaugurated before—that this time we are organizing by the thousands where formerly we organized only by scores—that it is designed to put a Farm Club into every school house in the state before we shall be satisfied with our efforts. At the outset it means supplying bran, shorts, flour, corn, hay, potatoes, cotton seed meal and cake, linseed oil meal, farm seeds, coal, salt, fertilizers, etc., to members at the first cost—and here alone is involved a possible saving of millions of dollars to the farmers of Missouri. But this is only the beginning. The real goal is not so much to "buy things cheap" as it is to compel a "square deal" for the farmer's wheat, corn, hogs, cattle, sheep, poultry and other farm products—to so band ourselves together that we shall have something to say about what the fruits of our sweat and toil shall bring in the market place and to shake ourselves loose from the gigantic parasites who have been plundering us for years and who are responsible for the tremendous increase in farm mortgages, land tenancy and the flocking of farmer boys and girls to the large cities.

For years these "leeches" have felt secure in the belief that the farmer wouldn't manifest enough enterprise to organize—but in hundreds of school houses all over Missouri the Farm Clubs are for the first time giving the lie to this sneer—and at this great forthcoming gathering let us sound a challenge which will bring glad tidings of hope and courage to the farmers of every state in the Union. To this end, see to it that your Club sends a strong delegation to Farmers Week for Tuesday and Wednesday when this great meeting will take place. But if you do not belong to a Farm Club, come anyway—and bring as many of your wide awake neighbors with you as possible. Don't say you haven't got the time, for nothing means so much to you as this great farm organization movement. Don't say you haven't got the money—because this fight involves tens of millions of dollars—and if we win, which we will—the few dollars of expense will come back to you a hundred fold.

WILLIAM HIRTH, Publisher.

experiment stations and the agricultural colleges, and the new line of work under the head of "extension service" going directly to farmers it would seem that about all that could be expected from the Government has been done and yet we all know there is still something lacking. If there is a "missing link" between Government aid and prosperity let us try to find it and turn the tide towards a Nation with all industries well balanced and prosperous.

The missing link, we believe to be, is more ready available capital for farmers to use in their business. The grain system of farming can be conducted with less capital than the live stock system and with all that has been done by the state and the National Govenment except the recently enacted rural credit legislation nothing has been done to supply this want. Gradually the Farm Loan Act of Congress supplemented by State Land Banks which are sure to come will help to fill this gap but will not do it completely until we have a system that will reach the tenant farmer and that will extend credit on personal security. But these must come by the slow process of legislation and the development of public opinion.

Business Men Should Co-operate Not Antagonize

The immediate filling of this need of capital among farmers can be supplied to a certain extent by the business and banking institutions of the country if they can be made to see their opportunity. It has been announced through the public press that the State Federation of Commercial Clubs of Missouri will endeavor to raise a fund of $150,000 to carry on an educational campaign for better farming. Among the projects they propose to inaugurate are these: To get every farmer to use the "rag-doll" test for his seed corn and to induce everyone of the 114 counties of Missouri to employ a county farm advisor. Both of these, are well meant but ill advised endeavors for a business organization to undertake. Among several very simple methods for testing seed corn the "rag-doll" test is about the last one to recommend and so that alone should convince a body of shrewd business men that it would be much better to leave all questions affecting farm practice to the agricultural college and the department of agriculture and to the farmers themselves. While THE MISSOURI FARMER has published much in favor of the farm advisor movement and we believe that with the right man on the job and with the farmers of the county organized and in sympathy with the work of an advisor much good can be accomplished, on the other hand we believe that incalculable harm could be done the cause of better farming by forcing a farm advisor on every county of the state. If the Legislature should provide an advisor for every county good men could not be found at once to fill all the places. This work will fail unless well trained men are put in these places and a failure not only injures the cause but wastes valuable money besides. Then where is the state to get the money just now when her finances are in such deplorable condition? We mention this matter here not in the nature of an unfriendly criticism of the State Federation of Commercial Clubs but to call attention to a line of work that will bring immediate and lasting results and which will not involve the risk of making some costly if not fatal blunder.

Co-operative Credit Needed

We have already pointed out that about all the educational work necessary for helping the farmers to better methods is now being done by the National and State governments. They may make mistakes, no doubt they are making many of them, but with all that these regularly organized institutions are better prepared to do this work than any business men's organization can possibly be. But these institutions are doing nothing to provide better markets, free from the restraint and oppression of monopoly and right here is a mighty good place for the business men to begin their work of bettering farm conditions. Then if the State Federation will use its development fund of $150,000 to inaugurate a few demonstrations in co-operative credit and also use their powerful influence with several hundred country bankers of the state to do the same thing we will soon see things begin to move in Missouri.

We recently published a report in these columns of a Trust Company at Carthage, Missouri, which had offered to finance without interest two boys and girls calf clubs of 40 members each. The object of the Trust Company is to arouse an interest in dairying and in the handling of a better quality of live stock and the management believes that if 80 boys and girls can be enlisted in this cause that it will be worth the amount of interest $2,000 or $3,000 would earn in a year. If the State Federation of Commercial Clubs in Missouri wants to render a valuable service where it is most needeed let them follow up this idea and make loans to members of Farm Clubs whose members will agree to handle dairy cows or some other line of the live stock business. We mention dairying first because that line can be made to pay its way from the start, because no other line of farming is so well adapted to a process of soil improvement; because Missouri climate, water and pasture facilities and diversity of crops make the conditions favorable for dairying; and finally because we are well located as to markets, our home market is not now nearly supplied by home dairy products. An investigation by these business men will prove to them that all highly developed dairy sections are prosperous and the farmers have a high purchasing rating and we know of no other way in which the Business Mens' League can so quickly develop the state's resources and bring back to themselves the profit they are looking for.

Developing the Dairy Business in Missouri

One reason dairy development has made such poor progress in Missouri has been the lack of good dairy cows. Men have tried dairying with scrub cows or with inferior individuals of the beef breeds and have failed, whereas had they started with well bred Holsteins, Jerseys or Guernseys, and had given them the proper care they would have a different story to tell. In times like these when feed is so scarce and high priced about the only man who can cheerfully fill up the feed boxes night and morning is the one who is feeding a good butter cow because he does not have to look farther ahead than the end of the week to see a check that will pay the feed bills and a little more. He looks ahead toward spring or towards an abundant crop season when his feed bills will grow less and his profits larger and hence it is that dairying is a more stable business than most other lines of live stock raising.

Let us now get down to "brass tacks" and develop a working plan. If the business men go ahead and spend their $150,000 fund under their present plan at the end of the year what will they have accomplished? Possibly a few more farmers will be testing their seed corn by the rag-doll or some other proces but probably they will not. Possibly a few more counties will have employed farm advisors but that is not certain either because obstacles are in the way that must be overcome and are being reduced by the regularly constituted authorities. But if this $150,000 should be spent for high grade, good producing dairy cows and a few pure bred bulls of the same breed and these animals sold to clubs of farmers who would agree to handle them under the general direction of the State Dairy Commissioner or the dairy department of the Agricultural College, the showing for both farmer and business man will be quite different. The kind of cows mentioned ought to be purchased for $75 to $100 a head and the bulls for $200 to $300. By putting 40 cows and one bull to the club there could be placed under this plan probably 40 of these cow clubs. If the cows were allotted to club members, not more than 4 to any one man we would start out with ten men in each community and with forty communities demonstrating the value of good cows and doing more to develop the dairy business in the state than 114 farm advisors could do without capital to introduce better dairy stock. Farmers are willing to pay for what they buy but they want to get all they pay for so these cows should be sold to cow club members at cost at the farmers railroad station at a low rate of interest, say 5 or 6 per cent. The cows

HOW YOU CAN HELP

Not since we started to publish THE MISSOURI FARMER have we received such splendid support from our readers as during the last three months—for never have our subscription receipts been so heavy. Again, we are receiving hundreds of letters from wide awake farmers from all over the state—commending in words of unstinted praise the great campaign for Farm Club organization which the paper is making as no other farm paper in the Country ever made a similar campaign before. As we have said for several years, THE MISSOURI FARMER regards the question of farm organization to be the overwhelming necessity of the hour—and through its incessant hammering fully 500 Farm Clubs have been brought into existence within the last year while, before the present winter is over we believe the number will reach fully one thousand. That the Farm Club movement is here to stay—that before long 100,000 progressive Missouri farmers will be solidly banded together and that they will take over the complete buying and selling of such commodities as feed, flour, farm seeds, potatoes, apples, coal, fertilizers, salt and other similar commodities and that it will involve for them the saving of millions of dollars there is not the slightest question. Nor do these items take into consideration the greater struggle for which we are girding up our loins in the meantime—the compelling of a "square deal" for the sale of our Pork, Beef, Wheat, Corn, Poultry and other staple farm products.

What other farm paper which is coming into your home has ever tried so hard to help you in a practical way? Don't the last one of them harp on "making two blades of grass grow where one grew before" without making the slightest effort to help you get a price for the first blade which leaves you some margin of profit for your years sweat and toil? THE MISSOURI FARMER fights as hard as any of them for better farming methods—but it doesn't believe in dealing in generalities when the house is on fire. And now don't you think that a paper which is making this kind of a fight deserves your hearty personal support? We have already saved thousands of dollars for the Farm Clubs of the state and we have hardly gotten started in this great fight. Furthermore, we have been supplying this help to our friends at our own expense—for we have not profited a penny's worth on a single carload of commodities which has been shipped—nor do we expect to in the future. We went into this great co-operative fight with clean hands and expect to come out of it in the same way.

And now, my good friend, don't you think we are entitled to your support in a heartfelt fashion? The least you can do is to send us a dollar and ask us to "mark you up" for a couple of years. If all our readers who are in arrears at this time would do this much for us—and do it at once—it would strengthen our hands tremendously. But why not go a step farther? Why not go to your neighbors who are not getting the paper now and ask them to give you a dollar? Why not make up a Club of a half dozen or a dozen new subscriptions? Not only will they get a full value of their money in splendid farm information but it will make the organization of a school house Farm Club an easy matter—once they become inoculated with the idea. Now that the farmers of Missouri have a farm paper which is not afraid to fight their battles, ought they not to stand by it and help to increase its power?. I want every reader of the paper to consider this appeal as personal to himself. I want my New Year's mail to be the heaviest in the history of the paper—and therefore I hope you will not only send me a dollar for your own renewal but see how many of your neighbors and friends you can bring into the fold as well. Then I will send you literature, Constitution and By-Laws for a Farm Club in your school district—and after your neighbors have read a few issues of the paper I am sure the work of organizing will be an easy task. THE MISSOURI FARMER is waging a fight for a "square deal" for you and your loved ones as no other farm paper ever waged it before—but remember that what it will be able to accomplish rests with individual farmers like you scattered from one end of this mighty state to the other. Trusting that you won't forget and with my best wishes for you and yours for a Merry Christmastime, I am your friend, WILLIAM HIRTH, Publisher.

will pay for themselves and the club members should be required to pay from $3 to $5 a head out of each monthly cream check until the debt is settled. With good cows such as we propose to buy this will leave the farmer enough balance to pay for the monthly feed bill even though he must buy much of his feed but as week by week he comes to know that he is paying for a better cow than he has ever owned he will begin to take a deeper interest in dairying and will begin to look forward to the time when he can own a high producing and profitable herd.

Can it be done? In a recent issue of Hoard's Dairyman, about the greatest dairy authority in this country we find the following:

"Trial over a period of two years has made it so certain that with good feeding, good housing, and ordinarily good attention in other respects, a good grade or pure-bred dairy cow will meet a payment of $3 per month and interest on the principal, and that the time seems not far off when in some cases it will be possible to risk sales on the credit plan without absolutely air-tight, six per cent security, such as the plan has been based up to date."

We need organization and we need co-operation and as it is agreed on all sides that the greatest need of farmers now is more capital to work with so that he can increase the size as well as the quality of his business we hope to see these far seeing business men and bankers move out in this new field of co-operation. We can think of no other endeavor where the country bank could do its community a greater service than to finance one or more of these co-operative cow improvement clubs.

Stop Walking Through Mud

From the road to the house and from the house to the barn, concrete walks mean that much less walking through mud, to be tracked into the house. Concrete walks are inexpensive and permanent. They add to the appearance and comfort of your home.

You can make a concrete walk in a few days' time. The materials necessary are Portland cement, sand and pebbles or broken stone. Cement can be bought from your local dealer. You may already have the sand and pebbles on your farm or they may be obtained nearby.

Concrete Feeding Floors and Barnyard Pavements

are really nothing more than several walks laid side by side. Concrete feeding floors are very profitable. They save feed, manure, and labor. Easily cleaned and disinfected; they are free from mud and filth, hence kept sanitary. Many diseases and consequent loss of stock are prevented.

Let us help you to improve your farm and add to your profits by sending you a free copy of Bulletin No. 137, "Concrete Feeding Floors, Barnyard Pavements and Concrete Walks." It tells how to build them.

CONCRETE FOR PERMANENCE

FARM ORGANIZATION IN SULLIVAN COUNTY

To the Missouri Farmer:

I will try and give you a report of the work done by our Farm Club.

We organized October 1915, having 45 charter members, representing the greater part of four school districts.

November 29, to December 3, we held a rousing school of Agriculture in which our various farm problems were discussed and made plain to us by the following gentlemen, Professors Hughs, L. F. Childers, P. B. Barker, J. W. Henceroth and T. J. Talbert. Sullivan County being adapted to live stock production, much stress was paid to that subject, and an annual stock judging contest was inaugerated between the Harris, Boon Hill and Prairie Chapel Clubs, which was pulled off at the close of the school of Agriculture, conducted by Professors E. A. Trowbridge and S. T. Simpson. The Harris club winning the cup for the year.

The short course fully convinced the members that farmers should work together o nmany farm problems. So to begin with they swore vengence on orchard pests ,and accordingly purchased pruning saws and a spray-pump, and securing Prof. T. J. Talbert as general, the war started, with the result of having nice clean and profitable fruit.

Also two experiments with soybeans convinced us that they could be successfully grown in this locality, and will fit in well on crop rotation.

Our members realizing that farmers should and must work together for self protection, and bein inspired by the splendid effort made on that line by THE MISSOURI FARMER, got busy and organized several other clubs, which resulted in the organization of The Sullivan County Farm Bureau.

It is the purpose of this Bureau to encourage and foster every project that is for the general welfare of Sullivan County.

As stock and poultry raising are two of our chief industries, and believing that a thorough knowledge of these is the surest foundation, a stock and poultry judging contest between the pupils of our schools was arranged.

About 300 pupils enrolled for this contest, who received literature and instruction from the extention service department of the University. A stockman was sent who gave exhibitions of stock judging work in five different towns in the county. The prize list which amounted to $500, was mostly raised by subscription and goes to the winning schools for agriculture and stock husbandry club work.

This contest promises to be an annual feature, plans having been made for another year and baby beef and pig feeding contests being added to the project.

The first annual farmers picnic near Milan was well attended by enthusiastic farmers and friends from Milan. A. J. Meyer and Dr. Bullock of the extension service being the principal speakers.

We have with us at present Mr. W. H. Baker, from Columbia, who is discussing the local farm problems and organizing farm clubs in the different parts of the county. We feel sure that by spring our organization will be very much strengthened.

What one club has accomplished, others can do by using a little push and sticktuitiveness.

We would like to hear from others.

Sam Yos, Chairman,
Pearce Chapel Farmers Club.

Have You Any Stump Land?

A number of our friends who have used a Hercules Stump Puller say that they have no trouble in pulling out the biggest stumps by the roots—and that once a couple of men get used to handing this device, very rapid progres can be made. We see no reason why three or four farmers should not buy one of these stump pullers in partnership and thus, during the winter months when there isn't much else to do, clear up the stumpy ground and make it raise a good crop of corn next season. Anyway, it is worth investigating and we suggest that those of our friends who are interested, write to the Hercules Stump Puller Co., 891, 25th St., Centerville, Iowa, and have them send you full particulars as to prices, etc.

Ditching and Terracing Made Easy—$35 to $50 buys this wonderful

THE Martin Ditcher Terracer

Will prevent crop failures. Cuts V-shaped ditch, cleans old ditches, remarkable dirt mover. Does work of 50 to 100 men. All-steel. Reversible—throws dirt either side. Adjustable for narrow or wide cut.

10 Days Free Trial. Write for FREE Book

Owensboro Ditcher and Grader Co., Inc. Box 121 Owensboro, Ky.

Cuts 1200 Yards 2-Foot Ditch in One Day—Goes Down 4 Feet

Bargains in Holsteins

Elsewhere we refer the reader to the advertisements of E. L. Ensign of Cameron, Mo., and Orrie Coburn of Whitewater, Wis., who are offering some splendid bargains in Holsteins. The Dairy business is a coming industry in Missouri and the sooner farmers begin to build up a herd, the better.

Want to Make Some Money?

Young farmers who will have some idle time this winter will do well to look up the advertisement of the Harrah Mfg. Co., which appears on the last page. Here is a handy tool which every farmer needs—and dozens of them will buy it. Why not take the agency in your community?

TOM AT THE UNIVERSITY

By Tom

Dear Dad: The Christmas holidays will soon be here and I am looking forward anxiously to the time to come home and see you and mother. The University studies are hard and it will be a great relief to me to get them off my mind for a few days, and to have the opportunity to feast upon some of mother's good cooking once more. I am also anxious to talk over farm topics with you, as I can look upon these topics now with more interest than I did before I began to make a study of them. I also want to try to get you and mother to come down to Columbia for Farmer's Week and make me a short visit and see what a great institution the University is and listen to the fine talks that practical farmers and experts will make during the week.

I am glad that you were interested in what I had to say in my last letter about the rotation. You mentioned though, that you thought that a rotation could not be worked out so easily in practice as on paper. To be sure, I agree with you there. It is not always possible to have our cropping plans to work out as we want them. Disappointments like this will always be met with at some time. The next best thing to do is to be prepared to meet them as nearly as possible with some remedy. For instance, you asked, "What will you do in case one of the crops in the rotation fails? Also, will this break up the rotation?" It will make a rearrangement for the field having the failure for that year but whatever the outcome, it will be best to go ahead with the rotation order just the same the following year.

As you well know ,the chances are that the failures will most likely come with the clover in not making a stand—what are you going to do? Now, I mentioned in my previous letter we must have a legume in the rotation to keep the nitrogen supply in the soil and we must supply one to fill this need. The legume that is a promising one for the state as a whole at the present time is the soybean. Now the soybean may not be a paying crop in all parts of the state, but as a whole it is a better paying crop than many farmers think it is. The soybean has the advantage over clover in adding nitrogen as it will take it from the air and place it in the soil much faster than clover. Soubeans may be sown in drills about 30 inches apart and cultivated. The latter method is the one that is the best for seed production. The farmers who have grown them usually get an average of about 16 bushels of seed to the acre. Some farmers have gotten smaller yields, partly due to the soil not being adapted, but in many cases the low yield resulted because they were not properly handled, as the farmer did not understand the proper growing of them. In many instances, where they have been properly handled and grown on proper soil, they have yielded 30 bushels and even more. The seed usually sells for $2.50 or more per bushel. A yield of 15 bushels to acre may be reasonably counted upon which would net $37.-50 per acre. This is more than the average acre of corn produces over the state. Cowpeas could be used instead of soybeans in some places.

Another feature that may be looked upon here in connection with a clover failure is the use of rye as a winter cover crop. We have grown rye in small patches on our farm every year for a winter and early spring pasture. This could be done in the case under consideration. Now our soils must have organic matter added to them so that the plant food will be liebrated in the soil for the crops. If the rye is allowed to get a little more than knee high in the spring and then plowed under as a "green manure" crop it will be adding the organic matter to make the "humus" that is so needed in most all of our soils. I heard an Experiment Station expert say the other day that the farmer could afford to seed his fields in the fall to rye and then turn it under in the spring, and the increased crop returns that would be obtained in following years would make the cost of seed and labor a very profitable investment. I think that you remember neighbor Smith had a small patch of rye one winter in the field east of his house and when he put the field in corn that year he plowed under the rye that was in this corner and you remember how much better the crops appeared on the rye patch for the two or three years following it, which is proof in itself that it is a big aid to building up soil fetility.

Care must be taken that the rye does not get too nearly mature before being turned under. This might form a layer of material that would interefere with the rise of water in the soil, and if it were a dry year it would prove a detriment.

The only other chance where there may be a failure in the rotation of corn, oats, wheat, clover, will be in winter killing of the wheat. In this case we have a harder problem to face in getting another crop to place in. It may not be in accord with the proper idea of a crop rotation, but it looks as if we must seed it again to oats. This is not a good paying crop for Misouri but it is the only one that we have left that we could use as a nurse crop for the clover which must be seeded at this time in the rotation.

I have so far spoken only of crops. The College of Agriculture has many herds of fine live stock which we use in our classes in learning how to judge live stock and they are also used to carry on many experiments in feeding and breeding. Quite a bit of enthusiasm is stirred up among the students to see who can excel in judging. Each year contests are held in a special class and a team is picked from the best. This team visits the State Fair and goes to the International Live Stock Show at Chicago and enters contests with teams from other Agricultural colleges. The teams that have gone out from the University of Missouri have carried off more premiums since the contests have been held than any of the other schools. The boys who make the team are an earnest bunch of fellows who go into the ring for business and later usually make the men who later go to farms and make our most successful live stock men. In future letters I am going to tell you more about live stock. A farm is not a real farm unless it is a combination of good crops, good live stock and a good master to handle them. I will close. Love to all. Tom.

Light Weight
Cushman Engines

Built light, built right—for farmers who want an engine to do **many jobs in many places,** instead of one job in one place. Easy to move around. Very steady and quiet—no jumping, no loud or violent explosions, but smooth running. **Throttle Governed.** Schebler Carburetor. Friction clutch pulley. Runs at any speed.

4 H. P. Weighs Only 190 lbs.

Mounted on light truck, it may be pulled around by hand. Besides doing all regular farm work, it is the original and successful **Binder engine.** Saves a team and saves the crop. **8 H. P. only 320 lbs. Not cheap** but cheap in the long run. Engine Book free.

CUSHMAN MOTOR WORKS
827 N. 21st St., Lincoln, Nebr.

For All Farm Work
4 to 20 H.P.

FREE 1917 PLANTING GUIDE AND PURE SEED BOOK

Ask now! This beautiful 96-page four-color book describes 1917 varieties vegetables and flowers; handsomely illustrated; beautiful home grounds, flower and vegetable gardens, landscaping, shrubbery, orchards, farms. A dictionary on gardening! Flower lover's delight! Berry grower's book! An orchardist's manual! Most wonderful gardening guide catalog ever published. Better than our famous 1916 book. Don't miss it. Ask today. A postal gets it.

1821 King Street, OTTAWA, KANSAS.

FARM BUTCHERING

Many of our country folk go about this important part of family provision with fear and misgiving, that the meat may spoil, or their guess has not been exactly right as to amount of salt used in the curing process. It is often the case, we use too much salt, thereby producing a very poor quality of ham and bacon. If we would eliminate "guess and luck," and use the scales and judgment we can produce hams and bacon that will have the packing house products skinned a city block.

I will not discuss the killing and scalding process as so many farmers have different ways of doing this, handed down by tradition or otherwise that it is no use to argue the point, until some progressive farmer installs a small butchering plant, and blazes the way for others.

I prefer a hog weighing from 250 to 300 lbs. After the hogs have been cleanly dressed, the leaf, ribs and back bones hould be removed, while the carcas is warm and blocked into shoulders, hams and middlings to be laid out on boards to cool. In case the weather should be warm, cracked ice should be placed around the meat until it is thoroughly cooled, for the meat should not be put down in cure until it is thoroughly cooled.

The following day the trimming should be done. I believe in trimming close. I like to see a nice shaped ham, shoulder and bacon. The trimmings make excellent sausage and if left in will be a loss. I would like to show every reader of this article how to trim a ham, but as I cannot, the next best thing to do, get a picture of a ham and trim until your ham looks like the picture. After the meat has been trimmed, we are now ready to weigh and to commence the curing process.

To each 1000 lbs. of meat the following mixture should be used: 40 lbs. salt, 10 lbs. brown cane sugar, 4 lbs. black pepper, ½ lb. red pepper, 2 lbs. petre.

Rub the meat thoroughly using about one-half the mixture. Let the meat lie one week in a cool place. Rub in the remainder of the mixture and allow the meat to lie about 25 days longer. Brush off the excess of mixture and smoke slowly each day for two or three weeks. Do not let the meat get too warm by having the fire too close. If you have a good smokehouse, slip a heavy paper bag over the meat and tie tightly around the string from which the meat is hung. This will prevent insects from getting in. Borax should not be used.

A good formula for Dixie Sausage: 25 lbs. of meat, one measuring cup salt, one measuring cup ground sage, one half cup black pepper, ½ teaspoon red pepper, mix before grinding.

Every farmer that visits Columbia Farmers' week, should meet Dr. P. F. Trowbridge, Professor of Agricultural Chemistry. His practical demonstration on butchering, cutting and curing meat is worth a trip across the continent to any farmer. The information you receive from him is worth all the articles that have ever been written on butchering. He can even show you how to make a good piece of bacon out of the jowl. He can teach the country beef club butcher how to make his work easier and at the same time have the member's satisfied.

I do not believe a butchering plant on the farm would be a profitable business, unless operated by a good butcher; even then he must consider the freight and handling proposition. But every farmer should always butcher his own meat and more than he really needs. A few good hams left over is a mighty fine asset. When our friends visit us—My! how they do enjoy the fresh country air when a properly cured country ham is broiling in the kitchen!

Our good friend Mr. W. L. Nelson, Assistant Secretary of Missouri Board of Agriculture, conceived a fine idea in having a Ham and Bacon Show put on during Farmers' Week. We have seen this show grow from a few pieces of meat until now it looks like a big butcher shop. Scores of hams, shoulders, bacon and sausage, from the four corners of this great state, hung on the hooks to be judged by our expert. I must confess that all bacon looked alike to me, until I became interested in this show. The first year I viewed the show. Realizing its importance, the next year I entered a ham, and landed the 3rd ribbon; the next year the 2nd premium came to me and last year the 1st premium fell into my hat. I am so interested in this show and the good it is doing towards stimulating the farmer to produce more and a better quality of bacon, that I expect to show every year, even if I get "licked."

I trust the readers of The Missouri Farmer will take a greater interest in curing their meat and if they have a real good ham send it down to the Ham and Bacon show, Jan. 1st to 5th, 1917. H. G. Windsor, Cooper County.

THE DRY SALT MEAT CURE

Between December 1, and February 1, 90 per cent of all the meat packed for home use will be cured, and the simple method used in our family for over 100 years will be given here. I may say, that in the past fifty years we have never had a single pound or spoiled meat, while hams that weigh twenty eight pounds or more are kept in the finest possible condition from year to year.

Have the meat thoroughly cooled out before cuittng up, this being most successfully done by killing in cold weather and letting the hogs hang

over night, but in no case must they be allowed to freeze.

After the meat is cut and trimmed, it is laid down and salt sprinkled over it until it is fairly well whitened, and allowed to lay a full day, in the case of extra heavy meat two days.

At the end of this time the real salting is done, when each piece is rubbed all over with dry salt, using especial care to rub salt into the ends of joints, and to keep the work up until the entire surface of the meat is damp and salt covered.

As each piece is rubbed, it is packed down in a box or cask, ample drainage being provided to carry off the bloody brine, and plenty of salt scattered over and between the pieces.

This packing is done skin side down, shoulders first, hams next, sides on top, and the meat is allowed to lay in this first salt ten days to three weeks according to size; but as a rule fifteen days is usually long enough.

At the end of this time it is taken up, the old salt shaken or brushed off, and hams and shoulders resalted, exactly as the first time, excepting that less rubbing is required and less salt used, while it is not necessary to resalt the side meat, as it will keep well without salting.

We allow the meat to lay in second salt about as long as in the first, then take it up, brush off all adhering salt, hang and smoke.

There is no rule about smoking excepting that the meat is smoked until it is a golden brown, this depending upon the weather as much as anything else, as meat takes smoke better on damp, than in cold, windy weather.

Before fly time, the meat is smoked another day, then taken down, each piece wrapped in paper, sacked and hung up to be taken down for use.

Our smoke room is 8 by 10 feet, 9 feet high, and perfectly dark, as yours should be, and if it is not, it can be made so, by lining with cheap one ply roofing felt, or even with common building paper, at very low cost.

C. D. Lyon, Ohio.

TIME REQUIRED TO CURE MEAT

The Misouri Farmer,

I have just received your November 15th. issue of the Misouri Farmer and desire to call your attention to the article o nthe curing of meat by Mr. Ingwersen. It appears to me that the meat should cure much longer than the time given by the above gentleman. For instance small hams only fourteen days and large hams thirty days and bacon never longer than four days. I have had some experience in curing meat and a safe rule for the curing of hams is to multiply the number pounds the ham weighs by three and one half. For instance a small ham of twelve pounds should be allowed to cure 42 days. Bacon should be allowed to cure from 15 to 24 days depending on the size.

I don't mean to be critical regarding the gentleman's receipt but I fear there would be considerable spoiled meat if they were followed and thought you might investigate. Just the other day I heard a farmer say all his meat spoiled and he put it away according to a formula he saw in a farm paper. F. C. Streeter,

Marshall, Mo.

Reply by Mr. T. B. Ingwersen

(Our readers may know that Mr. Ingwersen has had much experience in curing and marketing meats and that what he has to say should be carefully considered—Editor).

"To determine the length of time, meat should be cured, a good many factors must be considered.

If the meat is to be sold to a high class of trade then the greatest mistake that can be made is getting it too salty. This trade demands a mildly salted ham and it will take no other. Then there is the great difference in the salt itself. High grade salt, like the good butter salt, works much quicker than the common cattle salt used by most farmers. We also must consider the temperature. If the meat is in a very cold place it will not cure so fast, if it is frozen it will take no salt at all.

The spoiling of meat is due to several reasons: Cuttin and curing it before it is thoroughly cooled, is one of the most frequent ones. Another one is extremely warm weather, as we sometimes have it in Missouri even in mid-winter In such weather cold storage is of great value, but the farmer of course cannot have this and therefore must resort to other means to save his meat. In the first place we let the carcasses hang longer than usual, sometimes for two days; then we hand the different pieces of meat and let them hang for a day before we put them in the cure. Fermentation and later decay always starts in at the bone, therefore in order to save the meat it is of the utmost importance to get the salt to the bone first. This can only be done through an injection of brine, by means of a syringe or a brine-pump. Curing the meat for a long time cannot save it, as decay will have set in at the bone, long before the salt can get there. A third reason is the use of old and poor salt. And then sometimes a piece of meat will spoil apparently for no reason at all, but this is not the case very often.

So if we consider the fact that meat always begins to spoil around the bone, it stands to reason that a quicker cure is safer. Better salt and the injection of a little brine at the bone make a quick cure and in consequence a safe one. Since we adopted this method we have lost only two hams and I account for this loss, that the animal was overheated when it was driven to my place. Bacon will take salt very quickly, and I have never heard of a piece of bacon having spoiled. If we study the results of the Ham and Bacon show at Columbia, we can readily see the difference between bacon cured 4 days and bacon cured 15 to 24 days.

T. B. Ingwersen, Walhalla Farm,

Pike County.

CHARITON COUNTY LEADS

Mr. William Hirth, Publisher of The Missouri Farmer:

"It gives me great pleasure to write this letter, as I certainly have a fine report to make. As you doubtless know, Newcomer and Davis Clubs have been holding booster meetings in order to organize new clubs; for we are working to get a county organization in Chariton county. Accordingly, we organized two new clubs last week, with a combined membership of 17 new members, 5 at Warden and 13 at Bluff Point.

Last night we held a meeting at Jordan School house, having a total attendance of about 80, of which there were about 20 club members from various adjoining clubs. Mr. B. C. Smutz of our Club presided at the meeting, and after a number of us had presented the Club proposition from different angles, an invitation was extended to the men present to get into the Club movement. Then came the big surprise for us boosters, for while we had expected to be able to start a pretty strong club, we had no idea so many would join the first night. To be brief, we were able to enroll 36 new members, who proceeded to hold an election at once, electing Mr. J. S. Littrell, President; Mr. Ed Grotjan, Vice President and Mr. J. E. Lewis, Secretary. I believe you can expect some great things from this Club, as there are still lots of men in that district who are not Club members. The Club starts with a larger membership than any other Club around here that has been organized for several months. So I believe it will be in the interest of the Club movement for you to mention it in THE MISSOURI FARMER, as we feel that it will be a help for other Clubs to know what we are doing, and thus get them into these booster meetings in other districts. We intend to keep right on as long as good weather lasts, because we want to do our share in getting the county organized by school districts.

Much of the success of our meetings so far is due to Mr. B. C. Smutz and to Mr. Bachtel and the Heisel Brothers from Newcomer, who came about 8 miles and who are very helpful in getting the Clubs started.

And now I want to ask you what the Clubs in other parts of this county are doing? Are there any Clubs over near Keytesville and Salisbury, and are they doing anything to organize other Clubs? What is the number of Clubs in this County and what is the total membership? How many Clubs will be necessary before we get a county organization?

Now, Mr. Hirth, I know I have taken up lots of your space, but I think you will agree with me that such results as we secured last night are enough to make one enthusiastic, even in writing about it. You will find enclosed a list of members of the Jordan Farm Club, also a draft for $36. Enter their names as soon as convenient, and start a bunch of Discussions to them at once, since their next meeting will be next Friday.

I trust that our booster meetings will continue to get results, as we have done so far. With best wishes for "THE MISSOURI FARMER" I am, Your friend. C. R. Myers, Secy,

Davis Farm Club.

Note—The above letter from Mr. Myers is so inspiring we couldn't resist the temptation to publish it in full. Now why don't the farmers of a lot of other counties follow this fine example?—Publisher.

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get near $2 for wheat and raise 20 to 45 busheis to the acre he **is bound to make money**—that's what you can expect in Western Canada. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or daiay purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Vol. VIII December 15, 1916 No. 24

William Hirth, - - - Publisher
Geo. B. Ellis, - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 75c Cents a Year in Advance or two years for One Dollar.

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

REMEMBER FARMERS' WEEK

Those of our readers who have ever had the pleasure of attending one of the annual Farmers' Week Conventions held in the Agricultural College at Columbia know of both the pleasure and profit that a farmer can get out of one short week. The next meeting will begin on New Year's Day, 1917, and we know of no better way that a farmer can spend a week than to visit Columbia at that time and get some inspiration and perhaps a lot of information that will be helpful in his farm work or business management during the year.

About twenty different associations will hold their annual meetings during the week and a call has been issued for a state convention of Missouri Farm Clubs that should be attended by one or two delegates at least, from every local club in the state.

During each day from early morning to 3 p. m. lectures will be given in a number of courses of interest to farmers and farm women and every afternoon from 3 to 5 the various associations will meet. The evening meetings will consist of addresses interspersed by music. Among those from outside the state who will speak at the evening meetings the State Board of Agriculture announces will be Dr. H. J. Waters, President, Kansas Agricultural College; Assistant Secretary Carl Vrooman, U. S. Department of Agriculture; Dr. P. G. Holden, Chicago; Chas. S. Barrett, President National Farmers' Union; Jno. A. McSparran, representing the National Grange; Dr. Clarence J. Owens, Washington, D. C.; others have been invited including some distinguished women speakers.

The week's exercises will close with a big banquet given by the College of Agriculture and no farmer will regret the expense if he will come and bring his wife and if convenient the son and daughter for there will be something on the program every day of interest to every member of the family.

FOOD BOYCOTT

The boycott against butter, eggs and potatoes in some of our large cities may have been about the only means the city consumer could use effectively to break excessive prices on these necessities but unless the consumers can unite with the producers to get at the real cause of high prices very little good will be accomplished. There is no doubt but what the present shortage of crops and the European war together with a car shortage have given brokers, cold-storage and commission men an unusual opportunity to boost prices and they seem to have boosted to the limit. The margin between what the farmer received and what the consumer paid was entirely too great but with all that, city people can not expect normal prices under present condtions.

Some very cold facts confront us when we look into this matter. During ten years the land more than doubled in value in the Middle West and all that the farmer must buy including hired labor has increased very materially. Just now when on account of crop shortage most farmers are milking cows at an actual daily loss, the city family should not consider butter at 50 cents a pound or eggs at 35 cents a dozen an exhorbitant price. With corn at $1 to $1.10 a bushel and hay $18 to $22 a ton with all other feeds in proportion the only reason the farmer can have for milking cows now is that he hopes to get through the winter in good condition and with a fair price next summer he may make up the loss on cheaper feed.

The right thing to do is for consumer and producer both to organize and meet each other at midway and either by law regulate these combinations or to find a direct way of marketing under their own management.

It can be done and must be done if everyone is to get a square deal.

FOR BETTER LAND TITLES

How many of our readers who own a farm or any real estate whatever who feel absolutely secure in their title? You may have a warrantee deed, you may have paid in good money, every dollar the land is worth, you may hold an abstract of title furnished by a responsible abstractor but it is quite possible that sometime in the past some one held a claim against your land which has never been properly relinquished and which may show up some of these days and cause you a lot of worry and expense. Any one familiar with what is going on in the courts of his county knows that litigation over land titles is quite common. Most every term of court there is one or more suits to quiet the title to some one's home who had thought that he held a perfectly good title until some one discovered that there was a flaw in the record and before he could sell or borrow money on his land there was but one way open and that was to quiet the title by a suit in court and this is not only annoying but it is expensive.

Every one who has ever sold a piece of land or obtained a loan on it knows how expensive it is to have an abstract of title or if he buys the land or makes the loan he must have some competent person examine the abstract to be sure it is all right. The expenses in the transfer of land for both parties will run anywhere from $10 to $50 and when suit must be brought to quiet title that will cost anywhere from $50 to $200 and then you are never absolutely certain that your title is perfectly good. The older a county gets the more trouble there is in maintaining perfect titles to land because of the increased numbers of transfers and subdivisions of the tract. In some of the older and more populous states it is now a problem to find vault room in the public buildings for the thousands of volumns necessary to show the record of titles to the land. A more serious objection, however, is the length of time and the difficulty of examining so many thousand volumes in the investigations of titles.

If there is a simpler, less expensive and safer system for keeping land titles why not have it in Missouri? A number of states and foreign countries have adopted what is known as the Torrens system of registration which does away with all the needless expense we now have except a small fee for transfer and an assurance fund is provided which forever guarantees the owner against all claims forever. This system was first introduced in Australia in 1857 by an Englishman, Sir Robert Richard Torrens. The matter has been before the Missouri Legislature a number of times but owing to the opposition of those who profit by the present system it has not become a law.

We are informed by the Secretary of the Torrens System Land Title Registration League, Mr. J. F. Kern, that a bill will be introduced again this winter by state Senator Baldwin and in the House of Representatives, by Representative C. S. Nelson, of Cass County. In introducing this system no new offices will be necessary as the recorder of deeds can be made registrar ex-officio. Also it will be left optional for any land owner to preserve his title under the old system or to choose the new as he may desire.

The cost of getting a tract of land registered is estimated to be about the same ordinarily as the present cost of getting up an abstract of title and other transfer papers but when the title is once registered there is no further expense except a small fee for issuing a nw certificate of title. The greater security the owner possesses will be worth more than the first cost of registration. The guarantee fund is provided by assessing each tract registered a normal fee—one-tenth to one-fifth of one per cent on the value of the land. The experience of those countries where the Torrens System has been tried proves that this small fee is more than sufficient to cover all claims and make good all mistakes that may occur. Is it not more desirable to pay this small fee and have the state guarantee your title than it would be to pay possibly the same fee to an attorney to examine your title and have nothing but the attorney's opinion to protect you?

In California the Torrens Land Title Law was put into effect by the use of the Initiative in the year 1914 by a majority of 125,000. If the owners of real estate want to save to themselves the enormous waste that is now necessary in keeping our records, and would keep this amount of money in their pockets they should urge the present Legislature to pass a bill this winter giving us the safe, simple and inexpensive plan of land titles—the Torrens Registration System.

BANK VS. FARM PROSPERITY

One of the many excellent local papers which comes to our desk every week is the Maitland Herald. The Herald is a fine local newspaper but we are sorry to see the editor go so far wrong when discussing an important economic question. In commenting on the showing made by the banks of Holt County in their recent published statement an edtorial says: "We have examined reports of the various financial institutions in Holt County, and so far as we can note, every one of them show a good growth in deposits and business transacted. The Maitland banks are way up in the list, and it must be very gratifying to the stock holders and patrons in general to note their healthy condition. Right here an idea occurs to us, that has been on our minds all during the campaign. You all remember there was a lot of talk about a land bill, etc. The idea occurs to the Herald that a man who has 160 acres, more or less of Holt County land, does not need land bills or a land bank; if he wants any money he can go to any of these home banks and get it and on as good terms as any merchant or business man can get it."

It is gratifying to know that the banks are prospering and that deposits are increasing. There are few counties, if any, in the state with richer soil than Holt County is blessed with and so we agree with the Herald that a man who owns 160 acres of Holt County land is in postion to command pretty good credit anywhere. But we are afraid the Herald has overlooked some facts about Holt County farms and particularly about the operation and ownership of those farms that does not make very pleasant reading. May be that is why the editor of the Herald does not care to print this information so we will do that unpleasant duty. And by explanation let us say that what we are going to say about conditions in Holt County are true of practically every county in the Middle West, either in or outside Missouri.

The Census reports of the United States may not be very interesting reading but they furnish facts that a lot of editors as well as farmers and banks ought to know. In 1900 Holt County had 17,083 people but ten years later there were only 14,539 or a loss of 14.9 out of every 100 people. The county has more wealth, more rich people and more poor people. The land is getting into the hands of fewer people and there are not so many farms as there were 10 years ago and as a matter of course, the farms are getting larger, so are the mortgages. In 1900 there were 2,256 farms in Holt County but ten years later there were 321 fewer farms, or almost exactly the same percentage of loss in the number of farms there were in total population. Suppose this rate keeps up what will the condition be in fifty years from now? Is it not about time we were giving some thought to the future?

In 1910 only 1,180 of the farms of Holt County were operated by owners —about 61 out of each 100, the other 39 were run by tenants or hired managers. But that is not all for out of those operated by the owners 51 per cent, or more than half were mortgaged. If the farms operated by tenants are so heavily mortgaged as those operated by owners, and it is reasonable to assume that they are, then Holt County had 986 farms encumbered with a mortgaged indebtedness in 1910 and perhaps a great many more by this time. On the farms reporting mortgages it was found that the amount of debt represented 30.8 per cent of the value of the land and farm buildings. This means that the farms of Holt County now have a total debt hanging over them of more than $3,500,000 besides the personal debt which is not included.

Let the Herald put on another pair of glasses and scrutinize the prosperity of the mortgaged farmer, the tenant farmer, and the hired man on the farm, and tell us what the condition of the county will be in 50 years from now unless the present tendency is arrested?

Our banking system is not organized for the purpose of taking care of this great business of farm loans and the Holt County banks however prosperous they may be are no exception to the rule. Already several hundred thousand farmers have made inquiries concerning loans of the National Farm Loan Board before the farm loan banks were organized. Prejudice and lack of information are pretty hard to overcome but we hope they will both vanish before there are many more tenants and mortgaged farms in Missouri.

KEEP A RECORD OF YOUR BUSINESS

When we came to the farm eight years ago, we began to keep an itemized account of expenditures and income. But this required daily attention. And some days were too full without adding the duty of recording the doings so we soon felt that our records were not very reliable, and finally dropped it. But one thing we do, is to invoice every New Year's Day.

We begin with the live stock, giving number and a fair value, then the grain at market price, all hay and other feed, on down to household stuff. Then make note of all debts, bills payable and bills due us, etc.

This affords a means of comparing one year with another and knowing whether we are losing or gaining on all, but we are not able to say just where the bigger gains are made or where we have lost.

Two years ago our house burned and our yearly records were lost along with a great many other things. The shock and loss nealy paralyzed us mentally for several months, so no farm notes were kept.

But at the beginning of 1916 we made our invoice again, then began a somewhat detailed record of expense and saving in a very simple way.

The largest calendar we could secure was hung in a convenient place in the kitchen and each day note was made in the space for that day on the calendar of work done, purchases made, stock bred, born or sold. At the end of the month it was an easy matter to glance over this day book and figure up the time for the hand, transfer the necessary dates to reference books, etc. Then that leaf, without being torn off was pinned up over the face of the calendar and saved for further reference, until now we have a daily record for the year. We know what work was done to put in the several crops, and to harvest them; how many days were spent hauling manure; how many days work were hired; and a great many other things that before we could only guess at.

Blank sheets of paper, one marked Groceries, one Poultry, and another Cream, were tacked on the side of the kitchen cabinet and a pencil hung by them. When the cream and egg checks and groceriy bills were brought home they were easily recorded here without the busy wife having to move out of her tracks, much less opening a desk, pulling a set of books and hunting up a separate page for each, and no one missed the time given to this. When 1916 lies behind in the cold, cold ground and 1917 beckons us alluringly we shall take down the old sheets, add up the columns and enter intelligible figures on our permanent records, and with some reliable knowledge of this year's work, hang up our new calendar and clean sheets for another year.

The New Portable—A Real One-Man Stump Puller

Proven a most economical device for clearing stump land. Pulls stumps *faster*, *cheaper* and with less work. Your fifteen-year-old boy can drive it around, load and unload it alone. The

Hercules Triple Power Portable Stump Puller

Comes equipped complete, ready for work. The new portable is the greatest development in stump pullers of today. One man handles the job alone, no extra help needed. Think of the tremendous saving of two extra men at $2.25 per day. **Hercules Beats Hand-Power Machine.** In Minnesota State Experimental Farm test the Hercules pulled more stumps than a hand-power machine and pulled the stumps at **61% less cost.** Think of it, 61% cheaper for you to operate the Hercules. The Hercules, at another State Experimental Farm test, pulled stumps at 70% less cost than dynamite. Write me your stump pulling problems today. Tell me just how much land you have to clear. I'll tell you how to get stumps out for the least money. The stump puller that **will save you money** and **do the work faster** and **safer** is the puller you want. A card from you today brings my special low price, the most remarkable stump puller offer ever made—all facts and proof, with full particulars also information regarding **Hercules Hand-Power Machine with 120,000 lbs. pull.** My book contains a fund of practical, useful information. Write for it today. B. A. Fuller, Pres. **HERCULES MFG. CO.,** 591 24th St., Centerville, Ia.

However, this year, I think, we shall hang up two calendars, one for recording the farm work and one for the live stock. My wife always keeps a record of hatches and other events in connection with her poultry on a calendar. A. D. L., Lynn Co., Mo.

SAM JORDAN'S COLUMN

One of the perplexing problems in matters relative to Farm Clubs, is the want of a program that will appeal to those in attendance, and something that will be of most worth.

A Farm Club will live just so long as there is work to do, but "death" ensues with lack of action.

At this time I desire to outline at least a part of a program that should be of great interest as well as of great value.

This is the Farm Survey of the school district. A few of the many items in such a survey will give some idea of the extent to which it may be carried. A few questions to each person who reads this article may serve to make the reasons for a survey more apparent. First, do you know the lines of your district? Are you acquainted with all the people of your district? and do you know where they live? Do you know how many farmers in your district are farm owners and how many are tenants? Do you know how many miles of highway in your district, and how many miles of road are dragged and who does the dragging? Do you know how many head of cattle, sheep, horses and hogs your district has? How many purebred sires are used in the herds? How many acres of corn, wheat, oats, alfalfa, timothy and clover, and what are the yields? How many cattle are fed for the market and how many silos in the district? How does your district compare in all these things as compared with the districts that join you?

Some farmer grew the biggest yield of corn in your district this year, and more than likely it is the same one who has for several years been growing the largest yields. Do you know who he is, and how he does it? How many plant tested seed corn that has been field selected? How many hogs did your district lose last year from cholera? What means are your people taking to prevent cholera? How many acres of pasture lands, and how many acres of waste land in your district?

I wonder how many of us can answer six or more of the foregoing questions? I believe that such information in the hands of all the district would be of untold value in many ways. It would let us know more of ourselves, and until we have that information we are not in a position to know whether or not we are making any headway. Suppose these comparisons were made in a union meeting of several districts, do you not think it would bring out some interesting things to talk about?

But let us get an outline of the survey and how to make it. Have the work done as a part of the work of the school, by the school children. First make an outline map of the district, showing where each person in the district lives, writing in the name of the person or family, and whether farm owner or tenant. This item alone will be an eye-opener to many, since few know how many farmers are tilling the land of somebody else, really a sad situation in this country. On the map there should be such other matters as would suggest themselves, such as the location of streams, roads, wheat fields, etc. This can be done the first month of school. October should show the number of acres of wheat sown, how many acres of corn put into the shock, how many silos were filled, and such other information as would naturally come at such a season. November could sum up the hogs on full feed, the yields of hay crops, and reports on orchards, then the December report could make the final estimate on the corn crop, also what was the situation with reference to Hessian fly in the wheat? January could go over the prices that prevailed for farm products from September first. In February we could find out how many persons would have to buy seed corn, and how many had their own seed, how it was selected and cared for. A report also, as to the spring pig crop.

March should show how many have tested seed corn, or how many expect to test their seed. Further reports on the pig and calf crop, how the wheat has stood the winter up to that time, and such other data as would be of interest. April can make final reports on the crop of young stock, the seeding of oats up to that time, and such matter as would naturally suggest itself. A record of prices that prevail through the season should be kept also some weather data. At the end of the year a complete report of the season's activities will have been made, one that is reliable, and done by the school children (corrected as may be necessary at club meetings).

What do you think would be the effect if it should be shown at a union meeting of four or five districts that your district made the poorest showing of any? Suppose you had but ten purebred sires in your district, and the one just south of you had twenty-five? How would the other fellow feel if the corn in your district averaged forty bushels and his only twenty-nine? Suppose your district shows twenty miles of road kept dragged, and that measly district east of you does not drag at all?

Suppose your district by "knowing itself" as you would know by such a survey, and kept on record and display at all times, that in ten years you had doubled the number of purebred sires, increased your yield of corn per acre ten bushels, and that at the end of ten years, every foot of road is kept well dragged, that instead of hiring the cheapest teacher you could find, you hire the best one you can get, in other words, instead of apologizing for your district and its people you just brag about them to beat the band? Now, that would be worth while, wouldn't it? But in the final analysis, who would be the real beneficiaries? I guess, that it would be your children who did this "farm" work, that lets us see ourselves. This work would create a vital interest among the children making them know more of the farm and of farmers.

It is certainly true that the more one knows of his work the better he will like it and the better he will succeed at it.

Those who desire their children to remain on the farm would do well, it would seem, to take such means as may be at hand to have the children know the most of the farm and its affairs. Since the children are doing this work they should have full credit as a part of their school work.

Why should not a farm boy, who has to stay at home a day or two to select seed corn, or to help butcher the hogs, or to put up a crop of alfalfa, or to help build a hen house, be given as much credit as he would be given for spending a week or two studying the map of Asia, and learning to spell the names of the capitals of oriental countries—especially when that boy will have to make most of his living with his hands on the farm? I, perhaps, am wandering just a little from my text, but maybe the digression will not hurt much.

Now, would it not be fine to discuss the final summing up of the report for the month at some time during the last week of the month, then in two weeks hold a union meeting of at least four adjoining districts and make comparisons? A rivalry for the common good would, no doubt, be the result. This plan carried out in all the districts of the state would beat any statistical law, and not only not cost the state any thing, but help the children who would do the work, and when finally passed upon by the farmers' themselves would be reliable.

If your Farm Club is to live and become a permanent success, individual members must use a little common sense and patience. The other fellows commenced to organize 40 years ago and we therefore cannot hope to turn things upside down in 60 or 90 days. I have no patience with the fellow who looks for a chance to "knock" the minute a Club is organized and who, after it has been in existence for a month or two, grumbles and growls and says "It hasn't accomplished anything." Simply come to the meetings with a smile and resolve to push instead of pull back. It doesn't make any difference if your Club doesn't save you a dollar for the first six months. If you will "sit tight" there isn't a particle of question but what results will soon begin to come. I have in mind a certain Farm Club which was slow in getting started. Soon the "knockers" were busy and some of them dropped out—but during the last 90 days this Club has saved its members over $1,500—and now these fellows are sneaking back in. Of course we are going to succeed despite these wooden headed ones—but why should we have to carry this dead weight? When men are striving to better the condition of themselves and their neighbors they deserve smiles and an occasional friendly pat on the back—not kicks, growls and sour faces.

The Code of the Mountains

By CHARLES NEVILLE BUCK

A STORY OF A MOUNTAINEER WHO BECAME CIVILIZED

CHAPTER VI

When Newt Spooner had begun his search for Henry Falkins that afternoon he had not been so unobserved as he thought himself. Not very far behind him had walked Red Newton. He had not left Cawsler's with any intention of spying upon the boy and had seen him only by chance, yet when the latter halted in front of the hotel and stood there with the telltale expression which the recognition of Falkins brought to his face, Red Newton observed it and slipped silently into the door of a convenient store. When Newt went running excitedly back to Cawsler's place, the brain of the older clansman began to work rapidly. To his memory recurred the tirade that had broken so tempestuously from the boy's lips.

"I knows what I'm atter. I knows a feller I'm ergwine ter kill." The unforgiving malice in the boy's eyes, the rigid posture of his whole body as he stood contemplating his enemy, told Red Newton the whole story. This, then, was the man Newt meant to kill. It was logical enough. This was the witness who had riddled the alibi.

At first, Red Newton shrugged his shoulders in the fashion of one who has no call to meddle in the affairs of others, but as fresh aspects of the matter presented themselves to his consideration, a very real danger to all his family arose to confront him.

If Newt should shoot Henry Falkins on the streets of Winchester before the speaking of this afternoon ,it would stir into action such a tidal wave of public indignation against the mountaineers that the more vital conspiracy would be thwarted. He surmised that Newt was rushing back to Cawsler's place to arm himself, and his first instinct was to follow. Then he remembered that the place was now empty save for the drunken Dode, and Cawsler himself, whose discretion could be trusted. So, he took no action, and, when later the same buggy passed the court-house and within it on foot ,the disappointed face of the boy told the other that he had failed. Red Newton rubbed his stubbled chin reflectively, bit off a large chew of tobacco ,and withdrew into his inner consciousness for reflection. As the result of those cogitations he strolled over to the hitching rack where he found a lowland farmer with whom he had spent a part of the morning talking cattle.

"Stranger," he suggested, "I 'lowed I'd love to ride out the road a piece, an' I figgered I'd ask ye ter lend me yore horse fer about a half-hour. I hain't ergwine fur, an ' I won't ride him hard. I'll do es much fer you when you come up my way."

With ready assent, the farmer went over and untied his plug, and Red Newton swung himself to the saddle. Then he rode slowly and casually after the boy. He did not try to overtake him, satisfying himself with keeping him in sight, while he himself remained too far back to be recognizable. But Red Newton had affairs of consequence in town, so, as soon as he was satisfied that Newt had lost sight of the buggy, he turned back. He intended to mention the circumstance to Black Pete, but Black Pete was keeping discreetly out of sight, and so he found no opportunity for speech with him.

Meantime, the throng about the court-house was thickening, and Red Newton caught sight of Jake Falerin making his way to a place near the stand. That was his own cue for action, so, forgetting minor things, and keeping as inconspicuous as possible, he began edging toward a position of proximity in Falerin's rear. He signalled with a nod to one of his kinsmen, who was standing silently, but alertly, a little way off, and who at once began working forward in answer to the sign. The plan worked with well-oiled smoothness. Red Newton came so close that he almost brushed shoulders with his intended victim, and even when he stood at Jake Falerin's back, chewing his tobacco with as little expression as a cow chewing its cud, Falerin did not turn around or suspect his presence.

As the speaking went forward, Red Newton cast his eyes about, and placed those of his kinsmen who were present. It had not been deemed advisable to have the clan largely represented, and it gave him pleasure to recognize that Falerins largely out-numbered Spooners. Later, when the question of self-defense and placing the responsibility arose, it would appear that the Falkins element had come en masse, and from this circumstance would arise a presumption of malice aforethought on their part, that would materially strengthen the Spooner defense. In dividing the mountain men into the two factions of Spooner and Falkins, Red followed the classification of the feud. The Falerins and Hulburts and their kindred were "Falkinses," though they bore other names, just as he himself, though a Newton, was nevertheless a Spooner.

At the physcological moment, Red Newton stepped forward and violently dug his elbow into Jake Falerin's midriff. Falerin wheeled to see who was crowding him, and the eyes of the two mountaineers met in a glance which escaped the generality of upturned faces. So well did each understand what a quarrel between them must mean that Jake did not hedge an inch nor attempt to evade the issue. He planted his left fist on Red Newton's jaw, while he drew with his right. But Red Newton was the more prepared, though, as he reeled back under the blow, he would have fallen, had there been room to fall. As it was he leaned against the crowd, and fired from that position, just a fraction of a second before Falerin's weapon came free of the holster. It was only those directly at Red's back who saw the swift play, and to their eyes it bore the seeming of self-defense. In the same instant, the kinsman at Red Newton's shoulder fired on the attorney so suddenly that it looked as if he too were aiming at Falerin's head, instead of just to its side.

Later in the afternoon, Black Pete, whose name had been mentioned to the commonwealth attorney by several of the Falerins, walked voluntarily into the office of that functionary. His face was grieved. Moreover, it was characterized by a show of frankness that was disarming. He said he would be glad to submit to a search—that he never went armed. He feared that in an indirect way, though entirely without his intent, he had been instrumental in bringing on the afternoon's deplorable tragedy. The commonwealth's attorney was astounded at this unsolicited statement, verging so closely on a confession, and felt impelled to warn the Deacon that he might yet find himself a defendant, and that whatever he said would be used against him. Had the Deacon been addicted to smiling he would have smiled then. As it was, he only nodded his head gravely, half sadly, as he stood there, his hands in his pockets, and his steady gray eyes unwaveringly holding those of his inquisitor.

"I reckon that's right, an' I'm obliged to you." he answered respectfully, "but I find as I go 'long that a man gets just as far by tellin' the full truth."

"Just as you like. What part did you have in this affair?" demanded the state prosecutor—a little too eagerly.

"Maby you'd better let me tell it my own way." suggested Black Pete imperturbably. "I haven't got much education and I may ramble a little, but I'll do my best. You know all about the feud, I reckon? I went West years ago and out there I got to see that these things are foolish. A sort of truce was patched up finally, and it was agreed that I must stay West, and Jake Falerin must leave the mountains, too. I got a little money saved up, and sent word that I was coming home to settle up a mortgage on my sister's farm, and attend to some other family business. I didn't aim to stay, and I havn't been any closer to the mountains than right here. I wasn't goin' any closer till everybody agreed to it. I didn't think these fellers would fight right here in Winchester."

The Deacon stood with the regretful air of one who has been disappointed in his confidence as to the worthiness of others. At last, he continued in a conscious-stricken tone:

"I've been studying' about it considerable since it happened. I'm afraid the Falerins saw me, and figured I'd broke the truce by comin' back, and, when Jake met Red in the crowd, they both got panicky, and begun to shoot.'

That was all the Deacon had to state except his promise to remain in Winchester, subject to the call of the commonwealth. He knew that no one, save a handful whom he could trust, could implicate him in the conspiracy, which he had devised and engineered. His claws and fangs were well-tucked under his sheep's hide of innocence. While he was in the law-office, the jailer arrived with news that Red Newton and his other prisoner had asked to see Black Pete Spooner, with a view to employing counsel for the defense. The Deacon turned to the commonwealth's attorney.

"What do you think?" he said. "I reckon these boys have that privilege, haven't they? I want to be fair all round. If they did shoot in self-defense, I want them to have their rights, but I'll be here if you need me."

So, late in the afternoon, in the privacy of the cell which the two mountaineers complacently shared, the Deacon heard from Red how the boy, Newt, fresh from the penitentiary, was already on the trail of a marked-down" victim. It was news that disconcerted the master assassin to a degree which he would not have cared to admit. These men depended upon making a case of self-defense, and looked to him to see them through. The gravest element that confronted them was the violent dislike of the bluegrass, where they must face trial, for the murderous tendencies of the mountains. If there should occur on the heels of the first tragedy a second, traceable to a mountain man, the fat would be in the fire. At all costs, young Newt must for the present hold his hand. Above all else, that was imperative. Black Pete questioned the prisoner searchingly and learned that Newt had gone out Main street, and Red had followed him for some distance. Therefore, that was the road upon which young Newt must be watched. Cawsler later reported the manner in which the boy had come demanding arms, and the Deacon bitterly regretted having surrendered to him his own pistol.

And Newt had disappeared. Of each Spooner he met, the Deacon demanded news of his whereabouts. Finally, near the court-house, he met a man who had seen the sought-for one sauntering slowly out the road near the edge of town. Since it was only a few minutes before, he could not have gone far.

The Deacon hurried forward, and from a party of incoming negroes he learned of the dance, which explained the procession of buggies and gave reason that his intended victim would be there. At least, it would be worth investigating. But of Newt himself he saw nothing, for when he reached the spot where the boy had climbed the fense to kill time behind the hedge, he unwittingly passed him by. At the beginning of the stone fence, where he caught first the music and the light of the festivities, his eye took in the growth of locusts and his mountain mind reckoned by swift processes. Here was such natural cover as a man would be likely to seek in working his way surreptitiously rearward. He had begun to fear he might be too late in which event his coming at all would be more fatal than staying away. That haste prevented his using the most exhaustive caution, and so he did not explore to the far side of the woodland, but crossed the fence at the nearest corner and went swiftly back, skulking in the shadow. In point of fact, instead of being later than the boy, he arrived first, but on the opposite side of the broad lawn. When he had gone back as far as the house level, his painstaking search commenced. He was not only endeavoring to remain concealed, important as that was, but also to penetrate the shadows and find the other hidden man. It was the thing that would have been sheer impossibility but for his splendid woodcraft and the catlike focus of his eyes in the night. So, when he had exhausted the possibilities on that side of the house to his full satisfaction, he recognized his mistake, and knew that he had wasted precious time. He should be on the far side, and, taking a long detour which carried him far to the rear of the barns and led him behind the fence line of the paddock lots, he worked his way up again to the front until he reached the edge of the lilac bushes, and could see the summer-house. To that spot he began crawling noislessly, and, led by a sure instinct and while still some fifty yards away, his trained eye caught a stealthy shadow also hitching forward at his front. There still lay between him and Newt Spooner the matter of some thirty yards, and, even if he rose to his feet and ran for it, he would overtake the boy so close to the vine-covered retreat that any sound of interference would result in the discovery of both. He did not personally know that the summer-house was occupied, but he argued it from the movements of the other skulker. Newt was so engrossed in his hate that at this particular moment he had eyes and ears only for the front. Between the lilac thicket where Black Pete crouched and the vine shadows where Newt knelt, lay an open space of flooding radiance, but it was directly behind the summer-house, and, unless Newt saw him crossing it, no one was apt to see. The Deacon rose to his feet and ran for it.

As Newt thrust the revolver behind him to cock it, Black Pete's hand closed silently around his, and Black Pete's thumb was jammed between the backdrawn hammer and the firing pin.

CHAPTER VII.

Henry Falkins and Lucinda Merton had not kept close count on the flying moments since they had entered the summer-house. The girl had promised to sit out two consecutive dances with him, since to-morrow morning he must go back to the mountains. So, having only a little while and much to say, he had plunged in, and, though his voice was low, his words came tumuluously. Of course, she knew that he was in love with her, but until to-night it had been a thing which had been given no concrete declaration. Except for a glow of confession in her eyes ,she had said nothing of love to him. Yet now, when he wished to claim every moment for himself, she had asked him to tell her about the hills and their people, of whom she and her world knew so little.

"I want you to understand the life and conditions there," he told her, and yet I don't want to talk of that to-night. I would like to paint for you true picture of my mountains just as they look under this moon, as they will look when to-morrow's sun comes up over the peaks and begins to drive away the lingering mists; of the elder bushes and rhododendron and wild roses that bloom on the tangled slopes; but to-night I want to talk only of you and me."

He paused, and her voice carried a responsive thrill as she said:

"I should love your mountains; it must all be very beautiful—but so diferent from this." Her eyes traveled out with native pride over the smooth opulence of the country, which had seemed the Promised Land to the eyes of its pioneer discoverers.

"Yes," he admitted; "it is very different. We have rugged fields and rugged people. Down here you spring from Cavalier stock. But to-night there are in the world only ourselves. Let's talk of our private universe." His voice was feverishly eager. "Until I can in some way improve my fortunes, God knows I ought to be silent as to love." He leaned forward and added desperately: "But I can't be

silent. After all, what is the use? You know I love you. If I never spoke a syllable of it, you would still know it. You can feel it in the tremor of my hand when I take yours in greeting. And if I lock my lips, my eyes give them the lie. You know I love you, but you will never know how much."

He leaned forward and his breath came fast while his heart pounded with great anxiety of putting his fortunes to the touch. He had knowledge of other lovers who had come and gone; gone very reluctantly, from the quest of her heart.

He had known her a year ,and friendship had grown into that intimacy which tacitly admits something deeper than the casual. In her house he had been accepted almost as a member of the family—but that need not mean that he was accepted as a lover. In his mountains such an association would have been tantamount to an engagement, but here in the bluegrass it was different.

There had been sometimes a quality in her smile which he had never seen on her lips or in her eyes for other men, and she must know of his love. Still, he had heretofore been content to hope without certainty—and now the moment had come when, if he had builded on false dreams, he must wake to a reality of which he could think only with terror.

For his own crude land, he was a rich man, whose status was the status of a baron; but down here in the counties of aristocracy and wealth, he was poor and a mountaineer.

"I suppose," he went on, with a voice that came from a taut throat, which he forced into measured syllables, "I suppose that until I can offer you a home like this, I should not ask you to confess a love for me, even if you could feel it. I can't even ask you to marry me yet, and still because you must know it, because you have a heart that must tell you, it seems to me that it is only hypocritical to lock my lips. My heart is too full to be dammed up. It must have utterance. It must say, 'I love you.' I can't go on any longer being just a friend." He paused a moment and wiped the moisture of his anxiety from his brow, and his voice was tensely even in its control. "It means too much now, for that. If I am living in a fool's paradise I must know it before it is too late. They say we men of the Cumberlands have somber natures that take things seriously. To hope too long—and then fail—" He broke off again and added quietly—" that would be a thing that would utterly ruin me. I love you."

The girl did not at once speak. He saw that her face was downcast and that her breast rose and fell, in an emotion which might be pity. Perhaps she, too, found speech difficult because she was merciful. A man and a girl were coming toward the summer-house, and Henry Falkins watched them with a fascination of fear lest they interrupt. The seconds seemed to stretch into an interminable suspense. Slowly he put out his hand, and took hers. Her fingers trembled in his grasp and slowly he bent and kissed her lowered head.

"I am waiting," he whispered; but something in the voice said more and told her of the torture of his doubt.

At last, very slowly, her face came up and her eyes met his. They were misty eyes, but smiling, and as he bent with a wild leaping of his pulses and took her in his arms, her lips, too, met his, responsive to his kisses.

Finally he rose, and now it was his own hands that trembled and his own senses that swam with the intoxication of a happiness which seemed to him miraculous.

"I suppose," laughed the girl, "I ought to be ashamed to surrender so quickly—butI'm not. I'm very proud. proud."

For a moment after that they sat silent and across the moonlight came the band music and the softened laughter of the dancers. And it was at that moment that Newt Spooner, so close that they could almost have heard their breathing, was reaching into his pocket for his borrowed revolver. The pause was brief, or the girl, looking into her lover's eyes, became suddenly beset by a new thought—perhaps some subtle premonition—and in its wake came panic. She laid her hands on his shoulders and bent so close that he could feel the play of her breath on his forehead.

"But you are going back there," she exclaimed; "back to the mountains, and I'm afraid. Are you in any danger, because, if you are, you shan't go! I won't let you go. Why, only today, there in Winchester, think what happened!"

The man laughed.

"I sha'n't be hurt," he assured her. "Your love will be my talisman."

"If my love has such power," she exclaimed, "you will go on living to the end of time."

He took her two hands in his.

"Let's have no thought of danger tonight," he said. "To-night belongs to love, dearest: to love and to us."

And that was the exact moment at which Black Pete Spooner closed his hand over the pistol, thrusting his thumb between hammer and pin, and his fore-finger between trigger and guard.

So suddenly interrupted at the threshold of his attainment, a man from the lowlands would have betrayed himself with oath or explanation, or at least have struggled noisily in the grip that thwarted him. Newt Spooner was a mountaineer. Ambuscading caution was to him as instinctive as to the fox or weasel. He felt his hand drawn down at his back so forcibly that, crouching with his weight on one knee and one foot, he could not rise—yet he remained utterly noiseless. He carefully turned his head, and at the distance of a few inches recognized, even in the darkness, the drooping mustache and square jaw of the Deacon. The Deacon was holding a finger of the disengaged hand to his lips in an imperative command for silence. Black Pete was always a diplomat. He regarded this moment as one of rather desperate crisis, calling for extreme finesse.

No word of explanation could be spoken; the slightest sound of scuffling would give the alarm fatal to both. He knew that the implacable hatred of this single-idead boy was not a thing to yield readily. So he continued to put into his manner and touch something of subtle and friendly reassurance, lest Newt flare into reckless and needless antagonism. And Newt felt at the moment a wave of relief in recognizing one of his own people.

The strategist gently shook the hand which held the weapon in hint that Newt should surrender it, while he nodded and laid the other hand conciliatingly on the boy's shoulder. But Newt, although he made no sound or motion, held tightly to the pistol, and so for a moment while Henry Falkins was boasting of his safety with the confidence of youth and love, his intended assassin crouched not six feet away while the man who sought to prevent his act bent over him, holding his hand, and the wills of the two wrestled in utter silence.

There is in all leaders, good or bad, a phychological, almost hyponotic element of power which can, at need, act without words. Black Pete was recognized so thoroughly as a man of leadership that the enemy talked peace only on the basis of his exile. Newt Spooner had always regarded him with awe as the leader of his clan. Moreover, the Deacon's attitude just now was rather that of a friend than that of an enemy. The hypnotism of his masterful quiet was telling on the infuriated boy and yet there flared anew in his breast a dangerous resentment against the balking of his purpose. How it might have ended is problematical, but as they held their strained pose, and as Henry Falkins talked on in false security, a second couple came strolling to the summer-house. Finding it occupied, they banteringly apologized for intrusion, while Miss Merton and her escort blushingly declared themselves on the point of departure, and went back to the dance. So the chance was gone. Slowly, Newt surrendered his pistol, and the Deacon silently rose to his feet and pointed off through the bushes. The boy strode sullenly on ahead and neither he nor his captor made a sound or spoke a word until they had progressed so far into the shadow that they were safe from overhearing. Then and then only Newt wheeled. His voice was almost a sob in its bitter and vibrant passion, as, with blazing eyes and snarling teeth, he demanded:

"What in hell did ye do thet fur? Damn ye, he b'longs ter me. Ye didn't hev no call ter interfere." He threw himself prone on the ground, clawing into it with his lean fingers as a frenzied animal might claw, and his thin body racked itself with silent sobs of anger and frustration. It ended in a fit of coughing which he could not control, and which he mothered in his two hands until the paroxysm passed.

The Deacon sought to sooth him. Most mountaineers speak with a nasal harshness, but this man had the exceptional quality that gave to his words an ingratiating and velvety smoothness.

"Don't worry, son. I wouldn't have interfered, only I was obliged to. He's your enemy, and he did you wrong, but this ain't the moment to kill him. Go back home and bide your time. If you need help, call on me after a little."

"Hits as fitten a time es any," blurted Newt tensely. "They hain't no manner of use puttin' hit off. I tells ye I'm ergwine ter git him. Hit hain't ergwine ter do no good to argify with me. Nothin' hain't ergwine ter change me none."

"Son," insisted the other calmly, "I ain't aimin' to change you. I've never let men change me, have I? But there's a time for everything, an' just now you must hearken to me." He sketched briefly and forcibly his interviews in the office of the commonwealth attorney and at the jail. He enlarged on the fatality of having another shooting by a mountaineer tread so close on the heels of the first tragedy.

"You ain't aimin 'to put these boys' necks into ropes, son?" he suggested chidingly at the end. "You can get your man without makin' your own kin pay such a steep price. All I ask of you is to pass me your word that you won't do anything until you get back to the hills. Seems to me that's fair enough."

Newt sat silent for a time, scowling blackly, but at last he rose and nodded.

"I gives ye my hand on thet—because I don't see no way ter help myself," he capitulated. It is the mountain's formula of oath and though the men who use it rarely shake hands, its utterance is a recognized bond.

"Come along to town with me," suggested the Deacon. "You can sleep at my boarding' place, and in the morning you can start out."

But to that proposition Newt shook his head.

"I aims ter start right now, es soon es I kin buy a snack ter put in my pocket," he announced decisively. "Which road goes towards Jackson?" When at last he did lie down for sleep that night, it was under the lee of a last year's straw stack and surrounded by the rustling spears of this year's corn, where he could look up at the stars and call defiantly upon them all to bear witness that he had no intention of being deterred by the interference of any man.

Farmer Boys Attention!

Boys, wouldn't you like to own this fine single barreled breech loading shot gun? Its a beauty and money can't buy a better one—and all you need to do is to get ten of your neighbors to give you a dollar each for two years subscription to THE MISSOURI FARMER. Send for sample copies at once and get busy. A days hustling will win it. Hurry up before some other boy gets ahead of you in your neighborhood. THE MISSOURI FARMER, Columbia, Mo.

CANDY MAKING

By Bab Bell, University of Missouri.

Candy-making in the home is a source of great pleasure during the long winter evenings, especially for the youthful members of the family. While much improvement has been made in the commercial candies, a vast amount of cheap candy is sold. These cheap candies are handled in a dirty manner, exposed on counters and bought by many children. It is far better to teach the children to make good, clean, wholesome candy. Then, too, home-made candy is an economy.

The basis of all candy is plain sugar —the kind we have on our tables. This is called cane sugar or sucrose. Cane sugar and beet sugar are identical in composition — contrary to popular opinion. The differences which have been noted are probably due to the degree of purification in their manufacture.

Candy may be divided into several classes, but the underlying principles are always the same.

Fondant—Fondant is probably the most inexpensive and the most easily made. If every step in fondant making were understood thoroughly, other candy making would be much easier.

Recipe for fondant:—5 cups sugar, 2½ cups water, ¼ teaspoon cream of tartar.

Place in a smooth pan as one with a rough interior tends to collect crystals. Cook slowly, without stirring, to the soft ball stage. Remove the crystals from side of pan by means of a moist cloth, wrapped around a fork. Pour into a platter which has been moistened with cold water. Let stand until cool enough to hold the hand on the underside of the dish. Then stir until creamy. Afterwards knead with the hands.

Important Points in Fondant Making

1. The cream of tatar is added to split up the cane sugar into simpler sugars—glucose and fructose. Mixtures of equal amounts of glucose and fructose are called invert sugar. Fondant can be made without the addition of an acid as moist heat and slow cooking accomplish the same result as the acid.

2. Long, slow cooking is required in order to change cane sugar into invert sugar.

3. If the syrup refuses to cream when beaten, it is because too much acid has been added. Add more sugar and water and cool rapidly.

4. Do not stir the candy when cooking as this causes crystals to form.

Fondant may be kept weeks or months and then made into different kinds of candy.

After kneading place in a bowl and cover with moist cloth. Often fondant with crystals will become smooth with long standing.

Using fondant as a foundation, the following candies are possible:

Chocolate (dip fondant into melted chocolate); Stuffed dates (add nuts); Cocoanut balls; Fondant and figs; Cinnamon balls, etc.

Fondant may also be flavored with maple, carmel or coffee and shaped in any way desired.

Tutti-frutti also is made from fondant. Butter a dip dish or pan. Fill with three layers of fondant. Have the bottom layer maple, well mixed with English walnut meat; the second layer colored pink, flavored with rose, and mixed with candied cherries cut in quarters and figs finely chopped; the third layer white flavored with vanilla, mixed with nuts, candied cherries cut in quarters, and candied pineapple cut in small pieces. Cover mould with oiled paper and let stand over night. Remove from mould and cut.

After-dinner Mints

Melt fondant in a double boiler. Add essence of peppermint and fruit coloring (a delicate pink or green is very attractive.) Drop on oiled paper with spoon—let harden. From melted fondant various fruit and nut candies may also be made. Drop fruit and nuts into melted fondant. Remove and place on oiled paper. White grapes are especially attractive when dipped in fondant.

Fudge:—An easy and successful way of making fudge is as follows: Make fondant and pour into platter to cool. While hot break up piece of chocolate and drop on top of the fondant. Also butter and nuts may be added. When cool, stir and knead all together. It is easier to add nuts after most of the stirring has been done.

Brittle Candies:—Melt sugar, stirring constantly with a metal spoon (wooden spoon will burn). Pour into buttered pans in which nuts or cocoanut have been placed. These brittle candies are delicious as well as wholesome and nutritious, and so easy to make!

Candy for the Children

Children naturally crave sweets which is probably due to a physiological need. There is no necessity of depriving children of the pleasure of eating candy, if it is given in a judicious manner. However, no child should be allowed to eat candy at any or all hours of the day, because it lessens the desire for wholesome foods. Children need food for the growth and repair of tissues, and candy furnishes only energy. Therefore candy should be given after a meal. Many mothers try to eliminate candy from the diet of their children, claiming that it injures their teeth. Candy does not injure the teeth by direct contact as is generally supposed. The teeth decay owing to the lack of mineral salts in the diet. These mineral salts are supplied by wholesome foods given at the various meals. Now when candy is allowed between meals the children have no appetite for these wholesome foods, so the folly of the indiscriminate use of candy may be readily seen.

Sugar as a food.

Sugar is a very valuable article of diet. It furnishes the body with fuel for heat and energy. Sugar can be readily assimilated and its effects in case of fatigue or starvation can be felt in one-half hour. It should not be used in large quantities as it is likely to ferment in the stomach. Sugar contains but little moisture and must draw on the lining of the stomach for water. This is the reason we are thirsty after eating candy.

The 1916 Thanksgiving is past and Christmas will soon be here and, dear reader, what have you done to make the life of some unfortunate one more happy? Remember it is more blessed to give than to receive.

By Old Jim Riley

I know you all don't expect much from an old duffer like me—but here's wishin' all of you a Merry Christmas anyway. 'Th' World gets to believin' that th' hearts of us old codgers is all shriveled up—but its because th' World don't know. Just because we are old and wrinkled and because our faces are covered with whiskers—well, its alright but th' World don't know how we sometimes hanker for a little tenderness—for just a word or a smile —cause haven't we all bin boys in our time and don't you spose that once in a while we hear th' slay bells of th' moonlight nights of long ago and th' merry shouts of those whose voices are asleep on th' hill up yonder? No, th' World don't know. It doesn't think —and so sometimes when we get out our old bandanas it ain't because we'v got a cold. Its because somebody has stepped on an old man's heart—and we kind a gulp and make out as if th' tobacco smoke had got in our eyes. And so when I smoke my old cob pipe back of th' stove down at old "Hez" Browns on Christmas Eve—why I am goin' to be thinkin' about all of you and wishin' you well.

BUCKSHOT BY THE PROFESSOR

If some men should change dispositions with their dogs the dogs would get mighty badly cheated.

* * *

The egg nog bunch had better "make hay while the sun shines"—for the stuff that puts the "kick" in it is on skids and the skids are greased.

* * *

The only way some fellows believe in celebrating Christmas is to fill up with old "red eye." But never mind. There's a powerful dry spell a-comin'.

* * *

Once more I rise to make a motion —and my motion is that the regular Army get out of the way while the Anti Horse Thief Association attends to Mr. Villa.

* * *

When you murmur your Christmas prayer, don't forget the sad ones across the sea—the homes from which "Daddy" has gone forth to return nevermore.

* * *

The World has got some mighty mean men in it—but none is meaner than he who takes the sunshine out of a child's heart by telling it that there is no Santa Claus.

* * *

It doesn't make so much difference what Santa Claus brings to your little ones. The important thing is that he doesn't forget them. And then there is Mother—sweet, patient, uncomplaining Mother.

* * *

There are a thousand and one things that are "higher than a cats back"—but you don't hear of anybody proposing an embargo on them. And all this goes to show that the farmer has become the great National "goat."

* * *

Here's wishing all of you a Merry Christmas. And now try to get all the meanness out of your soul during these blessed Yuletide days. Try to get up with a smile each morning and contribute your share toward making everybody happy.

* * *

Get a half dozen of your good neighbors to join you and attend the big Farm Club Convention which meets in Columbia on January 2nd and 3rd. It will be mighty well worth your while —for it should prove the greatest gathering of farmers that ever met in the history of the state.

* * *

That Jim Riley person went to the city the other day to "see the sights." You see Christmas is close at hand and I guess he figured he had to lay in some "supplies." Well, the funny thing about it was that he stumbled over one of those "Safety First" signs on the street corner and came mighty near breaking his neck.

* * *

If you like old Jim Riley and me, won't you please send "the paper" a dollar on subscription as a sort of New Years remembrance?

You see with the high cost of paper and other things it costs more money than ever to keep it going—and if it should stop Old Jim and me would be out of a job. And would you miss us just a little bit? Here's hoping you will not only send a dollar for yourself but make up a Club of new ones among your neighbors. My best wishes are for you and yours.

PULLMAN AND TOURIST CAR RATES TO THE FARM CLUB CONVENTION

As most of the Farm Clubs of Missouri already know, a statewide Farm Club Convention will be held in Columbia during "Farmers' Week" on January 2nd and 3rd—and surely every Farm Club in the state should be represented by a strong delegation at this great gathering which will mark the beginning of the greatest farm organizaton movement ever attempted in any state in the Union.

Wherever possible, we suggest that a Tourist or Pullman Car Delegation be made up, for which the charges will be as follows: The cost of a Tourist Sleeper will be $25 per day with the understanding that it must be used **for not less than three days** and that **at least twenty persons** will purchase railroad tickets for the round trip. Your local railroad agent will make application for the car and have it ready for you on the evening of January 1st—or for use upon such regular train as your party desires to use in order that it may reach Columbia not later than the morning of Tuesday, January 2nd. It is necessary therefore that the local railroad agent be given plenty of time to order the car so that it will be at your station on time. These cars will run straight through from the starting point to Columbia—thus making it unnecessary for your party to change trains. When the car arrives in Columbia it will be parked in the local railroad yards and a porter will remain in constant charge. Thus your party will sleep in the car at night and not be compelled to look for hotels or prviate rooming houses—a source of great annoyance, especially in the winter time at gatherings of this kind when the local hotel accommodations cannot take care of the crowds. Again, your luggage can remain in the car in charge of the porter—and you will be free to eat at any hotel or restaurant you please.

A 16 section Tourist car contains 32 upper and lower berths—one person to the berth. At a cost of $25 per day therefore, these sleeping quarters and other comforts will cost less than $1 per day, per person, should your car contain as many as 32 passengers. If it only contains the minimum of 20 passengers the cost will be $1.25 per person. A Standard Pullman Sleeper can be gotten under the same conditions at a cost of $35 per day—but since the Tourist Cars are heated by oil stoves at night and cost $10 less per day, we feel sure delegations will be well pleased with the latter service.

A "manager" for your delegation should be appointed the moment the delegation is made up and such manager should look after ordering the car, buying the tickets, etc. While in Columbia, your delegation can take in as much of the splendid "Farmers' Week" program as it desires—starting on the journey home when you get ready. There is no reason why farmers should not bring their wives—for they are certain to enjoy the trip and the "Farmers' Week" program immensely. Already a lot of Farm Clubs are planning delegations—but there is no time to lose and all it needs is one or two "leaders". That every farmer who attends the great Farm Club Convention will feel repaid a hundredfold there is little doubt—for the trip will be like a big, pleasant "house party" and when you get back home the last one of you will feel like pulling off your coat for the great Farm Club movement. THE MISSOURI FARMER.

Stock Farm For Sale

280-acre farm belonging to the estate of Samuel Morton, located 10 miles west of Columbia, Mo., and 2 miles north of Huntsdale, consisting of 280 acres of good hill and creek bottom land all in splendid state of cultivation and mostly in grass, plenty of stock water the year around furnished by living springs. Improvements consist of good 4 room frame dwelling, 2 tenant houses, 2 barns and other necessary outbuildings. This is one of the best stock farms in Boone County and must be sold in order to make a division of the estate. I also have for sale splendid 80-acre farm near Columbia. Very respectfully, L. T. Proctor, Adm'r, Columbia, Mo.

LUMBER—POSTS AT LOWEST PRICES
Get our delivered prices. Send lumber list for estimate. Pay after unloading.
KIRK COMPANY,
Dept. H. Tacoma, Wash.

THE PUBLISHER'S CORNER

I have a number of requests for good farm hands and wish that those who read this paragraph would get in touch with me at once. I will have no difficulty in getting a good place for you.

* * *

A friend of mine in Chicago who owns a fine 340 acre Indiana farm wants to employ a young married german to help run it and he will offer the right man a good lay out. Write me when I will put you in touch with him.

* * *

As stated in our last issue, we have quotations on excellent Alflafa seed from Kansas farmers at all the way from $6 to $9 per bushel and if Farm Club Secretaries will get in touch with us we will put them in direct communication with these Kansas farmers. I am satisfied that this is more reliable seed than you can buy from the average seed dealer.

* * *

We have made arrangements with a big Michigan Salt Co. to supply the Farm Clubs with wholesale prices on carload shipments of salt—and generally speaking it means a saving of about 35c per barrel. Where Clubs can handle a carload the local dealer should be given a chance to bid, as he might be glad to turn the salt he has on hand into cash at a close price.

* * *

And now the politicians are considering an embargo on food stuffs—but you don't hear anything about an embargo on hundreds of other items upon which the price has increased over 100 per cent. Thus when a victim is needed the farmer always becomes the "goat"—and do you think this would be true if farmers were thoroughly organized? Isn't it high time we placed ourselves in position where we can defend ourselves?

* * *

I want every Farm Club member in Missouri to realize that the great fight ahead of us is not so much to "buy things cheap" as it is to get a "square deal" for what we have to sell. One reason why the farm organization movements of the past have amounted to so little is because they went gunning for rabbits and ground squirrels while the big beasts of the jungle were left unmolested. It is "big game" that we are after this time.

* * *

"Dollars are scarce" wrote a farmer from Vernon County the other day—"but I rustled around and found one and here it is to help you continue the great fight you are making for the farmers of this state. Wish I could make it a $10 bill. But I'll see if I can't scare up some new subscriptions among my neighbors." This is the kind of sentiment that counts. If we had 10,000 farmer friends like this in Missouri we'd "set the woods on fire."

* * *

The pitiful lack of farmer organization was never more vividly illustrated than in the Alfalfa hay which we succeeded in locating in the hands of Kansas farmers and which, less than 30 days ago could have been bought at from $11.50 to $12 per ton F. O. B. Kansas points. By the time our friends woke up, however, it had been gobbled up by the commission men—and now we will have to pay a premium of $4 or $5 per ton for it. How much longer will we remain "asleep at the switch?"

* * *

Our coal company, despite the car shortage has shipped about 25 car loads of coal to Farm Clubs during the last two weeks and as against present retail prices this has meant an average saving of close around $100 per car—or $2,500 on the whole bunch. In the near future we trust that each one of these Clubs will try and send us at least $20 in subscriptions which will still leave them a clear profit of $2,000. As the car shortage relaxes we trust to be able to move the coal out faster.

* * *

The National Live Stock Commission Co. does the biggest business at the National Stock Yards—and since it has been doing this for a number of years it indicates that it must give splendid satisfaction to the hundreds of shippers and feeders who consigners—and every one of them is a to it. I know every man in this great "wheel horse." concern personally and have no hesitancy in recommending them to the feeder and shipper friends of THE MISSOURI FARMER. If you expect to ship to the National Stock Yards this winter, get in touch with them.

* * *

If you believe in the fight which THE MISSOURI FARMER is making, why not send us a dollar to renew your subscription so it will reach us on New Year's Day? This is the best way to show us that you are with us. Now that the farmers of Missouri have a farm paper which is willing to fight their battles, ought they not to stand by it? The other fellows always stand by their friends. That's why they always win. With the help of every thinking farmer in the state there is no question about what we will be able to accomplish—but if only a farmer here and there gets up behind us the fight we are making in your behalf will fall short of the fullest measure of success.

* * *

We have made a strenuous effort to locate corn in the hands of Missouri farmers who have some to sell—and while we have been able to locate a quantity which the Farm Clubs have promptly gobbled up, we find that most farmers who have a surplus a holding it for higher prices. However, we will be glad to furnish wholesale prices at the hands of a big Kansas City Commission Co. and in this way we will be able to save at least the local dealers margin to our farmer friends. The first step to take is to organize several school house Farm Clubs so that carload shipments can be handled—and those in the drouth stricken sections should lose no time in doing this. Once we get a lot of Farmers Co-Operative Elevators scattered over the state this matter will be much simplified—and it will mean an enormous saving to the farmer.

* * *

I want every reader to read the fine letter of Mr. Myers, sec'y of the Davis Farm Club in Chariton County which appears elsewhere. Also the article from Mr. Gray of Vernon County—as these things show what farmers can do when they wake up. The Chariton County fight is being led by Messrs. Bachtel, Smutz, Heisel Bros. and Mr. Dryer, Ernest Schowengert, S. R. Schmutz, J. B. Hagood, Mr. Williamson, Mr. Gray, Mr. Graham, Mr. Winkler, Mr. Schumacher and Mr. Fitzpatrick are doing the same. Over in Saline, Messrs. Rea, Brownfield, Pence and a lot of other "wide awakes" are lighting up the school houses in every direction. In the near future the Farm Bureau of Marion County will hold a big farm organization convention and thus the good work goes on.

* * *

We regret to be compelled to change to a poorer quality of paper with this issue and the reader can get an idea of the advance in the cost of paper when I tell you that this car load of stock which has just arrived costs $1100 more than the same car would have cost 14 months ago. I trust our friends will help us to bear this heavy increased burden by sending us a dollar on subscription so it will reach us not later than New Years. Or better still, make up a Club of a half dozen subscriptions among your friends and neighbors—for upon this kind of support largely depends our ability to continue the fight which we, among all the other farm papers, are makin' single handed and alone. Again, is not this support a mere bagatelle after all when we offer to save ten times this amount in a few months to the farmers of any school district who w get together and form a Farm Club?

* * *

I hope that the women folks and the young folks in whose homes THE MISSOURI FARMER is a visitor will take immediate advantage of the splendid Free Library offer which we made some weeks ago. All you need to do to get a dozen of the finest books going is to make up a Club of a dozen two year subscriptions to THE MISSOURI FARMER at a dollar each. Then the dozen books can be passed around until each member of the club has read them. When this has been done, each club member will become the permanent owner of a book which would cost you 75c or a dollar at any book store. In the meantime, you also have two years subscription to the paper—and you have been permitted to read a dozen of the best books published. Now isn't this an easy way to get a fine winters reading? We will supply you with a list of 100 books out of which to make your selections. So get busy and make up your Club at once.

* * *

Here is a new idea for our Farm Club friends: If your Club will get busy at once and make up $20 in subscriptions for our splendid series of Farm Club Dissusions, we will give you a "Bulletin Board Service"— that is, once each month we will allow your members to list the things they have for sale or the things they want to buy—and this Bulletin will be mailed to each Club once per month and I feel sure it will provide a useful and much needed service. It is intended as a supplement to our regular Farmers Market Club Bulletin which was designed for individual farmers—a special service for the Farm Clubs which have qualified for the Farm Club Discussions which every Club should have any way because it means they will have a live topic for discussion on each meeting night. I feel that this free "Bulletin Board" will appeal strongly to every wide awake Farm Club in the state and officers should therefore get busy on the necessary subscriptions without delay.

Aaron Bachtel, Brunswick, Mo.

B. C. Smutz, President Davis Farm Club, Brunswick, Mo.

C. B. Myers, Secretary Davis Farm Club, Brunswick, Mo.

THREE FARM CLUB LEADERS IN OLD CHARITON

Above we print the pictures of three of the Farm Club Leaders of Chariton County—and our only regret is that we are not able to accompany them with the likenesses of Heisel Brothers who richly deserve a place in this litle gallery of "live ones." The first is the picture of Aaron Bachtel—the man who "set the ball rolling" in old Chariton. Mr. Bachtel is a splendid type of the successful farmer and fine citizen of which every community has its share—only, unlike Mr. Bachtel, many of them are "asleep at the switch." Mr. Bachtel is a farmer who believes that farmers "can do something"—and some months ago he organized the first Farm Club in Chariton County and "proved it." Mr. B. C. Smutz, successful farmer and President of the Davis Farm Club has not only built up a successful organization of his own, but together with Mr. Bachtel, Heisel Brothers and Mr. Myers he has perfected an "organization squad" which is lighting up the school houses far and near and soon Chariton will be ready for a County Farmers Ass'n. Mr. Myers, Sec'y of the Davis Farm Club is a splendid example of the young farmer who is "awake"—and he is contributing his full share toward the great Farm Club movement. And now why can't every county in the state follow the splendid example of these men? Don't you see that with such aggressiveness we could soon have 100,000 farmers banded together? These men don't stand around in a blue funk of doubt. They don't ask for speakers. They simply send word that they will be at such and such a school house on a certain night—and when they get through telling about what they are doing and what other farmers can do every man in the house is ready and anxious to form a new Farm Club. With 1000 such men we could literally set Missouri "on fire" in 60 days and we commend what these men are doing to our friends throughout the state.

EDGEWOOD FARMS,
WHITEWATER, - - WISCONSIN

Live Stock Notes

Shetland Ponies

Nothing makes a boy or girl more happy and contented than to have a fine Shetland Pony. This gives them a great pleasure and a recreation and will make them more contented with farm life. You could not give your children a better Christmas gift than a good pony. Elsewhere in this paper will be found the ad of J. B. Smith of Platte City who has some fine ones for sale.

Angus Sales

J. D. Blackwell, Fayette, Mo., reports the following sales in the past few weeks on registered Aberdeen-Angus cattle.

W. F. Gray of Trenton, Tenn. 4 head of yearling heifers.

W. W. Pierce of Trimble, Tenn. 10 head of cows and heifers.

T. H. Underwood of Kossuth, Miss. A fine yearling bull.

Chas. W. Weiss of Jackson, Mo. 4 head yearling heifers.

G. W. Helms of Eldon, Mo. 2 head of yearling heifers.

Watson's Durocs

Look up the ad of W. C. Watson, New London, Mo., who comes before the readers of THE MISSOURI FARMER with a superb offering of Durocs. He offers choice spring boars and bred gilts that are sure to please the most exacting. Most of spring crop is sired by Baxter's Cherry Chief, out of dams of the most popular blood lines. Mr. Watson has priced everything to move and ships only good individuals. Write for information and mention THE MISSOURI FARMER.

A Chance to Get Good Angus Cows

J. D. Blackwell of Fayette, Mo., offers well bred, registered Aberdeen-Angus cows that will calve in early spring, also two year old heifers, that will calve next summer, bred to fine Erica and Barbara bulls. Good individuals and well bred. Also, some yearling heifers, and calves from 9 months old up. Registered bulls from 18 to 22 months old, weights from 1000 to 1100 lbs., and several coming yearling bulls that will be ready for service in early spring.

Williamson's Polands and Shorthorns

Mr. H. S. Williamson, proprietor of the "Oakwoods" Herds, at Centralia, Missouri, writes that he now has 32 spring boars, big lusty fellows, for service now, and 21 summer and fall boars 160 to 100 lbs. "These spring boars are litter mates to the 60 head of good gilts I sold last June to the University of Missouri. Will also sell 15 to 20 tried sows, bred for early farrow. These are my herd sows, and are sold for no fault.. I also have some late fall yearling gilts 300 to 350 lbs. as good as walk in Missouri, and that means anywhere. Hogs immune from cholera.

"In Shorthorn's I have some real bargains in bull calves, young bulls of all ages, heifers, calves, yearlings, and some 2 year olds bred, and a few cows some with calves by side. Prices reasonable. Guaranteed as represented and to please you in value and quality, or money back on return of same to me."

Dryden's Choice O. I. C's

Mr. J. M. Dryden of Phelps City presents an exceptional lot of gilts for sale. These gilts are of March farrow sired by "Ohio Chief" by "Trade Winner." These gilts are out of aged sows and are bred to "Wonders Climax" by Wonder the grandsire of the Grand champion boar at the Omaha and International this fall. Wonder has more prize winners and grand champions to his credit than any Chester White sire living today. Wonder Climax crossed on these gilts will no doubt produce something worthy a place in any herd, as in this cross we have the blending of the blood of two grand chamion sires. Wonder and White Eagle are first prize winning blood on the dams side also.

Bargains in Boars

C. L. Conaway, Nelson, Mo., starts a card adv. in this issue that is of great interest to those in the market for boars. Mr. Conaway offers the choice of six fall yearling boars for $40. These boars are big, husky, stately fellows with high backs, big bone and quality. They are sired by Big Leader and Successful. Five growthy spring boars; one sired by Bridges' Bob Wonder, a bargain at $30, one by Big Leader and three by Columbus Defender at $25 each. Mr. Conaway needs the room and offers unusual values for immediate shipment. Why not enclose check with first letter and get choice. Mention THE MISSOURI FARMER when writing.

WHY NOT RAISE MORE SHEEP?

The weeds, the briars, the brush and the poor hillsides all over Missouri need more sheep and these may be added to the slim pocket books of thousands of hard working farmers. The increased demand for mutton and wool insures prices for many years to come, at least that will give a reasonable profit to the man who will give a little intelligent effort to the raising of sheep.

We have often stated but it will bear repeating that Missouri is better adapted to profitable sheep raising than any of the Middle Western states. This state already has a greater number of sheep than any state bordering on it but the number could be increased several times without interfering with any other branch of the live stock industry.

Sheep raising should be attractive to the poor man because he can get into the business on very little capital and because the returns will come in twice a year—when the wool is sold and when the lambs are ready for market. On most hill farms in Missouri a small flock of sheep can be kept at so little real expense that the wool will pay all costs of keeping and the farmer will have for his profit whatever he can get for the lambs and the added fertility left on the soil. It is not only advisable to keep sheep on our poorer lands but the best of our upland farms should have a flock of sheep to be used as gleaners, soil improvers and not the least important profit makers. If the farmers of England can make sheep raising profitable on land worth several times what our best lands are worth then why can we not do it with so many advantages in our favor?

We print below a few paragraphs on this subject from a bulltin of the Pennsylvania Agricultural College written by B. O. Severson which are worthy of careful consideration:

"The demand for mutton and wool is greater than the supply. The value of mutton is higher than it has ever been. Wool prices advanced even before the European war began, and the latter has created abnormal wool values. In spite of this increase in value, there has been a decrease in wool production in the United States. There were 328,000,000 pounds of wool grown in the United States in 1909, and 288,000,000 pounds in 1915, a decrease of 40,000,000 pounds in six years. The total number of sheep in the United States decreased from 52,447,861 in 1909 to 49,162,000 in 1915. The average increase in value of sheep in the United States has been gradual since 1910, when they were worth $4.12 per head, while on Jan. 1, 1916, they were worth $5.17 per head.

"Even with the decrease in numbers of sheep, their value has increased, due to a growing appreciation of mutton as food. The average value on the world's greatest market (Chicago), for 1915, was $6.40 per cwt. for sheep and $9.05 for lambs, an increase of 80 cents per cwt. for sheep and $1.15 per cwt. for lambs, over 1914 average. The question may properly be asked, "Why have mutton and wool production decreased?" The decrease has been largely due in the west to the "gradual encroachment of agriculture" on grazing lands, "and the consequent increase in the cost of sheep raising."

POLAND CHINAS

Poland Chinas & Shorthorns
Bred sows and gilts. The real big kind with bone and quality. A few serviceable boars. Several extra good young bulls and heifers. Satisfaction guaranteed.

BOWLING GREEN, - - MISSOURI

DUROC JERSEYS
Big spring boars and bred gilts priced to move. If you want royally bred Durocs with lots of stretch, bone and quality, write.
W. C. WATSON, NEW LONDON, MO.

Why the "National" Leads Them All

THERE ARE SEVERAL REASONS why the **National Live Stock Commission Co.** does the biggest business at the **National Stock Yards.** First and foremost is the reason that we have built up the most powerful force of salesmen that ever fought the selling battles of any Live Stock Commission Co. in the Country—it matters not where located—men who know what a hog, steer or sheep is worth and who go the limit of their splendid ability in trying to get the **"high dollar"** for it. **It is because hundreds of shippers in the 18 states which embrace our territory have come to have the utmost faith in us that we do the biggest business at the National Yards—and since "nothing succeeds like success," this is why our volume grows bigger each year!**

But, after all, there is another reason: It is because we pay just as much attention to the welfare of the small shipper as to the big one. In other words, we realize that, comparatively speaking, what a small shipper receives for one load of hogs, cattle or sheep means just as **much to him** as what a big shipper receives for a dozen loads—**and thus we have built up hundreds of friends among the smaller feeders and shippers who know that their interests will be painstakingly looked after in our hands!** If you expect to ship to the Nat'l Yards this winter, let us hear from you. We will be glad to give you any helpful suggestion in our power. In the meantime, we wish you and yours a Merry Christmas.

The National Live Stock Commission Co.

NATIONAL STOCK YARDS, - - ILLINOIS

"The fact that the United States imported 263,928,000 pounds of raw wool in 1910, and 308,083,000 pounds of raw wool in 1915, demonstrates that there is a great demand for wool. Pennsylvania ranks second to Massachusetts in the United States in the production of woolen goods. There were 104 establishments, employing 7,207 persons, and the industry was capitalized at $15,811,911, in Pennsylvania, in 1909.

"As a demonstration of the demand for wool in the United States at the present time, the following resolution was passed on January 31, 1916, by one of the largest wool and textile associations in the United States:

"'The Philadelphia Wool and Textile Association, being intimately acquainted by their trade requirements with the sheep industry of the world and especially of the United States, feel it to be their duty to arouse the attention of the people of the United States to the decrease in the number of sheep in the United States, and in consequence thereof, to the decreased supply of wool and meat available f the need of our population. From the facts regarding this matter, which come to our knowledge, we not only have evidence of decreased production, but it appears to us that this decrease will continue unless effective efforts are made to interest and encourage our farming population to engage more generally in the maintenance of sheep. Moreover, we a aware that these supplies available from foreign sources are evidently also on the decline, and we have seen what serious effect a foreign war can produce on such sources of supply.'

Aberdeen-Angus

I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good **Poland China Hogs** at moderate prices.

J. D. BLACKWELL, - Fayette, Mo.

ANGUS CATTLE

Herd founded 1904

V. E. LAWRENCE, - Salisbury, Mo.

High Grade Holstein

Holstein cattle for sale. High grades and pure breds. Registered bulls $50.00 up to $150.00. The kind that please. Tuberculin tested.

E. L. ENSIGN, - CAMERON, MO.

Relation to Soil Fertility

"The 'golden hoof' explains the relation between sheep and soil fertility. The high nitrogen and potassium content of sheep manure, which is readily available as plant food, and the tendency of sheep to spread their excrement uniformly are the factors which increase soil fertility. When sheep graze too closely they may injure grass land, but this should not be mistaken for depleting the soil of its fertility. The following table gives the relative value of manure from various classes of live stock.

Weight and Value of Manure from Farm Animals

	Total Excrement in one year	Value per ton
Horses	15,877 lbs.	$2.56
Cattle	26,061 lbs.	2.00
Sheep	1,367 lbs.	4.45
Swine	2,375 lbs.	3.38

Based on nitrogen 15.84 cents per lb., phosphoric acid 8.25 cents per lb., and potash 5.3 cents per lb.

"Although the value of sheep manure per head, annually, is not as great as that of cattle, horses or swine, its value per ton is greater because of its higher nitrogen and potassium content, and its lower moisture content.

Sheep as Weed Destroyers

"Sheep consume more weeds than any other class of live stock, except goats. It is estimated that sheep will eat 90 per cent of all troublesome weeds. They will destroy weeds in pastures, in grain fields and corn fields after harvesting, and clear the fence rows. However, sheep are not scavengers to the extent that they can thrive on refuse and weeds alone. In order to get sheep to consume leaves on shrubs, the tenderer grasses must be scarce. Goats are better adapted to clearing brush land than are sheep. Some farmers consider sheep necessary as an economical means of controlling weeds.

The Sheep's Place on the Farm

"It is the specialist only who would engage in sheep raising as his main farming enterprise, but a medium-sized flock is invariably suited to conditions on an average farm. Sheep require relatively little labor, the greatest amount being required during lambing time, which is generally in March, a month when the average farmer wants employment for his labor. Buildings may be erected cheaper than for any other class of live stock. Rough feeds that are wasted and weeds that are a nuisance are utilized and made into marketable products of mutton and wool, and sheep may be slaughtered so as to provide fresh meat at any season of the year."

BARGAINS IN JERSEY COWS!

From one to a car load of good, young registered Jersey cows, mostly fresh or soon due; offered at sacrifice prices because short of feed and cannot winter. Also, a few open heifers and young bulls. Write your wants or come and see this stock.

Tuberculin-tested.
S. W. COOKE & SON,
Maysville, De Kalb Co., - - Mo.

SHOULD FARMERS ORGANIZE?

Some months ago, 400,000 railroad employees demanded the eight hour law. They gave Congress an ultimatum to pass such a law within a certain number of hours. The law was promptly passed.

But when 6,000,000 farmers demanded an investigation into the affairs of the Beef Trust, furnishing sufficient proof that this Trust was violating the laws of the country, their demand was ignored. Why is it that the one demand was immediately complied with and the other denied?

The answer is easy. The railroad men are organized and have the power to enforce their demands. The farmers are not organized and are therefore helpless. The Beef Trust has made in recent years an annual profit of about 50% on its common stock, including water and all. The farmer has fed these same years, his hogs and cattle, just for the philanthropic purpose of feeding the world and enriching this Trust. For this noble work he has not alone donated his own sweat and toil, but most of his feed and grain too, and few cattle and hogs have realized for him more than the purchase price. In order to accomplish this, he had to spend all his savings and borrow all the money he could on his farm and otherwise.

Now in these times of greatest prosperity, of which the farmer has created the major part himself, he is actually facing the greatest calamity that can befall a farmer—that of losing the old homestead. It is hard to understand why the Packers are killing the goose that is laying the golden eggs for them. But these predatory trust magnates have never shown the least regard for their fellow-men, the future welfare of their own country and their own enterprises. The Lumber-kings have devastated whole states. The timber was acquired by them mostly for a mere song. The beautiful forests and the valuable timber which once belonged to all the people are gone forever—then, although these men paid little or nothing for all these millions of trees which they cut down they never went to the trouble and expense to replant a single one.

Just as our great forests have been destroyed for the benefit of a few greedy men, exactly so our once rich and fertile prairies were quickly robbed of their fertility for the sole benefit of the Grain and Beef Trusts. The poor farmer, like the slave he is has to do this miserable work and according to Government Statistics receives the pittance of one dollar for a day consisting of 16 hours of toil and about 3% on his invested capital. All profit goes to the Trust and even the fertility which is taken out of the soil by the crop goes without compensation, just as our beautiful trees did, as a gift to a few greedy milionaires. But what do these men care? They have no country which they love and in which they take any pride. As soon as they have skimmed the cream from one section, they move to another. The Lumber kings have moved to Canada and the Grain and Beef Barons have already begun their nefarious business in Argentine and Brazil. What is the distress of the American people to them, so long as there are other countries to plunder? Of all the modern highwaymen the Beef Barons certainly do the greatest damage. They have discouraged and ruined the Live Stock industry which is so indispensable to permanent Agriculture as only with it, it is possible to maintain the fertility of the soil. At the same time they exact a heavy toll from the city dweller on his daily bread and this hits the poorest classe the hardest.

A railroad man told me the other day that he was earning $150 a month. "If it was not for our union, I would be earning $1.50 per day," said he. We farmers are earning only one dollar a day. Would we work 16 hours for one dollar if we were organized? Would Congress have turned us down if we had as strong an organization as the railroad men? Would our State Legislature deny us a reasonable Co-operative and Corporation Law? Would it deny us a law that would protect our herds against vagrant dogs? Would it deny us any reasonable law we want, if we were thoroughly organized?

Why is it then that the American farmer is still holding back? Why is it that he is still selling his wheat to the Trust at a little over two cents a lb. and buying his flour from the same trust at almost five cents a pound? Why does he frequently sell his cattle at six cents to the trust and buy his meat back at 20 cents? Why does he pay from six to eight per cent interest when his own capital earns only three per cent? Why does he earn in sixteen hours only one dollar when his railroad brother earns five dollars in eight hours? Why does he allow the stray vagrant dogs to harass his cattle, and kill his sheep year after year? Why does he pay two and three and more profits for the implements, the machinery, the wire, the twine, and the necessities of life which he has to buy? Why is he still looking on, when the mortgage grows at an alarming rate and the remedy is within such easy reach?

Is he such a fatalist that he believes he cannot change his fate no matter what he does? A good many farmers have told me "What is the use, we cannot help it, the trusts are too strong for us, they've got all the money and they own the Government too—so they are bound to get us." Let me say that "faint heart never won fair lady," and that the man who never tries will certainly never get there. If 400,000 railroad men can dictate to Congress, what could six million farmers do?

I can tell you what one hundred united farmers did, in old Pike in the "Show Me State." In the dry year of 1913 they set the price of bran from $1.50 down to $1.00; of ship stuff from $1.65 to $1.10; of potatoes from $2.50 to $0.85. Woven wire bought by the carload was reduced over 50 cents a hundred. Salt, corn, oats, oil-meal and every thing was handled to great advantage to the farmers. Today these very same farmers own their own warehouse on the railroad tract and employ from three to five men continually doing the farmer's business for the benefit of the farmer instead for the benefit of the trusts, and saving their patrons a princely sum annually. What a hundred farmers have done and are doing in one poor county, certainly can be done in any community. If all farmers would organize in their respective school districts and buy and sell together they would reap an immediate benefit not only in dollars and cents but in pleasure as well.

All these clubs united in the state would possess a big stick that if wielded right could do wonders and united under a national head they would be the greatest power on Earth. Under such an organization all trusts would melt away like snow under a summers sun. Then there could be happy farm homes once more, relieved of the ever threatening mortgage. Farming would become a safe business and the city dweller would have his daily bread untaxed by the insatiable greed of useless middlemen. Every farmer in this fair land of ours owes it not only to himself and his family but also to his country to join the ranks of the fighters who fight for their homes and for their country against the meanest and mightiest enemies this country ever has had, or ever will have.

Your country needs you! ! !

Join your School District Farm Club without delay. If there is no start one. Become a leader. Leaders are needed, and many of them. Lead your fellow farmers in this great fight, for the battle is now on. It will be no sham battle either. It is in dead earnest.

It is either the Trusts will get us or we must get them. The old General said, "The battle is always won by the party who gets there firstest with the mostest men." So time and numbers are the greatest factors. Why then wait? You may be able to hold your own for a while yet. But remember, while you wait your weaker brother is falling by the wayside. His mortgage will be foreclosed and he will be a dead soldier—no longer able to help us fight the big battle. Don't say you are "too busy" with other things. What will it profit you to save one pig in the feed lot while the Packers steal two? If we will use our heads we will be able to save all three pigs. There isn't another thing in the world as important to the farmer at this hour as this great farm organization fight.

T. B. Ingwersen.

Forget Everything Else Think of Money-Making for a Minute!

Here is a Secret

ARE you making money? No? What's the matter? You want to, don't you? But wait. I know. I've been discouraged a thousand times. I've walked around with my hands in my pockets, thinking and thinking and getting nowhere.

Now things are different with me. I'm making money and I'm organizing the greatest crowd of money-makers the world has ever known. Want to get in? Listen. One man without training, just my instructions, made $45.00 in one day—another $1000 in one month.

You and Your Family Can Have the GOOD Things of Life

I am not sentimental. I like to make money. I am running this ad to make money. But when I slam down my desk at night and ride home under the maple trees of my Indiana town I like to think that I have helped a dozen or more fellows to make more money that day. Helped them to a happier life and to the good things we all want. Don't you want to write and find out what I mean and how I do it?

Did You See My Big Ad? It appeared in farm papers a little while ago. Probably you did. If you didn't read it—all right—but don't pass this up. Read it—read every word—think about it and first of all write and get the facts.

My Automatic Combination Tool is a Mechanical Marvel

I could get a hundred thousand of a certain kind of men to work for me tomorrow. You know the kind I mean. The tool is such a wonder, it does so many things and does them so well that any man can sell two or three a day and make $5 or $10. I want fellows who will make $100 to $200 a week. I want the big money-makers. Now think. You don't know whether you are one or not eh? Of course you don't. That rich fellow who owns the big house and the touring car didn't know, once. He had to find it out. I want to show you.

First of All—Write No long letter necessary at all. Just your name and address on a postal card if you are in a hurry. That puts it up to me. I've got to show you and I will.

What the Tool Does I'll tell you more about that later. But just to give you an idea—it does all the work of the old-fashioned jack, that costs almost as much, and eleven other tools besides—single wire stretcher, woven wire stretcher, wire mender, post puller, rail fence repairer, wheel repairer, press, hoist, vice and clamp, stump rooter and alligator wrench. It's a tool that farmers, teamsters, auto owners, contractors and builders have simply got to have. Once they know its merits they want it.

Let's Get Together I'll tell you the whole story in all its details as soon as I get your name. That's what I want now. I want you to put it up to me. Just address me or the company. I'll get the letter or the card. And please don't put it off.

Address P. J. HARRAH, Pres.
The Harrah Mfg. Company
122 Main Street
Bloomfield, Ind.
